PREFACE TO SIXTH EDITION

More than the usual amount of time and effort has been given toward making this new edition of Bergey's Manual useful. The volume has been completely revised and is reset in double column format so that each page carries about 20 per cent more type than the pages in the fifth edition. Those who are interested in special groups of bacteria will find something new in the presentation of the relationships in every genus. Because of our rapidly expanding knowledge, changes in the outline classification and text were made necessary. These changes have in every case been made by specialists in consultation with the Editorial Board. Every specialist possesses first hand knowledge of the species in the group that he or she has reviewed.

Because increasing knowledge has shown the fission fungi to be a larger and more diversified group than previously realized, the number of species described has increased from 1335 in the fifth edition to 1630 in the present edition of the Manual. This number does not cover all of the descriptions found in the literature for, as in all other fields of biology, many of the descriptions are so inadequate that the species described cannot now be identified. Many descriptions are obvious or probable duplications of previous descriptions while still others are based on nothing more substantial than the author's belief that he had something new, he having made but little effort to compare his cultures with those found by previous investigators. An indication of the large number of inadequate descriptions will be found by referring to the material in the appendixes to the various groups, and to the index where synonyms and incompletely described species are shown in italics.

The large number of these poorly described species suggests that there has been much unsatisfactory work done in the field of bacteriological taxonomy. Progress in this inadequately developed field is needed as it would help to clarify the approach to desirable research in many fields of bacteriology.

It is believed that both teachers and investigators will find the new Source and Habitat index useful. It is important to know what organisms have been described from any given habitat in determining the identity of a described species or whether a given species is new.

The future development of taxonomic work holds several interesting possibilities of increased international cooperation such as between the various National Type Culture Collections and within the International

Association of Microbiologists. The Trust Funds provided through the generosity of Dr. Bergey before his death have been used in developing the present edition of the Manual and future funds are to be used in the same way under the management of a self-perpetuating Board of Editor-Trustees.

We are all under obligation to those who have given so freely of their time and special knowledge in preparing this edition of the Manual. Moreover the Editor-in-Chief is under special obligation to his wife, Margaret Edson Breed who has carried the burden of the indexing; to Mrs. Eleanore Heist Clise who has given invaluable service in bibliographical research, in proof reading and other ways; and to his secretary, Miss Maude Hogan, who has cared for many difficult manuscripts and a voluminous technical correspondence.

Many binomials not previously mentioned in the Manual will be found in the Index of Genus and Species Names. Each new name means that there is a new bibliographic reference in the text. Practically all of the incomplete references of previous editions and all new references have been examined in the original, something that is essential in all accurate taxonomic work. The index of names is the most complete list that has appeared in the literature and should always be consulted before new genus or species names are proposed.

This edition of the Manual has been more than four years in press, thanks to the care that has been taken to make it complete and useful. Throughout, the Editorial Board has had the cooperation and understanding help of the publishers of the book who themselves have been forced to meet and overcome the trying difficulties of the war years.

The plan of the present book is such that it will be found useful both to teachers and research workers.

PREFACE OF FIRST EDITION

The elaborate system of classification of the bacteria into families, tribes and genera by a Committee on Characterization and Classification of the Society of American Bacteriologists (1917, 1920) has made it very desirable to be able to place in the hands of students a more detailed key for the identification of species than any that is available at present. The valuable book on "Determinative Bacteriology" by Professor F. D. Chester, published in 1901, is now of very little assistance to the student, and all previous classifications are of still less value, especially as earlier systems of classification were based entirely on morphologic characters.

It is hoped that this manual will serve to stimulate efforts to perfect the classification of bacteria, especially by emphasizing the valuable features as well as the weaker points in the new system which the Committee of the Society of American Bacteriologists has promulgated. The Committee does not regard the classification of species offered here as in any sense final, but merely a progress report leading to more satisfactory classification in the future.

The Committee desires to express its appreciation and thanks to those members of the society who gave valuable aid in the compilation of material and the classification of certain species. . . .

The assistance of all bacteriologists is earnestly solicited in the correction of possible errors in the text; in the collection of descriptions of all bacteria that may have been omitted from the text; in supplying more detailed descriptions of such organisms as are described incompletely; and in furnishing complete descriptions of new organisms that may be discovered, or in directing the attention of the Committee to publications of such newly described bacteria.

CONTENTS

INTRODUCTION

Suggestions for the Use of the Manual in Classifying Unknown Organisms

No organism can be classified before we have determined, through detailed study, its morphological, cultural, physiological and pathogenic characters.

The characters used in the keys to orders, families and genera may ordinarily be determined by the use of a dozen or more of the procedures described in the Manual of Pure Culture Study issued by the Committee on Bacteriological Technic (H. J. Conn, Chairman, Geneva, New York) of the Society of American Bacteriologists. More complete examinations must be made as indicated in the Manual of Pure Culture Study, and in the Descriptive Charts which accompany this Manual where it is desired to identify individual species. These tests must be made if bacteria are to be accurately identified and described.

It is urged that beginning students be taught the technics necessary for the identification of species in the hope that the taxonomic work of the future may be placed on a more satisfactory basis.

After a complete study of the characters of the organism has been made, turn to page 65 and ascertain first in which order the organism belongs. When the order and suborder (if necessary) have been ascertained, turn to the page of the Manual on which the key to that order or suborder is given. In this key ascertain the family or subfamily to which the organism belongs.

When the family or subfamily has been decided on, again refer to the page of the Manual on which the key to that family or subfamily is given. In this key ascertain the tribe to which the organism belongs.

When the tribe has been decided on, again find the page of the Manual on which the key to the tribe is given. In this key ascertain the genus to which the organism belongs.

When the genus has been decided on, again refer to the page of the Manual on which the key to that genus is given. In this key, trace out the species under investigation.

For example, if one wishes to trace a short, peritrichous, Gram-negative, non-spore-forming rod that grows well on ordinary culture media at 37°C, fermenting glucose and lactose with production of acid and gas, not liquefying gelatin, producing no pigment on any culture medium, with negative reaction for acetylmethylcarbinol, producing indole and reducing nitrates, consult the key to the orders on page 65.

In this key examine A. *Cells rigid, not flexuous.* This indicates our organism as its cells remain constant in form.

We next examine 1. *Cells single, in chains or masses. Not branching and mycelial in character. Not arranged in filaments. Not acid fast.* As the organism in question occurs as single cells or at most as short chains and is not acid fast, this indicates that it belongs to the Order *Eubacteriales.*

We now examine a. *Do not possess photosynthetic pigments. Cells do not contain free sulfur.* As our organism is unpigmented and the cells do not contain free sulfur, this indicates that our organism belongs to the Sub-order *Eubacteriineae.* We note that the key to this suborder is on page 67.

We next attempt to ascertain the family to which the organism belongs by tracing it through the key to the families of the Sub-order *Eubacteriineae,* p. 67.

I. *No endospores* indicates our organism. We proceed to A. *Can develop on inorganic media.* As the organism cannot grow without organic carbon, we turn to B. *Cannot develop on inorganic media.*

This corresponds with the physiology of our organism; so we turn to 1. *Polar flagellate,* etc. As our organism is peritrichous, we proceed to 2. *Large oval, pleomorphic cells sometimes almost yeast-like in appearance. Free living in soil. Fix free nitrogen.* As this does not correspond with the morphology or physiology of our organism, we next examine 3. *Peritrichous or non-motile rods, and cocci.* This corresponds with the characteristics of our organism.

We turn to a. *Heterotrophic rods which may not require organic nitrogen for growth. Usually motile with one to six or more flagella. Usually form nodules or tubercles on roots of plants, or show violet chromogenesis.*

This again does not indicate our organism; so we turn next to aa. *Heterotrophic rods or cocci which utilize organic nitrogen and usually carbohydrates.* As our rod-shaped organism prefers a medium containing organic nitrogen, we proceed to b. *Spherical cells in masses, tetrads and packets.*

This does not correspond to the morphology of our organism, and we now proceed to bb. *Spherical cells which grow in pairs and chains; and rods.* This includes our rod-shaped organism; so we turn to c. *Gram-positive cocci and rods. Non-motile.* Since these are not the characteristics of our organism, we turn to cc. *Gram-negative rods. When motile, from four to many peritrichous flagella.*

Our organism is Gram-negative and peritrichous; so we proceed to d. *Grow well on ordinary media containing peptone. Aerobic to facultative anaerobic.*

This corresponds with the characteristics of the organism we have studied; so we turn next to e. *Gram-negative, straight rods which ferment*

sugars with the formation of organic acids. This again corresponds with our organism. We turn next to f. *Produce little or no acid from litmus milk.* This does not correspond with the characters we have determined for our organism. We proceed to ff. *Produce CO_2 and frequently visible gas (CO_2 + H_2) from glucose. Reduce nitrates, etc.*

Our organism produces visible gas from glucose and reduces nitrates. This indicates that it belongs to *Family X. Enterobacteriaceae*, p. 443.

This appears to fit our unknown organism. We now refer to page 443 on which the key to the Family *Enterobacteriaceae* is found. In this key we ascertain the Tribe to which our organism belongs. 1. *Ferment glucose and lactose with the formation of acid and visible gas. Usually do not liquefy gelatin. Tribe I. Eschericheae.*

This corresponds with the characters exhibited by our organism. We refer to the key for Tribe I. *Eschericheae* on the same page. 1. *Methyl red test positive. Voges-Proskauer test negative. Salts of citric acid may or may not be used as sole source of carbon. Genus I. Escherichia*, p. 444.

This description appears to correspond with that of our unknown organism. We find the key to the species of Genus *Escherichia* follows the key to the Tribe *Eschericheae.* On tracing our organism in this key we find that it corresponds to *Escherichia coli.* A brief description of this organism is found on the same page.

* In the use of keys for identifying bacteria, the student is confronted with two difficulties, both based primarily on lack of knowledge and experience. The first is insufficient knowledge concerning the morphology, physiology, possible pathogenicity and habitat of the microorganisms that are to be identified. This may be due to careless observations or to poor training in the special techniques that must be used in determining the identity of a given bacterium.

The second difficulty in the use of a key comes from inexperience in the use of technical terms; that is, the student may not thoroughly understand the meaning of the statement in the key and so cannot follow a route through the key with certainty. For example in the keys used here, the student must know the difference (1) between chains of cells which are composed of dividing cells which do not separate at once, and (2) filaments which are composed of dividing cells which remain more permanently together and are normally flattened against each other on adjacent sides. They may show some differentiation into hold fast cells and reproductive cells (conidia), (3) Both chains of cells and filaments are to be distinguished from the mycelial threads found in *Actinomycetaceae.* These are unseptate and branching with a true branching.

---

* Condensed and paraphrased from Hitchcock's Descriptive Systematic Botany, New York, 1935.

The student should be warned not to take descriptions in the MANUAL too literally or too rigidly. Descriptions are usually drawn to represent average findings. Especially among bacteria, characters such as sugar fermentations, gelatin liquefaction, presence or absence of flagella and other things will vary. Sometimes these variations are due to slight, possibly unrecognized variations in the techniques used in determining these characters. Real knowledge of the characteristics of species may also be very incomplete. This is true not only of the physiological activities of these microorganisms; but also in regard to such detectable structural features as the number and position of flagella. Dark field movies of motile cells and photographs taken with the recently developed electron microscope are revealing new and heretofore unsuspected facts regarding structural features.

Source and habitat data are frequently helpful in aiding the student to recognize species of bacteria and may indicate that the pathogenicity of the culture in question may need to be tried on some specific animal or plant. By habitat is meant the kind of a place in which the organism normally grows; by source, the particular material and place from which the culture was obtained. This source may or may not indicate the natural habitat. The source of cultures is invariably more limited in scope than the habitat as bacteria normally occur wherever their particular habitat may be found in a world wide distribution.

The student is also reminded that it is impracticable to note all exceptions in keys. Bacteria like other living things are classified according to a combination of characters, not according to some single character, and exceptions to the characters noted in the keys will occur in nature. These may not be known to or may have been overlooked by the author of the key. On the other hand, the importance of such exceptions should not be overemphasized and the student would do well to use the key as if there were no exceptions.

HISTORICAL SURVEY OF CLASSIFICATIONS OF BACTERIA, WITH EMPHASIS ON OUTLINES PROPOSED SINCE 1923*

There have been numerous attempts to arrange the species of bacteria in natural systems of classification. The first simple system of Müller (Vermium terrestrium et fluviatilium, 1773) which he developed further a few years later (Animalcula infusoria fluviatilia et marina, 1786) listed but two genera (*Vibrio* and *Monas*) that included organisms that would today probably be accepted as bacteria. *Polyangium* Link (Mag. d. Ges. Naturforsch. Freunde zu Berlin, *3*, 1809, 42) is apparently the oldest of the generic terms retained in its original meaning for a bacterial genus while *Serratia* Bizio (Biblioteca italiana o sia giornale de lettera, scienze ed arti, *30*, 1823, 288) was proposed only fourteen years later.

Systems of classification developed after 1773 are given in complete outline form in the first edition of the MANUAL (1923) and this section of the MANUAL was reprinted without material change in the second (1925) and third (1930) editions. While it is not felt to be necessary to repeat these outlines in their entirety, sufficient reference is made below to permit the student to trace the origin of generic terms that are no longer commonly found in classification outlines. No attempt has been made to include reference to other little used generic terms except as they appear as synonyms in the descriptive portion of the MANUAL. For the origin of generic terms proposed before 1925, see Enlows (The Generic Names of Bacteria, Bul. No. 121, Hygienic Laboratory, Washington, D. C., 1920) and Buchanan (General Systematic Bacteriology, Baltimore, 1925).

Bory St. Vincent (Microscopiques, Dictionnaire classique d'histoire naturelle, *10*, 1826, 533) introduced the generic terms *Spirilina*, *Melanella*, *Lactrimatoria* and *Pupella* and accepted *Vibrio* for microorganisms, some of which must have been bacteria. None of these terms, except *Vibrio*, are in current use for bacterial groups.

Three of the terms accepted or proposed by Ehrenberg (Die Infusionstierchen als volkommene Organismen, Leipzig, 1838); namely, *Vibrio*, *Spirillum* and *Spirochaeta*, are still used. The generic term *Bacterium* proposed first by Ehrenberg in 1828 (Symbolae Physicae seu Icones et Descriptiones Animalium Evertebratorum Separasitis Insectis quae ex Itinere per Africam Borealem et Asiam Occidentalem, IV. Evertebrata, Berlin) to include but a single species *Bacterium triloculare* from an oasis

---

* **Contributed by Prof. R. S. Breed, New York State Experiment Station, Geneva, New York, July, 1938; revised, September, 1943.**

in North Africa, has had a varied history because this type species (monotypy) is no longer identifiable. It was reintroduced into the classification employed in the fifth edition of the MANUAL to cover species of non-spore-forming rods whose positions in the outline given in the MANUAL have not yet been satisfactorily determined (Breed and Conn, Jour. Bact., *31*, 1936, 517) and is used in the present edition with the same meaning. The term *Spirodiscus* was applied by Ehrenberg to a single organism that he found in a mountain stream. It has never been reidentified and subsequent authors have discarded this term.

Two new generic terms (*Metallacter*, *Sporonema*) were introduced by Perty (Zur Kenntniss kleinster Lebensformen, 1852). Neither *Metallacter* nor *Sporonema* is in common use at the present time.

Davaine (Dictionaire encyclop. des sciences méd., Art. bactéries, 1868) introduced one new generic term, *Bacteridium*, for straight motionless rods like the anthrax bacillus.

The generic terms employed by Cohn in his first classification (Untersuchungen über Bakterien. I. Beiträge z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 146) are all in current use. Only one (*Bacillus*) was new. Other generic terms were introduced into his second paper (Untersuchungen über Bakterien. II. *ibid.*, *1*, Heft 3, 1875, 141) which contained his more complete classification. For various reasons, six of these, *Merismopedia*, *Clathrocystis*, *Ascococcus*, *Myconostoc*, *Cladothrix* and *Streptothrix* are not found in recent bacteriological classifications.

Mangin (Les Bactéries, Paris, 1878) recognized three subgenera of the genus *Monas*, the first of which *Rhabdomonas* Cohn, 1875 is still used as a generic term, while the other two, *Ophidomonas* Ehrenberg, 1838 and *Spiromonas* Perty, 1852 have been dropped.

The bacterial species that had been placed in the genus *Clathrocystis* by Cohn (1875) were separated and placed in a new genus *Cohnia* by Winter (Die Pilze in Rabenhorst's Kryptogamen Flora, 1880), and this name is also used by Burrill (The Bacteria, Springfield, Ill., 1882). Because this name had previously been proposed for a genus of lilies, it was soon dropped.

Zopf (Die Spaltpilze, Leipzig, 1883) accepts *Phragmidiothrix*, a generic name suggested by Engler in 1882 for a single species found on the body of a crustacean (*Gammarus locusta*). Later authors generally either merge this genus with *Crenothrix* Cohn or disregard it because of the indefinite description of the one species included in it.

Baumgarten (Lehrbuch der pathologischen Mykologie, Braunschweig, 1890) following Hueppe accepts the term, *Spirulina*, for a genus of pleomorphic bacteria, disregarding the previous use of the term by algologists.

The generic terms found in Migula's first outline (Bakterienkunde für

Landwirte, Berlin, 1890) were those in conventional use at the time and many of them continue in use. Two new terms were introduced for motile types in his second outline (Arb. Bact. Inst. Karlsruhe, *1*, 1894, 235) and are also found in his later outlines (Engler and Prantl, Die natürlichen Pflanzenfamilien, *1*, 1a, 1895, 29, and System der Bakterien, *1*, 1897, 46, and *2*, 1900, 269 and 275) which have not been generally felt to be necessary by subsequent authors. These are *Planococcus* and *Planosarcina*. *Spirosoma* introduced by Migula in 1894 and *Rhabochromatium* Winogradsky accepted by Migula in 1900 are likewise no longer generally used. *Newskia* (original spelling *Nevskia* Famintzen, Bull. Acad. Imp. Sci., St. Petersburg, *34* (N.S. *2*), 1892, 484) has recently been revived by Henrici and Johnson (Jour. Bact., *29*, 1935, 3 and *30*, 1935, 83). The generic term *Microspira* Schroeter, accepted by Migula in 1894, is still frequently accepted in place of *Vibrio* as many regard it as having a better status than the later term.

The term *Pseudomonas* was first proposed for polar flagellate bacteria by Migula in his 1894 outline with reference to but a single species, *Pseudomonas violacea*, an organism which later investigators have shown to be peritrichous (Cruess-Callaghan and Gorman, Sci. Proc. Roy. Dublin Soc., *21*, 1935, 213). *Pseudomonas* was repeated in the 1895 outline with descriptions of *Pseudomonas pyocyanea* and other species. Later authors have generally accepted the term *Pseudomonas* as valid.

Fischer (Jahrb. f. wissensch. Bot., Berlin, *27*, 1895, 1) introduced a logical outline classification in which he proposed various new terms which have never come into general use. These are *Paracloster*, *Paraplectrum*, *Arthrobacter*, *Bactrinium*, *Clostrinium*, *Plectrinium*, *Arthrobactrinium*, *Bactrillum*, *Clostrillium*, *Plectrillium*, *Arthrobactrillium*, *Bactridium*, *Plectridium*, *Diplectridium*, and *Arthrobactridium*. In his modified classification (Vorlesungen über Bakterien, 1897), he also accepts *Pediococcus* Balcke, a term that has fallen into disuse except in the brewing industry.

In the conservative classification proposed by Lehmann and Neumann (Atlas und Grundriss der Bakteriologie, 2 vols., 1896, München), internationally accepted rules of nomenclature were followed. All of the generic terms employed by them are still in current use, their most important contribution being their acceptance of the suggestion that the genus *Bacillus* be separated from the genus *Bacterium* on the basis of endospore formation by the rods included in *Bacillus*. Two new genera were proposed (*Corynebacterium* and *Mycobacterium*) that have been generally accepted by later workers.

No new generic terms are proposed by Chester either in his preliminary reports (Delaware College of Agriculture, 9th Ann. Rept., 1897, 53 and 62;

11th Ann. Rept., 1899, 36), or in his complete outline (Manual Determ. Bact., 1901). Almost all of the generic terms found in his outlines are still in current use.

The term *Aplanobacter* suggested by Erwin F. Smith (Bacteria in Relation to Plant Diseases, *1*, 1905, 171, Washington) was accepted by certain American phytopathologists for a time but has never come into general use.

Because other differences between the non-chromogenic and chromogenic micrococci are unimportant, two generic terms, *Albococcus* and *Aurococcus*, suggested by the Winslows (Science, *21*, 1905, 669; Systematic Relationships of the Coccaceae, New York, 1908) have not come into general use. They also suggested *Rhodococcus* to include *Rhodococcus roseus* and *R. fulvus* apparently without realizing that Zopf (Ber. d. deutsch. bot. Gesellsch. Berlin, *9*, 1891, 28) had previously used the same term for *Rhodococcus erythromyxa* and *R. rhodochrous*. Hansgirg (Engler and Prantl, Die natürlichen Pflanzenfamilien, *1*, 1a, 1895, 52) had also used it previously to designate a sub-genus of the green algae, and later Molisch (Die Purpurbakterien, Jena, 1907, 20) used *Rhodococcus* for a genus of the purple bacteria to include *Rhodococcus capsulatus*.

In his complete outline of the classification of bacteria presented in 1909, Orla-Jensen (Cent. f. Bakt., II Abt., *22*, 1909, 305) introduced many new generic terms in an effort to create a nomenclature that appeared to him to express the natural relationships of bacteria more satisfactorily than names previously suggested had done. Thus he used the suffixes *coccus* and *sarcina* for spherical bacteria and *monas* for all genera known to be lophotrichous or so related to these types that they were regarded as essentially lophotrichous in nature. In the same way the suffix *bacterium* was used for genera of non-spore-forming rods. that were regarded as essentially peritrichous in nature, and the suffix *bacillus* for similar spore-forming rods. As, however, subsequent investigators have (1) accepted the priority rule, (2) felt that it was impossible to recognize the type of motility found in the ancestry of truly non-motile groups, or (3) felt that other characters were more fundamental than those selected by Orla-Jensen, many of these terms have not been generally used by later workers.

Among the little used terms suggested or accepted by Orla-Jensen are: *Acetimonas*, *Nitromonas*, *Azotomonas*, *Rhizomonas*, *Corynemonas*, *Mycomonas*, *Sulfomonas*, *Thiomonas*, *Thiococcus*, *Rhodomonas*, *Rhododictyon*, *Amoebomonas*, *Rhodopolycoccus*, *Rhodosarcina*, *Spirophyllum*, *Denitromonas*, *Liquidomonas*, *Liquidovibrio*, *Liquidococcus*, *Solidococcus*, *Solidovibrio*, *Sporosarcina*, *Denitrobacterium*, *Caseobacterium*, *Liquidobacterium*, *Urobacillus*, *Butyribacillus*, *Pectobacillus*, *Cellulobacillus*, *Putribacillus* and *Botulobacillus*.

While *Nitromonas* is not new, it is redefined as a synonym of *Nitrobacter* Winogradsky (Arch. Sci. Biol. St. Petersburg, *1*, 1892, 87), rather than as a synonym of *Nitromonas* Winogradsky (Ann. Inst. Past., *3*, 1890, 258). *Spirophyllum* is from Ellis (Cent. f. Bakt., II Abt., *19*, 1907, 507).

In a later monograph on The Lactic Acid Bacteria (Mém. d. Acad. Roy. Sci. et Lettres de Danemark, Sect. Sci., 8 Sér., *5*, 1919, No. 2) Orla-Jensen proposes the following additional generic terms: *Betacoccus*, *Betabacterium*, *Streptobacterium*, *Thermobacterium* and *Microbacterium*. The term *Tetracoccus* is introduced with a meaning different from that given the term previously by v. Klecki (Cent. f. Bakt., *15*, 1894, 354).

Buchanan prepared an outline classification in 1916 (Jour. Bact., *1*, 1916, 591; *2*, 1917, 155, 347, 603; *3*, 1918, 27, 175, 301, 403, 461, 591) which was utilized in part by the group of which he was a member (Winslow, Broadhurst, Buchanan, Krumwiede and Smith) in their preliminary Report to the Society of American Bacteriologists (Jour. Bact., *2*, 1917, 552) and in the final report by Winslow, Broadhurst, Buchanan, Krumwiede, Rogers and Smith (Jour. Bact., *5*, 1920, 191).

Although prepared earlier, some parts of the Buchanan outline were not published until after the first Winslow et al. report. As these reports formed the most important basis for the classification used in the first edition of the MANUAL, it is natural that the generic terms utilized are, in general, the same as those used in the MANUAL.

Generic and subgeneric terms included by Buchanan that are not used in the present edition of the MANUAL are: *Paraspirillum* Dobell (Arch. f. Protistenk., *24*, 1911, 97), *Eubacillus* Hansgirg (Osterr. Bot. Ztschr., *38*, 1888, 264; not *Eubacillus* Dangeard, Le Botaniste, *2*, 1891, 151) and *Metabacterium* Chatton and Perard (Comp. rend. Soc. Biol., Paris, *65*, 1913, 1232). *Siderocapsa* Molisch (Ann. Jard. Bot. Buitenzorg, Ser. 2, Supp. 3, 1909, 29) used by Buchanan but dropped by Winslow et al (Jour. Bact., *2*, 1917, 549) does not appear in the MANUAL classification outline until the present (6th) edition. The term *Mycoderma* recognized both by Buchanan (Jour. Bact., *3*, 1918, 45) and in the preliminary Winslow et al. report (Jour. Bact., *2*, 1917, 551) was replaced by the later and more valid term *Acetobacter* in the final report by Winslow et al. (Jour. Bact., *5*, 1920, 201). *Pfeifferella* Buchanan (Jour. Bact., *3*, 1918, 54) which is used in the three outline classifications under discussion and also in the first, second and third editions of the MANUAL, appeared in the literature through a clerical error (Buchanan, General Systematic Bacteriology, 1925, 420). It was combined in the fourth edition of the MANUAL with the genus *Actinobacillus* under the latter name. *Nocardia* Trevisan (1889) used by Buchanan and in the preliminary report by Winslow et al. (1917) was merged with *Actinomyces*

Harz (Jahresber. München. Thierarzneisch. for 1877–78, 125) in the final report by Winslow et al. *Erythrobacillus* Fortineau (Compt. rend. Soc. Biol. Paris, *58*, 1905, 104) is used by Winslow et al. (1920) but was not accepted in the first and following editions of the MANUAL as it is a synonym of the older *Serratia* Bizio (1823). Moreover, the species which must be accepted as type for the genus (*Erythrobacillus pyosepticus* Fortineau (monotypy)) is a species which has been reported by Breed (Manual, 3rd ed., 1930, 117) to be a variant of the older *Serratia marcescens*.

One of the most unsatisfactory portions of recent classifications, such as those outlined by Buchanan (1917–18) and by Winslow et al. (1917), is the treatment given the organisms of the coliform-dysentery-typhoid group in that the term *Bacterium* is retained for these as suggested by Orla-Jensen (1909). A strict limitation of *Bacterium* to this group gives it a still different meaning from that which it had had in previous and current classifications, and makes it necessary to find some other place for many other species of Gram-negative, non-spore-forming rods, some of which are well known and well described. The relationships of these miscellaneous species to other non-spore-forming rods is frequently poorly understood. In some cases, further study will probably show that they should be placed in well known and currently recognized genera. In others, further study will probably show that some of these species of non-spore-forming rods should be grouped in new genera.

Winslow et al. (1920) recognized this situation and broadened their definition of *Bacterium* thereby placing such well known species as are included in the colon-dysentery-typhoid group with other species of non-spore-forming rods of quite a different character. For this reason, partial use was made in the first edition of the MANUAL of the numerous generic terms newly proposed by Castellani and Chalmers (Manual of Tropical Medicine, 3rd ed., 1919). Thus the following new terms were introduced: *Alcaligenes*, *Salmonella*, *Escherichia* and *Encapsulatus;* and the earlier terms *Aerobacter* Beijerinck (1900) and *Eberthella* Buchanan (1918). Later it was found that *Encapsulatus* was a synonym of *Klebsiella* Trevisan (1887), so that the latter term was accepted in the second and subsequent editions of the MANUAL. *Shigella* Castellani and Chalmers was recognized as distinct from *Eberthella* in the third and subsequent editions.

Many of the new terms suggested by Castellani and Chalmers were, however, synonyms of earlier valid terms or have not been considered necessary, and so they have not come into general use. These are *Nigrococcus*, *Graciloides*, *Cloaca*, *Eberthus*, *Dysenteroides*, *Lankoides*, *Wesenbergus*, *Balkanella* and *Enteroides*. No new generic terms are given by Castellani and Chalmers in their later report (Ann. Inst. Past., *34*, 1920, 600).

Orla-Jensen (Jour. Bact., *6*, 1921, 263), in a paper published after the manuscript of the first edition of the Manual was prepared, suggested the use of *Colibacterium* and *Aerogenesbacterium* for the two genera in the coliform group and adds quite a number of other new terms formed in accordance with his system of nomenclature. These are, in most cases, synonyms of earlier valid names. The new terms are *Coccomonas*, *Spiromonas* (used in a new, different sense from that of earlier authors), *Fluoromonas*, *Photomonas*, *Propionicoccus*, *Butyriclostridium* and *Putriclostridium*.

Many new terms are proposed in the classification drawn up by Heller (Jour. Bact., *6*, 1921, 521; and *7*, 1922, 1). Details are given in the group of anaerobic spore-formers only. Here each of the new generic terms is based on a single species. The following outline is given in the first of these papers, two new genera (*Rivoltillus* and *Metchnikovillus*) being made the type genera for two new subfamilies *Clostridioideae* and *Putrificoideae*, respectively.

Phylum I. *Bacteria*
  Class I. *Eubacterieae*
    Order 1. *Eubacteriales*
      Family 6 (?). *Clostridiaceae*
        Subfamily 1. *Clostridioideae*
        Subfamily 2. *Putrificoideae*
    Order 2. *Thiobacteriales*
    Order 3. *Chlamydobacteriales*
  Class II. *Myxobacterieae*

In the more complete outline in the second paper, one generic term (*Clostridium*) is old, although it is used in a new and restricted sense, while with the exception of the type genera mentioned above, the other terms are new. In the subfamily *Clostridioideae*, the new terms are *Omelianskillus*, *Macintoshillus*, *Douglasillus*, *Henrillus*, *Flemingillus*, *Vallorillus*, *Multifermentans*, *Hiblerillus*, *Welchillus*, *Stoddardillus*, *Arloingillus*, *Meyerillus* and *Novillus*. Ten new generic terms are used in the subfamily *Putrificoideae* as follows: *Sequinillus*, *Reglillus*, *Robertsonillus*, *Nicollaierillus*, *Martellillus*, *Recordillus*, *Tissierillus*, *Putrificus*, *Ermengemillus*, and *Weinbergillus*. As there does not seem to be any good reason for sub-dividing the genus *Clostridium* in this way, the latter term has been used to cover anaerobic spore-forming rods in all previous editions of the MANUAL, and is again used in the present edition in this sense rather than with the restricted meaning proposed by Heller.

Enderlein (Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 309) proposed an outline classification covering the Kingdom of *Mychota*, or bacteria, which was based on comparative morphology with special emphasis on life cycles. This was as follows:

Phylum I. *Dimychota*
Kreis A. *Holocyclomorpha*
Class I. *Gonascota*
Order a. *Synascota*
Family 1. *Schaudinnidae*
Genus a. *Schaudinnum*
b. *Theciobactrum*
Family 2. *Sphaerotilidae*
Genus a. *Phragmidiothrix*
b. *Newskia*
c. *Chlamydothrix*
d. *Sphaerotilus*
e. *Clonothrix*
Family 3. *Syncrotidae*
Genus a. *Crenothrix*
b. *Beggiatoa*
c. *Syncrotis*
d. *Zygostasis*
Family 4. *Spirillidae*
Genus a. *Gallionella*
b. *Spirillum*
c. *Dicrospirillum*
Family 5. *Spirochaetidae*
Genus a. *Cristispira*
b. *Treponema*
c. *Entomospira*
d. *Spirochaeta*
e. *Cacospira*
Family 6. *Microspiridae*
Genus a. *Spirobacillus*
b. *Spirosoma*
c. *Photobacterium*
d. *Microspira*
e. *Dicrospira*
Family 7. *Corynobacteriidae*
Subfamily 1. *Actinomycinae*
Genus a. *Actinomyces*
Subfamily 2. *Eisenberginae*
Genus a. *Eisenbergia*
Subfamily 3. *Sclerotrichinae*
Genus a. *Zettnowia*
b. *Schlerothrix*
Subfamily 4. *Corynobacteriinae*
Genus a. *Corynobacterium*
b. *Heterocystia*
c. *Cladascus*
d. *Zygoplagia*
Subfamily 5. *Pseudostrepinae*
Genus a. *Pseudostreptus*
Order b. *Ascota*
Family 8. *Bacteriidae*

Genus a. *Atremis*
b. *Bacterium*
c. *Lamprella*
d. *Eucystia*
e. *Dicrobactrum*
f. *Acystia*
Family 9. *Fusiformidae*
Genus a. *Fusiformis*
Class II. *Sporascota*
Order a. *Parasynascota*
Family 10. *Migulanidae*
Genus a. *Migulanum*
Order b. *Parascota*
Family 11. *Bacillidae*
Genus a. *Rhagadascia*
b. *Plectridium*
c. *Bacillus*
d. *Bactrillum*
e. *Kochella*
f. *Fischerinum*
Kreis B. *Hemicyclomorpha*
Class I. *Anascota*
Family 12. *Hemallosidae*
Genus a. *Hemallosis*
Phylum II. *Monomychota*
Kreis A. *Acyclomorpha*
Family 1. *Mogallidae*
Genus a. *Mogallia*
Family 2. *Sarcinidae*
Genus a. *Diplococcus*
b. *Sarcina*
c. *Paulosarcina*
Family 3. *Micrococcidae*
Genus a. *Micrococcus*
b. *Planococcus*
c. *Streptococcus*
d. *Phacelium*

Three of the new generic terms, *Cladascus* type species *C. furcabilis* Enderlein, *Zygoplagia* type species *Z. alternans* Enderlein and *Heterocystia* type species *H. multiformiis* Enderlein, had been proposed in an earlier paper (Sitzber. Gesell. Naturf. Freunde, Berlin, 1916, 395). The following generic terms in the 1917 outline are new: *Schaudinnum*, *Theciobactrum*, *Syncrotis*, *Zygostasis*, *Dicrospirillum*, *Entomospira*, *Cacospira*, *Dicrospira*, *Eisenbergia*, *Zettnowia*, *Pseudostreptus*, *Atremis*, *Lamprella*, *Eucystia*, *Dicrobactrum*, *Acystia*, *Migulanum*, *Rhagadascia*, *Kochella*, *Fischerinum*, *Hemallosis*, *Mogallia*, *Paulosarcina* and *Phacelium*. Note that *Corynobacterium* is spelled with an o instead of an e.

Terms accepted from earlier workers that have not previously been

mentioned are: *Spirobacillus* Metschnikoff (Ann. Inst. Past., *3*, 1889, 62), *Photobacterium* Beijerinck, Maanblad voor Natuurwetenschappen Amsterdam, *16*, 1889, 1 and Arch. Neérl. d. Sci. Exactes, *23*, 1889, 401), and *Sclerothrix* Metschnikoff (Arch. f. Path. Anat. u. Physiol., *113*, 1888, 63–94; not *Sclerothrix* Kuetzing, Species Algarum, 1849, 319).

The above outline was changed in 1925, p. 235 ff. (Bakterien-Cyclogenie, Berlin, 390 pp.) by the addition of one new family, *Chondromycidae*, to include the genus *Newskia*, formerly included in *Sphaerotilidae*, and nine genera not previously given as follows: *Chondromyces*, *Cystodesmia*, *Monocystia*, *Ophiocystia*, *Apelmocoena*, *Polyangium*, *Cystoecemia*, *Myxococcus* and *Dactylocoena*. All except *Chondromyces*, *Polyangium* and *Myxococcus* are taken from Enderlein (Bemerkungen zur Systematik der Chondromyciden, Berlin, 1924, 6 pp.).

The new genus *Löhnisium* is added in the Family *Eisenbergiinae* to include the acetic acid and legume bacteria, and he also proposes the generic term *Macrocystita* (p. 278) for certain bacteria described by Peklo (O mšici krváve (Study of the blood louse). Zemědelského Archivu (Agricultural Archives), *1*, 1916) from aphids. According to Enderlein it is not clear whether this genus should be included in the Family *Bacteriidae* or in *Corynobacteriidae*.

Two genera proposed by others are also accepted. These are *Calymmatobacterium* Aragão and Vianna (Mem. Inst. Oswaldo Cruz, *6*, 1912, 211) placed in the family *Migulanidae*, and *Leuconostoc* Van Tieghem placed in the family *Micrococcidae*.

Later Enderlein (Sitzber. Gesell. Naturf. Freunde Berlin, 1930, 104–105) accepts *Serratia* Bizio in place of *Dicrobactrum* and *Leptotrichia* Trevisan in place of *Syncrotis*. *Streptus* with *Streptus scarlatinae* as type species, is proposed to cover the streptococci not included in *Pseudostreptus*.

The outline suggested by Pringsheim (Lotos, *71*, 1923, 357) is similar to that used by Lehmann and Neumann (Atlas und Grundriss der Bakteriologie, 2 vols., 1896, München). It is a conventional division into spherical, rod-shaped and curved forms so far as the true bacteria are concerned except that the pseudomonads are included in the same family as the vibrios and spirilla. *Rhodobacteriales* is recognized as an order to include the sulfur purple bacteria and the nonsulfur purple bacteria. Few details are given in regard to the other orders. His outline follows:

Schizomycetes
- Order I. ***Eubacteriales***
  - Family 1. ***Coccaceae***
    - Genus a. ***Streptococcus***
    - b. ***Micrococcus***
    - c. ***Sarcina***

Family 2. *Bacteriaceae*
Genus a. *Bacterium*
b. *Bacillus*
Family 3. *Spirillaceae*
Genus a. *Pseudomonas*
b. *Vibrio*
c. *Spirillum*
Order II. *Rhodobacteriales*
Family 1. *Rhodobacterinae*
2. *Thiorhodinae*
Order III. *Myxobacteriales*
Family 1. *Myxobacteriaceae*
Order IV. *Mycobacteriales*
Family 1. *Corynebacteriaceae*
2. *Mycobacteriaceae*
3. *Actinomycetaceae*
(Also possibly the long rod, lactic acid bacteria.)
Order V. *Desmobacteriales*
Family 1. *Chlamydobacteriaceae*
2. *Beggiatoaceae*

The first outline classification drawn up by Janke (Allgemeine Technische Mikrobiologie, I Teil, Dresden, 1924, p. 63) is an adaptation and expansion of that drawn up by Migula (System der Bakterien, 1900). The new genera recognized by Janke are *Planostreptococcus* A. Meyer (Die Zelle der Bakterien, Jena, 1912), *Thioploca* Lauterborn (Ber. dtsch. Bot. Gesell., *25*, 1907, 238), *Thiobacterium* Molisch (Cent. f. Bakt., II Abt., *33*, 1912, 55), *Thiobacillus* Beijerinck (Cent. f. Bakt., II Abt., *11*, 1904, 593), *Thiovibrio* Janke (*loc. cit.*), *Thiospirillum* Winogradsky (Beiträge zu Morphol. u. Physiol. d. Bakterien. Heft I. Schwefelbakterien. Leipzig, 1888), *Thiosphaerella* Nadson (Bull. Jar. bot. Petersburg, *13*, 1913, 106; ref. in Cent. f. Bakt., II Abt., *43*, 1915, 469), *Thiovulum* Hintze (Ber. Dtsch. Bot. Gesell., *31*, 1913, 189), *Spirophyllum* Ellis (Proc. Roy. Soc. Edinburgh, *27*, I, 1907, 21; ref. in Cent. f. Bakt., II Abt., *19*, 1907, 502), *Nodofolium* Ellis (Cent. f. Bakt., II Abt., *26*, 1910, 321), and *Actinococcus* Beijerinck (Fol. Microbiol., *2*, 1914, 185).

Janke's outline classification is given below:

Order I. *Eubacteria*
Family 1. *Coccaceae*
Genus a. *Streptococcus*
b. *Micrococcus*
c. *Sarcina*
d. *Planostreptococcus*
e. *Planococcus*
f. *Planosarcina*
Family 2. *Bacteriaceae*
Genus a. *Bacillus*
b. *Bacterium*

Family 3. *Spirillaceae*
Genus a. *Microspira*
b. *Spirillum*
c. *Spirosoma*
Order II. *Rhodobacteria*
Family 1. *Thiorhodaceae*
Subfamily 1a. *Thiocysteae*
Genus a. *Thiocystis*
b. *Thiocapsa*
c. *Thiosphaera*
d. *Thiosphaerion*
e. *Thiosarcina*
Subfamily 2b. *Lamprocysteae*
Genus a. *Lamprocystis*
Subfamily 3c. *Thiopedieae*
Genus a. *Thiopedia*
b. *Thioderma*
Subfamily 4d. *Amoebobacterieae*
Genus a. *Amoebobacter*
b. *Thiothece*
c. *Thiodictyon*
d. *Thiopolycoccus*
Subfamily 5e. *Chromatieae*
Genus a. *Chromatium*
b. *Rhabdochromatium*
c. *Thiorhodospirillum*
Subfamily 6f. *Rhodocapseae*
Genus a. *Rhodocapsa*
b. *Rhodothece*
Family 2. *Athiorhodaceae*
Subfamily 1a. *Rhodocysteae*
Genus a. *Rhodocystis*
b. *Rhodonostoc*
c. *Rhodococcus*
d. *Rhodobacterium*
e. *Rhodobacillus*
f. *Rhodovibrio*
g. *Rhodospirillum*
Order III. *Thiobacteria*
Family 1. *Beggiatoaceae*
Genus a. *Thiothrix*
b. *Beggiatoa*
c. *Thioploca*
Family 2. *Thiobacteriaceae*
Genus a. *Thiophysa*
b. *Thiobacterium*
c. *Thiobacillus*
d. *Thiovibrio*
e. *Thiospirillum*
f. *Thiosphaerella*
g. *Thiovulum*
h. *Achromatium*

Order IV. *Phycobacteria*
Genus a. *Leptothrix*
b. *Clonothrix*
c. *Cladothrix*
d. *Crenothrix*
e. *Phragmidiothrix*
Appendix Genera *Gallionella, Spirophyllum, Nodofolium*
Order V. *Mycobacteria*
Family 1. *Mycobacteriaceae*
Genus a. *Corynebacterium*
b. *Mycobacterium*
Family 2. *Actinomycetaceae*
Genus a. *Actinomyces*
b. *Actinococcus*
Order VI. *Myxobacteria*
Family 1. *Myxobacteriaceae*
Genus a. *Myxococcus*
b. *Chondromyces*
c. *Polyangium*

Lehmann and Neumann (Bakt. Diag., 2 vols., 7th ed., München, 1926–27; Breed, Eng. trans., New York, 1931) developed their first simple and much used outline classification, drawn up in 1896, in later editions of their Determinative Bacteriology. The 1927 Lehmann and Neumann outline is as follows:

Class I. *Schizomycetes*
Order I. *Schizomycetales*
Family 1. *Coccaceae*
Genus a. *Streptococcus*
b. *Sarcina*
c. *Micrococcus*
Sub-genus a. *Diplococcus*
b. (Gram-positive group)
Family 2. *Bacteriaceae*
Genus a. *Bacterium*
Sub-genus a. *Nitrosomonas*
b. *Nitrobacter*
c. *Rhizobium*
d. *Haemophilus*
e. *Brucella*
f. *Pasteurella*
g. (Glanders and dysentery group)
h. (Photogenic group)
i. (Aerogenes group)
j. *Encapsulatus*
k. (Typhoid group)*
l. *Salmonella*
m. (Coli group)*

* In a footnote under these groups, the authors refer to the names given by Castellani and Chalmers.

n. *Acetobacterium*
o. (Cloacae group)
p. (Red chromogens)
q. (Blue and violet chromogens)
r. *Pseudomonas*
s. *Proteus*
App. *Erysipelothrix*
Genus b. *Fusobacterium*
c. *Plocamobacterium*
Family 3. *Desmobacteriaceae*
Genus a. *Beggiatoa*
b. *Leptothrix*
Sub-genus a. *Leptothrix*
b. *Chlamydothrix*
Genus c. *Crenothrix*
d. *Cladothrix*
e. *Thiothrix*
Family 4. *Spirillaceae*
Genus a. *Vibrio*
b. *Spirillum*
Family 5. *Spirochaetaceae*
Genus a. *Spirochaeta*
Family 6. *Bacillaceae*
Genus a. *Bacillus*
Sub-genus a. (Aerobic group)
b. (Anaerobic group)
Order II. *Actinomycetales*
Family 1. *Proactinomycetaceae*
Genus a. *Corynebacterium*
b. *Mycobacterium*
Family 2. *Actinomycetaceae*
Genus a. *Actinomyces*

The generic term *Bacterium* is retained in this outline to cover those groups of the true bacteria that are Gram-negative, non-spore-forming, motile and non-motile rods. Lehmann and Neumann recognize 20 sub-groups in this genus, many of which correspond with the genera recognized in the MANUAL. In an effort to develop a rational nomenclature the term *Acetobacterium* (occurs first in review by Ludwig, Cent. f. Bakt., II Abt., *4*, 1898, 870) is used in place of *Acetobacter*, *Plocamobacterium* (Loewi, Wien. klin. Wchnschr., *33*, 1920, 730) in place of *Lactobacillus*, and *Fusobacterium* (Knorr, Cent. f. Bakt., I Abt., Orig., *89*, 1922, 4) in place of *Fusiformis* without regard to priority. *Encapsulatus* Castellani and Chalmers (Manual Tropical Med., 3rd ed., 1919, 934) is used in place of *Klebsiella* Trevisan (Atti Accad. Fis.-Med.-Stat. Milano, Ser. 4, *3*, 1885, 107).

Janke (Cent. f. Bakt., II Abt., *66*, 1926, 481) reprints the classification developed in the first edition of the present MANUAL and compares it with that proposed by Orla-Jensen and Enderlein.

The second complete outline drawn up by Janke (Oesterr. Bot. Zeitschr., *78*, 1929, 108) is similar to the classification employed by Lehmann and Neumann (Bakt. Diag., 2 vols., 7th ed., München, 1926–27). He follows Enderlein in placing *Azotobacter* in close association with the spore-forming rods. No new generic terms are suggested. His sub-groups of the genus *Bacterium* are even more closely similar to the genera used in the present edition of the MANUAL than are the sub-groups of Lehmann and Neumann.

Family 1. *Coccaceae*
- Genus a. *Micrococcus*
- b. *Neisseria*
- c. *Streptococcus*
  - Divided into 4 groups.
- d. *Sarcina*
  - Divided into 2 groups.

Family 2. *Bacillaceae*
- Genus a. *Bacillus*
  - Divided into 16 groups.
- b. *Azotobacter*

Family 3. *Bacteriaceae*
- Genus a. *Bacterium*
  - Divided into 27 groups.
- b. *Fusiformis*

Family 4. *Corynobacteriaceae*
- Genus a. *Mycobacterium*
- b. *Corynobacterium*
- c. *Actinomyces*

Family 5. *Spirillaceae*
- Genus a. *Microspira*
  - Divided into 2 groups.
- b. *Spirillum*
  - Divided into 2 groups.

Family 6. *Spirochaetaceae*
- Genus a. *Spirochaeta*
- b. *Borrelia*
- c. *Treponema*
- d. *Cristispira*
- e. *Saprospira*
- f. *Leptospira*

Family 7. *Desmobacteriaceae*
- Genus a. *Beggiatoa*
- b. *Thioploca*
- c. *Thiothrix*
- d. *Leptotrichia*
- e. *Crenothrix*
- f. *Sphaerotilus*
- g. *Clonothrix*
- h. *Leptothrix*
- i. *Phragmidiothrix*

Family 8. *Myxobacteriaceae*
Genus a. *Myxococcus*
b. *Polyangium*
c. *Chondromyces*

Pribram (Jour. Bact., *18*, 1929, 361) has rearranged some groups and combined others (e.g., *Rhizobium*, *Diplococcus*, *Leuconostoc*, *Serratia*, *Flavobacterium*, *Chromobacterium*, *Achromobacter*, *Cellulomonas*) recognized in the first edition of the MANUAL with little change in the nomenclature except among the anaerobic non-spore-forming rods and among the spore-forming rods. Unfortunately, he has sometimes used family and species names as generic names, thus in the latter case introducing adjectives and adjectival terms as substantives. New generic terms suggested are: *Dialisterea*, *Bacteroidea*, *Centrosporus*, *Fusibacillus*, *Pseudobacillus*, *Megatherium*, *Flexus*, *Anthrax*, *Botulinus*, *Chauvoea*, *Botulinea*, *Putrificus*, *Welchia*, *Phleobacterium*, *Distasoa*, *Tissieria*, and *Actinoidomyces*. *Astasia* as it appears in this outline does not appear to be the same as *Astasia* Meyer (Flora, *84*, 1897, 185). *Aerobacillus* is not synonymous with *Aerobacillus* Donker (Inaug. Diss., Delft, 1926). *Sideromonas* is accepted from Cholodny (Ber. Deutsch. Bot. Ges., *40*, 1922, 326).

Pribram's complete outline follows:

Class *Schizomycetes*
Subclass A. *Protozoobacteria*
Order I. *Spirochaetales*
Family 1. *Spirochaetaceae*
Genus a. *Spirochaeta*
b. *Treponema*
c. *Spironema*
Family 2. *Cristispiraceae*
Genus a. *Saprospira*
b. *Cristispira*
c. *Leptospira*
Subclass B. *Eubacteria*
Order I. *Protobacteriales*
Family 1. *Nitrobacteriaceae*
Related to *Pseudomonas*
Tribe A. *Hydrogenomonadae*
Genus a. *Hydrogenomonas*
b. *Methanomonas*
c. *Carboxyodomonas*
Tribe B. *Nitrobactereae*
Genus a. *Nitrosomonas*
b. *Nitrobacter*
Family 2. *Thiobacillaceae*
Tribe A. *Thiobacilleae*
Genus a. *Thiobacillus*

Order II. *Metabacteriales*
Family 1. *Pseudomonadaceae*
Tribe A. *Spirilleae*
Genus a. *Spirillum*
Tribe B. *Vibrioneae*
Genus a. *Vibrio*
Tribe C. *Pseudomonadeae*
Genus a. *Pseudomonas*
b. *Azotobacter*
Connects with *Polyangiaceae* and *Nitrobacteriaceae*
Family 2. *Bacteriaceae*
Tribe A. *Aerobactereae*
Genus a. *Aerobacter*
b. *Escherichia*
c. *Salmonella*
d. *Eberthella*
e. *Proteus*
Tribe B. *Pasteurelleae*
Genus a. *Alcaligenes*
b. *Pasteurella*
Connects with *Pfeifferella*
c. *Hemophilus*
Connects with *Dialister*
Family 3. *Micrococcaceae*
Tribe A. *Streptococceae*
Genus a. *Neisseria*
b. *Streptococcus*
Tribe B. *Micrococceae*
Genus a. *Micrococcus*
b. *Staphylococcus*
c. *Sarcina*
Connects with *Algobacteria*
Subclass C. *Mycobacteria*
Order I. *Bacteriomycetales*
Family 1. *Leptotrichaceae*
Tribe A. *Acetobactereae*
Genus a. *Acetobacter*
Connects with *Salmonella* and *Tissieria*
Tribe B. *Leptotricheae*
Genus a. *Kurthia*
b. *Lactobacillus*
Connects with *Corynebacterium*
c. *Leptotrichia*
Connects with *Erysipelothrix*
Family 2. *Bacteroidaceae*
Tribe A. *Dialistereae*
Genus a. ——— Type species *Dialisterea variegata*
Connects with *Distasoa*
b. ——— Type species *Dialisterea variabilis*
c. *Dialister*

Connects with *Hemophilus*
Tribe B. *Bacteroideae*
Genus a. ——— Type species *Bacteroidea multiformis*
b. *Bacteroides*
Connects with *Tissieria*
c. ——— Type species *Bacteroidea fusiformis*
Order II. *Bacillomycetales*
Family 1. *Bacillaceae*
Sub-family 1a. *Aerobacilloideae*
Tribe A. *Aerobacilleae*
Sub-tribe A1. *Centrosporineae*
Genus a. *Centrosporus*
b. *Fusibacillus*
Sub-tribe A2. *Aerobacillineae*
Genus a. *Aerobacillus*
Tribe B. *Pseudobacilleae*
Genus a. *Pseudobacillus*
Sub-family 1b. *Bacilloideae*
Tribe A. *Bacilleae*
Sub-tribe A1. *Bacillineae*
Genus a. *Bacillus*
b. *Megatherium*
Sub-tribe A2. *Astasineae*
Genus a. *Astasia*
b. *Flexus*
Tribe B. *Anthraceae*
Genus a. *Anthrax*
Family 2. *Clostridiaceae*
Sub-family 2a. *Botulinoideae*
Tribe A. *Botulineae*
Genus a. *Botulinus*
b. *Chauvoea*
c. ——— Type species *Botulinea saccharolytica*
d. ——— Type species *Botulinea butyrica*
Tribe B. *Putrificeae*
Genus a. *Putrificus*
Sub-family 2b. *Clostridioideae*
Tribe A. *Welchieae*
Genus a. *Welchia*
Tribe B. *Clostridieae*
Genus a. *Clostridium*
Order III. *Actinomycetales*
Family 1. *Mycobacteriaceae*
Tribe A. *Actinobacilleae*
Genus a. *Pfeifferella*
Connects with *Pasteurella*
b. *Actinobacillus*
c. *Corynebacterium*
d. *Erysipelothrix*
Connects with *Leptotrichia*

Tribe B. *Mycobactereae*
Genus a. *Phleobacterium*
b. *Mycobacterium*
Tribe C. *Tissierieae*
Genus a. *Distasoa*
b. *Tissieria*
Connects with *Bacteroides*, *Corynebacterium* and *Acetobacter*
Family 2. *Actinomycetaceae*
Tribe A. *Actinoidomycetaceae*
Genus a. *Actinoidomyces*
Tribe B. *Actinomycetaceae*
Genus a. *Actinomyces*
Subclass D. *Algobacteria*
Order I. *Desmobacteriales*
Family 1. *Sphaerotilaceae*
Genus a. *Sphaerotilus*
Order II. *Siderobacteriales*
Family 1. *Chlamydotrichaceae*
Tribe A. *Chlamydotricheae*
Genus a. *Leptothrix*
b. *Crenothrix*
Family 2. *Siderocapsaceae*
Genus a. *Didymohelix*
b. *Siderocapsa*
c. *Sideromonas*
Order III. *Thiobacteriales*
Family 1. *Rhodobacteriaceae*
Sub-family 1a. *Chromatoideae*
Tribe A. *Thiocapseae*
Genus a. *Thiocystis*
b. *Thiosphaera*
c. *Thiosphaerion*
d. *Thiocapsa*
e. *Thiosarcina*
f. *Lamprocystis*
Tribe B. *Thiopedieae*
Genus a. *Lampropedia*
b. *Thioderma*
Tribe C. *Amoebobacteriae*
Genus a. *Amoebobacter*
b. *Thiodictyon*
c. *Thiothece*
d. *Thiopolycoccus*
Tribe D. *Chromatieae*
Genus a. *Chromatium*
b. *Rhabdomonas*
c. *Thiospirillum*
d. *Rhodocapsa*
e. *Rhodothece*

Sub-family 1b. *Rhodobacteroideae*
Tribe A. *Rhodobacteriaceae*
Genus a. *Rhodobacterium*
b. *Rhodobacillus*
c. *Rhodovibrio*
d. *Rhodospirillum*
e. *Rhodosphaera*
Tribe B. *Rhodocysteae*
Genus a. *Rhodocystis*
b. *Rhodonostoc*
Connects with *Leuconostoc*
Family 2. *Beggiatoaceae*
Genus a. *Thiothrix*
b. *Beggiatoa*
c. *Thioploca*
Family 3. *Achromatiaceae*
Genus a. *Achromatium*
b. *Thiophysa*
c. *Thiospira*
d. *Hillhousia*
Order IV. *Myxobacteriales*
Family 1. *Polyangiaceae*
Genus a. *Chondromyces*
b. *Polyangium*
Family 2. *Myxococcaceae*
Genus a. *Myxococcus*

Later Pribram (Klassification der Schizomyceten (Bakterien), Leipzig and Wien, 1933, 143 pp.) developed this classification into a suggestive outline based on his experience in caring for the cultures of the Kral Collection. His most interesting contribution is the separation of the class of *Schizomycetes* into three subclasses which are based on differences in fundamental biological and nutritional relationships. The fourth sub-class of his earlier outline (the *Protozoobacteria* with its single order *Spirochaetales*) is omitted from this outline. The first class, *Algobacteria*, includes the bacteria that are primarily free living in water, usually motile with polar flagellation and live on easily soluble foodstuffs. They are frequently surrounded by insoluble secretions such as capsules, sheaths, etc., and form insoluble products in their protoplasm, such as calcium, sulfur and iron compounds, and pigments. The class *Eubacteria* includes those bacteria whose normal habitat is the animal body or complex waste products of plant or animal origin. Because of adaptation to environment, these organisms are motile or non-motile and can utilize compounds of complex molecular structure. The third sub-class, *Mycobacteria*, is adapted to life in soil, and shows a distinct tendency to differentiation in morphology and spore formation.

Internationally accepted rules of nomenclature are generally followed, and the generic terms proposed in his earlier outline that were not formed

in accordance with recommended practices are discarded. He has revived *Ulvina* Kützing, 1837 (status explained by Buchanan, General Systematic Bacteriology, 1925, p. 518) in place of *Acetobacter* Beijerinck and accepted *Plocamobacterium* (Loewi, Wien. klin. Wchschr., *33*, 1920, 730) in place of *Lactobacillus* Beijerinck, 1901. Among the spore-forming rods, he has accepted *Bactrillum* Fischer and *Welchillus* Heller, 1921. *Malleomyces* Hallier (Bot. Ztg., *24*, 1866, 383) is used for the glanders bacillus. *Anthracillus* is apparently new.

The new outline has the following form:

Class. *Schizomycetes*
- Subclass A. *Algobacteria*
  - Order 1. *Micrococcales*
    - Family 1. *Micrococcaceae*
      - Genus a. *Micrococcus*
      - b. *Rhodococcus*
      - c. *Rhodocapsa*
      - d. *Thiocapsa*
      - e. *Thiosphaera*
      - f. *Thiosphaerion*
      - g. *Thiocystis*
      - h. *Lamprocystis*
      - i. *Sarcina*
      - j. *Thiosarcina*
    - Family 2. *Pediococcaceae*
      - Genus a. *Pediococcus*
      - b. *Lampropedia*
      - c. *Thiothece*
      - d. *Thiopolycoccus*
      - e. *Thioderma*
      - f. *Amoebomonas*
      - g. *Rhodothece*
      - h. *Rhodonostoc*
      - i. *Thiophysa*
  - Order 2. *Pseudomonadales*
    - Family 1. *Pseudomonadaceae*
      - Genus a. *Pseudomonas*
      - b. *Rhodobacillus*
      - c. *Chromatium*
      - d. *Nitrosomonas*
      - e. *Vibrio*
      - f. *Rhodovibrio*
      - g. *Myxococcus*
      - h. *Spirillum*
      - i. *Rhodospirillum*
      - j. *Thiospira*
      - k. *Thiospirillum*
    - Family 2. *Serratiaceae*
      - Genus a. *Serratia*
      - b. *Hillhousia*

Family 3. *Nitrobacteriaceae*
Genus a. *Nitrobacter*
b. *Rhodobacterium*
c. *Rhodocystis*
d. *Didymohelix*
e. *Sideromonas*
f. *Siderocapsa*
g. *Chondromyces*
h. *Polyangium*
i. *Amoebobacter*
j. *Thiodictyon*
Family 4. *Azotobacteriaceae*
Genus a. *Rhizobium*
b. *Azotobacter*
Order 3. *Leptotrichales*
Family 1. *Leptotrichaceae*
Genus a. *Leptothrix*
b. *Sphaerotilus*
c. *Crenothrix*
Family 2. *Clonothrichaceae*
Genus a. *Clonothrix*
Order 4. *Rhabdomonadales*
Family 1. *Rhabdomonadaceae*
Genus a. *Beggiatoa*
b. *Rhabdomonas*
c. *Thioploca*
d. *Thiothrix*
Family 2. *Spirochaetaceae*
Genus a. *Spirochaeta*
b. *Treponema*
c. *Leptospira*
d. *Cristispira*
e. *Saprospira*
Subclass B. *Eubacteria*
Order 1. *Aerobacteriales*
Family 1. *Aerobacteriaceae*
Genus a. *Aerobacter*
b. *Escherichia*
c. *Salmonella*
d. *Eberthella*
e. *Shigella*
Family 2. *Pasteurellaceae*
Genus a. *Pasteurella*
b. *Brucella*
c. *Haemophilus*
d. *Neisseria*
Order 2. *Plocamobacteriales*
Family 1. *Streptococcaceae*
Genus a. *Streptococcus*
Family 2. *Ulvinaceae*
Genus a. *Proteus*
b. *Kurthia*

c. *Ulvina*
d. *Plocamobacterium*
e. *Leptotrichia*
Family 3. *Bacteroidaceae*
Genus a. *Dialister*
b. *Aerobacteroides*
c. *Bacteroides*
d. *Fusobacterium*
Subclass C. *Mycobacteria*
Order 1. *Bacillales*
Family 1. *Bacillaceae*
Genus a. *Bactrillum*
b. *Aerobacillus*
c. *Bacillus*
d. *Anthracillus*
Family 2. *Clostridiaceae*
Genus a. *Clostridium*
b. *Welchillus*
Order 2. *Mycobacteriales*
Family 1. *Mycobacteriaceae*
Genus a. *Malleomyces*
b. *Actinobacillus*
c. *Corynebacterium*
d. *Erysipelothrix*
e. *Mycobacterium*
f. *Distasoa*
g. *Tissieria*
Family 2. *Actinomycetaceae*
Genus a. *Actinomycoides*
b. *Actinomyces*

Janke (Cent. f. Bakt., II Abt., *80*, 1930, 481) reprints the earlier outline prepared by Pribram (1929) and, after commenting on Lehmann and Neumann's (1927) outline, proposes an outline which is slightly modified from his own previous (1929) outline. Two new subgeneric terms are used, *Anaerobacillus* and *Eubacterium*. The sub-genus *Aerobacillus* is apparently not the same as *Aerobacillus* Donker (Inaug. Diss., Delft, 1926), nor as *Aerobacillus* Pribram (Jour. Bact., *18*, 1929, 361).

Family I. *Micrococcaceae*
Genus 1. *Micrococcus*
Divided into 2 sections.
2. *Neisseria*
3. *Streptococcus*
Divided into 4 sections.
4. *Sarcina*
Divided into 2 sections.
Family II. *Bacillaceae*
Genus 1. *Bacillus*
Sub-genus a. *Anaerobacillus* or better *Clostridium*
Divided into 6 sections.

b. *Aerobacillus* or better *Eubacillus*
Divided into 10 sections.
Family III. *Bacteriaceae*
Genus 1. *Bacterium*
Sub-genus a. *Pseudomonas*
Divided into 6 sections.
b. *Eubacterium*
Divided into 11 sections.
c. *Trichobacterium*
Divided into 6 sections.
Genus 2. *Fusiformis*
Family IV. *Corynobacteriaceae*
Genus 1. *Mycobacterium*
2. *Pfeifferella*
3. *Erysipelothrix*
4. *Corynobacterium*
5. *Actinomyces*
Family V. *Spirillaceae*
Genus 1. *Microspira* or *Vibrio*
Sub-genus a. *Microspira*
b. *Spirosoma*
Genus 2. *Spirillum*
Sub-genus a. *Spirella*
b. *Dicrospirillum*
Family VI. *Spirochaetaceae*
Genus 1. *Spirochaeta*
2. *Cacospira*
3. *Entomospira*
4. *Treponema*
5. *Cristispira*
6. *Saprospira*
7. *Leptospira*
Family VII. *Desmobacteriaceae*
As in 1929 outline.
Family VIII. *Myxobacteriaceae*
As in 1929 outline.

Kluyver and Van Niel (Cent. f. Bakt., II Abt., *94*, 1936, 369) have developed an outline classification in which they indicate four lines of development from the simplest form of cell that is existent and conceivable, the sphere. They assign family rank to each of these four groups of bacteria, placing the lophotrichous (and related non-motile) rod-shaped bacteria first (*Pseudomonadaceae*). This is followed by the family of spherical bacteria (*Micrococcaceae*) and the family of permanently non-motile, rod-shaped bacteria (*Mycobacteriaceae*). The final family includes the peritrichous (and related non-motile) rod-shaped bacteria, the *Bacteriaceae*. These are grouped in the tribes of each family in accordance with their fundamental metabolism as photo-autotrophic, photo-heterotrophic, chemo-autotrophic and chemo-heterotrophic. Their outline follows:

Family A. *Pseudomonadaceae*
- I. Tribe *Spirilleae*
  - Genus 1. *Thiospirillum*
  - 2. *Phaeospirillum*
  - 3. *Rhodospirillum*
  - 4. *Sulfospirillum*
  - 5. *Spirillum*
- II. Tribe *Vibrioneae*
  - Genus 1. *Chromatium*
  - 2. *Rhodovibrio*
  - 3. *Didymohelix*
  - 4. *Vibrio*
  - 5. *Desulfovibrio*
- III. Tribe *Pseudomonadeae*
  - Genus 1. *Thiothece*
  - 2. *Phaeomonas*
  - 3. *Rhodomonas*
  - 4. *Sulfomonas*
  - 5. *Sideromonas*
  - 6. *Nitrosomonas*
  - 7. *Nitrobacter*
  - 8. *Acetobacter*
  - 9. *Pseudomonas*
  - 10. *Rhizobium*
  - 11. *Azotobacter*
  - 12. *Listerella*
  - 13. *Aeromonas*
  - 14. *Zymomonas*
  - 15. *Methanobacterium*

Family B. *Micrococcaceae*
- IV. Tribe *Micrococceae*
  - Genus 1. *Chlorobium*
  - 2. *Thiopolycoccus*
  - 3. *Rhodococcus*
  - 4. *Achromatium*
  - 5. *Siderocapsa*
  - 6. *Nitrosococcus*
  - 7 *Neisseria*
  - 8. *Micrococcus*
  - 9. *Veillonella*
  - 10. *Peptococcus*
  - 11. *Methanococcus*
- V. Tribe *Sarcineae*
  - Genus 1. *Thiopedia*
  - 2. *Thiosarcina*
  - 3. *Gaffkya*
  - 4. *Sarcina*
  - 5. *Zymosarcina*
  - 6. *Butyrisarcina*
  - 7. *Methanosarcina*

VI. Tribe *Sporosarcineae*
Genus 1. *Sporosarcina*
VII. Tribe *Streptococceae*
Genus 1. *Peptostreptococcus*
2. *Streptococcus*
3. *Betacoccus*
Family C. *Mycobacteriaceae*
VIII. Tribe *Corynebacterieae*
Genus 1. *Corynebacterium*
2. *Fusiformis*
3. *Propionibacterium*
4. *Streptobacterium*
5. *Betabacterium*
IX. Tribe *Mycobacterieae*
Genus 1. *Mycobacterium*
2. *Thermobacterium*
Family D. *Bacteriaceae*
X. Tribe *Bacterieae*
Genus 1. *Kurthia*
2. *Alcaligenes*
3. *Bacterium*
4. *Aerobacter*
XI. Tribe *Bacilleae*
Genus 1. *Bacillus*
2. *Aerobacillus*
3. *Zymobacillus*
4. *Clostridium*
5. *Peptoclostridium*

Some old names are displaced by new descriptive terms: *Phaeospirillum Sulfospirillum*, *Desulfovibrio*, *Phaeomonas*, *Aeromonas*, *Zymomonas*, *Methanobacterium*, *Methanococcus*, *Methanosarcina*, *Butyrisarcina*, *Peptococcus*, *Peptostreptococcus*, *Zymobacillus*. *Rhodomonas* is not used in the same sense as *Rhodomonas* Orla-Jensen (Cent. f. Bakt., II Abt., *22*, 1909, 331 and 334), the latter being a synonym of *Chromatium* Perty (Zur Kenntniss kleinster Lebensformen, 1852). *Sulfomonas* is indicated as new and as a synonym of *Thiobacillus* Beijerinck (Cent. f. Bakt., II Abt., *11*, 1904, 598) although the same term is used by Orla-Jensen (*loc. cit.*). Three new terms are accepted: *Chlorobium* Nadson (Bull. Jard. Bot. St. Petersburg, *6*, 1906, 184), *Zymosarcina* Smit (Die Gärungssarcinen, Jena, 1930) and *Peptoclostridium* (Donker, Inaug. Diss., Delft, 1926).

Rahn (Cent. f. Bakt., II Abt., *96*, 1937, 273) has reviewed the characters of the species of *Eubacteriales* included in the fourth edition of this MANUAL. He places 146 of the spore-forming species in a Sub-order *A*. *Endosporales* with a single family, and 536 of the species of non-spore-forming rods in a Sub-order *B*. *Asporales* in seven families. Unclassifiable species (total 224) are placed in a temporary eighth family *Bacteriaceae*. His outline follows:

Order *Eubacteriales*
- Suborder A. *Endosporales*
  - Family I. *Endosporaceae*
    - Genus 1. *Bacillus*
    - 2. *Aerobacillus*
    - 3. *Clostridium*
- Suborder B. *Asporales*
  - Family I. *Gramoxidaceae*
    - Genus 1. *Micrococcus* (including *Staphylococcus, Gaffkya, Rhodococcus* and most of the species of *Sarcina*)
    - 2. *Kurthia*
  - Family II. *Gramanoxidaceae*
    - Tribe a. *Streptococceae*
      - Genus 1. *Streptococcus* (including *Diplococcus*)
      - 2. *Leuconostoc*
      - 3. *Peptostreptococcus*
    - Tribe b. *Lactobacilleae*
      - Genus 4. *Lactobacillus* (including part of *Bacteroides*)
      - 5. *Propionibacterium*
    - Tribe c. *Sarcineae*
      - Genus 6. *Zymosarcina*
      - 7. *Butyrisarcina*
      - 8. *Methanosarcina*
  - Family III. *Neissereaceae*
    - Genus 1. *Neisseria*
    - 2. *Veillonella*
  - Family IV. *Protobacteriaceae*
    - Tribe a. *Protobacterieae*
      - Genus 1. *Carboxydomonas*
      - 2. *Methanomonas*
    - Tribe b. *Nitrobacterieae*
      - Genus 1. *Nitrosomonas*
      - 2. *Nitrobacter*
      - 3. *Nitrosococcus*
  - Family V. *Enterobacteriaceae*
    - Genus 1. *Enterobacter* (including *Escherichia, Salmonella, Aerobacter, Klebsiella, Proteus, Erwinia, Eberthella, Shigella,* and parts of *Serratia, Pseudomonas, Flavobacterium* and *Achromobacter*)
  - Family VI. *Pseudomonadaceae*
    - Genus 1. *Pseudomonas* (includes *Phytomonas* and other lophotrichous types only)
    - 2. *Vibrio*
    - 3. *Spirillum*
    - 4. *Acetobacter*
    - 5. *Azotobacter*
    - 6. *Rhizobium*

Family VII. *Parvobacteriaceae*
Genus 1. *Brucella*
2. *Pasteurella*
3. *Hemophilus* (including *Dialister*)
Family VIII. *Bacteriaceae*
Unclassifiable genera including *Alcaligenes* and *Protaminobacter;* some species from each of the following genera, *Achromobacter, Chromobacterium, Cellulomonas, Bacteroides, Flavobacterium, Phytomonas, Pseudomonas, Serratia;* and three species from the Family *Nitrobacteriaceae.*

One of the generic terms used in this outline is new, i.e., *Enterobacter.* Two other generic terms, *Fluorescens* and *Erythrobacterium,* are proposed incidentally (p. 284). The first includes the peritrichous forms included in the MANUAL under *Pseudomonas* and the second includes those red, non-spore-forming rods that are not included in *Serratia.* In another footnote (p. 281) a substitute, *Virgula,* is suggested for *Enterobacter.* Emphasis is placed on sporulation, Gram stain, and oxygen demand as the most important characters aside from cell form and flagellation.

Prévot, as an outgrowth of his studies on anaerobes with Weinberg (Weinberg, Nativelle and Prévot, Les microbes anaérobies, 1937, 1186 pp., Paris), has written a series of papers in which he has developed a classification of anaerobic bacteria (Ann. Sci. Nat., 10 Sér., *15*, 1933, 23–260; Ann. Inst. Past., *60*, 1938, 285–307; *61*, 1938, 72–91; *64*, 1940, 117–125). The conclusions reached in these studies are summarized in his Manual de Classification et de Détermination des Bactéries Anaérobies, Monographie de l'Institut Pasteur, Paris, 1940, 223 pp. He regards the bacteria as comprising a kingdom, *Schizomycetes,* intermediate between the animal and plant kingdoms and notes the presence of strict anaerobes in at least three of the seven orders recognized in the 5th edition of the MANUAL. These orders he regards as classes. The genus *Bacteroides* Castellani and Chalmers (Manual of Trop. Med., 3rd ed., 1919, 959) type species, *Bacteroides fragilis,* is dropped (Ann. Inst. Past., *60*, 1938, 288), and several new terms are proposed for the organisms included by Castellani and Chalmers and later investigators in the genus. Among the new generic names is *Ristella* which is based on *Ristella fragilis,* the species used by Castellani and Chalmers as the type species for *Bacteroides.*

The complete outline classification developed by Prévot in his Monograph (*loc. cit.*, p. 17) is given below:

Kingdom. *Schizomycetes* Nägeli
Class I. *Eubacteriales*
Sub-Class I. Non sporogenous *Eubacteriales*
Order I. *Micrococcales*

Family I. *Neisseriaccae*
Tribe I. *Neissericae*
Genus a. *Neisseria*
Tribe 2. *Veillonelleae*
Genus a. *Veillonella*
Family 2. *Micrococcaceae*
Tribe 1. *Streptococceae*
Genus a. *Diplococcus*
b. *Streptococcus*
Tribe 2. *Staphylococceae*
Genus a. *Gaffkia*
b. *Staphylococcus*
Tribe 3. *Micrococceae*
Genus a. *Sarcina*
b. *Micrococcus*
Order II. *Bacteriales*
Family 1. *Ristellaceae*
Genus a. *Ristella*
b. *Pasteurella*
c. *Dialister*
d. *Zuberella*
e. *Capsularis*
Family 2. *Bacteriaceae*
Genus a. *Eubacterium*
b. *Catenabacterium*
c. *Ramibacterium*
d. *Cillobacterium*
Order III. *Spirillales*
Family 1. *Vibrionaceae*
Genus a. *Vibrio*
Sub-class II. Sporogenous *Eubacteriales*
Order I. *Clostridiales*
Family 1. *Endosporaceae*
Genus a. *Endosporus*
b. *Paraplectrum*
Family 2. *Clostridiaceae*
Genus a. *Inflabilis*
b. *Welchia*
c. *Clostridium*
Order II. *Plectridiales*
Family 1. *Terminosporaceae*
Genus a. *Terminosporus*
b. *Caduceus*
Family 2. *Plectridiaceae*
Genus a. *Plectridium*
b. *Acuformis*
Order III. *Sporovibrionales*
Family 1. *Sporovibrionaceae*
Genus a. *Sporovibrio*

Class II. *Actinomycetales*
- Family 1. *Spherophoraceae*
  - Genus a. *Spherophorus*
  - b. *Spherocillus*
  - c. *Fusiformis*
  - d. *Fusocillus*
  - e. *Leptotrichia*
- Family 2. *Actinomycetaceae*
  - Genus a. *Actinobacterium*
  - b. *Bifidibacterium*
  - c. *Corynebacterium*

Class III. *Spirochetales*
- Family 1. *Spirochaetaceae*
  - Genus a. *Treponema*
  - b. *Borrelia*

In this outline, there are minor modifications in the names and in endings given to the orders and tribes as compared with those given in his preliminary papers. In the Order *Micrococcales*, *Leuconostoc* has been dropped as a genus of the tribe *Streptococceae* and *Rhodococcus* has been dropped as a genus of the Tribe *Staphylococceae*. *Veillonella* proposed by Prévot as a new genus in 1933 (*loc. cit.*, p. 70) is included as a genus in the Family *Neisseriaceae*. The spelling of *Gaffkya* is changed to *Gaffkia*. In the first of Prévot's papers published in 1938 (*loc. cit.*), he proposes the following new genera in the Order *Bacteriales: Ristella*, *Zuberella*, *Capsularis*, *Eubacterium*, *Catenabacterium*, *Ramibacterium* and *Cillobacterium*. In the same paper he also proposes the following new genera in the Order *Actinomycetales: Spherophorus*, *Spherocillus*, *Fusocillus*, *Pseudoleptothrix* (withdrawn in 1940 in favor of *Leptotrichia* Trevisan). He also accepts one genus *Actinobacterium* (Haas, Cent. f. Bakt., I Abt., Orig., *40*, 1906, 180) not previously mentioned in this discussion. With the single change noted (*Pseudoleptothrix* to *Lepototrichia*), the outlines of the genera in the orders *Bacteriales* and *Actinomycetales* remains in the 1940 outline as it was given in 1938.

In the outline given in Prévot's Monograph (*loc. cit.*, p. 17) one change is made in the generic terms recognized in the Order *Clostridiales* from those recognized in his second paper published in 1938. The genus name *Palmula* proposed in 1938, having been found to be invalid because of prior use for a genus of *Protozoa*, is changed to *Acuformis*. Other generic names which appeared for the first time in the 1938 outline are *Endosporus*, *Inflabilis*, *Terminosporus* and *Caduceus*. *Welchia* proposed by Prévot in 1933 (*loc. cit.*, p. 44) was previously proposed by Pribram (Jour. Bact., *18*, 1929, 374) for the same group of anaerobic spore-forming rods. A third order, *Sporovibrionales*, is proposed by Prévot in his Monograph (*loc. cit.*, p. 15) to include the family *Sporovibrionaceae* (Ann. Inst. Past., *64*, 1940,

119). This order and family include a single genus *Sporovibrio* Starkey (Arch. f. Microb., *9*, 1938, 300) syn. *Desulfovibrio* Kluyver and Van Niel (Cent. f. Bakt., II Abt., *94*, 1936, 389). Two genera (*Treponema* and *Borrelia*) of *Spirochaetales* are listed by Prévot in his Monograph (*loc. cit.*, p. 16) as including anaerobic species.

Stanier and Van Niel (Jour. Bact., *42*, 1941, 437–466) have proposed a rearrangement of the classification outline as indicated below:

Kingdom *Monera*
- Division I *Myxophyta* (Blue-green algae)
- Division II *Schizomycetae* (Bacteria)
  - Class I *Eubacteriae*
    - Order I *Rhodobacteriales*
    - Order II *Eubacteriales*
    - Order III *Actinomycetales*
  - Class II *Myxobacteriae*
    - Order I *Myxobacteriales*
  - Class III *Spirochaetae*
    - Order I *Spirochaetales*

Appendix to Division *Schizomycetae*
- Group I Includes two families, *Leptotrichaceae* and *Crenothricaceae*
- Group II *Achromatiaceae*
- Group III *Pasteuriaceae* (Includes three genera, *Pasteuria*, *Hyphomicrobium* and *Blastocaulis*)

The genera *Mycobacterium*, *Corynebacterium*, *Erysipelothrix*, *Leptotrichia*, *Nevskia*, *Gallionella*, *Caulobacter*, *Thiospira*, *Siderocapsa* and *Sideromonas* are placed in *Eubacteriales*. Two genera not previously discussed in this review whose relationships to other bacteria have recently been clarified are *Sporocytophaga* Stanier (Jour. Bact., *40*, 1940, 629) and *Cytophaga* Winogradsky (Ann. Inst. Past., *43*, 1929, 578).

This rearrangement has been carried out by including the organisms placed in the Order *Caulobacteriales* Henrici and Johnson (Jour. Bact., *30*, 1935, 61–93) in the Order *Eubacteriales* (Buchanan, Jour. Bact., *2*, 1917, 162). The genera of the Order *Chlamydobacteriales* Buchanan (*loc. cit.*) are transferred to an appendix or are dropped (*Clonothrix*) as belonging to the blue-green algae. Three of the remaining five orders are raised to the rank of classes, one of which (*Eubacteriae*) includes three orders *Rhodobacteriales* (Pringsheim, Lotos, *71*, 1923, 351), *Eubacteriales* (Buchanan, *loc. cit.*) and *Actinomycetales* (Buchanan, *loc. cit.*). *Rhodobacteriales* includes the sulfur purple, the non-sulfur purple and the green bacteria, the colorless sulfur bacteria (*Beggiatoaceae*) being transferred to the *Myxophyta* with the change of the name of the Order from *Thiobacteriales* Buchanan (*loc. cit.*) to *Rhodobacteriales* Pringsheim (*loc. cit.*).

The outline classification below is proposed by the Editorial Board of the MANUAL for use in the present (6th) edition of the MANUAL. It is based on those developed by Bergey et al. in earlier editions. These, in turn, were based on the outline classifications developed by Buchanan (Jour. Bact., *1*, 1916, 591; *2*, 1917, 155 ff.; *3*, 1918, 27 ff.) and Winslow et al. (Jour. Bact., *5*, 1920, 191).

Phylum *Schizophyta*
- Class I. *Schizophyceae*
- Class II. *Schizomycetes*
  - Order I. *Eubacteriales*
    - Sub-Order I. *Eubacteriineae* (includes *Corynebacteriaceae*)
    - Sub-Order II. *Caulobacteriineae*
    - Sub-Order III. *Rhodobacteriineae*
  - Order II. *Actinomycetales* (includes *Mycobacterium*, *Actinomyces*, and related genera)
  - Order III. *Chlamydobacteriales*
    - Family I. *Leptotrichaceae*
    - Family II. *Crenothrichaceae*
    - Family III. *Beggiatoaceae*
      - Appendix *Achromatiacea*
  - Order IV. *Myxobacteriales*
  - Order V. *Spirochaetales*

Supplement: Groups whose relationships are uncertain.
Group I. Order *Rickettsiales*, Group II. Order *Virales*. Group III. Family *Borrelomycetaceae*.

In this, the arrangement of *Schizomycetes* as a class coordinate with *Schizophyceae*, both belonging to a phylum *Schizophyta* of the plant kingdom, is maintained as before. The number of orders is reduced from seven as given in the fifth edition of the MANUAL to five, through recognition of the fact that the rigid, unicellular, sometimes branching but never truly mycelial nor filamentous organisms belonging to three of the previously recognized orders are presumably more closely related to each other than they are to the organisms in the four remaining orders. The family *Corynebacteriaceae* has been transferred from the order *Actinomycetales* to *Eubacteriales*.

The colorless, filamentous, sulfur bacteria (*Beggiatoaceae*) have been placed in the order *Chlamydobacteriales* with the other filamentous bacteria that are clearly related to the blue-green algae. While this marks the greatest deviation from the outline previously used, and separates these colorless sulfur bacteria from the purple sulfur bacteria placed in *Rhodobacteriineae*, it is in accordance with the arrangement accepted by Lehmann and Neumann (Bakt. Diag., 4 Aufl., *2*, 1907, 598), Pringsheim (Lotos, *71*, 1923, 307) and others. *Rhodobacteriineae* is also limited to the purple and green bacteria as suggested by Pringsheim (*loc. cit.*) and accepted by Kluyver and Van Niel (*loc. cit.*), by Stanier and Van Niel (*loc. cit.*) and others.

The *Rickettsiales* and *Borrelomycetaceae* are placed in a supplement as their relationships are still obscure. Several authors would place them near some of the organisms now placed in *Pasteurella* and *Haemophilus*. The viruses (*Virales*) whose nature and relationships are still more obscure are also placed in a supplemental group.

Although this outline maintains the simplicity that distinguished its predecessors, and provides places for all types of microorganisms thus far described that may properly be grouped under the fission fungi, it should not be regarded in any sense as final. An attempt has been made to express natural relationships, but these are so frequently obscure or unknown that in many places utilitarian considerations have prevailed. In some places, groups of known doubtful significance have been allowed to stand as they are out of a desire not to make unnecessary changes. It has appeared desirable to be conservative in making changes in the outline as used previously.

Addenda: After the above was in page proof, it was discovered that reference to the outline classification of Gieszczykiewicz (Bull. Adad. Polonaise d. Sci. et d. Lettres, Cl. Sci. Math. et Nat., Sér. B., 1939, 27 pp.) had inadvertently been omitted. This outline has some features like the outline that Lehmann and Neumann used in 1927 (see p. 17) and some like the outline used in the 4th ed. of the MANUAL.

The genus *Bacterium* is retained as in the Lehmann and Neumann outline for Gram-negative, non-spore-forming, peritrichous or polar flagellate rods. Twelve sub-genera are recognized and these bear subgeneric scientific names that are much the same as those used for genera in the 4th ed. of the MANUAL. A new subgeneric name *Enterobacterium* (see *Enterobacter* Rahn) is proposed to cover the genera *Escherichia*, *Aerobacter*, *Klebsiella*, *Salmonella*, *Eberthella* and *Shigella*. *Loefflerella* previously used by Gay et al. (Agents of Disease and Heat Resistance, Indianapolis, 1935, 782) is here also used as a subgeneric name for the glanders bacillus; and *Chromobacterium* is used for the organisms more properly placed in *Serratia* Bizio.

Corynebacterium is transferred from the order *Actinomycetales* to *Eubacteriales* and the family *Corynebacteriaceae* is made to include *Lactobacillus*, *Erysipelothrix* and *Fusobacterium*. Among the *Spirochaetales*, the genus name *Spirochaeta* is displaced by a new generic term, *Ehrenbergia*, and is itself used to displace *Borrelia*.

A seventh order *Rickettsiales* is proposed to include two families: *Rickettsiaceae* with one genus *Rickettsia* da Rocha Lima (Berl. klin. Wchnschr., 1916, 567); and *Bartonellaceae* with the genera, *Bartonella* Strong, Tyzzer, Brues, Sellards and Gastiaburú (Jour. Amer. Med. Assoc., *61*, 1913, 1713), and *Grahamella* Brumpt (Bull. Soc. Path. Exot., *4*, 1911, 514).

During 1945, Soriano (Ciencia e Investigación, *1*, 1945, 92–94 and 146–147; Rev. Argentina de Agronomia, *12*, 1945, 120) proposed an arrangement of the Class *Schizomycetes* in which he recognizes a new Order, *Flexibacteriales*, to include the families *Cytophagaceae* and *Beggiatoaceae* and an entirely new Family *Flexibacteriaceae* containing a single genus *Flexibacter*. The latter includes five newly recognized species of flexuous bacteria as follows: *Flexibacter flexilis*, type species, *F. elegans*, *F. giganteus*, *F. albuminosus* and *F. aureus*.

The outline given below shows how this new order and new family are fitted by Soriano into the classification used in the fifth edition of the MANUAL.

Class *Schizomycetes*

Subclass *Eubacteria*. Rigid cells.
- Order I. *Eubacteriales*
- Order II. *Caulobacteriales*
- Order III. *Rhodobacteriales*
- Order IV. *Actinomycetales*
- Order V. *Chlamydobacteriales*

Subclass *Flexibacteria*. Flexuous cells.
- Order VI. *Flexibacteriales*
    - Family I. *Cytophagaceae*
    - Family II. *Beggiatoaceae*
    - Family III. *Flexibacteriaceae*
- Order VII. *Myxobacteriales*
- Order VIII. *Spirochaetales*

Prévot (Ann. Inst. Past. *72*, 1946, 1) has developed his classification of Class *Actinomycetales*, subdividing it into orders and including several genera not recognized in his 1940 outline. This classification is as follows:

Class *Actinomycetales*

Order I. *Actinobacteriales*. New order. Not acid-fast
- Family I. *Spherophoraceae*.
    - Genus I. *Spherophorus*
    - Genus II. *Haverhillia*
    - Genus III. *Spherocillus*
    - Genus IV. *Fusiformis*
    - Genus V. *Fusocillus*
    - Genus VI. *Leptotrichia*
- Family II. *Actinomycetaceae*.
    - Genus I. *Actinomyces*
    - Genus II. *Proactinomyces*
    - Genus III. *Corynebacterium*
    - Genus IV. *Actinobacterium*
    - Genus V. *Bifidibacterium*
    - Genus VI. *Erysipelothrix*

Order II. *Mycobacteriales*. New order. Acid-fast
- Genus I. *Mycobacterium*

This classification differs from that used in this edition of the MANUAL in that it places several genera of Gram-negative organisms in *Actinomycetales*. These are *Spherophorus*, *Haverhillia*, *Spherocillus*, *Fusiformis* and *Fusocillus*, all of which are included here under *Parvobacteriaceae*. *Leptotrichia* which Prévot regards as Gram-negative is generally accepted as being a Gram-positive group. It is discussed in this edition of the MANUAL in connection with the genus *Lactobacillus*.

HOW BACTERIA ARE NAMED AND IDENTIFIED*

Some principles of taxonomy and nomenclature. "Taxonomy is that branch of biology that deals with the orderly arrangement of plants and animals" (Johnson, Taxonomy of the Flowering Plants, New York, 1931, p. 3).

The necessity for applying names to species or kinds of bacteria is self-evident. It is highly desirable that the name applied to an organism by one person should be understood by others. It is further desirable that as far as practicable all individuals use the same name for the same kind of organism. It is helpful, therefore, if there can be an agreement regarding the method of naming organisms, and as to the correct name for each organism. The term *nomenclature* is applied to the naming of plants and animals, and under this term may be included all discussions as to methods of naming and correctness of particular names.

It is not enough that bacteria be named. Some method of classification of the bacteria is essential if the names are to be rendered accessible and available, and identification of unknown forms be made possible. *Taxonomy* is that branch of biology which treats of classification in accordance with a convention or law. It is apparent that taxonomy must be dependent in part for its satisfactory development upon nomenclature. Even though there may not be agreement among bacteriologists as to the exact classification that is to be used, nevertheless it is highly desirable that there be agreement as to some of the fundamental characteristics of satisfactory biological classifications in general.

What kinds of names are used. Two kinds of names are commonly given to the different kinds of plants and animals, the common, provincial, vernacular or casual names on the one hand and the international or scientific names on the other. These should be carefully differentiated, and their respective advantages and disadvantages noted.

It is inevitable, and on the whole probably desirable, that for each kind of familiar animal or plant in each language there will be coined a name. Usually the name for the same organism will be different in each language. For example, we have in English *Oak*, in German *Eiche*, in Latin *Quercus*, etc. For many uncommon kinds, however, there may be no such vernacular names developed. There have been, of course, many casual or vernacular names given to kinds of bacteria. In English we speak of the tubercle bacillus, the typhoid germ, the gonococcus, the Welch bacillus, the golden

* Contributed by Prof. R. E. Buchanan, Iowa State College, Ames, Iowa, January, 1934; revised, March, 1943.

pus coccus, and many others. Similarly, we find in German Typhusbazillen and in French bacille typhique, enterococcus, etc. The use of these common names offers certain advantages. It does away frequently with the necessity of repeating longer and more formal scientific names. Not infrequently scientific names may be adopted into a language, and converted into vernacular names. For example, the English name *aster* and the scientific generic name *Aster* are applied to the same group. This is frequently a convenience, but there are also some difficulties, which will be emphasized below.

In contrast to common, vernacular or casual names, the scientific name for each kind of organism (each plant or animal) is supposed to be the same in all countries and in all languages. When such a scientific name is used, no question should arise in any language as to what organism is intended. The names thus applied are supposed to conform to certain general rules that have been formulated by international agreement. Obviously the use of such names is advantageous whenever one is desirous of accuracy, and of being definitely understood in all languages. It is further evident that in all questions relating to taxonomy and classification it is highly desirable that the scientific names be used.

International rules for nomenclature. In order that there be an international set of scientific names, it is essential that there be an international agreement as to the rules which should govern their creation. Both of the great groups of biologists, the botanists and the zoologists, have met in numerous international congresses in which delegates were accredited by the great botanical and zoological societies, museums, and educational institutions of the world. Codes of nomenclature designed to tell how names shall be manufactured and used, and how to tell which of two or more names that have been used is correct, have been developed by each of these groups. These codes or lists of rules and recommendations are quite similar in essentials for botany and zoology, although they differ in some details.

The question arises: Are either or both of these codes satisfactory or adaptable to the use of bacteriologists. Three views have been expressed by various writers. Some few have suggested that the naming of bacteria cannot well conform to the approved international rules as their classification involves considerations not familiar to botanists and zoologists generally. The second group, also a very small one, has insisted that unicellular forms of life are neither plants or animals, but protista, and that taxonomic rules, etc., should be distinct for this group and coördinate with the corresponding rules for plants and for animals.

The third view, more commonly expressed, is that the bacteria are sufficiently closely related to the plants and animals, so that (in so far as

they apply) the international agreements of the botanists (or zoologists) should be used as a basis for naming them.

International opinion on this topic was finally crystallized by resolutions adopted by the First International Congress of the International Society for Microbiology held in Paris in 1930 and by the Fifth International Botanical Congress held in Cambridge, England in the same year.

The resolutions unanimously adopted by the plenary session of the International Society for Microbiology were in part as follows:

"It is clearly recognized that the living forms with which the microbiologists concern themselves are in part plants, in part animals, and in part primitive. It is further recognized that *in so far as they may be applicable and appropriate* the nomenclatural codes agreed upon by International Congresses of Botany and Zoology should be followed in the naming of micro-organisms. Bearing in mind, however, the peculiarly independent course of development that bacteriology has taken in the past fifty years, and the elaboration of special descriptive criteria which bacteriologists have of necessity developed, it is the opinion of the International Society for Microbiology that the bacteria constitute a group for which special arrangements are necessary. Therefore the International Society for Microbiology has decided to consider the subject of bacterial nomenclature as a part of its permanent program."

The International Society of Microbiologists established a permanent Nomenclature Committee to pass upon suggestions and to make recommendations. This committee is composed of members from all participating nations. Two secretaries were named, one (Dr. St. John-Brooks of the Lister Institute, London, England) to represent primarily medical and veterinary bacteriology, and one (Dr. R. S. Breed, New York State Agricultural Experiment Station, Geneva, New York, U. S. A.) to represent other phases of bacteriology.

The coöperation of the International Botanical Congress was solicited in the naming of this committee. The resolutions were approved by the Section on Bacteriology of the Botanical Congress and the Congress itself incorporated into the Botanical Code certain special provisions relating to the bacteria. It also specifically recognized the International Committee as the body to prepare recommendations relating to bacterial nomenclature.

It is apparent, therefore, that there has been international agreement (in so far as this can be achieved) that bacteriologists should follow the botanical or zoological codes in the naming of bacteria to the extent they are applicable, and that exceptions or new problems should be presented to the International Committee.

These rules are so important in determining the validity of bacterial names that the rules of the Botanical Code are included in somewhat

abridged form in the section that follows this introduction. Any student who has occasion to name a new species or a new genus or determine the validity of a name should familiarize himself with these rules and recommendations.

An effort has been made in the present volume to use nomenclature in conformity with these rules.

Some general principles of nomenclature. Every student of bacteriology should be familiar with certain rules of nomenclature if he is to use names intelligently. If he wishes to correct names improperly used or if he desires to name new species, there are additional rules which he must observe.

1. Each distinct kind of bacterium is called a species.

2. To each distinct species a name is given consisting usually of two Latin words, as *Bacillus subtilis*.

3. The first word is the name of the genus or group to which the organism belongs. It is *always* written with a capital letter. It is a Latin or Greek word, or a new word compounded from Latin or Greek roots, or it may be derived from some other language; but this is important, whatever its origin when used as a generic name it must be regarded and treated as a Latin noun. If it is a word not found in classic Latin, it is regarded as modern Latin. Some generic names in bacteriology which are Latin or formed from Latin roots are *Bacillus* (masculine) a small rod; *Cristispira* (feminine) a crested spiral; *Lactobacillus* (masculine) a milk small rod; *Sarcina* (feminine) a packet or bundle. Many others are words from the Greek or compounded from Greek roots, with the words transliterated into Latin letters and endings in conformity with Latin usage; words of Greek origin are *Micrococcus* (masculine) a small grain (sphere); *Bacterium* (neuter) a small rod; *Clostridium* (neuter) a small spindle; *Corynebacterium* (neuter) clubbed small rod; *Actinomyces* (masculine) ray fungus. Other generic names have been given in honor of persons or places as *Beggiatoa* (feminine), *Borrelia* (feminine), *Eberthella* (feminine), *Pasteurella* (feminine), *Erwinia* (feminine), *Zopfius* (masculine).

4. The second word in the scientific name is a *specific* epithet. It is *not* capitalized except that certain authors capitalize species names derived from proper nouns.

It may be:

(a) An adjective modifying the noun, and indicating by its ending agreement with the generic name in gender, as *Bacterium album* (white *Bacterium*), *Bacillus albus* (white *Bacillus*), *Sarcina alba* (white *Sarcina*), *Eberthella dispar* (the different *Eberthella*), *Bacterium variabile* (the variable *Bacterium*), *Brucella melitensis* (the maltese *Brucella*), *Bacillus teres* (the rounded *Bacillus*), *Bacillus graveolens* (sweet-smelling *Bacillus*).

Typical adjectives

Masculine	Feminine	Neuter
albus	*alba*	*album*
niger	*nigra*	*nigrum*
tener	*tenera*	*tenerum*
acer	*acris*	*acre*
variabilis	*variabilis*	*variabile*
dispar	*dispar*	*dispar*
coccoides	*coccoides*	*coccoides*
aerogenes	*aerogenes*	*aerogenes*

(b) An adjective in the form of the present participle of a verb, as *Clostridium dissolvens* (the dissolving *Clostridium*, in the sense of the *Clostridium* which is able to dissolve), *Bacillus adhaerens* (the adhering *Bacillus*), *Acetobacter ascendens* (the climbing *Acetobacter*), *Bacillus esterificans* (the ester-producing *Bacillus*). The endings for present participles used as adjectives are the same for all genders. The past participle is used occasionally, as in *Pseudomonas aptata* (the adapted *Pseudomonas*), *Spirillum attenuatum* (the attenuated *Spirillum*).

(c) A noun in the genitive (possessive) modifying the generic name. There is no necessary agreement in gender or number. Examples, *Clostridium welchii* (Welch's *Clostridium*), *Salmonella pullorum* (the *Salmonella* of chicks), *Streptococcus lactis* (the *Streptococcus* of milk), *Brucella abortus* (the *Brucella* of abortion), *Clostridium tetani* (the *Clostridium* of tetanus), *Diplococcus pneumoniae* (the *Diplococcus* of pneumonia), *Salmonella anatum* (the *Salmonella* of ducks).

(d) A noun in apposition, that is, an explanatory noun. This does not agree necessarily with the generic name in gender. This method of naming is relatively not common in bacteriology. Examples are *Actinomyces scabies* (the scurf or scab *Actinomyces*), *Bacillus lacticola* (the milk-dweller bacillus), *Bacillus radicicola* (the root-dweller bacillus).

5. The author of the name is often indicated following the name of the species, as *Bacillus subtilis* Cohn. Sometimes a name is indicated also in parenthesis, as *Micrococcus luteus* (Schroeter) Cohn. This means that Schroeter first named the species, giving it the name *luteus*, but placed it in another genus (*Bacteridium*). Cohn placed it in a new genus. It should be noted that the name of a person, following the name of an organism is frequently not the person who first discovered or described it, but the person who first gave it the name used. For example, *Clostridium welchii* (Migula) Holland was first described by Dr. Wm. H. Welch, but not named by him. It was named by Migula in honor of Dr. Welch and later it was placed in the genus *Clostridium* by Holland.

6. Sometimes species of bacteria are subdivided into varieties. These are likewise given Latin designations, and the entire name written as:

Streptococcus lactis var. *maltigenes* (the *Streptococcus* of milk producing malt flavor).

Some principles of taxonomy. It is important further that the student of bacteriology recognize the meaning of certain terms used regularly in classifications.

(1) **Species** (plural **species**). A species of plant (or animal) is assumed above to be one kind of plant. But how much difference must exist between two cultures of bacteria before one is justified in regarding the organisms in them as being of distinct kinds or species? No rule can be laid down. It depends largely upon convenience and a more or less arbitrary decision. As stated by Hitchcock (Descriptive Systematic Botany, New York, 1925, p. 8): "The unit of classification is a coherent group of like individuals, called a species. The term is difficult to define with precision because a species is not a definite entity, but a taxonomic concept." Hucker and Pederson (New York Agric. Exper. Sta. Tech. Bull. 167, 1930, p. 39) state: "The difficulty met with among these lower forms in dividing them into well-defined groups has led many to question whether these small groups or 'species' are natural groups and whether such groups can be considered to be similar to 'species' among higher forms. However this may be, it is necessary to arrange bacteria as well as possible into groups or so-called 'species' for convenience in classification," and again (Hucker, New York Agric. Exper. Sta. Tech. Bull. 100, 1924, 29), "characters applicable to the differentiation of species must evidence a certain amount of constancy when studied over a large series of tests. Furthermore, characters adapted to the differentiation of larger natural groups or genera should, in addition to constancy, show some correlation with other constant characteristics. The presence of this relationship or correlation between characters for the division of genera indicates that the groupings are being made along natural rather than artificial lines."

Type culture. It is quite evident that when a new species of bacterium is described, it must include the particular culture from which the species description was made. This original culture is termed the type culture. We may develop a definition as follows:—A species of bacterium is the type culture or specimen together with all other cultures or specimens regarded by an investigator as sufficiently like the type (or sufficiently closely related to it) to be grouped with it. It is self-evident that different investigators may not draw the same boundaries for a given species. This leads to some practical difficulties, but no better definition has been evolved.

There are certain special cases which require brief discussion.

(a) How should one designate the different stages in an organism that exhibits a growth cycle? There seems to be increasing evidence that certain bacteria show cycles in morphology which parallel to some degree those well

known among the fungi. Such, for example, may well be the rough (R) and smooth (S) types described for many bacteria, possibly the filterable stages noted by many authors, the so-called G types, etc. It is evident that an adequate description of any species of bacterium should include a description of each of these stages in the cyclical development wherever such is proved to exist. In all other cases in botany and in zoology which involve growth stages or cycles one stage has been chosen and designated as the mature or adult or perfect stage. In ferns, for example, names and classifications are based largely upon the sporophytic generation, in insects upon the adult or imago, in the rusts upon the stage in which the teleutospores are produced. There has been no international agreement as to what stage should be thus designated for the bacteria. Beyond doubt, it would be the stage which is most easily cultured and studied in the laboratory, the stage with which we are best acquainted in the laboratory. It might easily happen in bacteria (as it has with fungi) that two different stages of the life cycle of single species have been described and named as separate species. When the mistake has been discovered, the name given to the mature or perfect stage is the one that is accepted. In general the descriptions given in the present volume are those which may be regarded as belonging to the perfect stage. Unfortunately it is not yet possible accurately to group the stages in many of the bacteria that have definite growth cycles.

It is desirable frequently to designate the stage with which one is working. This may be done by some conventional symbol, as S (smooth type), G (filterable stage), etc.

(b) How should one designate variants which differ in some minor respects from the type, but which do not constitute growth stages? For example, the species *Bacillus subtilis* normally produces endospores. Suppose that an asporogenous race is derived from such, agreeing with the parent culture in all respects, but showing no tendency to revert to spore production. What such an organism should be called is a matter of judgment. It might frequently be designated as an asporogenous strain, or more technically if one desires as a variety. It might be termed, for example, *Bacillus subtilis* var. *asporus*. In other cases such expressions as *Diplococcus pneumoniae* Type I, or the Rawlings strain of the typhoid bacillus may be used.

Unfortunately there is no general agreement upon the exact significance which the word "strain" should have in bacteriology. It is recommended that it refer merely to source, e.g. the Rawlings strain of *Eberthella typhosa*, and that it be never used to connote a biological character. This would not prevent such expressions as "a non-motile strain of *Salmonella suipestifer*". but it would make erroneous a statement to the effect that the A

strain of influenza virus differs from the B strain in certain ways. In other words, "strain" is not a synonym of "type" or "variety". We may have as many yellow strains of the typhoid bacillus as we have of cultures of it, from different sources or specimens.

(2) **Genus** (plural **genera**). A genus is a group of related species. In some cases a genus may include only a single species (is said to be *monotypic*) in most cases several to many species are included in a genus. The question asked above may be paraphrased. How close must be the resemblances (how close the relationships) among the species of a group to entitle them to inclusion in the same genus? In other words, how is it possible to delimit accurately the boundaries of a genus? This is a matter on which there is no agreement, and probably can be none. Much of the confusion in modern bacteriological terminology is to be attributed to this fact. Nevertheless, in course of time experience tends to delimit many genera with reasonable accuracy. As stated by Hitchcock (Descriptive Systematic Botany, New York, 1925, p. 9): "Convenience may play a rôle in determining generic lines. Extremely large groups may be broken up on the basis of differences of smaller degree not common to a group of closely allied species, than if the group consisted of a few species. In general, the botanist, in delimiting genera, keeps in mind two important requirements, that of showing natural affinities and that of aiding correct identification." However, a genus may be defined helpfully in another way. One of the species described as belonging to a genus is designated as the *type* species. A genus may be defined then, as including this type species together with such other species as the investigator (or taxonomist) regards as sufficiently closely related. It is apparent that some authors may draw the lines narrowly, others broadly. Some authors, for example, recognize only two genera of rod-shaped bacteria, one for those without endospores (*Bacterium*), and one for those producing endospores (*Bacillus*). These genera thus defined are very large, each containing hundreds, perhaps thousands, of species. Other students break up these large genera into many smaller ones. There is not much point to the question as to which is right and which is wrong. A better question is, which is the more convenient, better represents relationships, better facilitates diagnosis and proves most useful. As organisms become better known, it may be possible through the agency of the International Committee on Nomenclature to reach agreements where lack of agreement leads to serious confusion or misunderstanding.

(3) **Family.** A family in taxonomy is a group of related genera. In general the name of the family is made from the name or former name of one of their genera by affixing the suffix *-aceae* to the root. The word is regarded as plural. Among bacterial families commonly recognized are *Bacillaceae*, *Bacteriaceae*, *Micrococcaceae*, *Spirochaetaceae*, *Actinomycetaceae*,

(4) **Order.** An order is a group of related families. It is named usually (not always) by substituting the suffix *-ales* for *-aceae* in the name of the type family. Among ordinal names that have been used in bacteriology are *Actinomycetales*, *Spirochaetales*, *Eubacteriales*.

(5) **Class.** A class is a group of related orders. In this treatise it is considered that the bacteria constitute a class of the plant kingdom, and this is named *Schizomycetes*.

(6) **Other categories.** Other *categories* or *ranks* of names are used for higher groups. Sometimes families are divided into sub-families, these into tribes, these into subtribes, and these finally into genera.

How to identify an organism by name. One of the main purposes of a manual of determinative bacteriology is to facilitate the finding of the correct scientific name of a bacterium. Such is the purpose of this volume. It is well, however, to note some of the reasons why this result, the identification of an unknown culture, may not eventuate. Among these reasons the following may be listed:

(1) The unknown organism awaiting identification by the investigator may easily be one which has never been named, or perhaps adequately described. For the most part there has been little effort on the part of bacteriologists to describe or name bacteria except as they have been found to have some economic significance or possess some striking or unusual characteristics. It is quite probable that there are many times as many species of bacteria undescribed and named as have been described. Such undescribed species are all about us. It is not surprising, therefore, if one frequently encounters undescribed species. When such unnamed species are encountered, particularly if they are of economic importance or are related to such forms, it is highly desirable that they should be described, named and the results published and made accessible.

(2) The unknown organism may have been described and named in some publication, but the description and name have been over-looked in the preparation of the MANUAL. Perhaps the description has been so inadequate or incomplete that it has not been possible to place it in the classification. It should be noted that the number of species that have been described is so great that no one individual can know them all. Progress in classification comes about largely as the result of the work of specialists in particular groups. For example, Ford made a study of all of the aerobic spore-bearing bacteria which he had secured from various sources. He studied also the descriptions of such bacteria in the literature, and then monographed the group. Similar studies on other groups have resulted in more or less complete monographs. Such, for example, are the monographs on the intestinal group by Welden and Levine, of the acetic bacteria by Hoyer, and Visser 't Hooft, of the cocci by Hucker, of the

pathogenic spore-bearing anaerobes by the English Commission, by Weinberg, and by others, of the red, rod-shaped bacteria by Hefferan and by Breed, of the actinomycetes by Waksman and by Lieske, of the root nodule bacteria of legumes by Fred and his co-workers, etc. Unfortunately most groups of bacteria have not thus been monographed. It is evidently the function of a manual such as this to draw largely upon the work of the monographers, and to supplement their achievements as far as possible by less satisfactory consideration of the unmonographed groups.

It is clear that because an organism cannot be identified from this text is not proof that it has not been described and named. The species most closely related may be determined, then the literature searched carefully for species described still more closely related or perhaps one identical.

(3) It is possible, of course, that an error has been made in the selection of the correct name. It is desirable that users of these keys and descriptions should be familiar with the rules governing the correct choice of names, and make suitable corrections where needed.

Steps in determining the name of an organism. The steps in the identification of an unknown organism are usually the following:

(1) Preparation of an adequate description of the organism.

(2) Knowledge of construction and use of keys.

(3) Determination of order, family and genus by use of key.

Preparation of description of organism. Before attempting to determine the name of an "unknown" organism an adequate description is essential. Just what characteristics must be emphasized depends upon the group in which the organism falls. It is desirable that the knowledge of the characters of the unknown be as complete as possible.

Use and construction of keys. An exceptionally clear and satisfactory discussion of the making and use of keys and synopses is given by Hitchcock (Descriptive Systematic Botany, New York, 1925, p. 104). Anyone planning to monograph a group is advised to read this. He states: "A key is an orderly arrangement of a series of contrasting or directly comparable statements, by which groups of the same category may be distinguished and indicated or identified," and "A key is primarily a mechanical device by which one may arrive at the name of the ultimate member of the group." In general the keys used in this MANUAL are *dichotomous*, that is, the successive divisions are in twos, differentiation being into two contrasted groups.

Determination of order, family and genus by use of keys. The method of doing this is discussed in the introduction beginning on page 1.

RULES OF NOMENCLATURE*

In Paris in 1930, the First International Microbiological Congress voted to follow the rules of nomenclature agreed upon by International Congresses of Botany and Zoology "*in so far as they may be applicable and appropriate.*" The adoption of the date of the publication of Species Plantarum by Linnaeus in 1753 as the point of departure for bacteriological nomenclature was recommended. This recommendation was approved by the plenary session of the Microbiological Congress (Proc. 1er Cong. Internat. Microbiol., Paris, 1930, *2*, 1932, 519) and by the plenary session of the Botanical Congress (Rept. Proc. 5th Internat. Bot. Cong., 1930, Cambridge, 1931, p. 16 and 28).

This Congress also provided for the organization of an International Committee on Bacteriological Nomenclature with two permanent secretaries:

1. To represent primarily medical and veterinary bacteriology,—Dr. R. St. John-Brooks, Lister Institute, London, England.
2. To represent primarily other phases of bacteriology,—Dr. R. S. Breed, Experiment Station, Geneva, New York, U. S. A.

During the years that have elapsed since its appointment, this Committee has organized and has taken various actions in the interest of a more stable nomenclature and classification. Some of these have been completed and accepted by the Second International Congress of Microbiology held in London, 1936. These completed actions are quoted below, and are incorporated into the classification used in the descriptive portion of the MANUAL.

The International Rules of Botanical Nomenclature were originally adopted by the International Botanical Congresses of Vienna (1903) and Brussels (1910). They were modified by the Cambridge Congress (1930) so as to accept the type method, and validate species descriptions of bacteria unaccompanied by a Latin diagnosis. Some further but less important modifications were made at the Amsterdam Congress (1935) (See Sprague, Science, *83*, 1936, 416).

The following are the most important of the rules that are of interest to bacteriologists taken from the latest available edition of the Botanical Code (Gustav Fischer, Jena, 1935). Sections that were newly adopted or amended by the Amsterdam Botanical Congress (1935) are indicated in the text.

---

INTERNATIONAL RULES OF BOTANICAL NOMENCLATURE, 1930–1935

Chapter I. General Considerations and Guiding Principles (Art. 1–9)

Art. 1. Botany cannot make satisfactory progress without a precise system of nomenclature, which is used by the great majority of botanists in all countries.

Art. 2. The precepts on which this precise system of botanical nomenclature is based are divided into *principles*, *rules*, and *recommendations*. The principles (Art. 1–9, 10–14, 15–19) form the basis of the rules and recommendations. The object of the rules (Art. 19–74) is to put the nomenclature of the past into order and to provide for that of the future. They are always retroactive; names or forms of nomenclature contrary to a rule (illegitimate names or forms) cannot be maintained. The recommendations deal with subsidiary points, their object being to bring about greater uniformity and clearness in future nomenclature: names or forms contrary to a recommendation cannot on that account be rejected, but they are not examples to be followed.

Art. 3. The rules of nomenclature should be simple and founded on considerations sufficiently clear and forcible for everyone to comprehend and be disposed to accept.

Art. 4. The essential points in nomenclature are: (1) to aim at fixity of names; (2) to avoid or to reject the use of forms and names which may cause error or ambiguity or throw science into confusion.

Next in importance is the avoidance of all useless creation of names.

Other considerations, such as absolute grammatical correctness, regularity or euphony of names, more or less prevailing custom, regard for persons, etc., notwithstanding their undeniable importance, are relatively accessory.

Art. 5. In the absence of a relevant rule, or where the consequences of rules are doubtful, established custom must be followed.

Art. 7. Scientific names of all groups are usually taken from Latin or Greek. When taken from any language other than Latin, or formed in an arbitrary manner, they are treated as if they were Latin. Latin terminations should be used so far as possible for new names.

Art. 8. Nomenclature deals with: (1) the *terms* which denote the rank of taxonomic groups (Art. 10–14); (2) the *names* which are applied to the individual groups (Art. 15–72).

Art. 9. The rules and recommendations of botanical nomenclature apply to all groups of the plant kingdom, recent and fossil, with certain distinctly specified exceptions.

Chapter II. Categories of Taxonomic Groups, and the Terms Denoting Them (Art. 10–14, Rec. I, II)

Art. 10. Every individual plant belongs to a species (*species*), every species to a genus (*genus*), every genus to a family (*familia*), every family to an order (*orda*) every order to a class (*classis*), every class to a division (*diviso*).

Chapter III. Names of Taxonomic Groups (Art. 15–72, Rec. III–L)

Section 1. General Principles: Priority (Art. 15–17, Rec. III)

Art. 15. The purpose of giving a name to a taxonomic group is not to indicate the characters or the history of the group, but to supply a means of referring to it.

Art. 16. Each group with a given circumscription, position, and rank can bear only one valid name, the earliest that is in accordance with the Rules of Nomenclature.

Section 2. The Type Method (Art. 18, Rec. IV–VII)

Art. 18. The application of names of taxonomic groups is determined by means of *nomenclatural types*. A nomenclatural type is that constituent element of a group to which the name of the group is permanently attached, whether as an accepted name or as a synonym. The name of a group must be changed if the type of that name is excluded (see Art. 66).

Section 3. Limitation of the Principle of Priority: Publication, Starting-points, Conservation of Names (Art. 19–22)

Art. 19. A name of a taxonomic group has no status under the Rules, and has no claim to recognition by botanists, unless it is validly published (see Art. 37).

Art. 20. Legitimate botanical nomenclature begins for the different groups of plants at the following dates:

(*h*) *Myxomycetes*, 1753 (Linnaeus, *Species Plantarum*, ed. 1).*

Art. 21. However, to avoid disadvantageous changes in the nomenclature of genera by the strict application of the Rules of Nomenclature, and especially of the principle of priority in starting from the dates given in Art. 20, the Rules provide a list of names which must be retained as exceptions. These names are by preference those which have come into general use in the fifty years following their publication, or which have been used in monographs and important floristic works up to the year 1890.

Section 4. Nomenclature of the Taxonomic Groups According to Their Categories (Art. 23–35, Rec. VII–XX)

1. *Names of Groups above the Rank of Family.*

Rec. IX. Orders are designated preferably by the name of one of their principal families with the ending *-ales*.

2. *Names of Families and Subfamilies, Tribes, and Sub-tribes.*

Art. 23. Names of families are taken from the name or former name of one of their genera and end in *-aceae.*

Art. 24. Names of subfamilies (*subfamiliae*) are taken from the name of one of the genera in the group, with the ending *-oideae*, similarly for tribes (*tribus*), with the ending *-eae*, and for subtribes (*subtribus*) with the ending *-inae.*

3. *Names of Genera and Subdivisions of Genera.*

Art. 25. Names of genera are substantives (or adjectives used as substantives), in the singular number and written with an initial capital, which may be compared with our family names. These names may be taken from any source whatever, and may even be composed in an absolutely arbitrary manner.

Recommendation X. Botanists who are forming generic names show judgment and taste by attending to the following recommendations:

(a) Not to make names long or difficult to pronounce.
(b) Not to dedicate genera to persons quite unconnected with botany or at least with natural science, nor to persons quite unknown.
(c) Not to take names from barbarous languages, unless those names are frequently cited in books of travel, and have an agreeable form that is readily adaptable to the Latin tongue and to the tongues of civilized countries.

---

* See page 48 for action on date for *Schizomycetes.*

(d) To indicate, if possible, by the formation or ending of the name the affinities or analogies of the genus.
(e) To avoid adjectives used as nouns.
(f) Not to give a genus a name whose form is rather that of a subgenus or section (e.g. *Eusideroxylon*, a name given to a genus of *Lauraceae*. This, however, being legitimate, cannot be altered).
(g) Not to make names by combining words from different languages (*nomina hybrida*).

4. *Names of Species (binary names).*

Art. 27. Names of species are binary combinations consisting of the name of the genus followed by a single specific epithet. If an epithet consists of two or more words, these must either be united into one or joined by a hyphen. Symbols forming part of specific epithets proposed by Linnaeus must be transcribed.

The specific epithet, when adjectival in form and not used as a substantive, agrees with the generic names.

Recommendations:

XIII. The specific epithet should, in general, give some indication of the appearance, the characters, the origin, the history or the properties of the species. If taken from the name of a person it usually recalls the name of the one who discovered or described it, or was in some way concerned with it.

XIV. Names of men and women, and also of countries and localities used as specific epithets, may be substantives in the genitive (*Clusii*, *saharae*) or adjectives (*Clusianus*, *dahuricus*). It will be well, in the future, to avoid the use of the genitive and the adjectival form of the same epithet to designate two different species of the same genus: e.g. *Lysimachia Hemsleyana* Maximum. (1891), and *L. Hemsleyi* Franch. (1895).

XV. In forming specific epithets botanists will do well to have regard also to the following recommendations:
(a) To avoid those which are very long and difficult to pronounce.
(b) To avoid those which express a character common to all, or nearly all, the species of a genus.
(c) To avoid using the names of little-known or very restricted localities, unless the species is quite local.
(d) To avoid, in the same genus, epithets which are very much alike, especially those which differ only in their last letters.
(e) Not to adopt unpublished names found in travellers' notes or in herbaria, attributing them to their authors, unless these have approved publication.
(f) Not to name a species after a person who has neither discovered, nor described, nor figured, nor in any way studied it.
(g) To avoid epithets which have been used before in any closely-allied genus.
(h) To avoid specific epithets formed of two or more (hyphened) words.
(i) To avoid epithets which have the same meaning as the generic name (pleonasm).

Section 5. Conditions of Effective Publication (Art. 36)

Art. 36. Publication is effected, under these Rules, either by sale or distribution of printed matter or indelible autographs to the general public, or to specified representative botanical institutions.

No other kind of publication is accepted as effective: communication of new names at a public meeting, or the placing of names in collections or gardens open to the public, does not constitute effective publication.

Section 6. Conditions and Dates of Valid Publication of Names (Art. 37–45, Rec. XXI–XXIX)

Art. 37. A name of a taxonomic group is not validly published unless it is both (1) effectively published (see Art. 36), and (2) accompanied by a description of the group or by a reference to a previously and effectively published description of it.

Art. 38. From January 1, 1935, names of new groups of recent plants, *the Bacteria excepted*, are considered as validly published only when they are accompanied by a Latin diagnosis.

Art. 40. A name of a taxonomic group is not validly published when it is merely cited as a synonym.

Art. 42. A name of a genus is not validly published unless it is accompanied (1) by a description of the genus, or (2) by the citation of a previously and effectively published description of the genus under another name, or (3) by a reference to a previously and effectively published description of the genus as a subgenus, section or other subdivision of a genus.

Art. 43. The name of a monotypic new genus based on a new species is validated (1) by the provision of a combined generic and specific description, (2) by the provision of a plate with analyses showing essential characters; but this applies only to plates and generic names published before January 1, 1908.

Art. 44. The name of a species or of a subdivision of a species is not validly published unless it is accompanied (1) by a description of the group, or (2) by the citation of a previously and effectively published description of the group under another name, or (3) by a plate or figure with analyses showing essential characters; but this applies only to plates or figures published before January 1, 1908.

Art. 45. The date of a name or of an epithet is that of its valid publication (see Art. 19, 36). For purposes of priority, however, only legitimate names and epithets published in legitimate combinations are taken into consideration (see Art. 60). In the absence of proof to the contrary, the date given in the work containing the name or epithet must be regarded as correct.

Botanists will do well in publishing to conform to the following recommendations:

XXI. Not to publish a new name without clearly indicating whether it is the name of a family or a tribe, a genus or a section, a species or a variety; briefly, without expressing an opinion as to the rank of the group to which the name is given.

Not to publish the name of a new group without indicating its type (see Recommendation IV).

XXII. To avoid publishing or mentioning in their publications unpublished names which they do not accept, especially if the persons responsible for these names have not formally authorized their publication (see Recommendation XV (e).

XXVI. To give the etymology of new generic names and also of new epithets when the meaning of these is not obvious.

XXVII. To indicate precisely the date of publication of their works and that of the placing on sale or the distribution of named and numbered plants when these are accompanied by printed diagnoses. In the case of a work appearing in parts, the last published sheet of the volume should indicate the precise dates at which the different fascicles or parts of the volumes were published as well as the number of pages in each.

XXVIII. When works are published in periodicals, to require the publisher to indicate on the separate copies the date (year and month) of publication and also the title of the periodical from which the work is extracted.

XXIX. Separate copies should always bear the pagination of the periodical of which they form a part; if desired they may also bear a special pagination.

Section 7. Citation of Authors' Names for Purposes of Precision (Art. 46–49, Rec. XXX–XXXII)

Art. 46. For the indication of the name (unitary, binary, or ternary) of a group to be accurate and complete, and in order that the date may be readily verified it is necessary to cite the author who first published the name in question.

Art. 47. An alteration of the diagnostic characters or of the circumscription of a group does not warrant the citation of an author other than the one who first published its name.

When the changes have been considerable, an indication of their nature and of the author responsible for the change is added, the words *mutatis charact.*, or *pro parte*, or *excl. gen.*, *excl. sp.*, *excl. var.*, or some other abridged indication being employed.

Art. 48. When a name of a taxonomic group has been proposed but not published by one author, and is subsequently validly published and ascribed to him (or her) by another author who supplied the description, the name of the latter author must be appended to the citation with the connecting word "*ex*."

If it is desirable or necessary to abbreviate such a citation, the name of the publishing author, being the more important, must be retained.

When a name and description by one author are published by another author, the word *apud* is used to connect the names of the two authors, except where the name of the second author forms part of the title of a book or periodical in which case the connecting word *in* is used instead.

Art. 49. When a genus or a group of lower rank is altered in rank but retains its name or epithet, the original author must be cited in parenthesis, followed by the name of the author who effected the alteration. The same holds when a subdivision of a genus, a species, or a group of lower rank is transferred to another genus or species with or without alteration of rank.

Section 8. Retention of Names or Epithets of Groups which are Remodelled or Divided (Art. 50–52)

Art. 50. An alteration of the diagnostic characters, or of the circumscription of a group, does not warrant a change in its name, except in so far as this may be necessitated (1) by transference of the group (Art. 53–55), or (2) by its union with another group of the same rank (Art. 56–57), or (3) by a change of its rank (Art. 58).

Art. 51. When a genus is divided into two or more genera, the generic name must be retained for one of them, or (if it has not been retained) must be re-established. When a particular species was originally designated as the type, the generic name must be retained for the genus including that species. When no type was designated, a type must be chosen according to the regulations which will be given (Appendix I).*

Art. 52. When a species is divided into two or more species, the specific epithet must be retained for one of them, or (if it has not been retained) must be re-established. When a particular specimen was originally designated as the type, the specific epithet must be retained for the species including that specimen. When no type was designated, a type must be chosen according to the regulations to be given (Appendix I).

* **Appendix I has not been published as yet. See Type Basis Code, p. 61.**

Section 9. Retention of Names or Epithets of Groups Below the Rank of Genus on Transference to Another Genus or Species (Art. 53–55)

Art. 53. When a subdivision of a genus is transferred to another genus (or placed under another generic name for the same genus) without change of rank, its subdivisional name must be retained, or (if it has not been retained) must be re-established unless one of the following obstacles exists: (1) that the resulting association of names has been previously published validly for a different subdivision, or (2) that there is available an earlier validly published sub-divisional name of the same rank.

Art. 54. When a species is transferred to another genus (or placed under another generic name for the same genus), without change of rank, the specific epithet must be retained or (if it has not been retained) must be re-established, unless one of the following obstacles exists: (1) that the resulting binary name has been previously and validly published for a different species, (2) that there is available an earlier validly published specific epithet.

"When, on transference to another genus, the specific epithet has been applied erroneously in its new position to a different plant, the new combination must be retained for the plant on which the epithet was originally based, and must be attributed to the author who first published it." (Accepted in this revised form at the Amsterdam Botanical Congress, 1935.)

Art. 55. When a variety or other subdivision of a species is transferred, without change of rank, to another genus or species (or placed under another generic or specific name for the same genus or species), the original subdivisional epithet must be retained or (if it has not been retained) must be re-established, unless one of the following obstacles exists: (1) that the resulting ternary combination has been previously and validly published for a subdivision based on a different type, even if that subdivision is of a different rank; (2) that there is an earlier validly published subdivisional epithet available.

When the epithet of a subdivision of a species, on transference to another species, has been applied erroneously in its new position to a different plant, the epithet must be retained for the plant on which the group was originally based.

Example: The variety *micranthum* Gren. & Godf. (*Fl. France*, i, 171: 1847) of *Helianthemum italicum* Pers., when transferred as a variety to *H. penicillatum* Thib., retains its varietal epithet, becoming *H. penicillatum* var. *micranthum* (Gren. & Godr.) Grosser (in Engl. *Pflanzenreich*, Heft 14, 115: 1903).

Section 10. Choice of Names when Two Groups of the Same Rank are United, or in Fungi with a Pleomorphic Life-cycle (Art. 56, 57, Rec. XXXIII–XXXV)

Art. 56. When two or more groups of the same rank are united, the oldest legitimate name or (in species and their subdivisions) the oldest legitimate epithet is retained. If the names or epithets are of the same date, the author who unites the groups has the right of choosing one of them. The author who first adopts one of them, definitely treating another as a synonym or referring it to a subordinate group, must be followed.

Art. 57. Among Fungi with a pleomorphic life-cycle the different successive states of the same species (*anamorphoses, status*) can bear only one generic and specific name (binary), that is the earliest which has been given, starting from Fries, *Systema*, or Fries, *Synopsis*, to the state containing the form which it has been agreed to call the perfect form, provided that the name is otherwise in conformity with the Rules. The perfect state is that which ends in the ascus stage in the *Ascomycetes*,

in the basidium, in the *Basidiomycetes*, in the teleutospore or its equivalent in the *Uredinales*, and in the spore in the *Ustilaginales*.

Generic and specific names given to other states have only a temporary value. They cannot replace a generic name already existing and applying to one or more species, any one of which contains the "perfect" form.

The nomenclature of Fungi which have not a pleomorphic life-cycle follows the ordinary rules.

Section 11. Choice of Names when the Rank of a Group is Changed

Art. 58. When a tribe becomes a family, when a subgenus or section becomes a genus, when a subdivision of a species becomes a species, or when the reverse of these changes takes place, and in general when a group changes its rank, the earliest legitimate epithet given to the group in its new rank is valid, unless that name or the resulting association or combination is a later homonym (see Art. 60, 61).

Section 12. Rejection of Names (Art. 59–69, Rec. XXXVII)

Art. 59. A name or epithet must not be rejected, changed, or modified merely because it is badly chosen, or disagreeable, or because another is preferable or better known (see also Art. 69).

Art. 60. A name must be rejected if it is illegitimate (see Art. 2). The publication of an epithet in an illegitimate combination must not be taken into consideration for purposes of priority, "except as indicated in Art. 61." (Added at the Amsterdam Botanical Congress, 1935.)

A name is illegitimate in the following cases:

(1) If it was superfluous when published, i.e., if there was a valid name (see Art. 16) for the group to which it was applied, with its particular circumscription, position and rank.

(2) If it is a binary or ternary name published in contravention of Art. 16, 50, 52, or 54, i.e., if its author did not adopt the earliest legitimate epithet available for the group with its particular circumscription, position, and rank.

(3) If it is a later homonym (see Art. 61) (except as regards Art. 54 and 55).

(4) If it is a generic name which must be rejected under Art. 67.

(5) If its specific epithet must be rejected under Art. 68.

Art. 61. A name of a taxonomic group is illegitimate and must be rejected if it is a later homonym, that is, if it duplicates a name previously and validly published for a group of the same rank based on a different type. Even if the earlier homonym is illegitimate, or is generally treated as a synonym on taxonomic grounds, the later homonym must be rejected. "When an author simultaneously publishes the same new name for more than one group, the first author who adopts one of them, or substitutes another name for one of them, must be followed." (Added at the Amsterdam Botanical Congress, 1935.)

Art. 62. A name of a taxonomic group must be rejected if, owing to its use with different meanings, it becomes a permanent source of confusion or error. A list of names to be abandoned for this reason (*Nomina ambigua*) will form Appendix IV.*

Art. 63. A name of a taxonomic group must be rejected when its application is uncertain (*Nomen dubium*): e.g., *Ervum soloniense* L. (*Cent.* II. Pl. 28: 1756) is a name the application of which is uncertain; it must, therefore, be rejected (see Schinz and Thell in *Vierteljahrsschr. Nat. Ges. Zürich*, viii, 71: 1913).

* Appendix IV has not been published as yet.

Art. 64. A name of a taxonomic group must be rejected if the characters of that group were derived from two or more entirely discordant elements, especially if those elements were erroneously supposed to form part of the same individual.

A list of names to be abandoned for this reason (*Nomina confusa*) will form Appendix VI.*

Art. 65. A name or epithet of a taxonomic group must be rejected when it is based on a monstrosity.

Art. 66. The name of an order, suborder, family or subfamily, tribe or subtribe must be changed when it is taken from the name of a genus which is known not to belong to the group in question—e.g. if the genus *Portulaca* were excluded from the family now known as *Portulacaceae*, the residual group could no longer bear the name *Portulacaceae*, and would have to be renamed.

Art. 67. Names of genera are illegitimate in the following *special* cases and must be rejected:

(1) When they are merely words not intended as names: e.g. *Anonymous* Walt. (Fl. *Carol.* 2, 4, 9, etc.: 1788) must be rejected as being a word applied to 28 different genera by Walter to indicate that they were without names.

(2) When they coincide with a technical term currently used in morphology unless they were accompanied, when originally published, by specific names in accordance with the binary method of Linnaeus. On and after Jan. 1, 1912, all new generic names coinciding with such technical terms are unconditionally rejected.

(3) When they are unitary designations of species: e.g. Ehrhart (*Phytophylacium:* 1780; and *Beitr.* iv, 145–150: 1798) proposed unitary names for various species known at that time under binary names: e.g. *Phaeocephalum* for *Schoenus fuscus*, and *Leptostachys* for *Carex leptostachys*. These names, which resemble generic names, should not be confused with them, and must be rejected, unless they have been published as generic names by a subsequent author.

(4) When they consist of two words, unless these words were from the first combined into one, or joined by a hyphen.

Art. 68. Specific epithets are illegitimate in the following cases and must be rejected:

(1) When they are merely words not intended as names.

(2) When they are merely ordinal adjectives being used for enumeration.

(3) When they exactly repeat the generic name with or without the addition of a transcribed symbol.

(4) When they were published in works in which the Linnean system of binary nomenclature for species was not consistently employed.

Art. 69. In cases foreseen in Art. 60–68 the name or epithet to be rejected is replaced by the oldest legitimate name, or (in a combination) by the oldest legitimate epithet. If none exists, a new name or epithet must be chosen. Where a new epithet is required, an author may, if he wishes, adopt an epithet previously given to the group in an illegitimate combination, if there is no obstacle to its employment in the new position or sense.

Section 13. Orthography of Names (Art. 70–71, Rec. XXXVIII–XLIV)

Art. 70. The original spelling of a name or epithet must be retained, except in the case of a typographic error, or of a clearly unintentional orthographic error. When the difference between two generic names lies in the termination, these names must

* Appendix VI has not been published as yet.

be regarded as distinct, even though differing by one letter only. This does not apply to mere orthographic variants of the same name.

Note 1. The words "original spelling" in this Article mean the spelling employed when the name was validly published.

2. The use of a wrong connecting vowel or vowels (or the omission of a connecting vowel in a specific epithet, or in that of a subdivision of a species) is treated as an unintentional orthographic error which may be corrected (see Rec. XLIV). "The liberty of correcting a name must be used with reserve, especially if the change affects the first syllable, and above all the first letter of the name." (Added at the Amsterdam Botanical Congress, 1935.)

3. In deciding whether two or more slightly different names should be treated as distinct or as orthographical variants, the essential consideration is whether they may be confused with one another or not: if there is serious risk of confusion, they should be treated as orthographic variants. Doubtful cases should be referred to the Executive Committee.

4. Specific and other epithets of Greek origin differing merely by having Greek and Latin terminations respectively are orthographic variants. Epithets bearing the same meaning and differing only slightly in form are (considered as) orthographic variants. The genitive and adjectival forms of a personal name are, however, treated as different epithets (e.g. *Lysimachia Hemsleyana* and *L. Hemsleyi*).

Recommendations:

XXXVIII. When a new name is derived from a Greek word containing the *spiritus asper* (rough breathing), this should be transcribed as the letter h.

XXXIX. When a new name for a genus, subgenus or section is taken from the name of a person, it should be formed in the following manner:—

(a) When the name of the person ends in a vowel the letter *a* is added (thus *Bouteloua* after Boutelou; *Ottoa* after Otto; *Sloanea* after Sloane), except when the name already ends in *a*, when *ea* is added (e.g. *Collaea* after Colla).

(b) When the name of the person ends in a consonant, the letters *ia* are added (e.g. *Magnusia* after Magnus, *Ramondia* after Ramond), except when the name ends in *er*, when *a* is added (e.g. *Kernera* after Kerner).

(c) The syllables which are not modified by these endings, retain their original spelling, even with the consonants *k* and *w* or with groupings of vowels which were not used in classical Latin. Letters foreign to botanical Latin should be transcribed, and diacritic signs suppressed. The Germanic *ä, ö, ü* become *ae, oe, ue*; the French *é, è, ê* become generally *e*. In works in which diphthongs are not represented by special type, the diaeresis sign should be used where required, e.g., *Cephaëlis*, not *Cephaelis*.

(d) Names may be accompanied by a prefix or a suffix, or modified by anagram or abbreviation. In these cases they count as different words from the original name.

Examples: *Durvillea* and *Urvillea; Lapeyrousea* and *Peyrousea; Englera, Englerastrum* and *Englerella; Bouchea* and *Ubochea; Gerardia* and *Graderia.*

XL. When a new specific or other epithet is taken from the name of a man, it should be formed in the following manner:—

(a) When the name of the person ends in a vowel, the letter *i* is added (thus *Glazioui* from Glaziou, *Bureaui* from Bureau), except when the name ends in *a*, when *e* is added (thus *balansae* from Balansa).

(b) When the name ends in a consonant, the letters *ii* are added (thus *Magnusii* from Magnus, *Ramondii* from Ramond), except when the name ends in *-er* when *i* is added (thus *Kerneri* from Kerner).

(c) The syllables which are not modified by these endings retain their original spelling, even with the consonants *k* or *w* or with groupings of vowels which were not used in classical Latin. Letters foreign to botanical Latin should be transcribed and diacritic signs suppressed. The Germanic *ä*, *ö*, *ü* become *ae*, *oe*, *ou*, the French *é*, *è*, *ê* become generally *e*. The diaeresis sign should be used where required.

(d) When epithets taken from the name of a person have an adjectival form they are formed in a similar way (e.g. *Geranium Robertianum*, *Verbena Hasslerana*).

XLI. The same provisions apply to epithets formed from the names of women. When these have a substantival form they are given a feminine termination (e.g. *Cypripedium Hookerae*, *Rosa Beatricis*, *Scabiosa Olgae*, *Omphalodes luciliae*).

XLII. The specific (or other) epithets should be written in conformity with the original spelling of the words from which they are derived and in accordance with the rules of Latin and latinization.

Examples: *silvestris* (not *sylvestris*) *sinensis* (not *chinensis*).

XLIII. Specific (or other) epithets should be written with a small initial letter, except those which are derived from names of persons (substantives or adjectives), or are taken from generic "or vernacular" names (substantives or adjectives). (Emended Amsterdam Botanical Congress, 1935. See page 61 for actions taken by Second International Microbiological Congress, London, 1936 governing Bacteriological Nomenclature.)

XLIV. In the formation of specific (or other) epithets composed of two or several roots taken from Latin or Greek, the vowel placed between the two roots becomes a connecting vowel, in Latin *i*, in Greek *o*; thus *menthifolia*, *salvifolia*, not *menthaefolia*, *salviafolia*. When the second root begins with a vowel and euphony requires, the connecting vowel should be eliminated (e.g. *lepidantha*). The connecting vowels *ae* should be retained only where this is required for etymological reasons (e.g. *caricaeformis* from *Carica*, in order to avoid confusion with *cariciformis* from *Carex*). In certain compounds of Greek words no connecting vowel is required, e.g. *brachycarpus* and *glycylphyllus*.

Section 14. Gender of Generic Names

Art. 72. The gender of generic names is governed by the following regulations:—

(1) "A Greek or a Latin word adopted as a generic name retains its classical gender. In cases where the classical gender varies, the author has the right of choice between the alternative genders. In doubtful cases, general usage should be followed." "The following names, however, whose classical gender is masculine, are treated as feminine in accordance with historic usage: *Adonis*, *Orchis*, *Stachys*, *Diospyros*, *Strychnos*. *Hemerocallis* (m. in Sp. Pl.: Lat. and Gr. *hemercalles* n.) is also treated as feminine to bring it into conformity with all other generic names ending in *is*." (Emended Amsterdam Botanical Congress, 1935.) See Van Eseltine, Jour. Bact., *26*, 1933, 569, for discussion of the gender of generic names used for bacteria.

(2) Generic names which are modern compounds formed from two or more Greek or Latin words take the gender from the last. If the ending is altered, however, the gender will follow it.

(3) Arbitrarily formed generic names or vernacular names used as generic names take the gender assigned to them by their authors. Where the original

author has failed to indicate the gender, the next subsequent author has the right of choice.

Section 15. Various Recommendations (Rec. XLV–L)

XLV. When writing in modern languages botanists should use Latin scientific names or those immediately derived from them, in preference to names of another kind or origin (popular names). They should avoid the use of the latter unless these are very clear and in common use.

XLVII. Only the metric system should be used in botany for reckoning weights and measures. The foot, inch, line, pound, ounce, etc., should be rigorously excluded from scientific language.

Altitude, depth, rapidity, etc., should be measured in meters. Fathoms, knots, miles, etc., are terms which should disappear from scientific language.

XLVIII. Very minute dimensions should be reckoned in μ (micromillimeters, microns, or thousandths of a millimeter) and not in fractions of millimeters or of lines, etc.: fractions encumbered with ciphers and commas easily give rise to mistakes.

XLIX. Authors should indicate clearly and precisely the scale of the figures which they publish.

L. Temperatures should be expressed in degrees of the centigrade thermometer of Celsius.

Chapter IV. Interpretation and Modification of the Rules (Art. 73, 74)

Art. 73. A small permanent International Executive Committee is established with functions including the following:

(1) Interpreting the Rules in doubtful cases, and issuing considered "Opinions" on the basis of the evidence submitted.

(2) Considering *Nomina conservanda*, *Nomina ambigua*, *Nomina dubia* and *Nomina confusa*, and making recommendations thereon to the next International Botanical Congress.

(3) Considering all proposals for the modification of the Rules and reporting thereon to the next Congress.

(4) Reporting on the effects of modifications of the Rules accepted at the preceding Congress.

Art. 74. These Rules can be modified only by competent persons at an International Botanical Congress convened for the express purpose. Modifications accepted at one Congress remain on trial until the next Congress, at which they will receive sanction unless undesirable consequences, reported to the Executive Committee, show need for further amendment or rejection.

Eight appendices have been or are to be prepared for this Code as follows: (1) †Regulations for determining types, (2) †Nomina conservanda familiarum, (3) *Nomina generica conservanda, (4) †Nomina ambigua, (5) †Nomina dubia, (6) †Nomina confusa, (7) *Representative botanical institutions recognized under Art. 34, (8) †Nomenclature of garden plants.

Unfortunately the first appendix which is of greatest interest to bacteriologists has not been prepared. As many bacteriologists, especially those in other countries, have not caught the significance of the type species

* These appendixes have been prepared.

† These appendixes have not been published as yet.

concept as a means of defining bacterial genera, the reader is referred to the writings of Hitchcock (Amer. Jour. Bot., *8*, 1921, 251; Descriptive Systematic Botany, New York, 1925) for an excellent exposition of the value of this idea to systematists.

Hitchcock (1921, p. 252) explains this concept briefly as follows: "The old concept was that a genus was a group of species having a given combination of characters; a species, similarly, a group of specimens. The new type concept is that, from the nomenclatural standpoint, a genus is a group of species allied to the type species; a species, a group of individuals similar to the type specimen."

Rules for determining types taken from the Type Basis Code of Nomenclature (Science, *49*, 1919, 333; *53*, 1921, 312) drawn up by a Committee of which Hitchcock was Chairman are quoted as these are the most authoritative rules thus far available.

Type Basis Code of Nomenclature (Hitchcock et al.)

Article 4. The nomenclatural type species of a genus is the species or one of the species included when the genus was originally published.

If a genus included but one species when originally published, this species is the type.

When more than one species is included in the original publication of the genus, the type is determined by the following rules:

(a) When, in the original publication of a genus, one of the species is definitely designated as type, this species shall be accepted as the type regardless of other considerations.

If *typicus* or *typus* is used as a new specific name for one of the species, this species shall be accepted as the type as if it were definitely designated.

(b) The publication of a new generic name as an avowed substitute for an earlier one does not change the type of the genus.

(c) If a genus, without an originally designated type, contains among its original species one with the generic name used as a specific name, either as a valid name or synonym, that species is to be accepted as the type.

(d) If a genus, when originally published, includes more than one species, and no species is definitely designated as type, nor indicated according to (c), the choice of the type should accord with the following principles:

1. Species inquirendae or species doubtfully referred to the genus, or mentioned as in any way exceptional are to be excluded from consideration in selecting the type.
2. Genera of the first edition of Linnaeus's "Species Plantarum" (1753) are usually typified through the citations given in the fifth edition of his "Genera Plantarum" (1754) except when inconsistent with the preceding articles.
3. Species which definitely disagree with the generic description (provided others agree), or which possess characters stated in the generic description as rare or unusual, are to be excluded from consideration in selecting the type.

RECOMMENDATIONS

Article 5. In the future it is recommended that authors of generic names definitely designate type species; and that in the selection of types of genera previously published, but of which the type would not be indicated by the preceding rules, the following points be taken into consideration:

(a) The type species should usually be the species or one of the species which the author had chiefly in mind. This is often indicated by

1. A closer agreement with the generic description.
2. Certain species being figured (in the same work).
3. The specific name, such as *vulgaris*, *communis*, *medicinalis* or *officinalis*.

(b) The type species should usually be the one best known to the author. It may be assumed that an indigenous species (from the standpoint of the author), or an economic species, or one grown in a botanical garden and examined by the author, would usually represent an author's idea of a genus.

(c) In Linnaean genera the type should usually be chosen from those species included in the first technical use of the genus in pre-Linnaean literature.

(d) The types of genera adopted through citations of non-binomial literature (with or without change of name) should usually be selected from those of the original species which received names in the first binomial publication.

(e) The preceding conditions having been met, preference should be shown for a species which will retain the generic name in its most widely used sense, or for one which belongs to a division of the genus containing a larger number of species, or, especially in Linnaean genera, for the historically oldest species.

(f) Among species equally eligible, the preference should be given to the first known to have been designated as the type.

(g) If it is impossible to select a type under the conditions mentioned above, the first of equally eligible species should be chosen.

While the rules and recommendations of the above botanical codes are applicable in general to bacteria and related microorganisms, the fact that these are not infallible is evident because the rules developed independently by zoologists (see Proc. Biol. Soc. Washington, *39*, 1926, 75, for the latest Code of Zoological Nomenclature) frequently follow a quite different course. In some cases at least the zoological rules will appeal to microbiologists as more likely to produce uniformity of usage than the botanical rules.

For example, microbiologists assembled at the Second International Microbiological Congress in London, 1936 accepted (Jour. Bact., *33*, 1937, 445) Art. 13 of the International Rules of Zoological Nomenclature as preferable to Rec. 43 of the Botanical Rules to govern bacteriological practice. This reads as follows: "While specific substantive names derived from names of persons may be written with a capital initial letter, all other specific names are to be written with a small initial letter. Some examples taken from bacteriological literature are: *Salmonella Schottmuelleri* or *Salmonella schottmuelleri*, *Bacillus Welchii* or *Bacillus welchii*, *Acetobacter Pasteurianum* or *Acetobacter pasteurianum*, *Corynebacterium ovis*, *Nitrosomonas javanensis*, *Rhizobium japonicum*."

In the MANUAL all species names are written with a small letter. It is felt that the value of a name as a name is lessened if capitals or other marks are used to indicate etymology. The derivation of generic and specific names is given separately in the descriptive material.

Likewise for obvious reasons, microbiologists refused (Jour. Bact., *33*, 1937, 445) to follow the botanical and zoological practice which permits the use of duplicate generic names, one for an animal and the other for a plant group; and accepted the following rules to govern their practice.

"a. Generic homonyms are not permitted in the group *Protista*.
b. It is advisable to avoid homonyms amongst *Protista* on the one hand, a plant or animal on the other."

The following actions of the International Committee on Bacteriological Nomenclature (Cent. f. Bact., II Abt., *92*, 1935, 481) were confirmed (Jour. Bact., *33*, 1937, 445).

Bacillus Cohn 1872 was accepted as a *genus conservandum* with *Bacillus subtilis* Cohn *emend.* Prazmowski 1880 as type species. It was agreed that *Bacillus* should be defined so as to exclude bacterial species which do not form endospores; and that the so-called Marburg strain found in type culture collections should be accepted as the type or standard strain.

At the Third International Congress of Microbiology held in New York City in September, 1939, a series of recommendations of the Permanent International Committees on Bacteriological Nomenclature were accepted at the plenary session of the Congress. The third and fourth recommendations were:

3. That the Nomenclature Committee, as at present constituted, shall continue to function under the auspices of the International Association of Microbiologists as it did under the International Society for Microbiology.

4. That the International Committee shall select from its membership a Judicial Commission consisting of twelve members, exclusive of members *ex officio*, and shall designate a Chairman from the membership of the Commission. The two Permanent Secretaries of the International Committee on Bacteriological Nomenclature shall be members *ex officio* of the Judicial Commission. The Commissioners shall serve in three classes of four commissioners each for nine years, so that one class of four commissioners shall retire at every International Congress. In case of the resignation or death of any Commissioner, his place shall be filled for the unexpired term by the International Committee at its next meeting.

By prompt action at and subsequent to the Congress ballots were cast in spite of war conditions by 26 of the 62 members of the Permanent Committee on Nomenclature. These ballots when examined by the joint Secretaries of the Permanent Committee in November, 1942 were found to have resulted in the selection of the persons whose names appear below. These

are grouped in the three classes specified by the Permanent Committee, those receiving the highest number of votes being placed in the nine year class, those receiving the next highest in the six year class, etc. Names in the classes are arranged alphabetically.

Elected for nine years.—(The term normally expires in 1948.) R. E. Buchanan (U.S.A.), A. J. Kluyver (The Netherlands), E. G. D. Murray (Canada), S. Orla Jensen (Denmark): *Elected for six years.*—(Term normally expires in 1945.) J. Howard Brown (U.S.A.), A.-R. Prévot (France), J. Ramsbottom (Great Britain), Th. Thjötta (Norway); *Elected for three years.*—(Term normally would have expired in 1942.) A. Lwoff (France), R. Renaux (Belgium), A. Sordelli (Argentine), C. Stapp (Germany).

This announcement was made (Sci., *97*, 1943, 370) in the hope that some plan for taking tentative action on questions of nomenclature could be developed by those members of the Commission who could be reached under war conditions.

While no provision was made in 1939 for the contingencies that have arisen, it is felt that those elected should serve until successors are elected. Professor R. E. Buchanan has been asked to act as Chairman *pro tem* of the Judicial Commission as there is no possibility of securing an election under the rules as adopted.

Tentative International Rules of Bacteriological Nomenclature were presented to the Third International Congress of Microbiology by a U.S.A.-Canadian Committee on Compilation of Proposals on Bacteriological Nomenclature. As it proved impossible to give adequate consideration to these proposals during the Congress, the following recommendations of the Permanent Committee on Nomenclature were accepted:

1. That a recognized Bacteriological Code be developed.
2. That publication of such a proposed Code, when developed, be authorized with the proviso that it shall be regarded as wholly tentative, but in the hope that it shall be widely tested so that it may be brought up for further consideration and final disposition at the next Microbiological Congress which should normally take place in 1942.

Copies of this tentative Code have been issued in mimeographed form by Prof. R. E. Buchanan, Iowa State College, Ames, Iowa, U.S.A., Chairman of the U.S.A.-Canadian Committee and may be obtained from him.

CLASS SCHIZOMYCETES NÄGELI

(Bericht Verhandl. d. bot. Section d. 33 Versammling deutsch. Naturforsch. u. Arzt. Bot. Ztg., 1857, 760.)

Synonyms: *Bacteria* Cohn, Beitr. Biol. d. Pflanzen, *1*, Heft 1, 1872, 136; *Bacteriaceae* Cohn, *ibid.*, 237; *Bacteriales* Clements (as an ordinal name), The Genera of Fungi, Minneapolis, 1909, 8; *Schizomycetaceae* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, 8, 1889, 923; *Schizomycetacea* Castellani and Chalmers, Manual of Tropical Medicine, 3rd ed., 1919, 924; *Mychota* Enderlein, Bakteriencyclogenie, 1924, 236; *Schizomycetae* Stanier and Van Niel, Jour. Bact., *42*, 1941, 458.

Typically unicellular plants. Cells usually small, sometimes ultramicroscopic. Frequently motile. As in the closely related blue-green algae (Class *Schizophyceae*), the cells lack the definitely organized nucleus found in the cells of higher plants and animals. However, bodies containing chromatin which may represent simple nuclei are demonstrable in some cases. Individual cells may be spherical; or straight, curved or spiral rods. These cells may occur in regular or irregular masses or even in cysts. Where they remain attached to each other after cell division, they may form chains or even definite filaments. The latter may show some differentiation into holdfast cells, and into motile or non-motile reproductive cells (conidia). Some grow as branching mycelial threads whose diameter is not greater than that of ordinary bacterial cells, i.e., about one micron. Some species produce pigments. The true purple and green bacteria possess pigments much like or related to the true chlorophylls of higher plants. These pigments have photosynthetic properties. The phycocyanin found in the blue green algae does not occur in the *Schizomycetes*. Multiplication is typically by cell division. Endospores are formed by some species included in *Eubacteriales*. Sporocysts are found in *Myxobacteriales*. Ultramicroscopic reproductive bodies are found in *Borrelomycetaceae*. The bacteria are free-living, saprophytic, parasitic or even pathogenic. The latter types cause diseases of either plants or animals. Seven orders are recognized.

Key to the Orders and Sub-Orders of the Class **Schizomycetes.**

A. Cells rigid, not flexuous. Motility by means of flagella or by a gliding movement.
  1. Cells single, in chains or masses. Not branching and mycelial in character. Not arranged in filaments. Not acid-fast. Motility when present by means of flagella.

     Order I. *Eubacteriales*, p. 66.

   a. Do not possess photosynthetic pigments. Cells do not contain free sulfur.
     b. Not attached by a stalk. Do not deposit ferric hydroxide.

       Sub-Order I. *Eubacteriineae*, p. 67.

     bb. Attached to substrate, usually by a stalk. Some deposit ferric hydroxide.

       Sub-Order II. *Caulobacteriineae*, p. 827.

   aa. Possesses photosynthetic chlorophyll-like pigments. Some cells contain free sulfur.

       Sub-Order III. *Rhodobacteriineae*, p. 838.

2. Organisms forming elongated usually branching and mycelial cells. Multiply by cell division, special spores, oidiospores and conidia. Sometimes acid-fast. Non-motile.

Order II. *Actinomycetales*, p. 895.

3. Cells in filaments frequently enclosed in a tubular sheath with or without a deposit of ferric hydroxide. Sometimes attached. Motile flagellate and non-motile conidia. Filaments sometimes motile with a gliding movement. Cells sometimes contain free sulfur.

Order III. *Chlamydobacteriales*, p. 981.

B. Cells flexuous, not rigid.

1. Cells elongate. Motility, by creeping on substrate.

Order IV. *Myxobacteriales*, p. 1005.

2. Cells spiral. Motility, free swimming by flexion of cells.

Order V. *Spirochaetales*, p. 1051.

Supplements: Groups whose relationships are uncertain.

1. Obligate intracellular parasites or dependent directly on living cells.
   a. Not ultramicroscopic and only rarely filterable. More than 0.1 micron in diameter.

   Group I. Order *Rickettsiales*, p. 1083.

   aa. Usually ultramicroscopic and filterable. Except for certain pox viruses of animals and a few plant viruses, less than 0.1 micron in diameter.

   Group II. Order *Virales*, p. 1128.

2. Grow in cell-free culture media with the development of polymorphic structures including rings, globules, filaments and minute reproductive bodies (less than 0.3 micron in diameter).

Group III. Family *Borrelomycetaceae*, p. 1291.

ORDER I. EUBACTERIALES BUCHANAN.

(Jour. Bact., *2*, 1917, 162.)

Simple and undifferentiated rigid cells which are either spherical or rod-shaped. The rods may be short or long, straight or curved or spiral. Some groups or species are non-motile, others show locomotion by means of flagella. Elongated cells divide by transverse fission and may remain attached to each other in chains. Spherical organisms divide either by parallel fission producing chains, or by fission alternating in two or three planes producing thus either tetrads or cubes of 8 and multiples of 8 cells. Many spherical cells form irregular masses in which the plane of division cannot be ascertained. Endospores occur in some species. Some species are chromogenic, but only in a few is the pigment photosynthetic (bacteriochlorophyll or other chlorophyll-like pigments).

A group of rather large, spherical to short rod-shaped, colorless sulfur bacteria, which some feel should be included in the order *Eubacteriales*, has been attached as an Appendix to the order *Chlamydobacteriales* on account of the physiological similarity between the former organisms and the *Beggiatoaceae*. These are in Family *Achromatiaceae*, p. 997.

SUB-ORDER I. **Eubacteriineae** BREED, MURRAY AND HITCHENS.

(Jour. Bact., *47*, 1944, 421.)

These are, as the name *Eubacteriinae* implies, the true bacteria in the narrower sense of the word. The cells are rigid and free. Branching occurs only under abnormal conditions of life. They are not attached by holdfasts nor stalks. They form no sheaths. One-third of the species form pigments, but these have no photosynthetic properties. Endospores occur in one family (*Bacillaceae*), rarely in others.

Key to the Families of the Sub-Order **Eubacteriineae.**

I. No endospores (except *Sporosarcina*).
  A. Can develop on inorganic media. Autotrophic and facultative autotrophic.
    Family I. *Nitrobacteriaceae*, p. 69.
  B. Cannot develop on inorganic media (exceptions, see Family XII. *Bacteriaceae*). Heterotrophic.
    1. Polar flagellate, straight, curved or spiral rods. Gram-negative. (Some species with a single flagellum will be found under Family IV. *Rhizobiaceae*, Family V. *Micrococcaceae* and Family VIII. *Corynebacteriaceae*).
      Family II. *Pseudomonadaceae*, p. 82.
    2. Large, oval, pleomorphic cells sometimes almost yeast-like in appearance. Free living in soil. Fix free nitrogen. Peritrichous flagellation.
      Family III. *Azotobacteriaceae*, p. 219.
    3. Peritrichous or non-motile rods, and cocci.
      a. Heterotrophic rods which may not require organic nitrogen for growth. Usually motile with one to six or more flagella. Usually form nodules or tubercles on roots of plants, or show violet chromogenesis.
        Family IV. *Rhizobiaceae*, p. 223.
      aa. Heterotrophic rods or cocci which utilize organic nitrogen and usually carbohydrates.
        b. Spherical cells in masses, tetrads, and packets. A few species are motile with one or two flagella.
          c. Gram-positive to Gram-negative cocci. Not obligate parasites.
            Family V. *Micrococcaceae*, p. 235.
          cc. Gram-negative, and sometimes anaerobic cocci. Obligate parasites.
            Family VI. *Neisseriaceae*, p. 295.
        bb. Spherical cells which grow in pairs and chains; and rods.
          c. Gram-positive cocci and rods. Non-motile (some species of *Streptococcaceae* or *Corynebacteriaceae* may show motility).
            d. Microaerophilic to anaerobic cocci and rods. Frequently in chains. Active in the fermentation of sugars. Never reduce nitrates.
              Family VII. *Lactobacteriaceae*, p. 305.
            dd. Usually aerobic, but sometimes anaerobic rods. Less active in the fermentation of sugars. May or may not reduce nitrates.
              Family VIII. *Corynebacteriaceae*, p. 381.

cc. Gram-negative rods. When motile, from four to many peritrichous flagella.

d. Grow well on ordinary media containing peptone. Aerobic to facultative anaerobic.

e. Gram-negative, straight rods which ferment sugars with the formation of organic acids.

f. Produce little or no acid in litmus milk. May or may not reduce nitrates. Many yellow chromogens. Borderline between this and following family indistinct. Some species anaerobic.

Family IX. *Achromobacteriaceae*, p. 412.

ff. Produce CO_2 and frequently visible gas (CO_2 + H_2) from glucose. Reduce nitrates. Usually from the alimentary, respiratory or urinary tract of vertebrates, though some are free-living or even plant parasites.

Family X. *Enterobacteriaceae*, p. 443.

dd. Small Gram-negative rods. Obligate parasites which usually require body fluids for growth. Do not grow well on ordinary media. Some are anaerobic.

Family XI. *Parvobacteriaceae*, p. 545.

ccc. Rods of varied types not included in above families. Aerobic to facultative anaerobic.

Family XII. *Bacteriaceae*, p. 596.

II. Form endospores. Large rods, sometimes in chains. Aerobic to anaerobic.

Family XIII. *Bacillaceae*, p. 704.

*FAMILY I. NITROBACTERIACEAE BUCHANAN

(Jour. Bact., *2*, 1917, 349 and Jour. Bact., *3*, 1918, 179.)

Cells without endospores. Rod-shaped or ellipsoidal except for one spherical species (*Nitrosococcus nitrosus*). Spiral rods in *Nitrosospira* and in one species of *Thiobacillus*. Flagella either polar (so far as known), or absent. Gram stain uncertain, but presumably Gram-negative for all of the polar flagellate, rod-shaped species except for *Nitrosomonas monocella* which is reported to be Gram-positive. Capable of growing without organic compounds, using CO_2 as the source of carbon, and obtaining their energy by oxidation of ammonia, nitrite, hydrogen, sulfur, or thiosulfate. Some species can also utilize organic compounds. Non-parasitic, usually soil or water forms.

Key to the tribes and genera of family **Nitrobacteriaceae.**

A. Organisms oxidize ammonia to nitrite, or nitrite to nitrate. Growth on standard media very poor or absent.
Tribe I. *Nitrobacterieae*, p. 70.
 a. Cells oxidize ammonia to nitrite.
  b. Cells are separate, free or in dense aggregates. Do not form zoogloea.
   c. Cells ellipsoidal.
Genus I. *Nitrosomonas*, p. 70.
   cc. Cells spherical.
Genus II. *Nitrosococcus*, p. 71.
   ccc. Cells spiral.
Genus III. *Nitrosospira*, p. 71.
  bb. Cells form a zoogloea.
   c. The zoogloea is surrounded by a common membrane forming a cyst.
Genus IV. *Nitrosocystis*, p. 72.
   cc. The massed cells are embedded in slime. No common membrane surrounds the cells.
Genus V. *Nitrosogloea*, p. 73.
 aa. Cells oxidize nitrite to nitrate.
  b. Cells form no zoogloea.
Genus VI. *Nitrobacter*, p. 74.
  bb. Cells form a zoogloea.
Genus VII. *Nitrocystis*, p. 75.

B. Organisms oxidize hydrogen.
Tribe II. *Hydrogenomonadeae*, p. 76.
 a. Aerobic, non-spore-forming rods with single polar flagellum, or non-motile.
Genus I. *Hydrogenomonas*, p. 76.

---

* Text revised by Prof. R. S. Breed and Prof. H. J. Conn, Geneva, N. Y., Dec., 1937. Completely revised by Dr. R. L. Starkey, New Jersey Agricultural Experiment Station, New Brunswick, N. J., March, 1943.

C. Organisms oxidize sulfur or thiosulfate and similar inorganic compounds of sulfur.

Tribe III. *Thiobacilleae*, p. 78.

a. Aerobic to anaerobic, non-spore-forming rods with a single polar flagellum on each (so far as known), or non-motile.

Genus I. *Thiobacillus*, p. 78.

TRIBE I. NITROBACTERIEAE WINSLOW ET AL.

(Jour. Bact., *5*, 1920, 201.)

Organisms deriving energy from the oxidation of ammonia to nitrite or from nitrite to nitrate and depend on this oxidation for growth. Fail to grow on media containing organic matter in the absence of the specific inorganic materials used as sources of energy. Many organic compounds commonly used in standard culture media are toxic to this group.

Genus I. Nitrosomonas *Winogradsky.*

(*Nitromonas* Winogradsky, Ann. Inst. Past., *4*, 1890, 257; Arch. Sci. biol., St. Petersburg, *1*, 1892, 127; *emend.* S. and H. Winogradsky, Ann. Inst. Past. *50*, 1933, 350.)

Cells ellipsoidal, non-motile or with a single polar flagellum, occurring singly, in pairs, short chains or irregular masses, which are not enclosed in a common membrane. Oxidize ammonia to nitrite more rapidly than the other genera of this tribe. From Latin, *nitrosus*, full of soda; M.L. *nitrous*; and Greek *monas*, a unit; M.L. a monad.

The type species is *Nitrosomonas europaea* Winogradsky.

1. **Nitrosomonas europaea** Winogradsky. (Arch. Sci. biol., St. Petersburg, *1*, 1892, 127; *Bacterium nitrosomonas* Lehmann and Neumann, Bakt. Diag., 2nd ed., *2*, 1899, 187; *Pseudomonas europaea* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 29; *Planococcus europaeus* Vuillemin, Ann. Mycologie, Berlin, *11*, 1913, 525.) From Latin, *europaeus*, of Europe.

Rods: 0.9 to 1.0 by 1.1 to 1.8 microns occurring singly, rarely in chains of three to four. Possess a single polar flagellum 3 to 4 times the length of the rods, or rarely one at either end.

Grow readily in aqueous media without organic matter, and containing ammonium sulfate, potassium phosphate, and magnesium carbonate. The cells accumulate in soft masses around the particles of magnesium carbonate at the bottom of the flask. The liquid is occasionally turbid through development of motile swarmer cells or monads.

Small, compact, sharply defined colonies brownish in color on silica gel.

Aerobic.

Strictly autotrophic.

Source: Soils of Zurich, Switzerland; of Gennevilliers, France; and Kazan, Russia.

Habitat: Presumably widely distributed in soil.

1a. *Nitrosomonas europaea* var. *italica* Perotti (Rendic. d. Accad. d. Lincei Roma, *15*, 1906, 516; Abs. in Cent. f. Bakt., II Abt., *19*, 1907, 337). Also see Engel and Skallau (Cent. f. Bakt., II Abt., *97*, 305, 1937).

2. **Nitrosomonas monocella** Nelson. (Cent. f. Bakt., II Abt., *83*, 1931, 287.) From Greek *monos*, single and Latin *cella*, room; M.L. single cell.

Ovoid rods: 0.6 to 0.9 micron, often occurring in pairs. Young cells nearly spherical. Motile by means of a single

polar flagellum 3 to 5 times as long as the rod. Gram-positive (Nelson). Found negative by H. J. Conn (personal communication).

No growth in nutrient broth, nutrient agar, nutrient or plain gelatin, plain or litmus milk, glucose or plain yeast water, or on potato.

Silica gel or agar plates of inorganic medium: No typical colonies, but yellowish brown masses of growth around particles of $CaCO_3$ in the medium.

Inorganic liquid medium containing ammonium salts: Uniform development throughout the liquid as well as in the carbonate sediment.

Even low concentrations of organic matter retard or completely inhibit the initiation of growth. Plant extracts are toxic.

Free CO_2 and O_2 necessary for growth.

Optimum pH 8.0 to 9.0. Poor growth below pH 7.0. Some growth above pH 9.0.

Optimum temperature for growth and oxidation 28°C.

Aerobic.

Strictly autotrophic.

Source: Isolated from field soil.

Habitat: Presumably widely distributed in soil.

S. Winogradsky and H. Winogradsky (Ann. Inst. Pasteur, *50*, 1933, 394) have described 5 cultures of *Nitrosomonas* which were obtained from soils of France. An additional culture has been described by H. Winogradsky (Ann. Inst. Pasteur, *58*, 1937, 394) from activated sludge.

Genus II. **Nitrosococcus** *Winogradsky.*

(Arch. Sci. biol., St. Petersburg, *1*, 1892, 127.)

Cells large spheres, non-motile, not producing zoogloea. Oxidize ammonia to nitrite. From Latin, *nitrosus*, full of soda; and Greek *kokkos*, grain; M.L. nitrous coccus.

The type species is *Nitrosococcus nitrosus* (Migula) Bergey et al.

1. **Nitrosococcus nitrosus** (Migula) Bergey et al. (*Nitrosococcus* Winogradsky, Ann. Inst. Pasteur, *5*, 1891, 577; Arch. Sci. biol., St. Petersburg, *1*, 1892, 127; *Micrococcus nitrosus* Migula, Syst. d. Bakt., *2*, 1900, 194; *Nitrosococcus americanus* Buchanan, Jour. Bact., *3*, 1918, 180; Manual, 2nd ed., 1925, 35.) From Latin, *nitrous*, full of soda; M.L. nitrous.

Large spheres, 1.5 to 1.7 microns in size, with thick cell membrane. Motility could not be demonstrated. Stains readily with aniline dyes. Observed no zoogloea formation. Gram-positive (Omelianski, Cent. f. Bakt., II Abt., *19*, 1907, 263).

Liquid medium: Turbidity.

Silica gel: Both dark and light colonies. Surface colonies look like small drops of a turbid yellowish liquid.

Aerobic.

Optimum temperature 20° to 25°C.

Source: Isolated from soil from Quito, Ecuador; Companias, Brazil; Melbourne, Australia.

Habitat: Presumably widely distributed in soil.

Genus III. **Nitrosospira** *Winogradsky.*

(Compt. rend. Acad. Sci., Paris, *192*, 1931, 1004; Ann. Inst. Pasteur, *50*, 1933, 406.)

Cells spiral-shaped. Oxidize ammonia to nitrite very slowly. From Latin, *nitrosus*, full of soda; and *spira*, coil, spiral; M.L. nitrous spiral.

The type species is *Nitrosospira briensis* Winogradsky.

1. **Nitrosospira briensis** Winogradsky. (Ann. Inst. Pasteur, *50*, 1933, 407.) From French, *Brie*, a place name; M.L. of Brie.

Spirals wound tightly to form very small cylinders as long as 15 to 20 microns. Short spirals have the appearance of short rods and ellipsoidal cells. Small pseudo-cocci were observed in old cultures.

Colonies on silica gel: Small colonies which occasionally contain cyst-like aggregates of cells. The cysts are more poorly developed than in *Nitrosocystis*.

Aerobic.

Reaction optimum: pH 7.0 to 7.2.

Source: Uncultivated pasture soil of Brie, France.

Habitat: Presumably widely distributed in soil.

2. **Nitrosospira antarctica** Winogradsky. (Ann. Inst. Pasteur, *50*, 1933, 407.) From Greek, *antarkitos*, southern, antarctic.

Cells and colonies similar to *N. briensis* except that the cells are generally wound together to form more compact spirals.

Aerobic.

Reaction optimum: pH 7.0 to 7.2

Source: Soil from the Antarctic.

Habitat: Presumably widely distributed in soil.

Genus IV. Nitrosocystis *Winogradsky.*

(Compt. rend. Acad. Sci., Paris, *192*, 1931, 1003; Ann. Inst. Pasteur, *50*, 1933, 399.)

Cells ellipsoidal or elongated, uniting in compact, rounded aggregates surrounded by a common membrane to form cysts. The cysts disintegrate to free the cells, particularly when transferred to fresh media. Within the cyst, the cells are embedded in slime. Oxidize ammonia to nitrite at a rate intermediate between *Nitrosomonas* and *Nitrosospira*. From Latin, *nitrosus*, full of soda; and Greek, *kystis*, bladder; M.L. nitrous cyst.

The type species is *Nitrosocystis javanensis comb. nov.*

1. **Nitrosocystis javanensis** *comb. nov.* (*Nitrosomonas javanensis* Winogradsky, Arch. Sci. biol., St. Petersburg, *1*, 1892, 127; *Pseudomonas javanensis* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 30; Compt. rend. Acad. Sci., Paris, *192*, 1931, 1003.) From Latin, of Java.

Small ellipsoidal cells having a diameter of 0.5 to 0.6 micron. Possess a polar flagellum 20 times as long as the rods.

In liquid medium produces very compact zoogloeal masses of cells and motile swarmers. The large zoogloea are themselves composed of smaller compact aggregates of cells.

On silica gel the colonies are circular to elliptical becoming clear or light brown.

Aerobic.

Strictly autotrophic.

Source: Soil of Buitenzorg, Java; Tokyo, Japan; La Reghaia, Tunisia.

Habitat: Presumably widely distributed in soil.

2. **Nitrosocystis coccoides** *nom. nov.* (*Nitrosocystis a*, S. Winogradsky and H. Winogradsky, Ann. Inst. Pasteur, *50*, 1933, 401.) From Greek, *kokkos*, a grain; *cidos*, form, shape; M.L. coccus-like.

Ellipsoidal cells about 1.5 microns in diameter. Occur as compact aggregates of cells imbedded in mucus and surrounded by a thickened capsule to form cyst-like bodies. Cells rarely solitary but more often in pairs and in small groups of four or more. Probably motile. The mucus which surrounds the cells is not readily stained, whereas the outside coating stains more easily.

Colonies on silica gel: As colonies develop, the coating of $CaCO_3$ on the gel becomes yellowish and dissolves and the

colony appears as a bulbous, angular, brown body which may become 0.5 mm. in diameter. The cells are held firmly together in these irregularly shaped bulbous aggregates.

Aerobic.

Source: Poor soils of Brie and elsewhere in France.

Habitat: Presumably widely distributed in forest and manured soils.

A similar culture called *Nitrosocystis B.A.* was isolated from activated sludge by H. Winogradsky (Compt. rend. Acad. Sci., Paris, *200*, 1935, 1888; Ann. Inst. Pasteur, *58*, 1937, 326). It produced compact, bulbous, dented cyst-like aggregates of cells having a yellow color. The colonies produced clear zones on silica gel coated with $CaCO_3$. These cysts were composed of oval or elongated coccoid cells imbedded in mucus and surrounded by a thickened capsule, composed of two layers. The cells become dispersed from the cysts as motile cells and form new colonies. This culture differs from *N. coccoides* in that the colonies have a pale reddish yellow color and the oval cells are 0.5 by 1.5 microns in size.

Cultures of *Nitrosocystis* were obtained by Rommell (Svensk. botan. Tidskrift, *26*, 1932, 303) from forest soils. Kingma Boltjes (Arch. f. Mikrobiol., *6*, 1935, 79) obtained cultures which produced masses of cells, some of which were loose and others compact. They were not believed to be true zoogloea since no capsule or slimy substance was noted. The development of true cysts by nitrifying bacteria was questioned. Winogradsky (Bull. d. l'Inst. Pasteur, *33*, 1935, 1074) concluded that Kingma Boltjes worked with a culture of *Nitrosocystis* and not of *Nitrosomonas* as was believed.

Genus V. **Nitrosogloea** *H. Winogradsky.*

(Compt. rend. Acad. Sci., Paris, *200*, 1935, 1887; Ann. Inst. Pasteur, *58*, 1937, 335.)

Cells ellipsoidal or rod-shaped. Embedded in slime to form zoogloea. No common membrane surrounds the cells aggregates. Oxidize ammonia to nitrite. From Latin, *nitrosus*, full of soda; and Greek, *gloea*, glue, jelly; M.L. nitrous jelly.

The type species is *Nitrosogloea merismoides* H. Winogradsky.

1. **Nitrosogloea merismoides** H. Winogradsky. (*Nitrosocystis "I"*, H. Winogradsky, Trans. Third Intern. Cong. Soil Sci., Oxford, *1*, 1935, 139; Compt. rend. Acad. Sci., Paris, *200*, 1935, 1887; Ann. Inst. Pasteur, *58*, 1937, 333.) From Greek, *merismos*, a dividing, division; *eidos*, form, shape; M.L. division-like.

Ellipsoidal cells: 0.5 by 1.5 microns. Oval cells or short rods forming tetrads or chains, each group with its own sheath. The groups vary in shape to produce branched chains, irregular or compact aggregates.

Colonies on silica gel: Cells encased in a pale yellow mucilage giving the colony a dull appearance. Colony surface studded with little humps.

Aerobic.

Source: Activated sludge.

Habitat: Unknown.

2. **Nitrosogloea schizobacteroides** H. Winogradsky. (*Nitrosocystis "II"*, H. Winogradsky, Trans. Third Intern. Cong. Soil Sci., Oxford, *1*, 1935, 139; Compt. rend. Acad. Sci., Paris, *200*, 1935, 1887; Ann. Inst. Pasteur, *58*, 1937, 333.) From Greek, *schizo*, to split; *bakterion*, a small rod; *eidos*, form, shape; M.L. like a dividing rod.

Rods: Elongated rods or short filaments 3 to 4 microns long.

Colonies on silica gel: Flat groups of cells are produced which are united in a common sheath. The aggregates form a

pseudo-tissue of interwoven filaments suggestive of a fungus pad. The pad can be removed as a unit from the medium.

Aerobic.

Source: Activated sludge.

Habitat: Unknown.

3. **Nitrosogloea membranacea** H. Winogradsky. (*Nitrosocystis "III"*, H. Winogradsky, Trans. Third Intern. Cong. Soil Sci., Oxford, *1*, 1935, 139; Compt. rend. Acad. Sci., Paris, *200*, 1935, 1887; Ann. Inst. Pasteur, *58*, 1937, 333.) From Latin, *membranaceus*, of skin or membrane.

Ellipsoidal cells commonly in pairs and also solitary.

Colonies on silica gel: Appear as dull mucoid material with a pale straw color. The cells are held firmly together so that the entire colony is easily picked up with the transfer needle. No structural units within the colony.

Aerobic.

Source: Activated sludge.

Habitat: Unknown.

Genus VI. **Nitrobacter** *Winogradsky.*

(Winogradsky, Arch. Sci. biol., St. Petersburg, *1*, 1892, 127; *Nitromonas* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 334; not *Nitromonas* Winogradsky, Ann. Inst. Past., *4*, 1890, 257; *Nitrobacterium* Castellani and Chalmers, Manual Trop. Med., 1919, 933.)

Cells rod-shaped. Oxidize nitrite to nitrate. From Latin, *nitrum*, soda; M.L. nitre; and Greek *baktron*, a small rod.

The type species is *Nitrobacter winogradskyi* Buchanan.

1. **Nitrobacter winogradskyi** Buchanan. (*Nitrobacter* Winogradsky, Arch. Sci. biol., St. Petersburg, *1*, 1892, 127; *Bacterium nitrobacter* Lehmann and Neumann, Bakt. Diag., 2nd ed., *2*, 1899, 187; *Bacillus nitrobacter* Löhnis, Vorlesungen landw. Bakt., Berlin, 1913, 152; Buchanan, Jour. Bact., *3*, 1918, 180; *Nitrobacterium nitrobacter* Castellani and Chalmers, Manual Trop. Med., 1919, 933.) Named for S. Winogradsky, 1856– , the Russian microbiologist, who first isolated these bacteria.

Description taken from Gibbs, Soil Sci., *8*, 1919, 448.

Short, non-motile rods with gelatinous membrane, 0.6 to 0.8 by 1.0 to 1.2 microns. Does not stain readily. Gram-negative (Omelianski, Cent. f. Bakt., II Abt., *19*, 1907, 263.)

Can be cultivated on media free of organic matter. Sensitive to certain organic compounds.

Washed agar colonies: In 7 to 10 days very small, light brown, circular to irregular colonies, becoming darker.

Silica gel: Colonies smaller but more dense than on washed agar.

Washed agar slant: In 7 to 10 days scanty, grayish streak.

Inorganic solution medium: After 10 days flocculent sediment. Sensitive to ammonium salts under alkaline conditions.

Nitrite is oxidized to nitrate.

Aerobic.

Strictly autotrophic.

Optimum temperature 25° to 28°C.

Source: Soil.

Habitat: Presumably widely distributed in soil.

2. **Nitrobacter agile** Nelson. (Cent. f. Bakt., II Abt., *83*, 1931, 287.) From Latin *agile*, quick, agile, motile.

Rods: 0.5 by 0.8 to 0.9 micron, occurring singly, sometimes in pairs or larger aggregates. Rapidly motile with a long, thin, polar flagellum often 7 to 10 times as long as the rod. (Non-motile culture obtained by Kingma Boltjes, Arch. f. Mikrobiol., *6*, 1935, 79.) Gram-negative.

No growth in nutrient broth, nutrient agar, nutrient or plain gelatin, litmus or plain milk, glucose or plain yeast water, or on potato.

Nitrite agar: After two weeks, produces semi-spherical, minute, nearly transparent colonies. Oxidation usually complete in 10 to 14 days.

Inorganic liquid medium containing nitrite: Produces uniformly dispersed growth.

Optimum pH 7.6 to 8.6. Limits of growth 6.6 to 10.0.

Temperature relations: Optimum for growth 25° to 30°C. Optimum for oxidation 28°C. No oxidation at 37°C. Thermal death point 60°C. for five minutes.

Strictly autotrophic.

Aerobic.

Source: Isolated from greenhouse soils and from sewage effluents in Madison, Wisconsin.

Habitat: Presumably widely distributed in soil.

Genus VII. **Nitrocystis** *H. Winogradsky.*

(Trans. Third Intern. Cong. Soil Sci., Oxford, *1*, 1935, 139; *Nitrogloea* H. Winogradsky, Comp. rend. Acad. Sci., Paris, *200*, 1935, 1888.)

Cells ellipsoidal or rod-shaped. Embedded in slime and united into compact zoogloeal aggregates. Oxidize nitrite to nitrate. From Latin, *nitrum*, soda; M.L. *nitre;* and Greek, *kystis*, bladder; M.L. nitric cyst.

The type species is *Nitrocystis sarcinoides*.

1. **Nitrocystis sarcinoides** H. Winogradsky. (*Nitrocystis B. A.*, Winogradsky, H., Compt. rend. Acad. Sci., Paris, *200*, 1935, 1888; *Nitrocystis "I"* and *"II"*, Winogradsky, H., Trans. Third Intern. Cong. Soil Sci., Oxford, *1*, 1935, 139; Ann. Inst. Pasteur, *58*, 1937, 336.) From Latin, *sarcina*, a packet; M.L. *Sarcina*, a genus; Greek, *eidos*, form; M.L. *Sarcina*-like.

Rods: Small rods 0.5 by 1.0 micron. Cells ellipsoidal or wedge-shaped and grouped in sarcina-like packets.

Colonies on silica gel: On the surface of gel coated with kaolin the colonies appear as small raised amber warts. The colonies grow up to 5 mm. in diameter. The colonies are viscous and sticky when young and they become brown with age, shrink, and look like scales and become hard like grains of sand. Each colony is enveloped in several layers of a thick slime which holds the cells together so that the entire colony can be removed with a transfer needle.

Aerobic.

Source: Activated sludge.

Habitat: Unknown.

2. **Nitrocystis micropunctata** H. Winogradsky. (*Nitrocystis "III"*, Winogradsky, H., Trans. Third Intern. Cong. Soil Sci., Oxford, *1*, 1935, 139; *Nitrogloea micropunctata* Winogradsky, H., Compt. rend. Acad. Sci., Paris, *200*, 1935, 1888; Ann. Inst. Pasteur, *58*, 1937, 326.) From Greek, *mikros*, small, little; and Latin, *punctatus*, spotted; M.L. with small spots.

Cells are ellipsoidal rods about 0.5 micron in diameter which stain poorly except at the ends. Encased in a viscous slime.

Colonies on silica gel: Like *N. sarcinoides* except that the colonies are more clear and they have a more plastic consistency. The cells are not held together by the slime in the colony as with *N. sarcinoides*. The capsule is more readi'y differentiated in old colonies.

Aerobic.

Source: Activated sludge.

Habitat: Unknown.

Appendix: The following have been placed in the Tribe *Nitrobacterieae*, sometimes incorrectly so:

Bactoderma alba Winogradsky. (Ann.

Inst. Pasteur, *50*, 1933, 414.) From soil. This is the type species of genus *Bactoderma* Winogradsky.

Bactoderma rosea Winogradsky (*loc. cit.*, p. 415). Isolated from soil.

Bacterium nitrificans Chester. (Nitratbildner aus Northeim, Burri and Stutzer, Cent. f. Bakt., II Abt., *1*, 1895, 735; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 94; *Bacillus nitrificans* Chester Man. Determ. Bact., 1901, 239; *Achromobacter nitrificans* Bergey et al., Manual, 1st ed., 1923, 137.) From soil. Description of this organism was shown by Winogradsky (Cent. f. Bakt., II Abt., *2*, 1896, 415 and 449) to have been based on impure cultures.

Microderma minutissima Winogradsky. From soil. This is the type species of genus *Microderma* Winogradsky.

Microderma vacuolata Winogradsky (*loc. cit.*). Isolated from soil.

Nitrosobacillus thermophilus Campbell. See *Bacillus* appendix.

Nitrobacter flavum Sack. (Cent. f. Bakt., II Abt., *62*, 1924, 20.) Isolated from garden earth. See description, Manual, 5th ed., 1939, 74. Heterotrophic and does not belong here (Kingma Boltjes, Arch. f. Mikrobiol., *6*, 1935, 83).

Nitrobacter oligotrophum Beijerinck. (Folia Microbiol., *3*, 1914, 91; Verzamelde Geschriften van M. W. Beijerinck, *5*, 1922, 190.) Isolated from soil. On cultivation this species lost its autotrophic habit and became heterotrophic. The organism was then called *Nitrobacter polytrophum* Beijerinck.

Nitrobacter opacum Sack (*loc. cit.* p. 21). Source and relationships as above. See Manual, 5th ed., 1939, 75.

Nitrobacter punctatum Sack (*loc. cit.*, p. 20). Source and relationships as above. See Manual, 5th ed., 1939, 75.

Nitrobacter roseo-album Sack (*loc. cit.*, p. 17; *Serratia roseo-alba* Bergey et al., Manual, 3rd ed., 1930, 125.) Source and relationships as above. See description, Manual, 5th ed., 1939, 74.

Nitrosomonas groningensis Sack. (Cent. f. Bakt., II Abt., *64*, 1925, 34.) Source and relationships as above. See description, Manual, 5th ed., 1939, 77.

TRIBE II. HYDROGENOMONADEAE PRIBRAM.

(Jour. Bact., *18*, 1929, 370.)

Short rods, non-motile or with lophotrichous flagella. Organisms capable of deriving energy from oxidation of hydrogen. They probably grow well on organic media without hydrogen, although this has not been shown to be true for all species.

Genus I. **Hydrogenomonas** *Orla-Jensen.**

(Cent. f. Bakt., II Abt., *22*, 1909, 311.)

As the only genus of the tribe, its definition is identical with the definition of the tribe. From Greek *hydōr*, water; *genos*, producing and *monas*, a unit.

The type species is *Hydrogenomonas pantotropha* (Kaserer) Orla-Jensen.

---

* This group of bacteria is characterized by the ability to grow in substrates containing no organic matter and to utilize elemental hydrogen as the source of energy for growth. Under these conditions CO_2 is used as the source of carbon. Bacteria with similar physiological characteristics but differing in morphology are placed in the genera *Bacterium*, *Bacillus* and *Clostridium*. Although other bacteria and even certain algae have enzyme systems which can activate hydrogen and reduce CO_2 in the process, there is no evidence that these organisms are able to grow in inorganic media with hydrogen as the exclusive source of energy (See: Stephenson and Stickland, Biochem. Jour., *25*, 1931, 205, 215; Woods, Biochem. Jour., *30*, 1936, 515; Lee and Umbreit, Cent. f. Bakt., II Abt., *101*, 1940, 354; Gaffron, Amer. Jour. Bot., *27*, 1940, 273).

Key to the species of genus **Hydrogenomonas.**

A. Not sensitive to high O_2 concentrations. Growth in solution media under autotrophic conditions characterized by turbidity without pellicle formation.
1. *Hydrogenomonas pantotropha.*

B. Sensitive to high O_2 concentrations. Growth in solution media under autotrophic conditions characterized by pellicle adhering to walls of container.
2. *Hydrogenomonas vitrea.*

C. Sensitive to high O_2 concentrations. Growth in solution media under autotrophic conditions without pellicle formation.
3. *Hydrogenomonas flava.*

1. **Hydrogenomonas pantotropha** (Kaserer) Orla-Jensen. (*Bacillus pantotrophus* Kaserer, Cent. f. Bakt., II Abt., *16*, 1906, 688; Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 311.) From Greek *pantos*, everything and *trophos*, feeds on; M.L. omnivorous.

Rods: 0.4 to 0.5 by 1.2 to 1.5 microns with rounded ends. Occur singly, in pairs, and in chains. Encapsulated. Actively motile by means of a single long polar flagellum. Gram stain not recorded. Bipolar staining in old cultures.

Inorganic solution: When cultivated under an atmosphere of O_2, CO_2 and H_2, the liquid becomes turbid without pellicle formation.

Inorganic solid media: When cultivated under an atmosphere of O_2, CO_2 and H_2, the colonies are yellow and slimy, and the agar plates have an odor resembling hot soapy water.

Gelatin colonies: Yellow, smooth, rarely concentrically ringed or greenish.

Gelatin stab: Growth only at surface. As a rule no liquefaction.

Agar colonies: Same as on gelatin, greenish, often slimy.

Broth: Turbid, somewhat slimy, and occasional pellicle.

Milk: No coagulation. A yellow pellicle forms. Medium becomes slimy and assumes a dirty flesh color.

Potato: Moist, yellow, glistening.

Indole is not formed.

Hydrogen sulfide is not formed.

Nitrite is not produced from nitrate.

Does not act on carbohydrates.

Aerobic.

Optimum temperature 28° to 30°C.

Facultative autotroph.

Distinctive characters: Develops autotrophically in inorganic medium under an atmosphere of H_2, O_2 and CO_2. Oxidizes hydrogen to water and uses CO_2 as the source of carbon for growth.

Source: Isolated from soil near Vienna.

Habitat: Probably widely distributed in soil.

2. **Hydrogenomonas vitrea** Niklewski. (Jahrb. f. wissensch. Botanik, *48*, 1910, 113). From Latin *vitreus*, of glass, transparent.

Rods: 2.0 microns in length, cells adhering to each other as by slime. Motility not observed.

Agar colonies on inorganic medium in presence of H_2, O_2 and CO_2: Delicate, transparent, with slight fluorescence, and yellow center. Surface folded. Do not develop readily beneath the surface of medium.

Agar streak on inorganic substrate: Same as agar colonies except that growth is spreading.

Inorganic liquid medium in presence of H_2, O_2 and CO_2: Pellicle, adherent to wall of tube. Good development when there is from 2 to 8 per cent oxygen in the gas. At higher O_2 concentrations good growth occurs only in association with *H. flava* or other bacteria.

Oxidizes hydrogen to water.

Microaerophilic, growing in an atmosphere of low oxygen tension, not exceeding 8 per cent.

Facultative autotroph.

Distinctive characters: Grows in substrates containing no organic matter and produces a pellicle.

Source: Isolated from mud, garden soil, pasture land, vegetable mold, and peat.

Habitat: Presumably widely distributed in soil.

3. **Hydrogenomonas flava** Niklewski. (Jahrb. f. wissensch. Botanik., *48*, 1910, 113; emend. Kluyver and Manten, Antonie v. Leuwenhoek, *8*, 1942, 71.) From Latin *flavus*, yellow.

Rods: 1.5 microns in length. Motility by polar flagella. Gram-negative.

Agar colonies on inorganic medium in presence of H_2, O_2 and CO_2: Small, smooth, yellow, shining, adhering to medium. Develop well below surface of medium, but growth is paler.

Gelatin not liquefied.

Inorganic liquid medium in presence of H_2, O_2, and CO_2: No pellicle formation. Good development when there is from 2 to 8 per cent oxygen in the gas. At higher O_2 concentrations good growth occurs only in association with *H. vitrea* or other bacteria.

Oxidizes hydrogen to water.

Microaerophilic, growing in an atmosphere of low oxygen tension, not exceeding 8 per cent.

Facultative autotroph.

Distinctive characters: Found singly on slides whereas the rod-shaped cells of *Hydrogenomonas vitrea* tend to cling together in masses. Colonies on agar opaque, not transparent.

Source: Same as *H. vitrea*.

Habitat: Presumably widely distributed in soil.

Appendix: Incompletely described species are found in the literature as follows:

Hydrogenomonas agilis Niklewski. (Jubliäumsschrift f. Prof. E. Godlewski. Kosmos, Lemberg, 1913; See Cent. f. Bakt., II Abt., *40*, 1914, 430.) From soil.

Hydrogenomonas minor Niklewski. (Jubliäumsschrift f. Prof. E. Godlewski. Kosmos, Lemberg, 1913; See Cent. f. Bakt., II Abt., *40*, 1914, 431.) From soil.

TRIBE III. THIOBACILLEAE BERGEY, BREED AND MURRAY.

(Preprint, Manual, 5th ed., Oct., 1938, v.)

Organisms capable of deriving their energy from oxidation of sulfur or sulfur compounds. Most species do not grow on organic media.

Genus I. Thiobacillus *Beijerinck.*

(Beijerinck, Cent. f. Bakt., II Abt., *11*, 1904, 593; *Sulfomonas* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 314; not *Thiobacillus* Ellis, Sulphur bacteria, London, 1932, 130; *Thiobacterium* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 517; not *Thiobacterium* Janke, Allgemeine Tech. Mikrobiol., *1*, 1924, 68, Leipzig.)

Small Gram-negative, rod-shaped cells. Non-motile or motile by means of a single polar flagellum. Derive their energy from the oxidation of incompletely oxidized sulfur compounds, principally from elemental sulfur and thiosulfate but in some cases also from sulfide, sulfite, and polythionates. The principal product of oxidation is sulfate, but sulfur is sometimes formed. They grow under acid or alkaline conditions and derive their carbon from carbon dioxide or from bicarbonates in solution; some are obligate and some facultative autotrophic. One species is facultative anaerobic. From Greek *theion*, sulfur and Latin *bacillus*, a small rod.

The type species is *Thiobacillus thioparus* Beijerinck.

Key to the species of genus **Thiobacillus.**

I. Aerobic.
  A. Strictly autotrophic.
    1. Optimum reaction for growth close to neutrality.
      1. *Thiobacillus thioparus.*
    2. Optimum reaction for growth pH 2.0 to 3.5.
      2. *Thiobacillus thiooxidans.*
  B. Facultative autotrophic.
      3. *Thiobacillus novellus.*
      4. *Thiobacillus coproliticus.*

II. Anaerobic in presence of nitrate.
      5. *Thiobacillus denitrificans.*

1. **Thiobacillus thioparus** Beijerinck. (Cent. f. Bakt., II Abt., *11*, 1904, 593; Nathanson, Mitt. Zool. Station Neapel, *15*, 1902, 655; *Sulfomonas thioparus* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 326). From Greek *theion*, sulfur and *paro*, to make.

Thin, short rods, 0.5 by 1 to 3.0 microns. Motile (non-motile culture reported. See Starkey, Soil Sci., *39*, 1935, 197.) Gram-negative.

Thiosulfate medium (liquid): Pellicle consisting of cells and free sulfur.

Thiosulfate agar: Colonies small, circular, whitish yellow due to precipitated sulfur.

Optimum reaction: Close to neutrality.

Strictly autotrophic. Derives its energy by the oxidation of thiosulfate to sulfate and sulfur; also oxidizes sulfur to sulfate.

Aerobic.

Source: Sea water, river water, mud, sewage, and soil.

Habitat: Presumably widely distributed.

2. **Thiobacillus thiooxidans** Waksman and Joffe. (Jour. Bact., 7, 1922, 239; *Sulfomonas thiooxidans* Waksman, Jour. Bact., 7, 1922, 616; *Thiobacterium thiooxydans* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 517.) From Greek *theion*, sulfur and M.L. to oxidize.

Short rods: 0.5 by 1.0 micron with rounded ends. Occur singly, in pairs, or in chains. Motile by means of a single polar flagellum. Gram-negative (Starkey, Soil Sci., *39*, 1935, 210).

Thiosulfate agar: Scant growth. Nearly transparent colonies.

Sulfur medium (liquid): Uniform turbidity. No sediment or surface growth. Medium becomes very acid (below pH 1.0).

Thiosulfate medium (liquid): Uniform turbidity. Medium becomes acid and sulfur is precipitated.

Nitrogen sources: Utilizes ammonia nitrogen but not nitrate nitrogen which is toxic. Asparagin, urea and peptone not utilized.

Temperature relations: Optimum 28° to 30°C. Slow growth at 18° and 37°C. Death occurs at 55° to 60°C.

Optimum reaction: pH 2.0–3.5. (Limiting reactions, pH 6.0 to less than pH 0.5.)

Strictly autotrophic, deriving its energy from the oxidation of elementary sulfur and thiosulfate, oxidizing these to sulfuric acid. It utilizes the CO_2 of the atmosphere as a source of carbon.

Strictly aerobic.

Distinctive characters: This species produces more acid, from oxidation of sulfur, and continues to live in a more acid medium, than any other living organism yet reported, the hydrogen-ion concentration of the medium increasing to a pH 0.6 and less.

Source: Isolated from composts of soil, sulfur, and rock phosphate and soils containing incompletely oxidized sulfur compounds.

Habitat: Soil.

3. **Thiobacillus novellus** Starkey. (Jour. Bact., *28*, 1934, 365; Jour. Gen. Physiol., *18*, 1935, 325; Soil Sci., *39*, 1935, 207, 210.) From Latin *novellus*, new.

Short rods or ellipsoidal cells: 0.4 to 0.8 by 0.6 to 1.8 microns. Non-motile. Gram-negative.

Gelatin stab: Mucoid growth at point of inoculation. Sub-surface growth meager. Slow liquefaction.

Agar plate: Growth slow, colorless, moist, raised, circular, 1 mm in diameter. Deep colonies tiny, lens-shaped.

Thiosulfate agar plate: Growth slow, becoming white from precipitated sulfur. Surface colonies small, circular, moist. Crystals of $CaSO_4$ appear throughout the agar.

Agar slant: Growth fairly abundant, soft, somewhat ropy, raised, shining, moderately spreading; whitish in reflected light, brownish opalescence in transmitted light.

Thiosulfate agar slant: Growth very thin, practically colorless. No sub-surface growth. Sulfur usually precipitated as white frosty film on the surface.

Agar stab: White to cream-colored growth confined close to point of inoculation. Penetrates to bottom of tube.

Thiosulfate agar stab: No appreciable surface growth.

Broth: Slightly turbid. Gelatinous pellicle. Forms long streamer-like network extending from surface to the bottom. Some sediment.

Thiosulfate solution medium: Uniform turbidity. No pellicle. Whitish sediment with thin incomplete membrane on the bottom of the flask. Reaction acid in a few days, changes pH 7.8 to 5.8 with decomposition of a small quantity of thiosulfate.

Sulfur solution medium of slightly alkaline reaction: No growth.

Potato slant: Growth limited, cream-colored, moist, shining, slightly brown.

Litmus milk: Slow development of slight alkalinity.

Facultative autotrophic.

Optimum reaction: Close to neutrality (limiting reactions pH 5.0 to 9.0).

Aerobic.

Distinctive characters: Oxidizes thiosulfate to sulfate and sulfuric acid. Does not oxidize free sulfur.

Source: Isolated from soils.

Habitat: Soils.

4. **Thiobacillus coproliticus** Lipman and McLees. (Soil Sci., *50*, 1940, 432.) Latinized form of the English word *coprolite*, fossil dung.

Long thin rods: 0.1 to 0.2 by 6 to 8 (may measure 3 to 40) microns. Straight, S-shaped, and curved cells. Motile by means of a single polar flagellum.

Peptone soil extract agar: Slight growth.

Nutrient solution: Little or no growth.

Thiosulfate agar: Slow development. Produces small watery colonies raised above the agar surface. Colonies have been noted which were white from precipitated sulfur.

Thiosulfate solution: Thiosulfate is oxidized. Little or no turbidity. No pellicle. No sediment. Change in reaction from pH 7.6 to 6.1.

Sulfur medium: Sulfur is oxidized. No turbidity.

Facultative autotrophic.

Aerobic.

Distinctive characters: Develops in inorganic media and oxidizes thiosulfate and sulfur to sulfate. Media with slightly alkaline reactions most favorable for growth.

Source: Coprolite rock material from Triassic period (Arizona).

Habitat: Unknown.

5. **Thiobacillus denitrificans** Beijerinck. (Cent. f. Bakt., II Abt., *11*, 1904, 597; *Sulfomonas denitrificans* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 314.) From Latin, *de*, from; and M.L. *nitrifico*, to nitrify.

Short rods, 0.5 by 1 to 3.0 microns long. Motile by means of a single polar flagel-

lum (Tjulpanova-Mossevitch, Arch. d. Sci. Biol., U.S.S.R., *30*, 1930, 203).

Inorganic liquid medium: Growth with production of gas, predominantly nitrogen.

Thiosulfate agar medium: Colonies thin, clear, or weakly opalescent.

Optimum reaction: Neutral or slightly alkaline.

Autotrophic, utilizing carbon from CO_2, carbonates and bicarbonates. Considered to be strictly autotrophic by Lieske (Ber. d. deutsch. botan. Gesell., *30*, 1912, 12.) and facultative by Tjulpanova-Mossevitch (*loc. cit.*). Beijerinck stated (Kon. Akad. v. Wetenschappen Amsterdam, *42*, 1920, 899) that whereas the organism developed initially in an inorganic medium, it lost the autotrophic habit by cultivation in an organic medium.

Facultative anaerobic or even microaerophilic. Can live in the absence of free O_2 in the presence of nitrate.

Distinctive characters: Oxidizes thiosulfate to sulfate under anaerobic conditions using nitrate as the hydrogen acceptor which is reduced to N_2. Also oxidizes sulfide, elemental sulfur, and dithionate.

Habitat: Canal and river water, salt water, soil, peat, composts and mud.

Appendix: The following species have been placed in *Thiobacillus* or are regarded as belonging to the genus:

Thiobacillus concretivorus Parker. (Austral. Jour. Exper. Biol. and Med. Sci., *23*, 1945, 81.) From corroded concrete sewers. Similar to or identical with *Thiobacillus thiooxidans* Waksman and Joffe.

Thiobacillus crenatus Emoto. (Proc. Imp. Acad. Tokyo, *5*, 1929, 149.) Isolated from mud of hot springs in Japan. See description, Manual, 5th ed., 1939, 84. Almost identical with *Thiobacillus thiooxidans* Waksman and Joffe.

Thiobacillus lobatus Emoto (*loc. cit.*, p. 148). Source and relationships as above. See description, Manual, 5th ed., 1939, 83.

Thiobacillus thermitanus Emoto. (Bot. Mag. Tokyo, *42*, 1928, 422.) Source and relationships as above. See description, Manual, 5th ed., 1939, 83.

Thiobacillus trautweinii Bergey et al. See *Flavobacterium* appendix.

Thiobacillus umbonatus Emoto (*loc. cit.*, p. 150). Source and relationships as above. See description, Manual, 5th ed., 1939, 84.

Thiobacterium beijerinckii Issatchenko and Salimowskaja. (Zur Morphologie u. Physiol. der Thionsäurebakterien (Russian with German abstract), Izyiestia Gosud. Gidrobiol. Inst., No. 21, 1928, 61.) From salt seas in Russia. Similar to or identical with *Thiobacillus thioparus* Beijerinck.

Thiobacterium beijerinckii var. *jacobsenii* Issatschenko and Salimowskaja (*loc. cit.*). Variety of previously mentioned species.

Thiobacterium nathansonii Issatchenko and Salimowskaja (*loc. cit.*). From salt seas in Russia. Similar to or identical with *Thiobacillus thioparus* Beijerinck.

FAMILY II. PSEUDOMONADACEAE WINSLOW ET AL.

(Jour. Bact., *2*, 1917, 555.)

Cells without endospores, elongate rods, straight or more or less spirally curved. One genus (*Mycoplana*) has branched cells. Usually motile by polar flagella which are either single or in small or large tufts. A few species are non-motile. Gram-negative (a few doubtful Gram-positive tests are recorded in *Pseudomonas*). Grow well and fairly rapidly on the surface of ordinary culture media excepting *Methanomonas* and some vibrios that attack cellulose. They are preferably aerobic, only certain vibrios including *Desulfovibrio* being anaerobic. Either water or soil forms, or plant or animal pathogens.

Key to the tribes of family **Pseudomonadaceae.**

1. Straight rods.
   Tribe I. *Pseudomonadeae*, p. 82.
2. Cells more or less spirally curved.
   Tribe II. *Spirilleae*, p. 192.

TRIBE I. PSEUDOMONADEAE KLUYVER AND VAN NIEL.

(Cent. f. Bakt., II Abt., *94*, 1936, 397.)

This tribe includes all of the straight and branching rods of the family.

Key to the genera of tribe **Pseudomonadeae.**

I. Soil and water bacteria. Few animal and many plant pathogens. Usually produce a water-soluble pigment which diffuses through the medium as a bluish-green or yellowish-green pigment.
   Genus I. *Pseudomonas*, p. 82.

II. Cells usually monotrichous with yellow non-water-soluble pigment. Mostly plant pathogens causing necrosis.
   Genus II. *Xanthomonas*, p. 150.

III. Soil bacteria which oxidize methane.
   Genus III. *Methanomonas*, p. 179.

IV. Bacteria which oxidize alcohol to acetic acid.
   Genus IV. *Acetobacter*, p. 179.

V. Soil and water bacteria known to attack protamines.
   Genus V. *Protaminobacter*, p. 189.

VI. Soil bacteria with branching cells. Capable of using aromatic compounds, as phenol, etc., as a source of energy.
   Genus VI. *Mycoplana*, p. 191.

Genus I. **Pseudomonas** *Migula.**

(Migula Arb. bakt. Inst. Karlsruhe, *1*, 1894, 237; *Bacterium* Ehrenberg *emend.* Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 1, 1872, 167; *Bactrillum* Fischer, Jahrb. f. wissensch. Bot., *27*, 1895, 139; *Bactrinium* Fischer, *ibid.*, 41; *Arthrobactrinium* Fischer, *ibid.*, 139; *Arthrobactrillum* Fischer, *ibid.*, 139; *Bactrinius* Kendall, Public Health, *28*, 1902, 484; *Bactrillius* Kendall, *ibid.*; *Bacterium* Ehrenberg *emend.* Smith, Bacteria

---

* Revised for the 5th ed. of the Manual by Prof. D. H. Bergey, Philadelphia, Pennsylvania, 1937. Further revision for the 6th ed. by Prof. R. S. Breed, New York State Experiment Station, Geneva, New York, with incorporation of the plant pathogenic species by Prof. Walter H. Burkholder, Cornell University, Ithaca, New York. April, 1943.

in Relation to Plant Disease, *1*, 1905, 171; *Denitromonas* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 314; *Liquidomonas* Orla-Jensen, *ibid.*, 332; *Lamprella* Enderlein, Sitzber. Gesell. naturf. Freunde, Berlin, 1917, 317; *Fluoromonas* Orla-Jensen, Jour. Bact., *6*, 1921, 271.)

Cells monotrichous, lophotrichous or non-motile. If pigments are produced, they are of greenish hue, fluorescent, and water-soluble.* Gram-negative except Nos. 88, 122 and 128. Frequently ferment glucose, sometimes with the formation of visible gas. Inactive in the fermentation of lactose. Nitrates are frequently reduced either to nitrites or ammonia, or to free nitrogen. Some species split fat and attack hydrocarbons. Soil, water, and plant pathogens; very few animal pathogens. Certain salt water species (Nos. 58–64) some of which live in heavy brine are temporarily retained in this genus although they produce non-water-soluble pigments or phosphorescence. From Gr. *pseudes*, false; *monas*, a unit; M. L. monad.

The type species is *Pseudomonas aeruginosa* (Schroeter) Migula.

Key to the species of genus Pseudomonas.

I. Soil and fresh water forms with a few that are pathogenic on cold or warm blooded animals.
- 1. Green fluorescent pigment produced.
  - a. Gelatin liquefied.
    - b. Polar flagellate.
      - c. Grow readily at 37°C. Usually bluish-green.
        - 1. *Pseudomonas aeruginosa.*
        - 2. *Pseudomonas jaegeri.*
      - cc. Grow poorly or not at all at 37°C.
        - d. Milk not coagulated becoming alkaline.
          - e. Soil and water organisms. Not known to digest cellulose.
            - 3. *Pseudomonas fluorescens.*
            - 4. *Pseudomonas viscosa.*
            - 5. *Pseudomonas fairmountensis.*
            - 6. *Pseudomonas ureae.*
            - 7. *Pseudomonas pavonacea.*
          - ee. Soil forms that attack cellulose.
            - 8. *Pseudomonas effusa.*
          - eee. Pathogenic for lizards.
            - 9. *Pseudomonas reptilivorous.*
        - dd. Milk unchanged becoming blue in association with lactic acid bacteria.
          - 10. *Pseudomonas syncyanea.*
        - ddd. Milk coagulated.
          - 11. *Pseudomonas schuylkilliensis.*
          - 12. *Pseudomonas chlororaphis.*
          - 13. *Pseudomonas myxogenes.*
          - 14. *Pseudomonas septica.*
        - dddd. Soil form. Action on milk not recorded.
          - 15. *Pseudomonas boreopolis.*

---

* See Tobie, Jour. Boct., *49*, 1945, 459 for a discussion of the natụre of these pigments.

bb. Non-motile.
c. Grows readily at 37°C.
16. *Pseudomonas smaragdina.*
cc. Grows poorly or not at all at 37°C.
17. *Pseudomonas chlorina.*
aa. Gelatin not liquefied.
b. Polar flagellate.
c. Grow readily at 37°C. Usually bluish-green.
18. *Pseudomonas oleovorans.*
19. *Pseudomonas incognita.*
20. *Pseudomonas convexa.*
21. *Pseudomonas mildenbergii.*
cc. Grow poorly or not at all at 37°C.
d. Milk not coagulated.
22. *Pseudomonas putida.*
23. *Pseudomonas scissa.*
24. *Pseudomonas ovalis.*
25. *Pseudomonas striata.*
26. *Pseudomonas denitrificans.*
dd. Milk coagulated.
27. *Pseudomonas solaniolens.*
bb. Non-motile.
c. Grows poorly or not at all at 37° C.
d. Milk not coagulated.
28. *Pseudomonas eisenbergii.*
2. Green fluorescent pigment not produced or not reported.
a. Gelatin liquefied.
b. Polar flagellate.
c. Grow poorly or not at all at 37°C. No visible gas from sugars.
d. Rapid reduction litmus. Putrid odor.
29. *Pseudomonas putrefaciens.*
dd. Slow reduction litmus. Alkaline.
30. *Pseudomonas mephitica.*
31. *Pseudomonas geniculata.*
ddd. Acid coagulated.
32. *Pseudomonas fragi.*
cc. Acid and visible gas from glucose. Optimum temperature variable.
d. Litmus milk reduced and alkaline.
33. *Pseudomonas nebulosa.*
dd. Litmus milk acid coagulated.
34. *Pseudomonas coadunata.*
35. *Pseudomonas multistriata.*
36. *Pseudomonas punctata.*
37. *Pseudomonas hydrophila.*
38. *Pseudomonas ichthyosmia.*
aa. Gelatin not liquefied.
b. Polar flagellate.
c. Grow at 37°C.

39. *Pseudomonas ambigua.*
40. *Pseudomonas sinuosa.*
41. *Pseudomonas cruciviae.*

cc. Grow poorly or not at all at 37°C.
d. Action on hydrocarbons and cellulose unknown.
42. *Pseudomonas rugosa.*
dd. Utilize hydrocarbons.
43. *Pseudomonas desmolyticum.*
44. *Pseudomonas rathonis.*
45. *Pseudomonas dacunhae.*
46. *Pseudomonas arvilla.*
47. *Pseudomonas salopium.*
ddd. Utilize cellulose.
48. *Pseudomonas minuscula.*
49. *Pseudomonas tralucida.*
50. *Pseudomonas mira.*

aaa. Action on gelatin not recorded. Produces alcoholic fermentation of glucose.
51. *Pseudomonas lindneri.*

II. Sea water to brine species. Some species phosphorescent.
a. Gelatin liquefied.
b. Polar flagellate.
c. From sea water. Not deeply pigmented.
d. Nitrites not produced from nitrates.
52. *Pseudomonas membranoformis.*
53. *Pseudomonas marinoglutinosa.*
dd. Nitrites produced from nitrates so far as known.
e. Digest agar.
54. *Pseudomonas gelatica.*
ee. Deposit calcium carbonate in sea water gelatin and agar media in old cultures.
55. *Pseudomonas calcis.*
56. *Pseudomonas calciprecipitans.*
eee. Causes skin lesions in marine fish.
57. *Pseudomonas ichthyodermis.*
cc. Produce highly colored pigments in media containing salt or in heavy brines.
d. Blackens salted butter.
58. *Pseudomonas nigrificans.*
dd. Causes purple discoloration of salted beans.
59. *Pseudomonas beijerinckii.*
ddd. Reddens heavy brines (more than 18 per cent salt).
60. *Pseudomonas salinaria.*
61. *Pseudomonas cutirubra.*
ccc. Phosphorescent bacteria from decaying fish and crustaceans, and phosphorescent organs of sea animals.
d. Gelatin liquefied.
62. *Pseudomonas harveyi.*
dd. Gelatin not liquefied.
63. *Pseudomonas phosphorescens.*
64. *Pseudomonas pierantonii.*

III. Plant pathogens, causing leaf spot, leaf stripe and similar diseases.
- 1. Green fluorescent pigment produced.
  - a. Gelatin liquefied.
    - b. Acid from sucrose.
      - c. Nitrites produced from nitrates.
        - 65. *Pseudomonas martyniae.*
        - 66. *Pseudomonas striafaciens.*
        - 67. *Pseudomonas tomato.*
      - cc. Nitrites not produced from nitrates.
        - d. Growth in 5 per cent salt.
          - 68. *Pseudomonas aceris.*
          - 69. *Pseudomonas angulata.*
          - 70. *Pseudomonas aptata.*
          - 71. *Pseudomonas primulae.*
          - 72. *Pseudomonas viridilivida.*
        - dd. No growth in 5 per cent salt.
          - e. Beef peptone agar turns brown.
            - 73. *Pseudomonas delphinii.*
          - ee. Beef peptone agar uncolored.
            - 74. *Pseudomonas berberidis.*
            - 75. *Pseudomonas coronafaciens.*
            - 75a. *Pseudomonas coronafaciens* var. *atropupurea.*
            - 76. *Pseudomonas lachrymans.*
            - 77. *Pseudomonas maculicola.*
            - 78. *Pseudomonas marginata.*
            - 79. *Pseudomonas medicaginis.*
            - 79a. *Pseudomonas phaseolicola.*
            - 80. *Pseudomonas pisi.*
            - 81. *Pseudomonas syringae.*
        - ddd. Growth in salt solutions not recorded.
          - 82. *Pseudomonas atrofaciens.*
          - 83. *Pseudomonas cumini.*
          - 84. *Pseudomonas desaiana.*
          - 85. *Pseudomonas erodii.*
          - 86. *Pseudomonas apii.*
          - 87. *Pseudomonas matthiolae.*
          - 88. *Pseudomonas mors-prunorum.*
          - 89. *Pseudomonas rimaefaciens.*
          - 90. *Pseudomonas papulans.*
          - 91. *Pseudomonas pseudozoogloeae.*

1. **Pseudomonas aeruginosa** (Schroeter) Migula. (*Bacterium aeruginosum* Schroeter, in Cohn, Beitrage z. Biologie, *1*, Heft 2, 1872, 126; *Bacillus pyocyaneus* Gessard, Compt. rend. Acad. Sci., Paris, *94*, 1882, 536; *Micrococcus pyocyaneus* Zopf, Spaltpilze, 2 Aufl., 1884, 83; *Bacillua aeruginosus* Trevisan, Atti Accad. Fis.-Med. Stat., Milano, Ser. 4, *3*, 1885, 11; *Bacillus fluorescens* Crookshank, Man. of Bact., 3rd ed., 1890, 247; not *Bacillus fluorescens* Bergey et al., Manual, 1st ed., 1923, 287; *Pseudomonas pyocyanea* Migula, in Engler and Prantl, Die natürl. Pflanzenfam, *1*, 1a, 1895, 29; *Bacterium pyocyaneum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 267; Migula, Syst. Bakt., *2*, 1900, 884.) From Latin, full of copper rust, or verdigris; green.

Rods: 0.5 to 0.6 by 1.5 microns, occurring singly, in pairs and short chains. Motile, possessing one to three polar flagella. Monotrichous (Reid, Naghski, Farrell and Haley, Penn. Agr. Exp. Sta., Bull. 422, 1942, 6). Gram-negative.

Gelatin colonies: Yellowish or greenish-yellow, fringed, irregular, skein-like, granular, rapidly liquefying.

Gelatin stab: Rapid liquefaction. The fluid assumes a yellowish-green or bluish-green color.

Agar colonies: Large, spreading, grayish with dark center and translucent edge, irregular. Medium greenish.

Agar slant: Abundant, thin, white, glistening, the medium turning green to dark brown or black, fluorescent.

Broth: Marked turbidity with thick pellicle and heavy sediment. Medium yellowish-green to blue, with fluorescence, later brownish. Produces pyocyanin, fluorescein and pyrorubrin (Am. Jour. Hyg., *5*, 1925, 707).

Litmus milk: A soft coagulum is formed, with rapid peptonization and reduction of litmus. Reaction alkaline.

Potato: Luxuriant, dirty-brown, the medium becoming dark green.

Indole usually not formed (Sandiford, Jour. Path. and Bact., *44*, 1937, 567).

Nitrates are reduced to nitrites and nitrogen.

Glucose, fructose, galactose, arabinose, maltose, lactose, sucrose, dextrin, inulin, glycerol, mannitol and dulcitol are not attacked. Acid from glucose (Sandiford, *loc. cit.*).

Blood serum: Liquefied. Yellow liquid, greenish on surface.

Blood hemolyzed.

Cultures have marked odor of trimethylamine.

Aerobic, facultative.

Optimum temperature 37°C.

Pathogenic for rabbits, guinea pigs, rats and mice.

Common name: Blue pus organism.

Source: Pus from wounds. Regarded as identical with one of the plant pathogens (*Pseudomonas polycolor*) by Elrod and Braun (Jour. Bact., *44*, 1942, 633).

Habitat: Cause of various human and animal lesions. Found in polluted water and sewage.

2. **Pseudomonas jaegeri** Migula. (*Bacillus proteus fluorescens* H. Jaeger, Ztschr. f. Hyg., *12*, 1892, 593; Migula, Syst. d. Bakt., *2*, 1900, 885; *Bacillus proteus-fluorescens* Holland, Jour. Bact., *5*, 1920, 220; *Proteus fluorescens* Holland, *ibid.*, 224; *Pseudomonas protea-fluorescens* Holland, *ibid.*, 224.) Named for H. Jaeger who first described the species.

Short, thick rods, with rounded ends, occurring singly and in pairs. Motile with a tuft of polar flagella which may be pushed to one side where cells remain in a chain. Gram-negative.

Gelatin colonies: Small, transparent, becoming proteus-like.

Gelatin stab: Marked surface growth. Saccate to infundibuliform liquefaction. Liquefied portion green fluorescent.

Agar slant: Thick, yellowish-white layer, the medium becoming greenish-fluorescent. At times gas is formed.

Broth: Turbid, with greenish-gray pellicle and sediment.

Litmus milk: Not coagulated.

Potato: Thick, pale yellow becoming dark brown layer, slimy. The medium becomes bluish-gray.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 37°C.

Pathogenic for mice.

Source: Regarded by Jaeger as the cause of Weil's disease (infectious jaundice) as it was found repeatedly in patients suffering from this disease. See *Leptospira icterohaemorrhagiae*.

Habitat: Water.

3. **Pseudomonas fluorescens** Migula. (*Bacillus fluorescens liquefaciens* Flügge, Die Mikroorganismen, 1886, 289; Migula, in Engler and Prantl, Die natürl. Pflanzenfamilien, 1, 1a, 1895, 29; *Bacterium fluorescens* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 272.) From Latin, *fluor*, flowing; M.L. *fluoresco*, to fluoresce.

Rods: 0.3 to 0.5 by 1.0 to 1.8 microns, occurring singly and in pairs. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Circular, with greenish center, lobular, liquefying quickly.

Gelatin stab: Infundibuliform liquefaction, with whitish to reddish-gray sediment.

Agar slant: Abundant, reddish layer, becoming reddish-gray. The medium shows greenish to olive-brown coloration.

Broth: Turbid, flocculent, with yellowish-green pellicle and grayish sediment.

Litmus milk: No coagulation; becoming alkaline.

Potato: Thick, grayish-yellow, spreading, becoming light sepia-brown in color.

Indole is not formed.

Nitrates reduced to nitrites and ammonia.

Acid from glucose.

Blood serum liquefied.

Aerobic.

Optimum temperature 20° to 25°C.

Not pathogenic.

Source: Water, sewage, feces.

Habitat: Soil and water.

4. **Pseudomonas viscosa** (Frankland and Frankland) Migula. (*Bacillus viscosus* G. and P. Frankland, Ztschr. f. Hyg., *6*, 1889, 391; Migula, Syst. d. Bakt., *2*, 1900, 900.) From M. L. *viscidus*, sticky, viscid.

Small rods: 0.5 by 1.5 to 2.0 microns, occurring singly. Motile and presumably polar flagellate. Gram-negative.

Gelatin colonies: Grayish, granular, with fimbriate margin. Medium assumes a green fluorescent color around each colony.

Gelatin stab: Infundibuliform liquefaction. Liquefied portion green fluorescent with greenish-white pellicle.

Agar slant: Thin, greenish-white, the medium becoming greenish.

Broth: Turbid, with greenish pellicle.

Litmus milk: Not coagulated.

Potato: Moist, chocolate-brown, viscid.

Indole not formed.

Nitrites not produced from nitrates. Destroys nitrate with the production of ammonia.

Aerobic, facultative.

Distinctive characters: Resembles *Pseudomonas fluorescens* except that growth on agar, gelatin and potato is viscid.

Optimum temperature 20°C.

Source: Unfiltered water from Kent, England. Common.

Habitat: Water.

5. **Pseudomonas fairmountensis** (Wright) Chester. (*Bacillus fairmountensis* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 458; Chester, Man. Determ. Bact., 1901, 311; *Achromobacter fairmountense* Bergey et al., Manual, 1st ed., 1923, 146.) From M. L. of Fairmount Park (Philadelphia.)

Medium-sized rods, occurring singly, in pairs and in chains. Motile, possessing polar flagella. Gram-negative.

Gelatin colonies: Circular, white, translucent. Dark centers with a greenish shimmer, thinner edges and faint radial lines.

Gelatin stab: Crateriform liquefaction.

Agar slant: Grayish-white, glistening.
Broth: Turbid.
Litmus milk: Alkaline, litmus reduced.
Potato: Raised, granular, spreading, viscid.
Indole is formed.
Nitrites not produced from nitrates.
Aerobic, facultative.
Optimum temperature 20° to 25°C.
Habitat: Water.

6. **Pseudomonas ureae** Bergey et al. (Culture No. 3 of Rubentschick, Cent. f. Bakt., II Abt., *72*, 1927, 101; Bergey et al., Manual, 3rd ed., 1930, 173.) From Greek, *urum*, urine; M. L., *urea*, urea.

Rods: 0.6 to 0.7 by 1.7 to 2.0 microns, occurring singly and in pairs. Motile. Gram-positive.

Gelatin stab: Infundibuliform liquefaction.

Agar colonies: Circular, grayish-white.

Agar slant: Grayish-white layer becoming greenish-fluorescent.

Broth: Turbid.

Litmus milk: Peptonized.

Potato: Yellowish-brown streak.

Indole not formed.

Nitrates reduced with gas formation. Ammonia formed.

Urea attacked.

Hydrogen sulfide formed.

Methylene blue reduced.

Aerobic, facultative.

Can grow at 0° C.

Optimum temperature 20°C.

Habitat: Sewage filter beds.

This species is included here through an oversight. It should have been placed in the Appendix to the genus *Pseudomonas* as the original description is too incomplete to determine its real nature. It is reported to be Gram-positive and motile; but the number and arrangement of flagella are not given. If it really is Gram-positive, the species is probably peritrichous and does not belong in *Pseudomonas*.

7. **Pseudomonas pavonacea** Levine and Soppeland. (Bul. No. 77, Iowa State Agricultural College, 1926, 41.) From Latin, *pavo*, peacock.

Rods: 0.5 by 4.5 microns, with truncate ends, occurring singly and in chains. Motile. Gram-negative.

Gelatin stab: Crateriform liquefaction. Medium becoming brown.

Agar colonies: Circular, raised, becoming green, amorphous, entire.

Agar slant: Greenish, smooth, glistening, viscid, medium becoming slightly brown.

Broth: Turbid, with viscid sediment. Medium turned dark brown.

Litmus milk: Slightly alkaline. Litmus reduced. Peptonized after 10 days.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Blood serum liquefied in 5 days.

No acid or gas from carbohydrate media.

Aerobic, facultative.

Optimum temperature 22°C.

Source: Isolated from activated sludge.

8. **Pseudomonas effusa** Kellerman et al. (Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 515; also Soil Science, *1*, 1916, 472; *Cellulomonas effusa* Bergey et al., Manual, 1st ed., 1923, 162; *Bacillus effusus* appears first as a synonym in Bergey at al., *ibid.*; later used as name of species 5th ed., 1939, 616.) From Latin, *effusus*, effuse, spread out.

Rods: 0.4 by 1.7 microns. Motile with one to three polar flagella. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Luxuriant, glistening, moist, creamy growth. Greenish fluorescence.

Peptone starch agar slant: Abundant, flat, moist rich creamy growth. Medium shows greenish fluorescence.

Broth: Turbid.

Litmus milk: Alkaline. Coagulation and digestion.

Potato: Rich, creamy spreading growth.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia is produced.

Acid from glucose, maltose, starch, glycerol and mannitol. No acid from lactose or sucrose.

Cellulose is attacked.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Isolated from soils in Utah.

Habitat: Soil.

8a. *Pseudomonas effusa* var. *non-liquefaciens* Kellerman et al. (*loc. cit.*). A non-liquefying variety that acts more slowly on litmus milk.

Source: Soils from Utah.

9. **Pseudomonas reptilivorous** Caldwell and Ryerson. (Jour. Bact., *39*, 1940, 335.) From Latin, *reptile*, a reptile and *voro*, to devour, destroy.

Rods: 0.5 by 1.5 and 2.0 microns, occurring singly, in pairs and in short chains and having rounded ends. Actively motile with two to six polar flagella. Gram-negative.

Gelatin colonies: After 24 hours, small, circular, smooth, entire. Liquefaction with a yellowish-green fluorescence.

Gelatin stab: Infundibuliform liquefaction becoming stratiform. Putrid odor present.

Agar cultures: Circular, smooth, glistening, slightly raised, butyrous, translucent, 2 mm in diameter.

Agar slant: Growth abundant, smooth, filiform, glistening, butyrous and translucent.

Broth: Turbid with pellicle and sediment. Putrid odor.

Litmus milk: Alkaline, peptonization, complete reduction. Disagreeable odor.

Potato: Growth moderate, spreading, glistening, yellowish-gray to creamy. Disagreeable odor. Medium becomes brownish-gray.

Indole not formed.

Nitrates not produced from nitrates.

Hydrogen sulfide not produced.

Slightly acid, becoming alkaline in glucose. No acid from arabinose, xylose, lactose, sucrose, maltose, trehalose, raffinose, mannitol, dulcitol, inositol and salicin.

Starch not hydrolyzed.

Pathogenic for guinea pigs and rabbits, horned lizards, Gila monsters and chuckwallas.

Temperature relations: Optimum 20° to 25°C. Maximum 37°C.

Distinctive characters: Yellowish-green fluorescence present in meat infusion media. Pathogenic.

Source: Isolated in a bacterial disease of horned lizards and Gila monsters.

Habitat: Pathogenic for lizards.

10. **Pseudomonas syncyanea** (Ehrenberg) Migula. (*Vibrio syncyaneus* Ehrenberg, Berichte ü.d. Verh. d. k. Preuss. Akad. d. Wissensch. z. Berlin, *5*, 1840, 202; *Vibrio cyanogenes* Fuchs, Magazin für die gesamte Tierheilkunde, *7*, 1841, 190; *Bacillus syncyaneus* Schroeter, Kryptogam. Flora von Schlesien, *3*, 1, 1886, 157; *Bacillus cyanogenus* Zopf, Die Spaltpilze, 3 Aufl., 1885, 86; Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 29; *Bacterium syncyaneum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 275; *Pseudomonas cyanogenes* Holland, Jour. Bact., *5*, 1920, 224.) From Greek, *syn*, with; *kyaneos*, dark blue, dark.

Rods with rounded ends, occurring singly, occasionally in chains, 0.7 by 2.0 to 4.0 microns. Motile with two to four polar flagella. Gram-negative.

Gelatin colonies: Flat, bluish, translucent.

Gelatin stab: Surface growth shiny, grayish blue. The medium is colored steel-blue with greenish fluorescence. Gelatin is liquefied. Some strains do not liquefy.

Agar slant: Grayish-white streak. The medium takes on a bluish-gray color with slight fluorescence.

Broth: Turbid with marked fluorescence.

Litmus milk: Unchanged. In association with lactic acid bacteria the milk takes on a deep blue color.

Potato: Yellowish-gray, shiny layer, becoming bluish-gray. The medium becomes bluish-gray.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: The cause of blue milk.

11. **Pseudomonas schuylkilliensis** Chester. (*Bacillus fluorescens schuylkilliensis* Wright, Memoirs, Natl. Acad. Sci., *7*, 1895, 448; Chester, Determinative Bact., 1901, 320.) From M. L. of the Schuylkill (River).

Synonyms: *Pseudomonas capsulata* Chester, Man. Determ. Bact., 1901, 322 (*Bacillus fluorescens capsulatus* Pottien, Ztschr. f. Hyg., *11*, 1896, 140); *Pseudomonas dermatogenes* Fuhrmann, Cent. f. Bakt., II Abt., *17*, 1906, 356.

Short rods, with rounded ends, occurring singly, in pairs and in chains. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Grayish-white, translucent, with brownish center, radiate margin, becoming bluish-green.

Gelatin stab: Slow crateriform liquefaction, with blue-green fluorescence.

Agar slant: Grayish, translucent growth. Medium shows greenish fluorescent.

Broth: Turbid, with slight pellicle and blue-green fluorescence. Stringy sediment.

Litmus milk: Coagulated, with slow reduction of litmus; peptonized.

Potato: Brownish, spreading, viscid, thick.

Indole is formed (trace).

Nitrites not produced from nitrates.

Aerobic, facultative.

Does not grow at 35° to 36°C.

Source: Isolated from Schuylkill River water.

Habitat: Water.

12. **Pseudomonas chlororaphis** (Guignard and Sauvageau) Bergey et al. (*Bacillus chlororaphis* Guignard and Sauvageau, Compt. rend. Soc. Biol. Paris, *1*, 10 sér., 1894, 841; Bergey et al., Manual, 3d ed., 1930, 166; also see Lasseur and Dupaix-Lasseur, Trav. Lab. Microbiol. Fac. Pharm. Nancy, Fasc. 9, 1936, 35.) From Greek, *chlōros*, greenish yellow; *raphis*, needle.

Rods: 0.8 by 1.5 microns, with rounded ends, occurring singly and in pairs. Motile with polar flagella. Gram-negative.

Gelatin colonies: Circular, viscid, transparent, glistening, lobate margin, with fluorescent corona. Dissociates readily (Lasseur and Dupaix-Lasseur, *loc. cit.*).

Gelatin stab: Stratiform liquefaction.

Broth: Turbid, fluorescent, with crystals of green, water-soluble chlororaphine.

Litmus milk: Coagulation. Peptonization. Crystals of chlororaphine form in the central part of the culture.

Potato: Citron-yellow layer. Crystals of chlororaphine are formed.

Nitrates reduced to nitrites.

Indole not formed.

Pigment formation: Asparagine, potassium phosphate, glycerol, sulfate of magnesium and sulfate of iron are indispensable to the formation of crystals of chlororaphine.

Aerobic, facultative. Optimum temperature 25° to 30°C.

Pathogenic for laboratory animals. Exotoxin formed.

Habitat: Water.

13. **Pseudomonas myxogenes** Fuhrmann. (Cent. f. Bakt., II Abt., *17*, 1907, 356.) From Greek, *myxa*, mucus; *gennaō*, to beget; M. L. slime producing.

Rods: 0.4 to 0.5 by 1.0 to 1.5 microns, occurring singly and in pairs. Motile, possessing a bundle of five to seven polar flagella. Gram-negative.

Gelatin colonies: Smooth, soft, flat, spreading, entire, yellowish-green.

Gelatin stab: Growth along stab. Liquefaction with yellowish-white sediment.

Agar colonies: Circular, raised, smooth, amorphous, entire.

Agar slant: Yellowish-white, moist, glistening, becoming light green-fluorescent.

Broth: Turbid, with yellowish-white sediment.

Litmus milk: Flocculent precipitation. Slow peptonization with yellow serum. Alkaline.

Potato: Dirty yellow to olive, moist, glistening, entire.

Indole is formed.

Nitrates reduced to nitrites and ammonia. No gas formed.

Aerobic, facultative.

Optimum temperature 22°C.

Source: Isolated from beer.

14. **Pseudomonas septica** Bergey et al. (*Bacillus fluorescens septicus* Stutzer and Wsorow, Cent. f. Bakt., II Abt., *71*, 1927, 113; Bergey et al., Manual, 3rd ed., 1930, 169.) From Greek, *septikos*, putrefactive, septic.

Rods: 0.6 to 0.8 by 0.8 to 2.0 microns, occurring singly. Motile with a polar flagellum. Gram-negative.

Gelatin stab: Infundibuliform liquefaction.

Agar colonies: Circular with opalescent center and transparent periphery.

Agar slant: Moderate, undulate margin.

Broth: Turbid with fragile pellicle, greenish in upper portion.

Litmus milk: Alkaline, coagulated.

Blood serum not liquefied.

Acid from glucose.

Aerobic, facultative.

Optimum temperature 20°C.

Habitat: Disease of caterpillars.

15. **Pseudomonas boreopolis** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 74.) From Greek, *boreas*, the North wind; *polis*, city; M. L. North City.

Rods: 0.5 to 1.0 by 2.0 to 3.0 microns, occurring singly and in pairs. Motile with one to five polar flagella. Gram-negative.

Gelatin colonies: Liquefied.

Gelatin stab: Liquefied. Medium reddened.

Agar colonies: Circular or amoeboid, white to buff, flat to convex, smooth, glistening, translucent border.

Agar slant: Filiform, whitish, raised, smooth, glistening, fluorescent.

Broth: Turbid.

Nitrates reduced to nitrites.

Starch not hydrolyzed.

Acid produced from glucose.

Attacks naphthalene.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Habitat: Soil.

16. **Pseudomonas smaragdina** Migula. (*Bacillus smaragdinus foetidus* Reiman, Inaug. Dissertation, Würzburg, 1887; Migula, Syst. d. Bakt., *2*, 1900, 890.) From Greek, *smaragdinas*, green like the *smaragdus*, the emerald.

Small rods, occurring singly. Nonmotile. Gram-negative.

Gelatin colonies: Small, convex, irregular, whitish with greenish shimmer.

Gelatin stab: Slight surface growth. Infundibuliform liquefaction. The liquefied medium becomes light emerald green in color.

Agar colonies: Small, brownish-yellow, convex.

Agar slant: Abundant growth with greenish fluorescence.

Broth: Turbid.

Litmus milk: Not coagulated.

Potato: Dark brown, becoming chocolate brown.

Indole not formed.

Nitrates not reduced.

The cultures give off an odor resembling jasmine.

Aerobic, facultative.

Optimum temperature 37°C.

Subcutaneous and intravenous inoculations into rabbits cause death in 36 to 48 hours.

Source: Isolated from nasal secretions in ozena.

17. **Pseudomonas chlorina** (Frankland and Frankland) Levine and Soppeland. (*Bacillus chlorinus* G. and P. Frankland, Philos. Trans. Roy. Soc. London, *178*, 1887, 274; *Bacterium chlorinum* Migula, Syst. d. Bakt., *2*, 1900, 471; Levine and Soppeland, Bul. No. 77, Iowa State Agricultural College, 1926.) From Greek, *chloros*, greenish yellow.

Rods: 0.5 by 1.5 micron, occurring singly and in short chains. Non-motile. Gram-negative.

Gelatin stab: Crateriform liquefaction with green fluorescence. Lemon yellow sediment.

Agar colonies: Circular, raised, smooth, amorphous, entire, becoming greenish yellow.

Agar slant: Slightly raised, glistening, the medium becoming light greenish yellow.

Broth: Moderate turbidity. Dirty yellow sediment. No pellicle.

Litmus milk: Peptonized. Litmus reduced.

Potato: Scant, olive green growth.

Indole formed.

Nitrites produced from nitrates.

Starch hydrolyzed.

Blood serum liquefied in 5 days.

Acid from glucose.

Aerobic, facultative.

Optimum temperature 22°C.

Source: Air.

18. **Pseudomonas oleovorans** Lee and Chandler. (Jour. Bact., *41*, 1941, 378.) From M. L. oil destroying.

Short rods: 0.5 by 0.8 to 1.5 microns, occurring singly and in pairs. Motile. Gram-negative.

Gelatin stab: No liquefaction after 6 weeks.

Gelatin colonies: Up to 1 mm. in diameter, fluorescent; similar to agar colonies.

Surface agar colonies: After 24 hours 1 to 2 mm. in diameter, smooth, convex, shiny, opaque, creamy, fluorescent by transmitted light. Edge entire in young colonies.

Deep agar colonies: 0.5 by 1.0 to 1.5 mm., lens-shaped, buff-colored, not fluorescent.

Agar slant: Growth raised, smooth, fluorescent, edge erose.

Broth: After 24 hours moderate turbidity with slight yellowish viscid sediment. No pellicle or ring.

Litmus milk: No change.

Indole not formed.

Potato: Good growth.

Nitrites are produced from nitrates.

Starch is hydrolyzed.

No acid from glucose, lactose, sucrose, galactose, xylose, mannitol, salicin and glycerol.

Equally good growth at 25° and 37°C.

Aerobic.

Distinctive character: The fluorescent quality of the colonies is not imparted to any of the artificial media used.

Source: Isolated from cutting compound (oil-water emulsion) circulating in a machine shop. The oil in this compound may be utilized as a sole source of energy.

Habitat: Probably oil-soaked soils. Abundant in cutting compounds.

19. **Pseudomonas incognita** Chester. (*Bacillus fluorescens incognitus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 436; Chester, Determinative Bacteriology, 1901, 323.) From Latin, *in*, not; *cogito*, to think; M. L. unknown.

Short rods, with rounded ends, occurring singly, in pairs and in chains. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Thin, transparent, slightly granular, becoming greenish. Margin undulate. The medium assumes a blue-green fluorescence.

Gelatin stab: No liquefaction.

Agar slant: Thin, moist, translucent, becoming greenish.

Broth: Turbid, with pellicle, becoming greenish.

Litmus milk: Slightly acid in a month. The litmus is slowly reduced.

Potato: Moist, glistening, spreading, brown.

Indole is formed (trace).

Nitrites are produced from nitrates.

Aerobic, facultative.

Optimum temperature 35°C.

Habitat: Water.

20. **Pseudomonas convexa** Chester. (*Bacillus fluorescens convexus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 438; Chester, Determinative Bacteriology, 1901, 325.) From Latin, *convexus*, convex, arched.

Short, thick rods, with rounded ends. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Circular, convex, glistening, bright greenish, translucent. The medium becomes blue-green, fluorescent.

Gelatin stab: Light green, raised, glistening surface growth. No liquefaction.

Agar slant: Moist, translucent, glistening, light greenish. The medium assumes a greenish color.

Broth: Turbid, becoming greenish.

Litmus milk: No coagulation; alkaline.

Potato: Pale brown, spreading.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 30°C.

Habitat: Water.

21. **Pseudomonas mildenbergii** Bergey et al. (Der blaue bacillus, Mildenberg, Cent. f. Bakt., II Abt., *56*, 1922, 309; *Pseudomonas cyanogena* Bergey et al., Manual, 1st ed., 1923, 129; not *Bacillus cyanogenes* Flügge, Die Mikroorganismen, 1886, 201; not *Pseudomonas cyanogenes* Hammer, Dairy Bact., 1928, 70; Bergey et al., Manual, 3rd ed., 1930, 172.) Named for Mildenberg who first isolated this species.

Rods: 0.3 to 0.5 by 1.0 to 3.5 microns, with rounded ends, occurring singly. Motile, possessing polar flagella. Gram-negative.

Gelatin colonies: Circular, lobed, smooth, glistening, slightly raised, steel-blue, entire.

Gelatin stab: No liquefaction.

Agar colonies: Small, circular, yellowish or reddish-yellow, entire, becoming lobed, grayish-green, iridescent. The medium becomes dirty grayish-green.

Agar slant: Smooth, spreading, slimy, glistening, grayish-green to dark green, fluorescent.

Broth: Turbid green, iridescent to opalescent with slimy sediment.

Litmus milk: Not coagulated, blue ring.

Potato: Slimy, glistening, spreading, steel blue.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 25°C.

Source: Isolated from air.

2. **Pseudomonas putida** (Trevisan) Migula. (*Bacillus fluorescens putidus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 288; *Bacillus putidus* Trevisan, I gen. e le specie d. Batteriacee, 1889, 18; Migula, in Engler and Prantl, Die natür. Pflanzenfam., *1*, 1a, 1895, 29; *Bacillus fluorescens putridus* (sic) Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 292; *Bacterium putidum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 271; *Pseudomonas putrida* (sic) Migula, Syst. d. Bakt., *2*, 1900, 912.) It is not clear which spelling should be used. Either is correct. From Latin *putida* or *putrida*, rotten, stinking.

Rods, with rounded ends. Motile,

possessing polar flagella. Gram-negative.

Gelatin colonies: Small, finely granular, fluorescent with dark center, surrounded by a yellow zone, with pale gray margin.

Gelatin stab: Dirty-white surface growth, becoming greenish, fluorescent. No liquefaction.

Agar colonies: Circular, raised, smooth, amorphous, entire, with fluorescent zone around the periphery.

Agar slant: Yellowish-green layer, becoming fluorescent.

Broth: Turbid, fluorescent.

Litmus milk: Unchanged.

Potato: Thin, gray to brownish, slimy layer.

Cultures give off odor of trimethylamine.

Indole not formed.

Nitrites are produced from nitrates.

Aerobic, facultative.

Optimum temperature 25°C. Will grow at 37°C. (Reid et al., Penn. Agr. Exp. Sta., Bull. 422, 1942, 9).

Distinctive features: Identical with *Pseudomonas fluorescens* Migula according to Lehmann and Neumann (*loc. cit.*) except that it does not liquefy gelatin. See *Pseudomonas eisenbergii* Migula.

Habitat: Putrefying materials; water.

23. **Pseudomonas scissa** (Frankland and Frankland) Migula. (*Bacillus scissus* G. and P. Frankland, Ztschr. f. Hyg., *6*, 1889, 398; Migula, Syst. d. Bakt., *2*, 1900, 927.) From Latin, *scissus*, p.p. of *scindo*, to cut.

Rods: 0.5 by 0.5 to 1.0 micron, with rounded ends, occurring singly, in pairs and in chains; on gelatin, coccus-like. Motile with presumably polar flagella. Gram-negative.

Gelatin colonies: Small, greenish.

Gelatin stab: Thin, smooth, glistening surface growth, irregular, serrate margin. No liquefaction. The medium becomes light green in color.

Agar slant: Smooth, glistening, lobed. The medium assumes a greenish color.

Broth: Turbid, with whitish sediment.

Litmus milk: Not coagulated.

Potato: Glistening, reddish-brown growth.

Indole not formed.

Nitrites produced from nitrates.

Aerobic, facultative.

Optimum temperature 20°C.

Distinctive characters: Resembles *Pseudomonas viscosa* Migula.

Source: Found in water and soils in Kent, England.

Habitat: Water and soil.

24. **Pseudomonas ovalis** Chester. (*Bacillus fluorescens ovalis* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 9; Chester, Determinative Bacteriology, 1901, 325; not *Bacillus ovalis* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 435.) From *ovum*, egg; M. L. oval.

Rods: 0.3 to 0.7 by 0.7 to 1.3 microns, occurring singly. Motile, possessing a single polar flagellum. Gram-negative.

Gelatin colonies: Irregular, lobate, slightly granular.

Gelatin stab: No liquefaction.

Agar colonies: Circular, opaque, entire, greenish fluorescence.

Agar slant: Thick, white, becoming greenish, fluorescent.

Broth: Turbid, with pellicle.

Litmus milk: No coagulation; alkaline.

Potato: Luxuriant, dirty-brown.

Indole not formed.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Blood serum not liquefied.

Acid from glucose.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Soil. Has been found in intestinal canal.

25. **Pseudomonas striata** Chester. (*Bacillus striatus viridis* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 22; Chester, Determinative Bacteriology, 1901, 325.) From Latin, *strio*, streak, groove.

Slender rods, of variable lengths, stain-

ing irregularly, occurring singly and in pairs. Motile, possessing polar flagella. Gram-negative.

Gelatin colonies: Circular, yellowish, with filamentous border.

Gelatin stab: Raised, white surface growth. No liquefaction.

Agar slant: Thin, yellowish-green, smooth, glistening.

Broth: Turbid, becoming slightly greenish.

Litmus milk: No coagulation; becoming alkaline; litmus reduced.

Potato: Moist, glistening, becoming chocolate-brown.

Indole is formed.

Nitrites are produced from nitrates.

Aerobic.

Optimum temperature 25°C.

Habitat: Soil.

26. **Pseudomonas denitrificans** Bergey et al. (*Bacillus denitrificans fluorescens* Christensen, Cent. f. Bakt., II Abt., *11*, 1903, 190; Bergey et al., Manual, 1st ed., 1923, 131.) From Latin, *de*, from, out of; *nitrum*, soda, nitre; M. L. denitrifying.

Rods: 0.5 to 0.7 by 0.5 to 1.25 microns, occurring singly and in pairs in large, slimy masses. Motile. Gram-negative.

Gelatin colonies: Small, circular, contoured, raised, moist, pearly-gray, glistening.

Gelatin stab: Whitish, lobed surface growth. Yellowish-green growth in stab. No liquefaction.

Agar colonies: Pearly white, circular, entire.

Agar slant: Broad, whitish, contoured, moist, entire.

Broth: Turbid, with thick, wrinkled pellicle.

Litmus milk: Not coagulated.

Potato: Reddish-gray layer.

Indole not formed.

Nitrates reduced with production of nitrogen.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Soil.

27. **Pseudomonas solaniolens** Paine. (Rept. Int. Conf. Phytopath. and Econ. Ent. Holland, 1923, 77; *Phytomonas solaniolens* Bergey et al., Manual, 3rd ed., 1930, 274.) From M. L. *Solanum*, a generic name.

Small oval rods: Motile with a polar flagellum. Gram-negative.

Produces an iridescence in gelatin.

Gelatin: No liquefaction.

Gelatin colonies: Round. Iridescence in medium.

Agar colonies: Pale buff.

Litmus milk: Curd, with no sign of digestion.

Potato: Pale buff-colored growth, no change in medium.

Nitrites not produced from nitrates.

Acid but not gas from glucose. No acid or gas from lactose, sucrose, mannitol or glycerol.

Starch: Action feeble.

Optimum temperature 20° to 30°C.

Aerobic, facultative.

Source: Isolated from potato showing internal rust spots.

28. **Pseudomonas eisenbergii** Migula. (*Bacillus fluorescens non liquefaciens* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 145; *Bacillus fluorescens immobilis* Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 294; Migula, Syst. d. Bakt., *2*, 1900, 913; *Bacterium immobile* Chester, Man. Determ. Bact., 1901, 180; *Pseudomonas nonliquefaciens* Bergey et al., Manual, 1st ed., 1923, 132.) Named for Eisenberg, the bacteriologist who first reported this species.

Short, slender rods, with rounded ends, occurring singly. Non-motile. Kruse (*loc. cit.*, p. 293) lists the motile form of this organism as *Bacillus fluorescens non liquefaciens*. Gram-negative.

Gelatin colonies: Fern-like surface colonies. Medium around colonies has a pearly luster.

Gelatin stab: Surface growth has fluorescent shimmer. No liquefaction.

Agar slant: Greenish layer.

Broth: Turbid, fluorescent.

Litmus milk: Unchanged.

Potato: Diffuse, brownish layer. Medium acquires a grayish-blue color.

Indole is not formed.

Nitrites produced from nitrates.

Acid from glucose.

Blood serum liquefied.

Aerobic, facultative.

Optimum temperature 25°C.

Not pathogenic.

Habitat: Water.

29. **Pseudomonas putrefaciens** (Derby and Hammer) Long and Hammer. (*Achromobacter putrefaciens* Derby and Hammer, Iowa Agr. Exp. Sta. Res. Bul. 145, 1931, 401; Long and Hammer, Jour. Bact., *41*, 1941, 100.) From Latin, *putrida*, rotten, stinking; *faciens*, making.

Rods: 0.5 to 1.0 by 1.1 to 4.0 microns, occurring singly and in pairs. Motile, with a single flagellum. Gram-negative.

Gelatin stab: Rapid, saccate to stratiform liquefaction, with reddish-brown sediment in the liquefied portion.

Agar colony: Circular, smooth, glistening, slightly raised, somewhat transparent, with brownish tinge.

Agar slant: Echinulate, slightly reddish-brown, viscous.

Broth: Turbid, with thin, gray pellicle, and reddish-brown sediment.

Litmus milk: Rapid reduction and proteolysis with odor of putrefaction.

Potato: Echinulate, smooth, glistening, viscous, reddish-brown.

Indole not produced.

Nitrites are produced from nitrates.

Acid from maltose and sucrose. No action on glucose, fructose, galactose, arabinose, lactose, raffinose, dextrin, inulin, salicin, amygdalin, glycerol.

Ammonia is formed.

Aerobic, facultative.

Optimum temperature 21°C.

Source: Isolated from tainted butter.

Habitat: Milk, cream, butter, water, soil, creamery equipment (Long and Hammer, *loc. cit.*; Claydon and Hammer, Iowa Agr. Exp. Sta., Res. Bull. 267, 1939.)

30. **Pseudomonas mephitica** Claydon and Hammer. (Jour. Bact., *37*, 1939, 254.) From Latin, *mephitis*, pestilential, malodorous; M.L. *Mephitis*, a generic name.

Rods: 0.5 to 1.0 by 1.5 to 14.0 microns, occurring singly, in pairs and in chains. Actively motile with a polar flagellum. Gram-negative.

Gelatin: Slow liquefaction.

Agar colonies: Convex, circular, about 3 mm. in diameter, shiny, grayish white, edge entire, of the consistency of bread dough.

Agar slant: Growth grayish-white, wrinkled, echinulate. After 1 or 2 days, a skunk-like odor develops.

Broth: Turbid. Sediment. White pellicle.

Potato: Growth echinulate, shiny, brownish.

Litmus milk: A skunk-like odor develops in 1 to 2 days. Grayish blue surface ring in about 3 days. Alkaline in 7 to 10 days. In two weeks complete reduction. Slight proteolysis and viscosity.

Hydrogen sulfide not produced.

Indole not formed.

Nitrites produced from nitrates.

Acid but not gas produced slowly from glucose, fructose, maltose, and sucrose. No acid from arabinose, dextrin, galactose, glycerol, lactose, mannitol, raffinose or salicin.

Aerobic, facultative.

Optimum temperature 21°C. Growth slight at 5° and 30°C. No growth at 37°C.

Source: Several cultures isolated from butter having a skunk-like odor.

Habitat: Probably from water.

31. **Pseudomonas geniculata** (Wright) Chester. (*Bacillus geniculatus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 459; Chester, Man. Determ. Bact., 1901, 313; *Achromobacter geniculatum* Bergey et al., Manual, 1st ed., 1923, 146.) From Latin,

geniculatus, p.p. of *geniculo*, knotted, jointed.

Medium-sized rods, occurring singly, in pairs and chains, motile, possessing polar flagella. Gram-negative.

Gelatin colonies: Circular, whitish, translucent. Deep colonies yellowish.

Gelatin stab: Infundibuliform liquefaction. Sediment light pink.

Agar slant: Grayish, glistening, translucent, limited, becoming brownish-gray.

Broth: Turbid, with slight gray pellicle and sediment.

Litmus milk: Alkaline; reduction of litmus; slight coagulation.

Potato: Thin, brownish, moist, glistening, viscid.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Habitat: Water.

32. **Pseudomonas fragi** (Eichholz) Huss *emend.* Hussong, Long and Hammer. (*Bacterium fragi* Eichholz, Cent. f. Bakt., II Abt., *9*, 1902, 425; Huss, Cent. f. Bakt., II Abt., *19*, 1907, 661; Hussong, Long and Hammer, Iowa Agr. Exp. Sta. Res. Bull. 225, 1937, 122; also see Long and Hammer, Jour. Dairy Sci., *20*, 1937, 448.) From Latin *fragum*, strawberry.

Description from Hussong, Long and Hammer, *loc. cit.*

Rods: 0.5 to 1.0 by 0.75 to 4.0 microns, occurring singly, in pairs and in chains. Motile with a polar flagellum. Gram-negative.

Gelatin: Crateriform to stratiform liquefaction in 3 to 4 days.

Agar colonies: Convex, glistening, generally butyrous, occasionally viscid. Rough, smooth and intermediate forms are recognized in the description quoted. The rough forms are less proteolytic, and less active in the hydrolysis of fats.

Agar slant: Growth abundant, spreading, raised, white, shiny, generally butyrous. Sweet ester-like odor resembling that of the flower of the May apple.

Broth: Turbidity and sediment with a thin pellicle.

Litmus milk: Acid ring followed by acid coagulum at surface. Complete coagulation in 2 to 3 weeks, some digestion. Characteristic May apple or strawberry odor.

Potato: Growth echinulate to arborescent, raised, glistening, white, becoming brownish.

Indole not produced.

Nitrites not produced from nitrates.

Ammonia produced from peptone.

Hydrogen sulfide not produced.

Acid from glucose and galactose, sometimes arabinose. No acid from glycerol, inulin, lactose, fructose, maltose, mannitol, raffinose, salicin and sucrose.

No acetylmethylcarbinol produced.

Fat is generally hydrolyzed.

Aerobic.

Grows from 10° to 30°C. No growth at 37°C. Very sensitive to heat.

Source: Isolated from milk and other dairy products, dairy utensils, water, etc.

Habitat: Soil and water. Widely distributed (Morrison and Hammer, Jour. Dairy Sci., *24*, 1941, 9).

Hussong (Thesis, Iowa State College, 1932) regards *Bacterium fragi* Eichholz (*loc. cit.*) as the R type, *Pseudomonas fragariae I* Gruber (Cent. f. Bakt., II Abt., *9*, 1902, 705) as the O form, and *Pseudomonas fragariae II* Gruber (Cent. f. Bakt., II Abt., *14*, 1905, 122) as the S form of the same organism. He makes no mention of *Pseudomonas fragaroidea* Huss (*loc. cit.*) which from its description would belong to the smooth type. A brief characterization of each of these organisms follows: (1) *Bacterium fragi* came from milk as drawn from an individual cow; it does not liquefy gelatin, exhibits no fluorescence, is strongly alkaline in litmus milk, and does not grow at 37°C, (2) *Pseudomonas fragariae I* came from fodder beets; it does not liquefy gelatin, has weak blue-greenish fluorescence, is weakly alkaline in milk, and grows at 37°C, (3) *Pseudomonas fragariae II* came from pasteurized milk; it liquefies gelatin, coagulates milk, and does not grow at 37°C, (4) *Pseudomonas*

fragaroidea came from butter; it liquefies gelatin, coagulates milk, and grows at 37°C.

*33. **Pseudomonas nebulosa** (Wright) Chester. (*Bacillus nebulosus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 465; Chester, Man. Determ. Bact., 1901, 311; *Achromobacter nebulosum* Bergey et al., Manual, 1st ed., 1923, 145; not *Bacillus nebulosus* Hallé, Thèse de Paris, 1898; not *Bacillus nebulosus* Vincent, Ann. Inst. Past., *21*, 1907, 69; not *Bacillus nebulosus* Migula, Syst. d. Bakt., *2*, 1900, 844; not *Bacillus nebulosus* Goresline, Jour. Bact., *27*, 1934, 52.) From Latin, *nebula*, mist.

Medium-sized rods, occurring singly. Motile, possessing polar flagella. Gram-negative.

Gelatin colonies: Thin, circular, gray, translucent, hazy, with white center.

Gelatin stab: Crateriform liquefaction.

Agar slant: Thin, transparent streak.

Broth: Turbid, with gray sediment.

Litmus milk: Alkaline; reduction of litmus.

Potato: Scanty growth.

Indole not formed.

Nitrites not produced from nitrates.

Sugar gelatin in deep stab: Fair growth, with some gas formation.

Aerobic, facultative.

Optimum temperature 30° to 35°C.

Habitat: Water.

Probable synonym: *Pseudomonas centrifugans* Chester. (Man. Determ. Bact., 1901, 312; *Bacillus centrifugans* Wright, Mem. Nat. Acad. Sci., *7*, 1895, 462.)

34. **Pseudomonas coadunata** (Wright) Chester. (*Bacillus coadunatus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 460; Chester, Man. Determ. Bact., 1901, 310; *Achromobacter coadunatum* Bergey et al., Manual, 1923, 147.) 1st ed., From Latin, *coadunatus*, to unite closely.

Medium-sized rods, with rounded ends, occurring singly, in pairs and in chains. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Circular, brownish, dense.

Gelatin stab: Crateriform to stratiform liquefaction.

Agar slant: Gray, translucent, spreading.

Broth: Turbid, with gray pellicle and sediment. The medium has a slight greenish tint.

Litmus milk: Acid; coagulated.

Indole is formed.

Nitrites not produced from nitrates.

Sugar gelatin in deep stab: Good growth of discreet and confluent whitish colonies. Marked gas production; no liquefaction.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Habitat: Water.

35. **Pseudomonas multistriata** (Wright) Chester. (*Bacillus multistriatus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 462; Chester, Man. Determ. Bact., 1901, 310; *Achromobacter multistriatum* Bergey et al., Manual, 1st ed., 1923, 147.) From Latin, *multus*, many, much; *striatus*, grooved.

Medium-sized rods, with rounded ends, occurring singly and in pairs. Motile, possessing polar flagella. Gram-negative.

Gelatin colonies: Circular, grayish-white, translucent.

Gelatin stab: Crateriform liquefaction.

Agar slant: Narrow, translucent, grayish streak.

Broth: Turbid.

Litmus milk: Slightly acid; coagulated.

Potato: Grayish to creamy, thick, glistening, viscid, spreading.

Indole not formed.

Nitrites not produced from nitrates.

Sugar gelatin in deep stab: Vigorous growth with marked gas production; also liquefaction.

---

*Prof. E. R. Hitchner, Univ. of Maine, Orono, Maine assisted in rearranging the descriptions of the acid and gas producing pseudomonads (*Aeromonas*), April, 1943.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Habitat: Water.

36. **Pseudomonas punctata** (Zimmermann) Chester. (*Bacillus punctatus* Zimmermann, Bakt. unserer Trink- und Nutzwässer, Chemnitz, *1*, 1890, 38; *Bacillus aquatilis communis* Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 315; *Bacterium punctatum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 238; Chester, Man. Determ. Bact., 1901, 313; *Achromobacter punctatum* Bergey et al., Manual, 1st ed., 1923, 147.) From Latin, *punctus*, a puncture, point; M. L. punctate, dotted.

Rods: 0.7 by 1.0 to 1.5 micron, occurring singly, in pairs and in chains. Motile with a single polar flagellum. Gram-negative.

Gelatin colonies: Small, circular, gray, erose to filamentous, punctiform.

Gelatin stab: Crateriform liquefaction. No pellicle.

Agar slant: Gray, smooth, filamentous.

Broth: Turbid with delicate pellicle.

Litmus milk: Acid; coagulated; peptonized.

Potato: Brownish-yellow to brownish-red color.

Indole is formed.

Nitrites not produced from nitrates.

Hydrogen sulfide is formed.

Acid and gas from glucose.

Aerobic, facultative.

Optimum temperature 25° to 30°C.

Source: Common in the Chemnitz tap water.

Habitat: Cause of a hemorrhagic septicemia in carp (*Cyprinus*) (Schäperclaus, Ztschr. f. Fischerei, *28*, 1930; Cent. f. Bakt., II Abt., *105*, 1942, 49).

37. **Pseudomonas hydrophila** (Chester) *comb. nov.* (*Bacillus hydrophilus fuscus* Sanarelli, Cent. f. Bakt., *9*, 1891, 222; *Bacterium hydrophilus fuscus* Chester, Delaware College Agr. Expt. Sta., 9th Ann. Rept., 1897, 92; *Bacillus hydrophilus* Chester, Manual Determ. Bact., 1901, 235; *Bacterium hydrophilum* Weldin and Levine, Bact. Abs., *7*, 1923, 14; *Proteus hydrophilus* Bergey et al., Manual, 1st ed., 1923, 211; *Aeromonas hydrophila* Stanier, Jour. Bact., *46*, 1943, 213.) From Greek, *hydōr*, water, *philus*, loving; M. L. water-loving.

It was reported by Russell, Jour. Amer. Med. Assoc., *30*, 1898, 1442 and later by Emerson and Norris, Jour. Exper. Med., *7*, 1905, 32 who made a complete study of its properties and its pathogenic action.

Weldin (Iowa State College Jour. Sci., *1*, 1927, 151) considers *Bacillus ranicida* Ernst (Beiträge z. path. Anat. u. z. Allgemein. Pathol., *8*, 1890, 204; *Bacterium ranicida* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 141) a possible synonym of *Proteus hydrophilus*.

Rods: 0.6 by 1.3 microns, occurring singly and in chains. Motile, with a single polar flagellum (Kulp and Borden, Jour. of Bact., *44*, 1942, 673). Gram-negative.

Gelatin colonies: Small, circular, gray, translucent, stippled.

Gelatin stab: Napiform liquefaction.

Agar colonies: Whitish, raised, moist, stippled.

Agar slant: Thin, whitish, glassy, spreading, becoming yellowish.

Broth: Turbid, with heavy pellicle.

Litmus milk: Acid; coagulated; peptonized.

Potato: Yellowish-brown, moist slightly raised.

Indole is formed.

Nitrites produced from nitrates.

Acid and gas from glucose, maltose, sucrose and mannitol. No action on lactose.

Gas ratio $H_2:CO_2 = 1:4.71$. Methyl red negative, acetylmethylcarbinol positive, indol negative, citrate positive (Speck and Stark, Jour. Bact., *44*, 1942, 697).

Aerobic, facultative.

Optimum temperature 37°C.

Pathogenic for frogs, salamanders, fish,

mice, guinea pigs and rabbits, causing hemorrhagic septicemia.

Distinctive characters: Much like *Pseudomonas punctata* (Guthrie and Hitchner, Jour. Bact., *45*, 1943, 52).

Source: Isolated from frogs dead of septicemia (red leg).

Habitat: Water and infected fresh water animals.

38. **Pseudomonas ichthyosmia** (Hammer) *comb. nov.* (*Bacillus ichthyosmius* Hammer, Iowa Agr. Sta. Res. Bul. 38, 1917; *Escherichia ichthyosmia* Bergey et al., Manual, 1st ed., 1923, 201; *Proteus ichthyosmius* Bergey et al., Manual, 4th ed., 1934, 364.) From Greek, *ichthys*, a fish; *osmē*, an odor.

Rods: 0.6 to 0.8 by 1.0 to 2.1 microns, occur singly. Motile with a single polar flagellum (Breed). Gram-negative.

Gelatin stab: Liquefaction.

Agar colonies: Small, white, becoming darker with age.

Agar slant: Dirty white, viscid growth.

Broth: Turbid with gray sediment.

Litmus milk: Acid. Litmus reduced. Cultures have fishy odor.

Potato: Thin, glistening layer.

Indole is formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, galactose, maltose, sucrose, glycerol, salicin and mannitol. Lactose, dulcitol, raffinose and inulin not fermented.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Isolated from can of evaporated milk having a fishy odor.

Habitat: Not known.

39. **Pseudomonas ambigua** (Wright) Chester. (*Bacillus ambiguus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 439; Chester, Man. Determ. Bact., 1901, 308; *Achromobacter ambiguum* Bergey et al., Manual, 1st ed., 1923, 148.) From Latin, *ambiguus*, doubtful, uncertain.

Small rods, with rounded ends, occurring singly, in pairs and in chains. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Gray, translucent, slightly raised, irregular, radiate, with transparent margin.

Gelatin stab: No liquefaction.

Agar slant: Gray, limited, entire.

Broth: Turbid, with gray sediment.

Litmus milk: Acid, slowly coagulated.

Potato: Gray to creamy, viscid, spreading.

Indole is formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 30° to 35°C.

Habitat: Water.

40. **Pseudomonas sinuosa** (Wright) Chester. (*Bacillus sinuosus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 440; Chester, Man. Determ. Bact., 1901, 307; *Achromobacter sinosum* (sic) Bergey et al., Manual, 1st ed., 1923, 148.) From Latin, *sinuosus*, full of bends, sinuous.

Medium-sized rods, with rounded ends, occurring singly, in pairs and in chains. Motile, possessing two to four polar flagella. Gram-negative.

Gelatin colonies: Thin, translucent, irregular, center brownish.

Gelatin stab: Grayish-white, glistening, translucent. No liquefaction.

Agar slant: Scanty, grayish growth.

Broth: Turbid, with gray sediment.

Litmus milk: Unchanged.

Potato: Grayish-white, moist, spreading.

Indole is formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 30° to 35°C.

Habitat: Water.

41. **Pseudomonas cruciviae** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 91; *Achromobacter cruciviae* Bergey et al., Manual, 3rd ed., 1930, 218.) From Latin, *crux*, a cross, *via*, way, road; from Waycross, a place name.

Rods: 1.0 by 1.0 to 3.0 microns, occurring singly and in pairs. Motile with one to five polar flagella. Gram-negative.

Gelatin colonies: Circular, white with buff center, convex, smooth, undulate.

Gelatin stab: No liquefaction.

Agar colonies: Circular or amoeboid, white to buff, flat to convex, smooth, entire.

Agar slant: Filiform, pale buff, raised, smooth, undulate.

Broth: Turbid.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

No acid in carbohydrate media.

Attack phenol and *m*-cresol.

Aerobic, facultative.

Optimum temperature 30 to 35°C.

Habitat: Soil.

42. **Pseudomonas rugosa** (Wright) Chester. (*Bacillus rugosus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 438; not *Bacillus rugosus* Henrici, Arb. Bakt. Inst. Tech. Hochsch. Karlsruhe, *1*, 1894, 28; not *Bacillus rugosus* Chester, Determinative Bacteriology, 1901, 220; Chester, Determinative Bacteriology, 1901, 323.) From Latin, *rugosus*, wrinkled.

Small rods, with rounded ends, occurring singly, in pairs and in chains. Motile, possessing one to four polar flagella. Gram-negative.

Gelatin colonies: Grayish, translucent, slightly raised, irregular, sinuous, radiately erose to entire.

Gelatin stab: Dense, grayish-green, limited, wrinkled, reticulate surface growth. No liquefaction.

Agar slant: Grayish-white, limited, slightly wrinkled, translucent.

Broth: Turbid, with grayish pellicle and sediment.

Litmus milk: Acid, coagulated.

Potato: Moist, glistening, brown.

Indole is formed.

Nitrites not produced from nitrates.

Aerobic.

Optimum temperature 30°C.

Habitat: Water.

43. **Pseudomonas desmolyticum** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 90; *Achromobacter desmolyticum* Bergey et al., Manual, 3rd ed., 1930, 217.) From Greek *desmos*, bond, band; *lytikos*, able to dissolve.

Rods: 0.7 to 0.8 by 2.0 to 3.0 microns, occurring singly and in pairs. Motile, with one to five polar flagella. Gram-negative.

Gelatin colonies: Circular, gray to buff, raised or umbonate. Smooth, glistening, entire.

Gelatin stab: No liquefaction.

Agar colonies: Circular or amoeboid, whitish, flat or convex, smooth, translucent to opaque, entire.

Agar slant: Filiform, pale buff, raised, smooth, undulate.

Broth: Turbid.

Nitrites produced from nitrates.

Starch not hydrolyzed.

Acid from glucose.

Attack phenol and naphthalene.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Soil.

44. **Pseudomonas rathonis** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 90; *Achromobacter rathonis* Bergey et al., Manual, 3rd ed., 1930, 216.) From M. L. of Ratho Park (Edinburgh).

Small rods: 0.5 to 1.0 by 1.0 to 3.0 microns. Motile, with polar flagella. Gram-negative.

Gelatin colonies: Circular, white, raised, smooth, glistening, undulate.

Gelatin stab: No liquefaction.

Agar colonies: Circular, buff, flat, smooth, glistening, entire.

Agar slant: Filiform, pale buff, convex, smooth, glistening, undulate.

Broth: Turbid, with pellicle.

Nitrites produced from nitrates.

Starch hydrolyzed.

Acid from glucose and glycerol.

Attack phenol and cresol at times, also naphthalene.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Manure and soil.

45. **Pseudomonas dacunhae** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 90; *Achromobacter dacunhae* Bergey et al., Manual, 3rd ed., 1930, 217.) From M. L. from the Island of d'Acunha.

Rods: 0.5 to 0.8 by 1.5 to 3.0 microns. Motile with one to six polar flagella. Gram-negative.

Gelatin colonies: Circular, whitish, raised, smooth, glistening, undulate.

Gelatin stab: No liquefaction.

Agar colonies: Circular to amoeboid, white, flat, glistening, opaque, entire.

Agar slant: Filiform, pale buff, raised, smooth, glistening, undulate.

Broth: Turbid.

Nitrites produced from nitrates.

Starch not hydrolyzed.

No acid from carbohydrate media.

Attack phenol.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Soil.

46. **Pseudomonas arvilla** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 90; *Achromobacter arvillum* Bergey et al., Manual, 3rd ed., 1930, 217.) From Latin, *arvum*, an arable field; M. L. dim. a little field.

Rods: 0.5 to 0.7 by 2.0 to 3.0 microns. Motile with one to five polar flagella. Gram-negative.

Gelatin colonies: Circular, whitish, convex, smooth, glistening, lobate.

Gelatin stab: No liquefaction.

Agar colonies: Circular or amoeboid, white to buff, flat to convex, smooth, glistening, opaque, entire.

Agar slant: Filiform, whitish, concave, smooth, ringed, entire.

Broth: Turbid.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Acid from glucose.

Attacks naphthalene.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Soil.

47. **Pseudomonas salopium** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 91; *Achromobacter salopium* Bergey et al., Manual, 3rd ed., 1930, 219.) From Latin, *Salop*, Shropshire.

Rods: 0.7 to 1.0 by 1.0 to 3.0 microns, occurring singly and in pairs. Motile with one to six polar flagella. Gram-negative.

Gelatin colonies: Circular, grayish-buff, flat, rugose or ringed, translucent border.

Gelatin stab: No liquefaction.

Agar colonies: Circular or amoeboid, white to buff, flat to convex, smooth, glistening, translucent border, entire.

Agar slant: Filiform, whitish, raised, smooth, glistening, lobate.

Broth: Turbid with pellicle.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Acid from glucose and sucrose.

Attacks naphthalene.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Soil.

48. **Pseudomonas minuscula** McBeth. (McBeth, Soil Science, *1*, 1916, 437; *Cellulomonas minuscula* Bergey et al., Manual, 1st ed., 1923, 162.) From Latin dim. rather small.

Rods: 0.5 by 0.9 micron. Motile with one to two polar flagella. Gram-negative.

Gelatin stab: Moderate growth. Slight napiform liquefaction.

Agar colonies: Small, circular, slightly convex, butyrous becoming brittle, grayish-white, finely granular, entire.

Agar slant: Moderate, flat, grayish-white.

Broth: Turbid.

Litmus milk: Acid, not digested.
Potato: No apparent growth.
Indole is formed.
Nitrites produced from nitrates.
Ammonia is produced.
Acid from glucose, lactose, maltose, sucrose and starch.
Aerobic, facultative.
Optimum temperature 20°C.
Habitat: Soil.

49. **Pseudomonas tralucida** Kellerman et al. (Kellerman, McBeth Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 37; *Cellulomonas tralucida* Bergey et al., Manual 1st ed., 1923, 163.) From Latin, clear, transparent.

Rods: 0.6 by 1.2 microns. Motile with one or two polar flagella. Gram-negative.
Gelatin stab: No liquefaction.
Agar slant: Scant, grayish growth.
Broth: Turbid.
Litmus milk: Acid.
Potato: No growth.
Indole not formed.
Nitrites produced from nitrates.
Ammonia not produced.
Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.
Aerobic, facultative.
Optimum temperature 20°C.
Habitat: Soil.

50. **Pseudomonas mira** McBeth. (McBeth, Soil Science, *1*, 1916, 437; *Cellulomonas mira* Bergey et al., Manual, 1st ed., 1923, 165.) From Latin, *mirus*, wonderful, extraordinary.

Rods: 0.4 by 1.6 microns. Motile with a single polar flagellum. Gram-negative.
Gelatin stab: Good growth. No liquefaction.
Agar colonies: Circular, convex, grayish-white, granular, lacerate.
Agar slant: Moderate, flat, grayish-white, somewhat iridescent.
Broth: Turbid.
Litmus milk: Alkaline.
Potato: Moderate, grayish-white.
Indole not formed.
Nitrites produced from nitrates.
Ammonia is produced.
Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.
Aerobic, facultative.
Optimum temperature 20°C.
Habitat: Soil.

51. **Pseudomonas lindneri** Kluyver and Hoppenbrouwers. (Lindner, 50 Jubiläumsber. Westpreuss. Bot.-Zool. Vereins, 1928, 253; *Termobacterium mobile* Lindner, Atlas d. Mikrosk. Grundl. d. Gärungsk., 3 Aufl., *2*, 1928, Taf. 68; Kluyver and Hoppenbrouwers, Arch. f. Mikrobiol., *2*, 1931, 259; *Achromobacter mobile* Kluyver and Hoppenbrouwers, *ibid.*, 258; not *Pseudomonas mobilis* Migula, Syst. d. Bakt., *2*, 1900, 923.) Named for Lindner, the German bacteriologist who first studied this organism.

Short rods 1.4 to 2.0 by 4.0 to 5.0 microns. Occurring singly, in pairs and short chains. Motile with a single polar flagellum. Gram-negative.
Peptone gelatin: Poor growth.
Peptone agar: Poor growth.
Wort agar: White, round, raised colonies, 1 mm. in diameter. Good growth. Still better where 2 per cent sucrose, or yeast extract with sucrose is added. Chalk added to neutralize acid.
Broth: Poor growth in peptone or yeast extract broth unless sugars are added.
Carbon dioxide, ethyl alcohol and some lactic acid produced from glucose and fructose, but not from mannose. May or may not ferment sucrose. May produce as much as 10 per cent alcohol.
Catalase produced.
Anaerobic, facultative.
Optimum temperature 30°C.
Distinctive character: The fermentation resembles the alcoholic fermentation produced by yeasts.
Source: Isolated from the fermenting sap (pulque) of *Agave americana* in Mexico.
Habitat: Fermenting plant juices in tropical countries (Mexico).

52. **Pseudomonas membranoformis** (Zobell and Allen) Zobell. (*Achromobacter membranoformis* Zobell and Allen, Jour. Bact., *29*, 1935, 246; Zobell, Jour. Bact., *46*, 1943, 45). From Latin *membrana*, membrane, and *forma* having the form of.

Rods: 0.9 to 1.2 by 3.5 to 4.8 microns, occurring singly and in pairs. Motile with lophotrichous flagella. Encapsulated. Gram-negative.

Gelatin stab: Growth filiform, best at top, with slow crateriform liquefaction.

Agar colonies: Circular, 1.0 to 2.5 mm, with crinkled surface.

Agar slant: Moderate, beaded, raised growth. Membranous consistency. Becomes browned with age.

Broth: Slight turbidity, flocculent sediment, film of growth on walls of test tube.

Milk: No growth.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

No H_2S produced.

Acid but not gas from glucose, sucrose, dextrin and mannitol. No acid from lactose or xylose.

No diastatic action.

Optimum temperature 20° to 25°C.

Aerobic.

Source: Sea water.

Habitat: Sea water.

53. **Pseudomonas marinoglutinosa** (Zobell and Allen) Zobell. (*Achromobacter marinoglutinosus* Zobell and Allen, Jour. Bact., *29*, 1935, 246; Zobell, Jour. Bact., *46*, 1943, 45). From Latin *marinus*, pertaining to the sea, and *glutinosus*, full of glue, sticky.

Short rods: 0.7 to 1.0 by 1.8 to 2.4 microns, with rounded ends, occurring singly, in pairs and in clumps. Motile with polar flagella. Staining granular. Encapsulated. Gram-negative.

Gelatin stab: Moderate filiform growth with slight napiform liquefaction. No pigment.

Agar colonies: Round with concentric circles and crinkled radial lines, 1.5 to 5.0 mm. in diameter. No pigment.

Agar slant: Moderate, filiform, flat. Butyrous consistency.

Broth: Moderate clouding, marked ring, adherent film of growth on test tube wall, and flaky sediment.

Milk: No growth.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Hydrogen sulfide and ammonia produced from Bacto-tryptone.

Acid but not gas from xylose and dextrin. No acid from glucose, lactose, sucrose and mannitol.

Starch is hydrolyzed.

Optimum temperature 20° to 25°C.

Aerobic, facultative.

Source: Sea water.

Habitat: Sea water.

54. **Pseudomonas gelatica** (Gran) Bergey et al. (*Bacillus gelaticus* Gran, Bergens Museums Aarbog., 1902, 14; *Bacterium gelaticum* Lundestad, Cent. f. Bakt., II Abt., *75*, 1928, 328; Bergey et al., Manual, 3rd ed., 1930, 175.) From French, like gelatin.

Rods, with rounded ends, 0.6 to 1.2 by 1.2 to 2.6 microns, occurring singly, in pairs, and sometimes in short chains. Motile. Gram-negative.

Fish-gelatin colonies: Circular, transparent, glistening, becoming brownish in color.

Fish-gelatin stab: Liquefaction infundibuliform, with greenish color.

Sea-weed agar colonies: Circular, flat, entire, glistening, reddish-brown center with grayish-white periphery. Liquefied.

Fish-agar slant: Flat, transparent streak, with undulate margin, reddish-brown.

Broth: Turbid with flocculent pellicle, and greenish-yellow sediment.

Indole not formed.

Nitrites are produced from nitrates.

Starch hydrolyzed.

No action on sugars.

Anaerobic, facultative.

Optimum temperature 20 to 25°C.

Habitat: Sea water of Norwegian coast.

55. **Pseudomonas calcis** (Drew) Kellerman and Smith. (*Bacterium calcis* Drew, Yearbook Carnegie Inst. Wash., *11*, 1912, 136–144; Kellerman and Smith, Proc. Nat. Acad. Sci., *4*, 1914, 400.) From Latin *calx* (*calc-*), lime.

Ovoid rods, 1.1 by 1.5 to 3 microns, usually single but may form long chains. Actively motile with one polar flagellum. Gram-negative.

Grows best in sea water or 3 per cent salt media. Deposits $CaCO_3$.

Agar colonies: Circular, with finely irregular outline, granular appearance, elevated, spreading; old colonies having brownish tinge in center.

Gelatin stab: Infundibuliform liquefaction.

Gelatin colonies: Small, with liquefaction.

Broth: Good growth especially in presence of potassium nitrate, peptone or calcium malate.

Acid from glucose, mannite and sucrose but not from lactose.

Nitrates reduced to nitrites and ammonia.

Aerobic, facultative.

Optimum temperature 20 to 28°C.

Habitat: Sea water and marine mud.

Bavendamm (Arch. f. Mikrobiol., *3*, 1932, 214) states that *Pseudomonas calcis* is probably synonymous with *Bacterium brandti*, *Bacterium bauri* and *Bacterium feiteli* described by Parlandt (Bull. Jard. imp. Bot. St. Petersburg, *11*, 1911, 97–105).

56. **Pseudomonas calciprecipitans** Molisch. (Cent. f. Bakt., II Abt., *65*, 1925, 130.) From Latin, *calx* (*calc-*), lime; *praecipito*, to cast down headlong, to precipitate.

Thin rods: 0.5 to 0.8 by 1.5 to 3.6 microns, with rounded ends, often staining irregularly. Motile, with one polar flagellum. Gram-negative.

Gelatin colonies: Circular, light brown in color (large colonies show $CaCO_3$ crystals).

Gelatin stab: Surface growth with filiform growth in depth. Liquefaction starts at bottom.

Agar colonies (sea water). Grayish-white, glistening. In two to three weeks crystals of calcium carbonate form in the agar.

Agar slant: Slight, whitish, surface growth, becoming thick, spreading, glistening, with abundant $CaCO_3$ crystals in medium.

Ammonia formed.

Aerobic, facultative.

Optimum temperature 20°C.

Habitat: Sea water.

57. **Pseudomonas ichthyodermis** (Wells Zobell) Zobell and Upham. (*Achromobacter ichthyodermis* Wells and Zobell, Proc. Nat. Acad. Sci., *20*, 123, 1934; Zobell and Upham, Bull. Scripps Inst. Oceanography, *5*, 1944, 246 and 253.) From Greek, *ichthys*, a fish; *derma*, skin.

Small rods, 0.9 to 1.3 by 3 to 5 microns, occurring singly and in pairs. No spores. Encapsulated. Polar flagella. Pleomorphic forms predominate in old cultures. Gram-negative.

Requires sea water following initial isolation. The following differential media are prepared with sea water.

Agar colonies: Glistening, colorless, convex, circular colonies 2 to 4 mm. in diameter.

Agar slants: Abundant, filiform, raised, smooth, opalescent growth.

Gelatin tube: Rapid crateriform liquefaction complete in 5 days at 18°C.

Sea water broth: Turbidity, with pellicle, little granular sediment and no odor.

Milk: No growth. Casein digested when 3 per cent salt is added.

Potato: No growth unless dialyzed in sea water. Then fair growth with no pigment.

Acid from glucose, maltose, sucrose and mannitol but not from lactose or glycerol.

Starch hydrolyzed.

Ammonia liberated from peptone but no hydrogen sulfide produced.

Indole formed in tryptophane sea water broth.

Nitrites produced from nitrates.

Optimum temperature 20 to 25°C.; 30°C. incubation will kill recently isolated organisms.

Aerobic, facultative.

Source: Isolated from diseased kilifish (*Fundulus parvipinnis*).

Habitat: Skin lesions and muscle tissue of infected marine fish.

58. **Pseudomonas nigrifaciens** White. (Scientific Agriculture, *20*, 1940, 643.) From Latin *niger*, black and *faciens*, making.

Rods: 0.3 to 0.7 by 1 to 5 microns, occurring singly or in pairs, and having rounded ends. Actively motile, with a single polar flagellum. Gram-negative.

Gelatin stab: Pigmented surface growth after 24 hours. Slight crateriform liquefaction changing to saccate.

Agar colonies: Circular, convex, smooth, glistening, entire, 2 to 4 mm in diameter. Slight fluorescence in early stages. The medium assumes a brownish color.

Agar slant: Growth filiform, smooth, moist, glistening, with blackish pigmentation at 4° and 15°C. in 48 hrs., the medium turning brownish. Slight fluorescence in early stages.

Broth: Turbid after 24 hours. After 5 to 6 days a black ring and then a pellicle forms, later a black sediment. Medium turns brown.

Litmus milk: A black ring appears after 3 days at 15°C. followed by a pellicle. Litmus is reduced. Alkaline reaction. No coagulation. Digested with a putrid odor.

Indole not formed.

Nitrites not produced from nitrates in 7 days. No gas produced.

Starch is hydrolyzed. Natural fats not hydrolyzed.

Alkaline reaction produced in sucrose, maltose, lactose, glucose, mannitol and raffinose broth (pH 8.2). No gas produced.

Ammonia produced in peptone broth.

Aerobic.

Optimum pH 6.8 to 8.4.

Temperature relations: Minimum 4°C. Optimum 25°C. Maximum 33–35°C.

Distinctive characters: No or slow growth in culture media in the absence of salt. Maximum growth and pigmentation appeared with 1.5 and 2.5 per cent salt. Optimum pigmentation occurs at 4° and 15°C.

Source: Several cultures isolated from samples of discolored butter.

Habitat: Causes a black to reddish-brown discoloration of print butter. Evidently widely distributed in nature.

59. **Pseudomonas beijerinckii** Hof. (Travaux botaniques néerlandais, *32*, 1935, 152.) Named for M. W. Beijerinck, Dutch bacteriologist.

Small rods: Motile with polar flagella.

Gelatin: No liquefaction.

Indole not formed.

Nitrites produced from nitrates by four out of six strains.

Cellulose not decomposed.

Acid from glucose. In yeast-water with 2 per cent glucose and 12 per cent NaCl no gas is produced.

Pigment production: Insoluble purple pigment produced but not in all media; is localized markedly; reduced oxygen tension necessary; optimum pH 8.0; not produced in yeast-water or in peptone-water; produced only when grown in extracts of beans or some other vegetable.

Aerobic.

Source: Six strains isolated from beans preserved with salt.

Habitat: Causes purple discoloration of salted beans.

60. **Pseudomonas salinaria** Harrison and Kennedy. (Harrison and Kennedy, Trans. Royal Soc. of Canada, *16*, 1922, 121; *Serratia salinaria* Bergey et al., Manual, 1st ed., 1923, 93; *Flavobacterium (Halobacterium) salinarium* Elazari-Volcani, Studies on the Microflora of the Dead Sea, Thesis, Hebrew Univ., Jerusalem, 1940, 59.) From Latin, *salinae*, saltworks.

Probable synonym: *Serratia sambharianus* Dixit and Vachna, Current Sci., *11*, 1942, 107 (see Biol. Abs., *17*, 1943, 793). Halophilic growing in 30 per cent salt. From salt lake in India.

Occurs as spheres and rods, 2.0 to 3.0 microns in diameter, 1.0 to 1.6 by 3.0 to 15.0 microns, occurring singly, as ovoid, amoeboid, clavate, cuneate, truncate, spindle, club, pear-shape, and irregular forms. Motile, frequently with a flagellum at each pole. Gram-negative.

Does not grow on ordinary culture media. Grows well on salted fish.

Codfish agar (16 to 30 per cent salt): Growth slow, smooth, raised, coarsely granular, entire, pale pink to scarlet (Ridgway chart).

No acid from carbohydrate media.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 42°C.

Source: Isolated from cured codfish (Harrison and Kennedy, *loc. cit.*). Isolated from salted fish by Browne (Absts. Bact., *6*, 1922, 25 and Proc. Soc. Exper. Biol. and Med., *19*, 1922, 321) who regarded this pleomorphic bacterium as two organisms—*Spirochaeta halophilica* and *Bacterium halophilica*.

Habitat: Produces reddening of dried codfish and causes rusty herring. In sea salt, and salt ponds containing not less than 16 per cent salt.

61. **Pseudomonas cutirubra** Lochhead. (*Serratia cutirubra* Lochhead, Can. Jour. of Research, *10*, 1934, 275; *Bacterium cutirubrum* Lochhead, Jour. Bact., *27*, 1934, 62; *ibid.*, *45*, 1943, 575; *Flavobacterium (Halobacterium cutirubrum* Elazari-Volcani, *loc. cit.*, 59.) From Latin, *cutis*, skin, hide; *ruber*, red.

Occurs as rods and spheres. Spheres 1 to 1.5 microns in diameter. Rods 1.5 to 8.0 by 0.7–1.4 microns. Rod forms motile with single polar flagellum. Coccoid forms motile when young. Gram-negative.

No growth on ordinary media.

Milk agar (20 per cent salt to saturation; optimum 28–32 per cent): Colonies 3–4 mm. in diameter, round and slightly convex. Pink to rose dorée (Ridgway chart).

Milk agar slants: Growth filiform, slightly spreading, rather flat with smooth, glistening surface and membranous consistency. Proteolytic action.

Liquid media: No or slight growth.

Gelatin (salt): Pronounced liquefaction.

Indole not formed, Lochhead (*loc. cit.*), Faint test, Gibbons (Jour. Biol. Board Canada, *3*, 1936, 75).

Nitrites not produced from nitrates.

Diastatic action negative.

No carbohydrate fermentation.

Aerobic, obligate.

Optimum temperature 37°C.

Halophilic.

Source: Isolated from salted hides.

Habitat: Sea water and sea salt.

62. **Pseudomonas harveyi** Johnson *comb. nov.* (*Achromobacter harveyi* Johnson and Shunk, Jour. Bact., *31*, 1936, 587.) Named for E. N. Harvey, who studied luminous bacteria.

Rods: 0.5 to 1.0 by 1.2 to 2.5 microns, occurring singly or in pairs, with rounded ends. Occasionally slightly curved; ends occasionally slightly pointed. Non-spore-forming. Capsules absent. Motile with a single polar flagellum, 2 to 3 times the length of the cell. Gram-negative.

Sea water gelatin colonies: After 24 hours at 20°C, circular, about 1.5 mm. in diameter or larger, margin slightly undulate, sunken due to the beginning of liquefaction, interior somewhat zonate; colonies surrounded by a halo of numerous small secondary colonies, circular and finely granular. In crowded plates a large number of gas bubbles are formed. Luminescent.

Sea water gelatin stab: Rapid saccate liquefaction complete in 5 days at 22°C. Abundant flocculent sediment.

Sea water agar colonies: Mostly very large, 6 to 8 cm. in diameter in 24 hours, flat, highly iridescent, circular with undulate margin, or composed of narrow and close or wide filamentous growth. Occasionally small colonies appear that are circular, with entire or slightly undulate margin, often producing irregular secondary growth, surface always smooth. Luminescent.

Sea water agar slant: Growth abundant, spreading, grayishly viscous, homogeneous, iridescent, the medium becoming rapidly alkaline when inoculated at an initial pH of 7.0. With fish decoctions added to the medium, luminescence is much brighter and growth becomes brownish after several days.

Growth on autoclaved fish: Abundant, smooth, glistening, yellowish, becoming dirty brown after several days. Mild putrefactive odor. Luminescence very brilliant.

Sea water containing 0.2 per cent peptone: Abundant uniform turbidity, thin pellicle, sediment accumulating over a period of several days. Luminescence at surface only unless the tube is shaken.

Milk, with or without the addition of 2.8 per cent salt: No growth.

Potato plugs resting on cotton saturated with sea water: Growth slight, somewhat spreading, slightly brownish. Luminous.

Indole is formed (Gore's method).

Nitrites are produced from nitrates.

Ammonia is produced in peptone media (Hansen method).

Fixed acid from glucose, fructose, mannose, galactose, sucrose, maltose, mannitol, dextrin, glycogen, trehalose, cellobiose; slowly from salicin. Non-fixed acid from melezitose; slight acid from sorbitol, disappearing in 24 hours. No acid from glycerol, xylose, arabinose, dulcitol, inositol, adonitol, erythritol, arabitol, lactose, raffinose, rhamnose, fucose or alpha methyl glucoside.

Starch agar: Wide zone of hydrolysis.

Hydrogen sulfide is produced (Zobell and Fantham method).

Temperature relations: Optimum 35° to 39°C. Abundant growth at 22° to 25°C. Optimum luminescence at 20° to 40°C.

Not pathogenic for white rats or amphipods.

Aerobic, facultative anaerobe.

Source: Isolated from a dead amphipod (*Talorchestia sp.*) at Woods Hole, Massachusetts.

Habitat: Sea water.

63. **Pseudomonas phosphorescens** (Fischer) Bergey et al. (*Bacillus phosphorescens* Fischer, Zeitschr. f. Hyg., *2*, 1887, 58; *Photobacterium indicum* Beijerinck, Arch. Néerl. d. Sci. Exactes, *23*, 1889, 401; *Bacterium phosphorescens* Lehmann, Cent. f. Bakt., *5*, 1889, 785; not *Bacterium phosphorescens* Fischer, Cent. f. Bakt., *3*, 1888, 107; Bergey et al., Manual, 3rd ed., 1930, 177.) From Greek *phosphoreō*, to bear or bring light.

See page 699 for additional synonyms.

Description taken from Fischer (*loc. cit.*).

Small, thick rods: 2 to 3 times as long as wide, with rounded ends. Motile. Stain lightly with aniline dyes.

Gelatin colonies: After 36 hours, small, circular, gray-white, punctiform. Liquefaction. Bluish to green phosphorescence in 4 to 5 days.

Blood serum: Gray-white, slimy growth.

Potato: Thin white layer in 2 to 3 days.

Cooked fish: Abundant growth. Entire surface covered with a gray-white, slimy growth. Bluish-white phosphorescence.

Alkaline broth: Slight turbidity in 24 hours. Pellicle in 3 days.

Acid broth: No turbidity. No phosphorescence.

Milk: No growth.

No gas formed.

Not pathogenic for laboratory animals.

Aerobic.

Optimum temperature 20° to 30°C.

Source: From sea water of the West Indies.

Habitat: Sea water.

64. **Pseudomonas pierantonii** (Zirpolo) Bergey et al. (*Micrococcus pierantonii* Zirpolo, Boll. del. Societa dei Natural. in Napoli, *31*, 1918, 75; *Cocco-bacillus pierantonii* Meissner, Cent. f. Bakt., II Abt., *67*, 1926, 204; Bergey et al., Manual, 3rd ed., 1930, 176.) Named for Pierantoni, an Italian.

Oval rods: 0.8 by 1.0 to 2.0 microns. Polymorphic rods, sometimes vacuolated. Motile. Gram-negative.

Gelatin colonies: Circular, luminous.

Gelatin stab: Not liquefied.

Sepia agar colonies: Circular, white, convex, smooth, serrate edge. Intense greenish luminescence.

Egg-glycerol agar slant: Yellowish-green, luminous streak.

Broth: Turbid.

Indole not formed.

Acid from glucose and maltose, some strains also produce acid from lactose and sucrose.

Best growth in alkaline media.

Aerobic.

Optimum temperature 33°C.

Source: Isolated from the photogenic organ of the cephalopod *Rondeletia minor*.

*65. **Pseudomonas martyniae** (Elliott) Stapp. (*Bacterium martyniae* Elliott, Jour. Agr. Res., *29*, 1924, 490; Stapp, in Sorauer, Handbuch der Pflanzenkr., *2*, 5 Auf., 1928, 278; *Phytomonas martyniae* Bergey et al., Manual, 3rd ed., 1930, 262.) From M. L. *Martynia*, a generic name.

Rods: 0.59 to 1.68 microns. Capsules. Chains. Motile with one to several bipolar flagella. Gram-negative.

Green fluorescent pigment produced.

Gelatin: Liquefied.

Beef agar colonies: White, round, smooth, glistening, raised.

Broth: Clouding in bands. Thin pellicle. Small crystals.

Milk: Soft acid curd with peptonization.

Nitrites produced from nitrates after 2 weeks.

Indole not produced.

Hydrogen sulfide production slight.

Acid but not gas from glucose, galactose, arabinose and sucrose. No acid from rhamnose, lactose, maltose, raffinose, mannitol and glycerol.

Starch hydrolysis none or feeble.

Optimum temperature 26°C. Maximum 37°C. Minimum 1.5°C.

Optimum pH 6.0 to 6.7. pH range 5.4 to 8.9.

Aerobic.

Source: Isolated from diseased leaves of the unicorn plant from Kansas.

Habitat: Pathogenic on *Martynia louisiana*.

66. **Pseudomonas striafaciens** (Elliott) Burkholder. (*Bacterium striafaciens* Elliott, Jour. Agr. Res., *35*, 1927, 823; *Phytomonas striafaciens* Bergey et al., Manual, 3rd ed., 1930, 268; Burkholder, Phytopath., *32*, 1942, 601.) From L. *stria*, stripe; *faciens*, making,

* The section covering the pseudomonads that cause plant diseases has been revised by Prof. Walter H. Burkholder, Cornell Univ., Ithaca, New York, April, 1943.

referring to the type of lesion caused on the blades of oats.

Rods: 0.66 by 1.76 microns. Motile with one to several flagella. Capsules. Gram-negative.

Green fluorescent pigment produced.

Gelatin: Liquefied.

Beef-peptone agar colonies: White, raised, margins entire or slightly undulating.

Broth: Clouding in layers. Ring and slight pellicle.

Milk: Alkaline, sometimes a soft curd which digests or clears.

Slight production of nitrites from nitrates.

Indole not produced.

Acid but not gas from glucose, fructose and sucrose. No acid from lactose, maltose, glycerol and mannitol.

Starch: Hydrolysis slight.

Optimum temperature 22°C.

Optimum pH 6.5 to 7.0.

Aerobic.

Distinctive characters: Differs from *Pseudomonas coronafaciens* in that the cells are somewhat smaller and the pathogen produces a streak on oat blades instead of a halo spot.

Source: Forty cultures isolated from oats gathered in various parts of America.

Habitat: Pathogenic on cultivated oats, and to a slight degree, on barley.

67. **Pseudomonas tomato** (Okabe) *comb. nov.* (*Bacterium tomato* Okabe, Jour. Soc. Trop. Agr. Formosa, *5*, 1933, 32; *Phytomonas tomato* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 422.) Named for the host plant, tomato.

Probable synonym: *Bacterium punctulans* Bryan, Phytopath., *23*, 1933, 897.

Rods: 0.69 to 0.97 by 1.8 to 6.8 microns. Motile with 1 to 3 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Slow liquefaction.

Beef-extract agar colonies: White, circular, flat and glistening.

Broth: Turbid in 24 hours. Pellicle.

Milk: Becomes alkaline and clears.

Nitrites are usually produced from nitrates.

Indole not produced.

No H_2S produced.

Acid but not gas from glucose, sucrose and lactose. No acid from maltose and glycerol.

Starch hydrolysis feeble.

Slight growth in 3 per cent salt.

Optimum temperature 20° to 25°C. Maximum 33°C.

Aerobic.

Source: Isolated from diseased tomato leaves.

Habitat: Pathogenic on tomato, *Lycopersicon esculentum*.

68. **Pseudomonas aceris** (Ark) Burkholder. (*Phytomonas aceris* Ark, Phytopath., *29*, 1939, 969; Burkholder, Phytopath., *32*, 1942, 601.) From Latin *acer*, maple; M.L. *Acer*, generic name.

Rods: 0.3 to 0.8 by 0.8 to 2.5 microns. Motile with 1 to 2 polar flagella. Gram-negative.

Green fluorescent pigment produced.

Gelatin: Liquified.

Beef-extract-peptone agar: Colonies are grayish-white. Appearing in 24 hours.

Broth: Turbid.

Milk: Clearing with no coagulation.

Nitrites not produced from nitrates.

Indole not produced.

Hydrogen sulfide not produced.

Acid from glucose, fructose, galactose, arabinose, xylose, sucrose, maltose, lactose, raffinose, mannitol, glycerol and dulcitol.

Slight growth in broth plus 6 per cent salt (Burkholder).

Temperature: 13° to 31°C.

Source: From diseased leaves of the large leaf maple, *Acer macrophillum*.

Habitat: Causes a disease of *Acer spp.*

69. **Pseudomonas angulata** (Fromme and Murray) Holland. (*Bacterium angulatum* Fromme and Murray, Jour. Agr. Res., *16*, 1919, 219; Holland, Jour. Bact., *5*, 1920, 224; *Phytomonas angulata* Bergey

et al., Manual, 3rd ed., 1930, 267.) From L. *angulatus*, referring to the type of lesion produced on the tobacco leaf.

Description taken from Clara (Cornell Agr. Exp. Sta. Mem. 159, 1934, 24).

Rods: 0.75 to 1.5 by 1.5 to 3.0 microns. Motile by 1 to 6 polar flagella. Gram-negative.

Gelatin: Liquefaction.

Green fluorescent pigment produced.

Beef-extract agar colonies: Dull white, circular, raised, smooth and glistening.

Broth: Turbid in 36 hours and greenish.

Milk: Alkaline.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Lipolytic action negative (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, galactose, fructose, mannose, arabinose, xylose, sucrose and mannitol. Alkaline reaction from salts of citric, malic, succinic and tartaric acid. Rhamnose, maltose, lactose, raffinose, glycerol, salicin, and acetic, lactic and formic acids are not fermented.

Starch not hydrolyzed.

Slight growth in broth plus 5 to 6 per cent salt (Burkholder).

Facultative anaerobe.

Distinctive characters: Braun (Phytopath., *27*, 1937, 283) considers this species to be identical in culture with *Pseudomonas tabaci*, but they differ in the type of disease they produce.

Sources: Isolated by Fromme and Murray from small angular leaf spots on tobacco.

Habitat: Causes the angular leaf spot of tobacco (*Nicotiana tabacum*).

70. **Pseudomonas aptata** (Brown and Jamieson) Stevens. (*Bacterium aptatum* Brown and Jamieson, Jour. Agr. Res., *1*, 1913, 206; *Phytomonas aptata* Bergey et al., Manual, 1st ed., 1923, 184; Stevens, Plant Disease Fungi, New York, 1925, 22.) From Latin *aptatus* adapted.

Rods: 0.6 to 1.2 microns. Motile with bipolar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar slants: Moderate growth along streak, filiform, whitish, glistening.

Broth: Turbid: A pellicle formed.

Milk: Becomes alkaline and clears.

Nitrites not produced from nitrates.

Indole not produced in 10 days. Slight amount found later.

No H_2S produced.

Acid from glucose, galactose and sucrose. No acid from lactose, maltose and mannitol (Paine and Banfoot, Ann. Appl. Biol., *11*, 1924, 312).

Starch not hydrolyzed.

Slight growth in broth plus 7 per cent salt (Burkholder).

Optimum temperature 27° to 28°C. Maximum 34° to 35°C. Minimum below 1°C.

Aerobic.

Source: Isolated from diseased nasturtium leaves from Virginia and diseased beet leaves from Utah.

Habitat: Pathogenic on sugar beets, nasturtiums, and lettuce.

71. **Pseudomonas primulae** (Ark and Gardner) Starr and Burkholder. (*Phytomonas primulae* Ark and Gardner, Phytopath., *26*, 1936, 1053; Starr and Burkholder, Phytopath., *32*, 1942, 601.) From L. *primulus*, first; M.L. *Primula*, a generic name.

Rods: 0.51 to 0.73 by 1.0 to 3.16 microns. Motile with a polar flagellum. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar colonies: Round, convex, smooth, glistening, yellowish.

Milk: Coagulated.

Nitrites not produced from nitrates.

Indole not produced. No H_2S produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, lactose, sucrose, maltose, galactose, arabinose,

glycerol, dulcitol and mannitol. Starch not hydrolyzed.

Growth in broth plus 5 per cent salt.

Optimum temperature 19° to 22°C. Maximum 34°C. Minimum 10°C.

Optimum pH 6.8 to 7.0. Minimum 4.5 to 5.0.

Facultative anaerobe.

Source: Isolated from leaf-spot of *Primula polyantha*.

Habitat: Pathogenic on *Primula spp.*

72. **Pseudomonas viridilivida** (Brown) Holland. (*Bacterium viridilividum* Brown, Jour. Agr. Res., *4*, 1915, 475; Holland, Jour. Bact., *5*, 1920, 225; *Phytomonas viridilivida* Bergey et al., Manual, 1st ed., 1923, 187.) From Latin, *viridis*, green; *lividus*, blue.

Rods: 1.0 to 1.25 by 1.25 to 3.0 microns. Motile with 1 to 3 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Slow liquefaction.

Beef agar colonies: Cream white, round, smooth, translucent, edges entire.

Broth: Turbid, becomes lime green.

Milk: Alkaline and clears.

Nitrites not produced from nitrates.

Indole is produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid from glucose and sucrose (Burkholder).

Grows well in 4.5 per cent salt. Grows in 7 per cent salt (Burkholder).

Maximum temperature 34.5°C. Minimum 1.5°C.

Aerobic.

Source: Isolated from diseased lettuce from Louisiana.

Habitat: Pathogenic on lettuce, *Lactuca sativa*.

73. **Pseudomonas delphinii** (Smith) Stapp. (*Bacillus delphini* Smith, Science, *19*, 1904, 417; *Bacterium delphinii* Bryan, Jour. Agr. Res., *28*, 1924, 261; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 106; *Phytomonas delphinii* Bergey et al., Manual, 3rd ed., 1930, 261.) From Latin, *delphin*, a dolphin; M.L. *Delphinium*, a generic name.

Rods: 0.6 to 0.8 by 1.5 to 2.0 microns. Chains present. Motile with 1 to 6 polar flagella. Capsules. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquified.

Beef agar slants: Growth thin, smooth, shining, transparent, margins entire, crystals. Agar becomes dark brown.

Broth: Turbid in 24 hours with delicate pellicle.

Milk: Becomes alkaline and clears.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Lipolytic action negative (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid from glucose, galactose and fructose; slightly acid from sucrose. No acid from lactose, maltose, glycerol and mannitol.

Starch: Hydrolysis feeble.

Weak growth in broth plus 4 per cent salt.

Optimum pH 6.7 to 7.1. pH range 5.6 to 8.6.

Optimum temperature 25°C. Maximum 30°C. Minimum 1°C. or less.

Source: Isolated from black spot of delphinium.

Habitat: Pathogenic on delphinium causing a black spot in the leaves.

74. **Pseudomonas berberidis** (Thornberry and Anderson) Stapp. (*Phytomonas berberidis* Thornberry and Anderson, Jour. Agr. Res., *43*, 1931, 36; Stapp, Bot. Rev., *1*, 1935, 407; *Bacterium berberidis* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 153.) From M.L. *Berberis*, barberry, generic name.

Rods: 0.5 to 1.0 by 1.5 to 2.5 microns, occurring singly or in pairs. Motile with 2 to 4 polar flagella. Capsules present.

Gram-negative (Burkholder); not Gram-positive as stated in original description.

Green fluorescent pigment produced in culture (Burkholder).

Gelatin: Not liquefied.

Glucose agar slants: Growth moderate, filiform at first, later beaded, raised, smooth, white. Butyrous in consistency.

Milk: Becomes alkaline. No other change.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid from glucose, galactose, and sucrose. Maltose and rhamnose not utilized (Burkholder).

No gas from carbohydrates.

Starch not hydrolyzed.

Optimum temperature 18°C. Maximum 30°C. Minimum 7°C.

Aerobic.

Sources: Repeated isolations from leaves and twigs of barberry.

Habitat: Pathogenic on barberry, *Berberis thunbergerii* and *B. vulgaris*.

75. Pseudomonas coronafaciens (Elliott) Stapp. (*Bacterium coronafaciens* Elliott, Jour. Agr. Res., *19*, 1920, 153; *Phytomonas coronafaciens* Bergey et al., Manual, 1st ed., 1923, 180; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 20.) From L. *corona*, halo; *faciens*, producing, referring to the lesions on oat blades.

Probable synonyms: Elliott (Bact. Plant Pathogens, 1930, 122) lists as synonyms, *Bacillus avenae* (Russell, Johns Hopkins Univ. Thesis, 1892) and *Bacillus avenae* Manns and *Pseudomonas avenae* Manns (Ohio Agr. Exp. Sta. Bul. 210, 1909, 133; *Phytomonas avenae* Bergey et al., Manual, 3rd ed., 1930, 263).

Rods: 0.65 by 2.3 microns, occurring in chains. Motile with polar flagella. Capsules. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Slow liquefaction.

Nutrient agar colonies: White, becoming irregularly circular, flat with raised margins.

Broth: Slight turbidity in 24 hours. Heavy pellicle formed.

Milk: Alkaline. A soft curd formed followed by clearing. Curd sometimes absent.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but no gas from glucose and sucrose. Starch hydrolysis slight.

Slight growth in broth plus 2 per cent salt.

Optimum temperature 24° to 25°C. Maximum 31°C. Minimum 1°C.

Source: Numerous isolations from blighted blades of oats.

Habitat: Causes a halo spot on oats (*Avena sativa*). Artificial inoculations show barley (*Hordeum vulgare*), rye (*Secale cereale*) and wheat (*Triticum aestivum*) to be susceptible.

75a. *Pseudomonas coronafaciens* var. *atropurpurea* (Reddy and Godkin) Stapp. (*Bacterium coronafaciens* var. *atropurpureum* Reddy and Godkin, Phytopath., *13*, 1923, 81; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 39; *Phytomonas coronafaciens* var. *atropurpurea* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 371.) From L. *ater*, black, dark; *purpureus*, purple, referring to the color of the lesion on brome grass.

Distinctive characters: This variety differs from *Pseudomonas coronafaciens* in that it infects the brome-grass, *Bromus inermis*, where it produces a water soaked spot which is dark purple in color.

Source: Numerous isolations from diseased brome-grass.

Habitat: Pathogenic on *Bromus inermis* and *Agropyron repens*. Has been artificially inoculated on oats, *Avena sativa*.

76. **Pseudomonas lachrymans** (Smith and Bryan) Carsner. (*Bacterium lachrymans* Smith and Bryan, Jour. Agr. Res., *5*, 1915, 466; Carsner, Jour. Agr. Res., *15*, 1918, 15; *Bacillus lachrymans* Holland, Jour. Bact., *5*, 1920, 218; *Phytomonas lachrymans* Bergey et al., Manual, 1st ed., 1923, 184.) From Latin, causing tears, probably referring to the opaque drops formed on the lesion caused by this pathogen.

Synonym: Elliott (Man. Bact. Plant Pathogens, 1930, 147) lists the following as a synonym: *Bacillus burgeri* Potebnia, Khartov Prov. Agr. Exp. Sta., *1*, 1915, 37.

Description from Smith and Bryan (*loc. cit.*) and Clara (Cornell Agr. Exp. Sta. Mem. 159, 1934, 26).

Rods: 0.8 by 1 to 2 microns. Motile with 1 to 5 polar flagella. Capsules. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefied.

Beef-peptone agar colonies: Circular, smooth, glistening, transparent, whitish, entire margins.

Broth: Turbid in 24 hours. White precipitate with crystals.

Milk: Turns alkaline and clears.

Nitrites not produced from nitrates.

Indole reaction weak.

No H_2S produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, fructose, mannose, arabinose, xylose, sucrose and mannitol. Alkaline reaction from salts of citric, malic and succinic acid. Maltose, rhamnose, lactose, raffinose, glycerol and salicin not fermented (Clara, *loc. cit.*).

Starch partially digested. Not digested (Clara, *loc. cit.*).

Growth in 3 per cent salt after 12 days. No growth in 4 per cent salt.

Optimum temperature 25° to 27°C. Maximum 35°C. Minimum 1°C.

Aerobic. Facultative anaerobe (Clara, *loc. cit.*).

Source: Isolated from diseased cucumber leaves collected in New York, Wisconsin, Indiana and in Ontario, Canada.

Habitat: Pathogenic on cucumber, *Cucumis sativus*, and related plants.

77. **Pseudomonas maculicola** (McCulloch) Stevens. (*Bacterium maculicolum* McCulloch, U. S. Dept. Agr., Bur. Plant Ind. Bul., *225*, 1911, 14; Stevens, The Fungi which cause Plant Diseases, 1913, 28; *Phytomonas maculicola* Bergey et al., Manual, 1st ed., 1923, 189; *Bacterium macculIochianum* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 77.) From L. *maculus*, spot; *-cola*, dweller.

Rods: 0.9 by 1.5 to 3 microns. Filaments present. Motile with 1 to 5 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefied.

Beef-peptone agar colonies: Whitish, circular, shining, translucent, edges entire.

Broth: Turbid. No ring or pellicle.

Milk: Becomes alkaline and clears.

Nitrites not produced from nitrates.

Indole production feeble.

No H_2S formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid from glucose, galactose, xylose, sucrose, glycerol, and mannitol. Alkaline reaction from salts of citric, malic, malonic, and succinic acid. Salicin, maltose, and salts of hippuric and tartaric not utilized (Burkholder).

Slight growth in broth plus 4 per cent salt (Erw. Smith, Bact. Plant Diseases, 1920, 306).

Aerobic.

Optimum temperature 24° to 25°C. Maximum 29°C. Minimum 0°C.

Source: Isolated from diseased cauliflower leaves from Virginia.

Habitat: Pathogenic on cauliflower and cabbage.

Note: *Bacterium maculicola* var. *japonicum* Takimoto, Bul. Sci. Fak. Terkult

Kjusu Imp. Univ., *4*, 1931, 545 has not been seen.

78. **Pseudomonas marginata** (McCulloch) Stapp. (*Bacterium marginatum* McCulloch, Science, *54*, 1921, 115; Jour. Agr. Res., *29*, 1924, 174; *Phytomonas marginata* Bergey et al., Manual, 1st ed., 1923, 188; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 56.) From L. *marginatus*, having a border, probably refers to the definite margin of the colony.

Rods: 0.5 to 0.6 by 0.8 to 1.8 microns. Motile with 1 to 4 bipolar flagella. Capsules. Gram-negative.

Green fluorescent pigment produced in Uschinsky's and Fermi's solutions.

Gelatin: Liquefied.

Agar colonies: White, circular, smooth, translucent, viscid, with definite margins at first thin but later thick and contoured. Surface wrinkled.

Milk: At first slightly acid, then alkaline. Casein digested.

Nitrites not produced from nitrates.

Indole production slight.

Hydrogen sulfide production slight.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, lactose, sucrose and glycerol.

Starch hydrolysis feeble.

Growth in 3.5 per cent salt. No growth in 4 per cent salt. pH range, 4.6 to 9.1.

Optimum temperature 30° to 32°C. Maximum 40°C. Minimum 8° to 9°C.

Source: Repeatedly isolated from diseased gladiolus.

Habitat: Pathogenic on *Gladiolus spp.* and *Iris spp.*

79. **Pseudomonas medicaginis** Sackett. (Sackett, Science, *31*, 1910, 553; also Colorado Agr. Exp. Sta., Bull. 158, 1910, 11; *Bacillus medicaginis* Holland, Jour. Bact., *5*, 1920, 219; *Phytomonas medicaginis* Bergey et al., Manual, 1st ed., 1923, 179; *Bacterium medicaginis* Elliott, Bact. Plant Path., 1930, 162.) From L. *medica*, ancient Media; M.L. *Medicago*, a generic name.

Rods: 0.7 by 1.2 microns. Motile with 1 to 4 flagella. Filaments present. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Not liquefied.

Nutrient agar colonies: Growth in 24 hours whitish, glistening.

Broth: Turbid in 24 hours. Pellicle formed. Viscid sediment.

Milk: Becomes alkaline. No change.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Starch not hydrolyzed.

No gas from carbohydrates. Acid from sucrose.

Slight growth in broth plus 3.75 per cent salt.

Optimum temperature 28° to 30°. Maximum 37.5°C.

Aerobic.

Source: Isolated from brown lesions on leaves and stems of alfalfa.

Habitat: Pathogenic on alfalfa, *Medicago sp.*

79a. **Pseudomonas phaseolicola** (Burkholder) Dowson. (*Phytomonas medicaginis* var. *phaseolicola* Burkholder, Phytopath., *16*, 1926, 915; *Bacterium medicaginis* var. *phaseolicola* Link and Hull, Bot. Gaz., *83*, 1927, 413; *Pseudomonas medicaginis* var. *phaseolicola* Stapp and Kotte, Nachrichtenb. f. d. Deutschen Pflanzenschutzdienst, *9*, 1929, 35; Dowson, Brit. Mycol. Soc. Trans., *26*, 1943, 10.) From L. *phaseolus*, bean; M.L. *Phaseolus*, a generic name;-*cola*, dweller.

Synonym: *Bacterium puerariae* Hedges. (Phytopath., *17*, 1927, 48 and *20*, 1930, 140; *Phytomonas puerariae* Bergey et al., Manual, 3rd ed., 1930, 267.)

Description from Burkholder and Zaleski (Phytopath., *22*, 1932, 85).

Rods: 1 by 2 microns, sometimes slightly curved, filaments present. Motile with polar flagellum. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin stab: Slow liquefaction.

Beef extract agar: Whitish, circular colonies, 2 mm. in diameter. Edges entire.

Broth: Turbid.

Milk: Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide not formed.

Not lipolytic (Starr and Burkholder, Photopath., *32*, 1942, 601).

Acid but no gas from glucose, fructose, mannose, arabinose, xylose, sucrose and glycerol. No acid from rhamnose, lactose, maltose, mannitol and salicin. Alkali from salts of citric and malic acids, but not from acetic, formic, lactic or tartaric acids. Starch and cellulose not hydrolyzed.

Slight growth in broth plus 4 per cent salt.

Optimum temperature 20° to 23°C. Maximum 33°C. Minimum 2.5°C. (Hedges, *loc. cit.*).

Optimum pH 6.7 to 7.3. Maximum 8.8 to 9.2. Minimum 5.0 to 5.3. (Kotte, Phyt. Zeitsch., *2*, 1930, 453.)

Microaerophilic.

Source: Isolated from leaves, pod and stem of beans showing halo blight.

Habitat: Pathogenic on beans (*Phaseolus vulgaris*), the kudzu vine (*Pueraria hirsuta*) and related plants.

80. **Pseudomonas pisi** Sackett. (Sackett, Colorado Agr. Exp. Sta., Bull. 218, 1916, 19; *Bacterium pisi* Erw. Smith, An Introduction to Bacterial Diseases of Plants, 1920, 474; *Phytomonas pisi* Bergey et al., Manual, 1st ed., 1923, 181.) From Gr. *pisum*, the pea; M.L. *Pisum*, a generic name.

Rods: 0.68 to 2.26 microns. Motile with a polar flagellum. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar slants: Moderate growth in 24 hours, filiform, glistening, grayish-white.

Broth: Turbid with a scum in 5 days.

Milk: Alkaline, soft curd, clears.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, galactose and sucrose.

Starch not hydrolyzed.

Optimum temperature 27° to 28°C. Maximum 37.5°C. Minimum 7°C.

Aerobic.

Source: Ten cultures isolated from 5 collections of diseased peas showing water soaked lesions on stems and petioles.

Habitat: Pathogenic on garden peas, *Pisum sativum* and field peas, *P. sativum* var. *arvense*.

81. **Pseudomonas syringae** van Hall. (Kennis der Bakter. Pflanzenziekte, Inaug. Diss., Amsterdam, 1902, 191; *Bacterium syringae* Erw. Smith, Bacteria in Relation to Plant Diseases, *1*, 1905, 63; *Phytomonas syringae* Bergey et al., Manual, 3rd ed., 1930, 257.) From Latin, *syringa*, a nymph that was changed into a reed; M.L. *Syringa*, a generic name.

Synonyms: Bryan (Jour. Agr. Res., *36*, 1928, 225) lists *Bacterium citriputeale* C. O. Smith, Phytopath., *3*, 1913, 69, and *Bacterium citrarefaciens* Lee, Jour. Agr. Res., *9*, 1917, 1 (*Pseudomonas citrarefaciens* Stapp, in Sorauer, Handb. d. Pflanzenkrankheiten, *2*, 5 Aufl., 1928, 190). Clara (Cornell Agr. Exp. Sta. Mem. 159, 1934, 29) lists *Bacterium vignae* (*Pseudomonas vignae*) Gardner and Kendrick, Science, *57*, 1923, 275 (*Phytomonas vignae* Bergey et al., Manual, 1st ed., 1923, 188), *Pseudomonas viridifaciens* Tisdale and Williamson, Jour. Agr. Res., *25*, 1923, 141 (*Bacterium viridifaciens* Tisdale and Williams, *ibid.*; *Phytomonas*

viridifaciens Bergey et al., Manual, 2nd ed., 1925, 208), and *Phytomonas vignae* var. *leguminophila* Burkholder, Cornell Agr. Exp. Sta. Mem. 127, 1930, 51. Wilson (Phytopath., *30*, 1940, 27) lists *Phytomonas cerasi* (Griffin) Bergey et al. (*Pseudomonas cerasus* Griffin, Science, *34*, 1911, 615; *Bacillus cerasus* Holland, Jour. Bact., *5*, 1920, 217; Bergey et al., Manual, 3rd ed., 1930, 262; *Bacterium cerasi* Elliott, Bact. Plant Pathogens, 1930, 109.) This would include, therefore the following synonyms which have been listed for *Phytomonas cerasi*. Clara (Cornell Agr. Exp. Sta. Mem. 159, 1934, 25) lists *Bacterium trifoliorum* Jones et al. (Jour. Agr. Res., *25*, 1923, 471; *Phytomonas trifoliorum* Burkholder, Phytopath., *16*, 1926, 922; *Pseudomonas trifoliorum* Stapp, in Sorauer, Handb. d. Pflanzenkrankheiten, *2*, 5 Aufl., 1928, 177) and *Bacterium holci* Kendrick (Phytopath., *16*, 1926, 236; *Pseudomonas holci* Kendrick, *ibid.*; *Phytomonas holci* Bergey et al., Manual, 3rd ed., 1930, 258). Wilson (Hilgardia, *10*, 1936, 213) lists *Pseudomonas prunicola* Wormald (Ann. Appl. Biol., *17*, 1930, 725), *Pseudomonas cerasi* var. *prunicola* Wilson (Hilgardia, *8*, 1933, 83), *Bacterium citriputeale* C. O. Smith (Phytopath., *4*, 1913, 69; *Pseudomonas citriputealis* Stapp, in Sorauer, Handb. d. Pflanzenkrankheiten, *2*, 5 Aufl., 1928, 190; *Phytomonas citriputealis* Bergey et al., Manual, 3rd ed., 1930, 278) and *Pseudomonas utiformica* Clara, Science, *75*, 1932, 111 (*Phytomonas utiformica* Clara, Cornell Agr. Exp. Sta. Mem. 159, 1934, 29; *Bacterium utiformica* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 444). A probable synonym is *Phytomonas spongiosa* (Aderhold and Ruhland) Magrou (*Bacillus spongiosus* Aderhold and Ruhland, Cent. f. Bakt., II Abt., *15*, 1905, 376; *Pseudomonas spongiosa* Braun, Die Landwirtschaft, 41, 42, 1927, 2 pp.; *Bacterium spongiosum* Elliott, Man. Bact. Plant Pathogens, 1930, 214; Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 414). C. O. Smith (Phytopath., *33*, 1943, 82) lists the following as a synonym: *Pseudomonas hibisci* (Nakata and Takimoto) Stapp (*Bacterium hibisci* Nakata and Takimoto, Ann. Phytopath. Soc. Japan, *1*, 5, 1923, 18; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, 5 Aufl., *2*, 1928, 203; *Phytomonas hibisci* Bergey et al., Manuals 3rd ed., 1930, 264).

Description from Clara (*loc. cit.*).

Rods: 0.75 to 1.5 by 1.5 to 3.0 microns. Motile with 1 or 2 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Beef-extract agar colonies: Circular, grayish-white with bluish tinge. Surface smooth. Edges entire or irregular.

Broth: Turbid in 36 hours. No pellicle.

Milk: Alkaline.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Slight growth in broth plus 4 per cent salt.

Acid but not gas from glucose, galactose, mannose, arabinose, xylose, sucrose, mannitol and glycerol. Alkaline reaction from salts of citric, malic, succinic and lactic acid. Rhamnose, maltose, lactose, raffinose, salicin, and acetic, formic and tartaric acid not fermented.

Starch not hydrolyzed.

Facultative anaerobe.

Source: Van Hall originally isolated the pathogen from lilac.

Habitat: Pathogenic on lilac, citrus, cow peas, beans, lemons, cherries and many unrelated plants.

81a. Orsini reports the following as a variety—*Bacterium syringae* var. *capsici* Orsini. (Intern. Bull. Plant Prot., *33*, 1942, 33.) Pathogenic on the pepper plant (*Capsicum*).

82. **Pseudomonas atrofaciens (McCulloch) Stevens.** (*Bacterium atrofaciens*

McCulloch, Jour. Agr. Res., *18*, 1920, 549; *Phytomonas atrofaciens* Bergey et al., Manual, 1st ed., 1923, 185; Stevens, Plant Disease Fungi, New York, 1925, 22.) From Latin, *ater*, black; *faciens*, making, referring to the color of the lesion on wheat.

Rods: 0.6 by 1 to 2.7 microns. Long chains formed in culture. Capsules present. Motile with 1 to 4 polar or bipolar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefied.

Beef-peptone-agar colonies: Circular, shining, translucent, white.

Broth: Growth never heavy, slight rim, and a delicate pellicle.

Milk: Becomes alkaline and clears.

Nitrites not produced from nitrates.

Indole: Slight production.

Hydrogen sulfide: Slight production.

Acid and no gas from glucose, galactose and sucrose.

Starch is slightly hydrolyzed.

Optimum temperature 25° to 28°C. Maximum 36° to 37°C and minimum below 2°C.

Aerobic.

Sources: Isolated from diseased wheat grains collected throughout United States and Canada.

Habitat: Causes a basal glume-rot of wheat.

83. **Pseudomonas cumini** (Kovacevski) Dowson. (*Phytomonas cumini* Kovacevski, Bull. Soc. Bot. Bulgarie, *7*, 1936, 27; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 10.) From Greek *cuminum*, cumin; M.L. *Cuminum*, a generic name.

Rods: 0.5 to 0.7 by 1 to 3 microns, occurring in chains and filaments. Motile with 1 to 3 polar flagella. Gram-negative.

Green fluorescent pigment formed in culture.

Gelatin: Rapidly liquefied.

Potato agar colonies: Grayish-white, circular, glistening, smooth, butyrous.

Broth: Moderate turbidity. Pseudozoogloea.

Milk: Not coagulated. Casein peptonized.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Acid but not gas from glucose and sucrose. No acid from lactose or glycerol. Starch not hydrolyzed.

Temperature range 5°C to 31°C.

Aerobic.

Source: Isolated from blighted cumin (*Cuminum*).

Habitat: Pathogenic on cumin and dill.

84. **Pseudomonas desaiana** (Burkholder) *comb. nov.* (*B. pyocyaneus saccharum* Desai, Ind. Jour. Agr. Sci., *5*, 1935, 391; *Phytomomas desaiana* Burkholder, in Bergey et al., Manual, 5th ed., 1939, 174.) Named for Desai who first isolated the species.

Rods: 0.6 to 1.2 by 1.2 to 2.2 microns. Motile with a polar flagellum. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar colonies: Grayish-blue. Raised.

Broth: Light clouding. Pellicle.

Milk: Peptonized without coagulation.

Nitrites not produced from nitrates.

Indole not formed.

Glucose, sucrose, lactose and glycerol fermented without gas.

Starch: Hydrolysis present.

Optimum temperature 30°C.

Aerobic.

Source: Isolated from stinking rot of sugar cane in India and associated with a white non-pathogenic bacterium.

Habitat: Pathogenic on sugar cane, *Saccharum officinarum*.

85. **Pseudomonas erodii** Lewis. (Phytopath., *4*, 1914, 231; *Bacterium erodii* Lewis, *ibid.*; *Phytomonas erodii* Bergey et al., Manual, 3rd ed., 1930, 256.) From Greek, *erodius*, heron; M.L. *Erodium*, a generic name.

Rods: 0.6 to 0.8 by 1.2 to 1.8 microns.

Motile with 1 to 3 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar stroke: Heavy, smooth, cream-colored growth in 24 hours.

Broth: Dense clouding in 24 hours.

Milk: Turns alkaline and clears, litmus reduced.

Nitrites not produced from nitrates.

Indole produced in 14 days.

No H_2S produced.

Acid but not gas from glucose, sucrose, lactose and glycerol.

Temperature: No growth at 35°C.

Aerobic, obligate.

Source: Isolations from *Erodium texanum* and 4 varieties of *Pelargonium*.

Habitat: Causes a leaf spot of *Erodium texanum* and *Pelargonium spp.*

86. **Pseudomonas apii** Jagger. (Jagger, Jour. Agr. Res., *21*, 1921, 186; *Phytomonas apii* Bergey et al., Manual, 1st ed., 1923, 184; *Pseudomonas jaggeri* Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Aufl., 1928, 210; *Bacterium jaggeri* Elliott, Bacterial Plant Pathogens, 1930, 142; *Phytomonas jaggeri* Magrou, in Handuroy et al., Dict. d. Bact. Path., Paris, 1937, 371.) From Latin, *apium*, parsley, M.L. *Apium*, a generic name.

Description from Clara (Cornell Agr. Exp. Sta. Mem. 159, 1934, 24).

Rods: 0.75 to 1.5 by 1.5 to 3.0 microns. Motile with a polar flagellum. Gram-negative.

Green fluorescent pigment produced in various media.

Gelatin: Liquefaction.

Beef-extract agar colonies: Circular, glistening, smooth, edges entire. Grayish-white with bluish tinge.

Broth: Turbid in 36 hours. Pellicle formed.

Milk: Becomes alkaline. No curd.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Acid but not gas from glucose, galactose, fructose, mannose, arabinose, xylose, sucrose, mannitol and glycerol. Alkaline reaction from salts of acetic, citric, malic and succinic acids. Rhamnose, maltose, lactose, raffinose, salicin, and formic, lactic and tartaric acid are not utilized.

Starch not hydrolyzed.

Facultative anaerobe.

Distinctive characters: Pathogenicity appears limited to celery.

Source: Jagger isolated this repeatedly from diseased celery leaves.

Habitat: Pathogenic on celery, *Apium graveolens*.

87. **Pseudomonas matthiolae** (Briosi and Pavarino) Dowson. (*Bacterium matthiolae* Briosi and Pavarino, Atti della Reale Accad. dei Lincei Rend., *21*, 1912, 216; *Phytomonas matthiolae*, Bergey et al., Manual, 3rd ed., 1930, 266; Mushin, Proc. Roy. Soc. Victoria, *53*, 1941, 201; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 10.) From M.L. *Matthiola*, a generic name.

Rods: 0.4 to 0.6 by 2 to 4 microns. Gram-positive. Gram-negative (Mushin, *loc. cit.*).

Green fluorescent pigment produced in culture.

Gelatin: Liquefied.

Beef agar colonies: White, circular colonies, slightly elevated, margins smooth.

Broth: Slightly turbid. Becomes pale green.

Milk: Coagulation with acid react on.

Nitrites produced from nitrates (Mushin).

Hydrogen sulfide not formed.

Acid from glucose, galactose, fructose, mannose, rhamnose, glycerol, mannitol, acetic acid, citric acid, formic acid, lactic acid, malic acid, and succinic acid. Feeble acid in maltose. No acid: no gas in lactose, sucrose, raffinose, starch, salicin, and tartaric acid (Mushin).

Optimum temperature 20 to 24°C.

Maximum temperature 38.5 C. Minimum below 0°C. (Mushin).

Limits of growth in broth are pH 4.4 to pH 9.5 (Mushin).

Aerobic.

Source: Isolated from vascular and parenchymatic disease of stocks, *Matthiola incana* var. *annua*.

Habitat: Pathogenic on stocks.

NOTE: Burkholder (Phytopath., *28*, 1938, 936) and Santarelli (Rev. di Pat. Veg., *29*, 1939, 364) consider this species a synonym of *Pseudomonas syringae*. Adam and Pugsley (Jour. Dept. Agric. Victoria, *32*, 1934, 306) give a description of a green fluorescent pathogen on stocks which is similar to *Pseudomonas syringae*. Mushin (*loc. cit.*) considers *Pseudomonas matthiolae* to be a distinct species.

88. **Pseudomonas mors-prunorum** Wormald. (Jour. Pom. and Hort. Sci., *9*, 1931, 251; *Phytomonas mors-prunorum* Wormald, Trans. Brit. Mycol. Soc., *17*, 1932, 169; *Bacterium mors-prunorum*, *ibid.*) From L. *mors*, death; *prunus*, plums.

Rods: Motile with a polar flagellum. Gram-positive (1931). Gram-negative (1932).

Note: Possibly a green fluorescent organism since it produces a faint yellow color in Uschinsky's solution.

Gelatin: Liquefaction.

Agar colonies: White.

Broth plus 5 per cent sucrose: White and cloudy.

Nitrites not produced from nitrates.

Acid but not gas from glucose, lactose, sucrose and glycerol.

Starch not hydrolyzed.

Strict aerobe.

Distinctive characters: Differs from *Pseudomonas prunicola* (*Pseudomonas syringae*) in that it produces a white cloudy growth in broth plus 5 per cent sucrose; a rapid acid production in nutrient agar plus 5 per cent sucrose, and a faint yellow or no color in Uschinsky's solution.

Source: Isolated from cankers on plum trees in England.

Habitat: Pathogenic on *Prunus spp.*

89. **Pseudomonas rimaefaciens** Koning. (Chron. Bot., *4*, 1938, 11; Meded. Phytop. Labor, Willie Comm. Scholt., *14*, 1938, 24.) From L. *rima*, fissure; *faciens*, producing.

Rods: 0.6 to 2.4 microns in length. Motile with 1 to 3 polar flagella. Gram-negative.

Yellow-green fluorescent water-soluble pigment produced in culture.

Gelatin: Liquified.

Agar colonies: Round, convex, smooth, somewhat granular with hyaline edge.

Broth: Turbid. Surface growth with a sediment in a few days.

Milk: Alkaline and clears.

Nitrites not produced from nitrates. Peptone, asparagin, urea, gelatin, nitrates and ammonia salts are sources of nitrogen.

Hydrogen sulfide not produced.

Indole production slight.

Growth with the following carbon sources plus NO_3, glucose, sucrose, glycerol, succinates, malates, citrates and oxalates. Less growth with mannitol, fructose, galactose, lactose, salicylate. Acid is produced from the sugars. No growth with dextrin, inulin, maltose, lactose, rhamnose, salicin, tartrates, acetates, formates.

Starch not hydrolyzed.

Aerobic.

Optimum temperature 25°C. Maximum about 37°C. Very slow growth at 14°C. Thermal death point 42° to 48°C.

Source: Strains of the pathogen isoated from poplar cankers in France and in the Netherlands.

Habitat: Pathogenic on *Populus brabantica*, *P. trichocarpa* and *P. candicans*.

This may be *Pseudomonas syringae* since the characters are the same and both organisms can infect *Impatiens sp.* *Pseudomonas syringae* infects poplars (Elliott, Bacterial Plant Pathogens, 1930, 218).

90. **Pseudomonas papulans** Rose. (Rose, Phytopath., *7*, 1917, 198; *Phytomonas papulans* Bergey et al., Manual, 3rd ed., 1930, 267; *Bacterium papulans* Elliott, Bacterial Plant Pathogens, 1930, 175; *Phytomonas syringae* var. *papulans* Smith, Jour. Agr. Res., *68*, 1944, 294.) From L. *papulans*, forming blisters.

Rods: 0.6 by 0.9 to 2.3 microns. Motile with 1 to 6 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefied.

Broth: Moderate turbidity in 24 hours.

Milk: Alkaline and at times a soft coagulum.

Nitrites not produced from nitrates.

Indole: May or may not be produced.

Acid but not gas formed from glucose and sucrose.

Optimum temperature 25° to 28°C. Maximum 37°C.

Source: Twenty-five cultures isolated from blisters on apples and from rough bark.

Habitat: Pathogenic on apple trees.

91. **Pseudomonas pseudozoogloeae** (Honing) Stapp. (*Bacterium pseudozoogloeae* Honing, Bull. van Het. Deli Proefstation, Medan, *1*, 1914, 7; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 274; *Phytomonas pseudozoogloeae* Bergey et al., 3rd ed., 1930, 261.) From Gr., *pseudo*, false; M. L. *zoogloea*, zooglea.

Rods: 0.7 to 1.5 by 0.9 to 2.5 microns. Chains. Motile with 1 or 2 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar colonies: Round, flat, yellow-gray.

Broth: Moderate turbidity with pseudozoogloea in the pellicle.

Milk: Coagulation. No clearing.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide produced.

Acid but not gas from glucose, lactose, maltose, sucrose and mannitol.

Facultative anaerobe.

Source: Isolated from the black rust of tobacco.

Habitat: Pathogenic on tobacco, *Nicotiana tabacum*.

92. **Pseudomonas tabaci** (Wolf and Foster) Stevens. (*Bacterium tabacum* Wolf and Foster, Science, *46*, 1917, 362; also Jour. Agr. Res., *12*, 1918, 449; *Phytomonas tabaci* Bergey et al., Manual, 1st ed., 1923, 185; Stevens, Plant Disease Fungi, New York, 1925, 34.) From *Nicotiana tabacum*, tobacco.

Rods: 1.2 by 3.3 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Potato agar colonies: Grayish-white, circular, raised, wet-shining, smooth.

Milk: Alkaline; clears.

Nitrites not produced from nitrates.

Indole not formed.

Acid from glucose, galactose, fructose, l-arabinose, xylose, sucrose, pectin, mannitol and glycerol (Braun, Phytopath., *27*, 1937, 289).

Ammonium sulfate, potassium nitrate, cystine, glutamic acid, glycine, succinimide, oxamide, acetamide, and urea can be used as nitrogen source (Braun).

Starch not hydrolyzed. Aerobic.

Distinctive character: Braun (*loc. cit.*) states that *Pseudomonas tabaci* and *Pseudomonas angulata* are identical in culture.

Source: Isolated from wildfire lesions on tobacco leaves in North Carolina.

Habitat: Pathogenic on tobacco, *Nicotiana tabacum*.

93. **Pseudomonas lapsa** (Ark) Burkholder. (*Phytomonas lapsa* Ark, Phytopath., *30*, 1940, 1; Burkholder, *ibid.*, *32*, 1942, 601.) From Latin, *lapsus*, falling, referring to a symptom of the disease.

Rods: 0.56 by 1.55 microns. Motile with 1 to 4 polar flagella.

Produces fluorescence in Uschinsky's Fermi's, and Cohn's solutions.

Gelatin: Liquefied (Burkholder).

Acid but no gas is produced from glucose, sucrose, maltose, lactose, glycerine, arabinose, xylose, galactose, raffinose and mannitol.

Slight growth in broth plus 5 per cent salt (Burkholder).

Source: Isolated from stalk rot of field corn in California; also from *Diabrotica* beetles.

Habitat: Pathogenic on corn and sugar cane.

NOTE: Like *Pseudomonas desiana*.

94. **Pseudomonas bowlesiae** (Lewis and Watson) Dowson. (*Phytomonas bowlesii* Lewis and Watson, Phytopath., *17*, 1927, 511; *Bacterium bowlesii* Elliott, Bacterial Plant Pathogens, 1930, 96; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 9.) From M. L. *Bowlesia*, a generic name.

Rods: 0.5 to 0.7 by 1.2 to 1.6 microns, occurring singly, in pairs or in short chains. Motile with bipolar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefied.

Agar slants: Yellowish, moist, glistening and viscid.

Broth: Uniform turbidity throughout. Heavy viscous sediment in old cultures.

Milk: Alkaline; coagulation, with a slow peptonization.

Nitrites are produced from nitrates.

Indole is produced.

Hydrogen sulfide is produced.

Acid from glucose, maltose and xylose. No acid from sucrose.

Optimum temperature 27°C. Maximum 37°C. Minimum —1°C.

Optimum pH 7.2. pH range 4.5 to 8.6. Aerobic.

Source: Isolated from diseased, water soaked spots of bowlesia.

Habitat: Pathogenic on *Bowlesia septentrionalis*.

95. **Pseudomonas intybi** (Swingle) Stapp. (*Phytomonas intybi* Swingle, Phytopath., *15*, 1925, 730; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 291; *Bacterium intybi* Elliott, Bacterial Plant Pathogens, 1930, 142.) From Latin, *intibus*, endive.

Description from Stapp, Cent. f. Bakt., II Abt., *91*, 1935, 232.

Rods: 0.4 to 0.5 by 1.4 to 2.8 microns. Motile with one to several polar flagella. Gram-negative.

Green fluorescent pigment formed in culture.

Gelatin: Liquefaction.

Agar colonies: White, glistening, transparent.

Broth: Turbid with fragile pellicle, and good sediment.

Milk: Coagulated. Casein not peptonized.

Nitrites are produced from nitrates with the formation of gas.

Indole not formed.

Acid but not gas from arabinose, xylose and glucose. No acid from sucrose.

Optimum temperature 23° to 28°C. Maximum 40° to 42°C. Minimum 0°C.

Distinctive character: Differs from *Pseudomonas cichorii* in that it liquefies gelatin and produces nitrites from nitrates.

Source: Isolated from French endive, *Cichorium intybus* by Swingle, from *C. endiva* and lettuce, *Lactuca sativa* by Stapp.

Habitat: Pathogenic on endive and lettuce, causing a rot.

96. **Pseudomonas marginalis** (Brown) Stevens. (*Bacterium marginale* Brown, Jour. Agr. Res., *13*, 1918, 386; *Phytomonas marginalis* Bergey et al., Manual, 1st ed., 1923, 182; Stevens, Plant Disease Fungi, New York, 1925, 30.) From Latin, *margo* (*marginis*), edge, margin; M.L. *marginalis*, on the margin, a character of the disease.

Description from Brown (*loc. cit.*) and Clara (Cornell Agr. Exp. Sta. Mem. 159, 1934, 27).

Rods: Motile with 1 to 3 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar colonies: Cream-colored to yellowish.

Broth: Turbid, with pellicle.

Milk: Alkaline. Soft curd at times.

Nitrites are produced from nitrates. Not produced (Clara, *loc. cit.*).

Indole not produced.

No H_2S produced.

Acid but not gas from glucose, galactose, fructose, mannose, arabinose, xylose, rhamnose, mannitol and glycerol. Alkali from salts of acetic, citric, malic, formic, lactic, succinic and tartaric acid. Sucrose, maltose, lactose, raffinose and salicin not fermented (Clara, *loc. cit.*).

Starch hydrolysis feeble. None (Clara, *loc. cit.*).

Optimum temperature 25° to 26°C. Maximum 38°C. Minimum 0°C.

Aerobic.

Source: Isolated from marginal lesion on lettuce from Kansas.

Habitat: Pathogenic on lettuce and related plants.

97. **Pseudomonas setariae** (Okabe) *comb. nov.* (*Bacterium setariae* Okabe, Jour. Soc. Trop. Agr. Formosa, *6*, 1934, 63; *Phytomonas setariae* Burkholder, in Bergey, Manual, 5th ed., 1939, 183.) From L. *seta*, bristle; *-arius*, like; M. L. *Setaria*, a generic name.

Rods: 0.4 to 0.8 by 1.8 to 4.4 microns. Motile with a polar, seldom bipolar, flagellum. Gram-negative.

Yellowish water-soluble pigment produced in culture.

Gelatin: Slow liquefaction.

Beef-extract agar colonies: Circular, white, opalescent, smooth, glistening.

Broth: Turbid after 18 hours. Pellicle.

Milk: Alkaline; clears.

Nitrites are produced from nitrates.

Indole is produced.

No H_2S produced.

Acid but not gas from glucose, galactose and glycerol. No acid from lactose, maltose or sucrose.

Starch: Feeble hydrolysis.

Grows in 3 per cent salt.

Optimum temperature 31° to 34°C. Maximum 42°C.

Aerobic.

Source: Isolated from brown stripe of Italian millet.

Habitat: Pathogenic on Italian millet, *Setaria italica*.

98. **Pseudomonas polycolor** Clara. (Clara, Phytopath., *20*, 1930, 704; *Phytomonas polycolor* Clara, *ibid.*, *Bacterium polycolor* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 148.) From Gr. *poly*, many; L. *color*, color.

Note: Delacroix (Comp. rend. Acad. Sci., Paris, *137*, 1903, 454) describes *Bacillus aerogenosus* as being a tobacco pathogen. The organism described by Delacroix might be the same as *Pseudomonas polycolor*. Braun and Elrod (Jour. Bact., *43*, 1942, 40) are of the opinion that Clara's pathogen is *Pseudomonas aeruginosa*.

Description taken from Clara (Cornell Agr. Exp. Sta. Mem. 159, 1934, 28).

Rods: 0.75 to 1.2 by 1.05 to 3.0 microns. Motile with 1 or 2 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Beef-extract agar colonies: Grayish-white, circular, raised, thin transparent margins.

Broth: Turbid in 36 hours with thin pellicle.

Milk: Alkaline; no curd.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, galactose, fructose, mannose, arabinose, xylose, mannitol and glycerol. Alkaline reaction from salts of acetic, citric, malic,

lactic and formic acid. Rhamnose, sucrose, maltose, lactose, raffinose and salicin not fermented.

Starch not hydrolyzed.

Facultative anaerobe.

Good growth in broth plus 7 per cent salt.

Optimum temperature 25° to 30°C. Maximum 37° to 39°C.

Distinctive character: Differs from *Pseudomonas mellea* in type of lesion produced, does not digest starch, nor reduce nitrates and does not form acid from lactose nor sucrose. Pathogenic for laboratory animals (Elrod and Braun, Sci. *94*, 1941, 520).

Source: Repeatedly isolated from leaf spot of tobacco in the Philippines.

Habitat: Pathogenic on tobacco.

99. **Pseudomonas viridiflava** (Burkholder) Clara. (*Phytomonas viridiflava* Burkh., Cornell Agr. Exp. Sta. Mem. 127, 1930, 63; Clara, Science, *75*, 1934, 111; *Bacterium viridiflavum* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 127.) From Latin *viridis*, green; *flavus*, yellow.

Description from Clara (Cornell Agr. Exp. Sta. Mem. 139, 1934, 30).

Rods: 0.75 to 1.5 by 1.5 to 3.15 microns. Motile with 1 or 2 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Beef-extract agar colonies: Grayish-white, margins corrugated, edges irregular.

Broth: Turbid in 36 hours.

Milk: Becomes alkaline and clears.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S produced.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, fructose, mannose, arabinose, xylose, mannitol and glycerol. Alkaline reaction from salts of acetic, citric, malic, lactic and succinic acids. Sucrose, lactose, maltose, raffinose, salicin, and salts of formic and tartaric acids not fermented.

Starch: No hydrolysis.

Growth in broth plus 5 per cent NaCl.

Facultative anaerobe.

Source: Two cultures isolated from spotted beans, one from England and one from Switzerland.

Habitat: Pathogenic on bean, *Phaseolus vulgaris*.

99a. *Pseudomonas viridiflava* var. *concentrica* (Petersen) *comb. nov.* (*Phytomonas viridiflava* var. *concentrica* Petersen, Tridsskr. f. Planteavl., *38*, 1932, 851; *Bacterium viridiflavum* var. *concentricum* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 127.) From M. L. *concentricus*, concentric, referring to the rings on the colonies.

Distinctive characters: Differs from *Pseudomonas viridiflava* in that it does not grow in Uschinsky's solution, and also in the shape of the colonies.

Source: Isolated from the stems and leaves of blighted beans in Denmark.

Habitat: Pathogenic on the bean, *Phaseolus vulgaris*.

100. **Pseudomonas ananas** Serrano. (Serrano, Philipp. Jour. Sci., *55*, 1934, 355; *Phytomonas ananas* and *Bacterium ananas* Serrano, *ibid.* (not to be confused with *Erwinia ananas* Serrano, *ibid.*, *36*, 1928, 271); *Bacterium serranoi* Burgwitz, Bact. Dis. of Plants, Leningrad, 1936.) From Brazilian Indian, *ananas*, pineapple; M.L. *Ananas*, generic name.

Rods: 0.6 by 1.8 microns. Motile with 1 to 4 polar flagella. Gram-negative.

Green fluorescent pigment produced in certain media.

Gelatin: Liquefied.

Beef-extract glucose agar colonies: White, with undulating edges, smooth to rugose, glistening to dull.

Beef-extract agar: Growth scant.

Broth: Feeble growth.

Milk: Becomes alkaline with curd.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Acid but not gas from glucose, xylose and mannitol. Feeble with lactose. No acid with sucrose.

Starch not hydrolyzed.

Optimum temperature 30° to 31°C. Maximum 45°C. Minimum 7° to 10°C.

Aerobic.

Habitat: Causes a rot of pineapples, *Ananas comosus*.

101. **Pseudomonas ligustri** (d'Oliveira) *comb. nov.* (*Bacterium ligustri* d'Oliveira, Revista Agron., *24*, 1936, 434.) From L. *ligustrum*, privet; M. L. *Ligustrum*, a generic name.

Rods: 0.5 to 0.7 by 1.3 to 3 microns. No chains. No capsules. Motile with 2 to 5 polar flagella. Gram-negative.

Green pigment produced on Dox agar, and in broth.

Gelatin: Liquefied.

Beef-extract agar colonies: Growth moderate. Milky white, circular, convex.

Broth: Turbid in 24 hours. No pellicle.

Milk: Coagulated in 6 days, and later digested. Litmus slightly acid.

Nitrites not produced from nitrates.

Indole not produced.

Ammonia not produced.

No gas from carbohydrates. Acid from glucose, galactose, arabinose and mannose. No acid from sucrose, maltose, lactose, raffinose, mannitol and salicin.

Source: From diseased Japanese privet in Lisbon, Portugal.

Habitat: Pathogenic on privet, *Ligustrum japonicum*.

102. **Pseudomonas sesami** Malkoff. (Malkoff, Cent. f. Bakt., II Abt., *16*, 1906, 665; *Bacterium sesami* Nakata, Ann. Phyt. Soc. Japan, *2*, 1930, 242; *Phytomonas sesami* Kovachersky, Ann. Univ. de Sofia, Fac. Agron., *8*, 1930, 464.) From Gr. *sesamum*, sesame; M. L. *Sesamum*, a generic name.

Synonym: Nakata (*loc. cit.*) lists *Bacterium sesamicola* Takimoto, Jour. Plant Protect. Tokyo, *8*, 1927, 433 (*Phytomonas sesamicola* Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 412).

Description from Nakata (*loc. cit.*).

Rods: 0.6 to 0.8 by 1.2 to 3.8 microns. Motile with 2 to 5 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction rapid.

Beef-agar colonies: Circular, flat, striate, smooth, entire margins, white.

Broth: Growth rapid. No pellicle.

Milk: Alkaline. No coagulation.

Nitrites not produced from nitrates.

Indole not produced.

No H_2S produced.

Acid but not gas from glucose. No acid from lactose, sucrose or glycerol.

Starch not hydrolyzed.

Optimum temperature 30°C. Maximum 35°C. Minimum 0°C.

Facultative anaerobe.

Source: Isolated from brown spots on leaves and stems of sesame.

Habitat: Pathogenic on sesame.

103. **Pseudomonas tolaasii** Paine. (Paine, Ann. Appl. Biol., *5*, 1919, 210; *Phytomonas tolaasi* Bergey et al., Manual, 3rd ed., 1930, 259; *Bacterium tolaasi* Elliott, Bacterial Plant Pathogens, 1930, 226.) Named for A. G. Tolaas who first reported the species.

Rods: 0.4 to 0.5 by 0.9 to 1.7 microns. Motile with 1 to 5 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Bouillon agar: Streak develops in 24 hours, dirty bluish-white, wet-shining and slightly raised.

Broth: Turbid in 24 hours. Pellicle.

Milk: Becomes alkaline and clears.

Nitrites not produced from nitrates.

Indole production slight.

Acid but not gas from glucose. No acid from lactose or sucrose.

Starch hydrolysis feeble.

Optimum temperature 25°C.

Source: Isolated in England from brown-spot of cultivated mushrooms.

Habitat: Pathogenic on cultivated mushrooms.

104. **Pseudomonas xanthochlora** (Schuster) Stapp. (*Bacterium xanthochlorum* Schuster, Arbeit. a. d. Kaiserl. Biolog. Anstalt. f. Land. u. Forstw., *8*, 1912, 452; *Phytomonas xanthochlora* Bergey et al., Manual, 1st ed., 1923, 180; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 213.) From Gr. *xanthus*, yellow; *chlorus*, green.

Description from Erw. Smith, Bacteria in Rel. to Plant Dis., *3*, 1914, 272.

Rods: 0.75 to 1.5 by 3.0 microns. Motile with 1 to 3 flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Slow liquefaction.

Agar colonies: Circular, slightly raised, yellow-white.

Broth: Strong clouding in 24 hours. A white pellicle.

Milk: Slow coagulation and clearing.

Nitrites are produced from nitrates.

Indole is produced after 10 days.

Hydrogen sulfide produced slowly.

Acid but not gas from glucose and galactose.

Optimum temperature 27°C. Maximum 44°C. Minimum 2°C.

Source: Isolated from rotting potato tubers in Germany.

Habitat: Pathogenic on potato tubers and a number of unrelated plants.

105. **Pseudomonas rhizoctonia** (Thomas) *comb. nov.* (*Aplanobacter rhizoctonia* Thomas, Ohio Agr. Exp. Sta. Bull. 359, 1922, 211; *Bacterium rhizoctonia* Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 290; *Phytomonas rhizoctonia* Burkholder, Phytopath., *20*, 1930, 7.) From Gr. *rhizo*, root; *ctonus*, murder.

Rods: 0.5 to 0.85 by 1.4 to 1.9 microns. Non-motile. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Nutrient agar colonies: Greenish-yellow, later olive-buff, circular, raised, slightly viscid.

Broth: Turbid, pyrite yellow.

Milk: Alkaline; clears.

Nitrites are produced from nitrates.

Indole reaction very slight.

No H_2S formed.

Starch: Potato starch slightly hydrolyzed.

Growth in 8 per cent salt.

Optimum temperature 25° to 27°C. Maximum 38°C. Minimum 0°C.

Source: Isolated from roots of lettuce showing the rosette disease.

Habitat: Pathogenic on roots of lettuce.

106. **Pseudomonas barkeri** (Berridge) Clara. (Bacillus of pear blossom disease, Barker and Grove, Ann. Appl. Biol., *1*, 1914, 94; Barker and Grove's organism, Doidge, Ann. Appl. Biol., *4*, 1917, 50; *B. barkeri* Berridge, Ann. Appl. Biol., *11*, 1924, 73; *Phytomonas barkeri* Bergey et al., Manual, 3rd ed., 1930, 265; *Bacterium barkeri* Elliott, Bacterial Plant Pathogens, 1930, 95; Clara, Science, *75*, 1934, 11.) Named for B. T. P. Barker who first reported the species.

Description from Doidge (*loc. cit.*).

Rods: 0.5 to 0.8 by 2 to 4 microns. Motile with 1 to 4 polar flagella. Gram-negative (Burkholder), not Gram-positive as stated.

Green fluorescent pigment produced in culture.

Gelatin: Liquefaction.

Agar: Growth is white, feeble, flat, glistening, smooth edged.

Broth: Slightly turbid in 24 hours.

Milk: Slowly cleared.

Nitrites not produced from nitrates.

Indole not formed unless culture warmed.

Starch slowly digested.

Source: Barker made many cultures

from blighted pear blossoms. Doidge received a culture from Barker.

Habitat: Causes a blossom blight of pear.

107. **Pseudomonas gladioli** Severini. (Severini, Annali d. Bot., Rome, *11*, 1913, 420; *Bacterium gladioli* Elliott, Bact. Plant Pathogens, 1930, 132; *Phytomonas gladioli* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 356.) From L. *gladiolus*, a little sword; M. L. *Gladiolus*, a generic name.

Rods: 0.6 by 2.3 to 2.8 microns. Motile with one or more polar flagella. Gram-negative.

A pale yellow water-soluble pigment found, later orange.

Gelatin colonies: Cream-colored, wart-like. Rapid liquefaction.

Milk: Coagulated and slowly peptonized.

Nitrites not produced from nitrates.

Indole not formed.

No gas.

Aerobic.

Optimum temperature 28° to 30°C.

Habitat: Causes a corm rot of gladiolus and other tubers.

108. **Pseudomonas mellea** Johnson. (*Bacterium melleum* Johnson, Jour. Agr. Res., *23*, 1923, 489; Johnson, *loc. cit.*, 489; *Phytomonas mellea* Bergey et al., Manual, 3rd ed., 1930, 254.) From L. *melleus*, of or belonging to honey, the color of the colonies.

Rods: 0.6 by 1.8 microns. Capsules. Motile with 1 to 7 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Liquefied.

Potato - glucose agar: Abundant growth, smooth, glistening, viscid, honey-colored.

Broth: Turbid in 24 hours. Pellicle.

Milk: Alkaline; clears.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Starch hydrolysis feeble.

Growth inhibited by 4 per cent salt.

Optimum temperature, 26° to 28°C. Maximum 36°C.

Facultative anaerobe.

Distinctive character: Differs from *Pseudomonas pseudozoogloeae* in that it produces on tobacco a brown instead of a black spot with a halo, is orange-yellow in culture, and turns milk alkaline.

Source: Isolated from brown rusty spots on tobacco in Wisconsin.

Habitat: Pathogenic on leaves of tobacco, *Nicotiana tabacum*.

109. **Pseudomonas betlis** (Ragunathan) *comb. nov.* (*Bacterium betle* Ragunathan, Ann. Roy. Card., Peradeniya, Ceylon, *11*, 1928, 51; *Aplanobacter betle* Elliott, Bact. Plant Pathogens, 1930, 4; *Phytomonas betlis* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 337.) From Malayan, *betle*, *betel*, a kind of pepper, *Piper betle*.

Rods: 0.5 by 1.5 to 2.5 microns, occurring singly or in short chains. Non-motile. Gram-negative.

Green pigment formed in nutrient gelatin and in broth.

Gelatin: Liquefaction.

Bovril agar colonies: Honey-yellow, circular at first, later echinulate. Raised, smooth and shiny.

Broth: Surface becomes cloudy in 2 days. Pellicle.

No gas from lactose, maltose or sucrose.

Starch is reduced.

Aerobic.

Source: Five cultures isolated from leaf spots on the betel vine.

Habitat: Pathogenic on the betel vine, *Piper betle*.

110. **Pseudomonas panacis** (Takimoto) Dowson. (*Bacterium panaxi* Nakata and Takimoto, Bul. Agr. Sta. Chosen, *5*, 1922, 1; *Phytomonas panaxi* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 389; Dowson, Trans. Brit.

Mycol. Soc., *26*, 1943, 10.) From Gr. *panax* (*panicis*), a plant heal-all; M. L. *Panax*, a generic name.

Description from Elliott, Bact. Plant Pathogens, 1930, 173.

Rods: 0.5 by 1.3 to 1.5 microns. Chains. Motile with 4 to 6 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Slight liquefaction.

Agar colonies: White.

Milk: Coagulated.

No gas from sugars.

Habitat: Causes a root rot of ginseng, *Panax quinquefolium*.

111. **Pseudomonas aleuritidis** (McCulloch and Demaree) Stapp. (*Bacterium aleuritidis* McCulloch and Demaree, Jour. Agr. Res., *45*, 1932, 339; Stapp, Bot. Rev., *1*, 1935, 408; *Phytomonas aleuritidis* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 328.) From Gr. *aleurites*, of wheaten flour; M. L. *Aleurites*, generic name.

Rods: 0.6 to 0.7 by 1.1 to 3 microns. Motile with 1 to 5 polar, rarely bipolar, flagella. Capsules present. Gram-negative.

Green fluorescent pigment produced in certain media.

Gelatin: Not liquefied.

Beef agar slants: Growth is thin, white and viscid.

Broth: A heavy white surface growth in 24 hours. Sediment.

Milk: Becomes alkaline, but no separation.

Nitrites are produced from nitrates.

Indole test feebly positive.

Hydrogen sulfide test feebly positive.

Acid but no gas from glucose, galactose and glycerol. Slow acid production from sucrose, maltose and lactose.

Starch hydrolysis feeble.

Optimum temperature 27° to 28°C. Maximum temperature 37°C.

Optimum pH 6.2 to 6.8. pH range 5.4 to 8.9.

Source: Isolations from naturally infected tung oil trees in Georgia.

Habitat: Pathogenic on the tung oil tree (*Aleurites fordi*), on the bean (*Phaseolus vulgaris*) and the castor bean (*Ricinus communis*).

112. **Pseudomonas glycinea** Coerper. (*Bacterium glycineum* Coerper, Jour. Agric. Research, *18*, 1919, 188; Coerper, *loc. cit.*, 188; *Phytomonas glycinea* Burkholder, Phytopath., *16*, 1926, 922.) From *glycys*, sweet; *ine*, like; M.L. *Glycine*, generic name.

Synonym: *Bacterium sojae* Wolf, Phytopath., *10*, 1920, 132 (*Phytomonas sojae* Burkholder, Phytopath., *16*, 1926, 922; *Pseudomonas sojae* Stapp, in Sorauer, Handb. d. Pflanzenkrankheiten, *2*, 5 Aufl., 1928, 174). See Elliott, Bact. Plant Pathogens, 1930, 134; and Shunk and Wolf, Phytopath., *11*, 1921, 18.

Rods: 1.2 to 1.5 by 2.3 to 3 microns. Motile with polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Not liquefied.

Beef-peptone agar colonies: Appear in 24 hours. Circular, creamy white, smooth, shining and convex. Margins entire. Butyrous in consistency.

Milk: Litmus turns blue and later a separation of the milk occurs. Casein not digested.

Nitrites not produced from nitrates.

Indole test feebly positive.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Starch not hydrolyzed.

Acid from glucose and sucrose.

Optimum temperature 24° to 26°C. Maximum 35°C. Minimum 2°C.

Facultative anaerobe.

Source: A number of cultures isolated from soy beans in Wisconsin.

Habitat: Pathogenic on soybean, *Glycine max* (*Soja max*).

112a. *Pseudomonas glycinea* var. *japonica* (Takimoto) *comb. nov.* (*Bac-*

terium soyae var. *japonicum* Takimoto, Jour. Plant Protect. Tokyo, *14*, 1927, 556; *Bacterium glycineum* var. *japonicum* Elliott, Bact. Plant Pathogens, 1930, 136; *Phytomonas glycinea* var. *japonica* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 358.) From M. L. *Japonicus*, japanese.

Distinctive characters: Differs slightly from *Pseudomonas glycinea* in size of cell, length of chains, action in milk, and color in media. Okabe (Jour. Soc. Trop. Agr., Formosa, *5*, 1933, 162) gives a description of the organism which leads one to believe the differences are not great enough to be varietal.

Source: Isolated from leaf spots on soy bean in Formosa.

Habitat: Pathogenic on soy bean, *Glycine max*.

113. **Pseudomonas savastanoi** (Erw. Smith) Stevens. (*Bacterium savastanoi* Erw. Smith, U. S. Dept. Agr. Plant Ind. Bull. 131, 1908, 31; Stevens, The Fungi which Cause Plant Diseases, 1913, 33; *Phytomonas savastanoi* Bergey et al., Manual, 1st ed., 1923, 190.) Named for F. Savastano, the Italian plant pathologist.

NOTE: Smith (*loc. cit.*) lists and discards the following species since they were either mixed cultures or names with no descriptions: *Bacterium oleae* Arcangeli, Istit. Bot. delle R. Univ. di Pisa, Ricerche e Lavori, fasc. *1*, 1886, 109; *Bacillus oleae tuberculosis* Savastano, Atti. R. Accad. Naz. Lincei Rend. Cl. Sci. Fis., Mat. e Nat., *5*, 1889, 92; *Bacillus prillieuxianus* Trevisan, I generi e le specie delle Batteriacee, Milano, 1889, 19; *Bacillus oleae* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 982.

Description from Brown, Jour. Agr. Res., *44*, 1932, 711.

Rods: 0.4 to 0.8 by 1.2 to 3.3 microns. Motile with 1 to 4 polar flagella. Gram-negative.

Green fluorescent pigment found in culture.

Gelatin: No liquefaction.

Beef agar colonies: White, smooth, flat, glistening, margins erose or entire.

Broth: Turbid on the second day. No pellicle or ring.

Milk: Becomes alkaline.

Nitrites not produced from nitrates.

No H_2S produced.

Acid but not gas from glucose, galactose and sucrose.

Starch is hydrolyzed.

Optimum temperature 23° to 24°C. Maximum 32°C. Minimum 1°C.

Optimum pH 6.8 to 7.0. Maximum 8.5. Minimum 5.6.

Aerobic.

Source: Smith isolated his cultures from olive galls collected in California.

Habitat: Pathogenic on olive.

113a. *Pseudomonas savastanoi* var. *fraxini* (Brown) Dowson. (*Bacterium savastanoi* var. *fraxini* Brown, Jour. Agr. Res., *44*, 1932, 721; *Phytomonas savastanoi* var. *fraxini* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 410; *Pseudomonas fraxini* Skoric, Ann. Exp. For. Zagreb, *6*, 1938, 66; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 11.) From M. L. *Fraxinus*, a generic name.

Distinctive characters: Differs but slightly from *Pseudomonas savastanoi*, but is pathogenic on ash and not on olive.

Source: Three cultures isolated from cankers on ash.

Habitat: Pathogenic on ash, *Fraxinus excelsior* and *F. americana*.

114. **Pseudomonas tonelliana** (Ferraris) *comb. nov.* (*Bacterium tonellianum* Ferraris, Trattato di Patologia e Terapia Vegetale, 3rd ed., *1*, 1926, 104; *Phytomonas tonelliana* Adams and Pugsley, Jour. Dept. Agr. Victoria, *32*, 1934, 304.) Named for Tonelli, the Italian botanist.

Synonym: *Pseudomonas savastanoi* var. *nerii* C. O. Smith, Phytopath., *18*, 1928, 503.

Description from Smith (*loc. cit.*) unless otherwise noted.

Rods: 0.5 to 0.6 by 1.5 to 2.5 microns. Motile with 1 to 3 polar flagella. Gram-negative (Adams and Pugsley, *loc. cit.*).

Gelatin: No liquefaction.

Potato glucose agar colonies: Flat, circular, shining, margins somewhat undulated.

Broth: Dense clouding with partial pellicle.

Milk: Alkaline. No separation.

Nitrites not produced from nitrates (Adams and Pugsley).

Indole produced. Not produced (Adams and Pugsley).

Acid but not gas from glucose and sucrose. No acid from lactose (Adams and Pugsley).

Starch not hydrolyzed (Adams and Pugsley).

Distinctive character: *Pseudomonas savastanoi* is similar in culture but is not pathogenic on oleanders.

Source: Both Ferraris and C. O. Smith isolated the pathogen from galls on oleander.

Habitat: Pathogenic on oleander, *Nerium oleander*.

115. **Pseudomonas calendulae** (Takimoto) Dowson. (*Bacterium calendulae* Takimoto, Ann. Phytopath. Soc. Japan, *5*, 1936, 341; *Phytomonas calendulae* Burkholder, in Manual, 5th ed., 1939, 201; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 9.) From Latin, *calendae*, throughout the month; M.L. *Calendula*, a generic name.

Rods: 0.5 by 1 to 2 microns. Motile with 1 to 3 polar flagella. Gram-negative.

Green fluorescent pigment produced in Uschinsky's and in Cohn's solutions.

Gelatin: Not liquefied.

Agar colonies: Circular, smooth, flat, dirty white.

Broth: Turbid.

Milk: No coagulation.

Nitrites not produced from nitrates.

Indole formed in small amount.

No H_2S produced.

Acid but not gas from glucose and glycerol. No acid from lactose or sucrose.

Starch not hydrolyzed.

Optimum temperature 27° to 30°C. Maximum 37°C. Minimum 0° to 7°C.

Habitat: Pathogenic on marigolds, *Calendula officinalis*.

116. **Pseudomonas cichorii** (Swingle) Stapp. (*Phytomonas cichorii* Swingle, Phytopath., 15, 1925, 730; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 291; *Bacterium cichorii* Elliott, Bact. Plant Pathogens, 1930, 112.) From Gr. *cichoria*, chicory; M. L. *Cichorium*, generic name.

Probable synonyms: *Pseudomonas endiviae* Kotte, Phyt. Ztschr., *1*, 1930, 609; *Phytomonas endiviae* (Kotte) Clara, Cornell Agr. Exp. Sta. Mem. 159, 1934, 26; and *Bacterium formosanum* Okabe, Jour. Soc. Trop. Agr., Formosa, *7*, 1935, 65.

Description from Clara (*loc. cit.*) which is a description of a culture of *Pseudomonas endiviae* from Kotte. Swingle's description is very meager.

Rods: 0.75 to 1.5 by 1.5 to 3.75 microns. Motile with 1 or 2 polar flagella. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: No liquefaction.

Beef-extract agar colonies: Circular, grayish-white with bluish tinge, raised with slightly irregular edges.

Broth: Turbid in 36 hours with a smooth viscous pellicle.

Milk: Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, galactose, fructose, mannose, arabinose, xylose, mannitol and glycerol. Alkaline production from salts of acetic, citric, lactic, malic, succinic and tartaric acids.

Rhamnose, maltose, sucrose, lactose, raffinose and salicin not utilized.

Starch not hydrolyzed.

Slight growth in broth plus 6 per cent NaCl.

Optimum pH 6.8 to 7.1. Maximum 9.2 to 9.4. Minimum 5.0 to 5.3 (Kotte, Phyt. Ztsch., *2*, 1930, 453).

Facultative anaerobe.

Distinctive characters: Differs from *Pseudomonas intybi* in that it does not liquefy gelatin or reduce nitrates to nitrites.

Source: Isolated from rot of French endive, *Cichorium intybus* by Swingle and by Okabe, and from *C. endivia* by Kotte.

Habitat: Pathogenic on endive, lettuce and larkspur.

117. **Pseudomonas cissicola** (Takimoto) *comb. nov.* (*Aplanobacter cissicola* Takimoto, Ann. Phytopath. Soc. Japan., *9*, 1939, 43.) From Greek, *cissus*, ivy; M. L. *Cissus* a generic name.

Rods: 0.5 to 0.9 by 1.0 to 2.0 microns. Non-motile. Capsules. Gram-negative.

Green fluorescent pigment formed in Uschinsky's solution.

Gelatin: No liquefaction.

Potato-extract agar colonies: Circular, convex, smooth, and dirty white.

Broth: Feeble clouding followed by precipitation of pellicle and rim.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide not produced.

No acid nor gas from sucrose, glucose, lactose and glycerol.

Starch is not digested.

Salt toleration is 3 per cent.

Optimum temperature 30°C. Maximum 35°C. Minimum 10°C. Thermal death point 49° to 50°C.

Source: Isolated from black spots on leaves of Japanese ivy, *Cissus japonica* in Japan.

Habitat: Pathogenic only on *Cissus japonica*.

118. **Pseudomonas nectarophila** (Doidge) Rosen and Bleeker. (*Bacterium nectarophila* Doidge, Ann. Appl. Biol., 4, 1917, 73; *Phytomonas nectarophila* Bergey et al., Manual, 3rd ed., 1930, 262; Rosen and Bleeker, Jour. Agr. Res., *46*, 1933, 98.) From Gr. *nectar*, nectar; *philus*, loving.

Rods: 0.5 to 0.7 by 0.6 to 1.5 microns. Motile with 1 to 5 polar flagella. Capsules. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: No liquefaction.

Nutrient agar colonies: Yellowish-white, wet-shining, smooth, margins irregular.

Broth: Heavy turbidity in 24 hours. Sediment.

Milk: Cleared.

Nitrites not produced from nitrates.

Indole not formed.

Acid from glucose and galactose. No acid from sucrose.

Starch hydrolysis feeble.

Optimum temperature 25 to 30°C.

Facultative anaerobe.

Distinctive character: Differs from *Pseudomonas barkeri* in that it does not liquefy gelatin, nor produce indole. Produces capsules.

Source: Isolated from blighted pear blossoms in South Africa.

Habitat: Pathogenic on pear blossoms.

119. **Pseudomonas viburni** (Thornberry and Anderson) Stapp. (*Phytomonas viburni* Thornberry and Anderson, Phytopath., *21*, 1931, 912; Stapp, Bot. Rev., *1*, 1935, 407; *Bacterium viburni* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 160.) From L. *viburnum*, the wayfaring tree; M. L. *Viburnum*, a generic name.

Rods: 0.5 to 1.0 by 1 to 2.0 microns. Capsules present. Motile with 2 to 4 polar flagella. Gram-negative (Burkholder); not Gram-positive as stated.

Green fluorescent pigment produced in culture (Burkholder).

Gelatin: No liquefaction.

Glucose beef-extract colonies: Dull gray, circular, edges entire.

Broth: Turbid with pellicle.

Milk: Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid from glucose and galactose, but not sucrose (Burkholder).

Starch: No hydrolysis.

Slight growth in 3.5 per cent salt (Burkholder).

Optimum temperature 25°C. Minimum 12°C. Maximum 35°C.

Aerobic.

Source: Isolated from angular leaf spots and stem lesions on arrow-wood, *Viburnum opulus*, etc.

Habitat: Pathogenic on *Viburnum spp.*

120. **Pseudomonas mori** (Boyer and Lambert) Stevens. (*Bacterium mori* Boyer and Lambert, Compt. rend. Acad. Sci. Paris, *117*, 1893, 342; *Bacterium mori* Boyer and Lambert *emend.* Erw. Smith, Science, *31*, 1910, 792; Stevens, The Fungi which Cause Plant Diseases, 1913, 30; *Bacillus mori* Holland, Jour. Bact., *5*, 1920, 222; *Phytomonas mori* Bergey et al., Manual, 1st ed., 1923, 191.) From Gr. *morum*, mulberry; M. L. *Morus*, a generic name.

Synonyms: Elliott (Bact. Plant Pathogens, 1930, 166) lists *Bacillus cubonianus* Macchiati, Staz. Sperim. Agr. Ital., *23*, 1892, 228 (Macchiati described the disease due to *Pseudomonas mori*, but gave an incorrect description of the pathogen); also *Bacterium cubonianum* Ferraris, Curiano le Plante, *6*, 1928, 180 (Ferraris uses Macchiati's name but the description of *Pseudomonas mori*).

Description from Smith (*loc. cit.*).

Rods: 0.9 to 1.3 by 1.8 to 4.5 microns. Motile with a polar flagellum. Gram-negative.

Green fluorescent pigment produced in culture.

Gelatin: Not liquefied.

Agar colonies: White, slow-growing, smooth, flat, edges entire becoming undulate.

Milk: Becomes alkaline and clears.

Nitrites not produced from nitrates.

Indole none or feeble production.

Hydrogen sulfide not produced (Okabe, Jour. Soc. Trop. Agr., *5*, 1933, 166).

No growth in broth plus 4 per cent salt (Okabe, *loc. cit.*).

No gas from carbohydrates.

Temperature range 1°C to 35°C.

Source: Smith isolated the pathogen from blighted shoots of mulberry from Georgia. Also received cultures from Arkansas and the Pacific Coast.

Habitat: Pathogenic on mulberry, *Morus*.

121. **Pseudomonas stizolobii** (Wolf) *comb. nov.* (*Aplanobacter stizolobii* Wolf, Phytopath., *10*, 1920, 79; *Bacterium stizolobii* McCulloch, Phytopath., *18*, 1928, 460; *Phytomonas stizolobii* Bergey et al., Manual, 3rd ed., 1930, 280.) From Gr. *stizo*, to prick; *lobium*, a little lobe; *Stizolobium*, a generic name.

Rods: 0.6 to 0.7 by 1.0 to 1.6 microns. Non-motile (Wolf). Motile with a short polar flagellum (McCulloch). Capsules. Gram-negative.

Gelatin: No liquefaction.

Agar colonies: Circular, smooth, white, raised and opaque. Margins entire to slightly undulate.

Broth: Slightly turbid throughout. No pellicle or ring.

Milk: Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

No acid or gas in peptone broth plus sugars.

Starch not hydrolyzed.

Optimum temperature 25° to 28°C.

Distinctive characters: Differs from *Pseudomonas sojae* (*Pseudomonas glycinea*) in the smaller size of cell, and absence of pellicle and dense clouding of broth. The pathogen does not infect soy bean.

Source: Isolated from the leaf spot of velvet bean.

Habitat: Pathogenic on velvet bean, ***Stizolobium deeringianium.***

122. **Pseudomonas viciae** Uyeda. (Uyeda in Takimoto, Jour. Plant Protect., Japan, *2*, 1915, 845; *Bacterium viciae* Nakata, see Elliott, Bact. Plant Pathogens, 1930, 259; *Phytomonas viciae* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 430.) From L. *vicia*, vetch; M. L. *Vicia*, a generic name.

Rods: 0.5 to 0.8 by 1.2 to 2.0 microns. Motile with 2 to 4 polar flagella. Gram-positive.

Green fluorescent pigment produced in culture.

Gelatin colonies: Pale white, glistening, finally turning brown. No liquefaction.

Milk: Coagulates and clears.

Nitrites not produced from nitrates.

No H_2S produced.

Facultative anaerobe.

Habitat: Pathogenic on the broad bean (*Vicia faba*), the turnip (*Brassica rapa*), the carrot (*Daucus carota*) and the sweet potato (*Ipomoea batatas*).

123. **Pseudomonas alliicola** Burkholder. (Burkholder, Phytopath., *32*, 1942, 146; *Phytomonas alliicola* Burkholder, *ibid.*) From L. *allium*, onion; *-cola*, dweller.

Rods: 0.7 to 1.4 by 1.05 to 2.8 microns. Motile with 1 to several polar flagella, at times bi-polar. Gram-negative.

Gelatin: Liquefaction.

Beef-extract peptone agar streaks: Moderate in growth, white at first, later dirty in appearance, edges wavy, consistency viscid. Medium deep brown.

Potato-glucose agar frequently becomes greenish.

Broth: Turbid with light pellicle. Brown.

Milk: Cleared and litmus reduced. Neutral.

Nitrites produced from nitrates.

Indole not produced.

Hydrogen sulfide not produced.

Lipolytic action very strong.

Acid but no gas from l-arabinose, d-xylose, rhamnose, glucose, d-galactose, fructose, d-lactose, maltose, sucrose, glycerol, mannitol and salicin. Alkali from salts of acetic, citric, formic, hippuric, lactic, malic, succinic, tartaric acids.

Starch not hydrolysed.

Slight growth in broth plus 4 per cent salt.

Aerobic.

Optimum temperature 30°C. Maximum 41°C. Minimum 5°C.

Source: Seven isolates from storage rot of onion bulbs.

Habitat: Pathogenic on onion bulbs, *Allium cepa*.

124. **Pseudomonas gardeniae** Burkholder and Pirone. (Burkholder and Pirone, Phytopath., *31*, 1941, 194; *Phytomonas gardeniae* Burkholder and Pirone, *ibid.*) From M. L. *Gardenia*, a generic name.

Rods: 0.75 by 2.4 microns. Motile with 1 to 2 polar flagella. Gram-negative.

Gelatin: Liquefaction.

Beef-extract peptone agar colonies: Growth fair, white to dirty gray and viscid. Medium becoming dark brown.

Potato-glucose agar: No brown color.

Broth: Turbid with pellicle. Dark brown.

Milk: Soft curd with pellicle. Clears in zones. Litmus reduced.

Nitrites produced from nitrates.

Hydrogen sulfide not produced.

Indole not formed.

Acid from glucose, galactose, xylose, rhamnose, sucrose, maltose, mannitol, glycerol, and salicin. Alkali produced from the salts of citric, malic, malonic, succinic, tartaric and hyppuric acids. Good growth in tyrosine and in asparagine broth.

Starch is not hydrolyzed.

Aerobic.

Source: Eight isolates from leaf spots of gardenias in New Jersey.

Habitat: Pathogenic on leaves of *Gardenia jasminoides*.

125 **Pseudomonas caryophylli** Burkholder. (Burkholder, Phytopath., *31*,

1941, 143; *Phytomonas caryophylli*, Burkholder, *ibid.*) From M. L. *Caryophyllus*, an old generic name.

Rods: 0.35 to 0.95 by 1.05 to 3.18 microns. At times slightly curved. Motile with 1 to several polar flagella. Frequently bipolar. Gram-negative.

Gelatin: Liquefaction after 3 to 4 weeks.

Potato glucose agar colonies: 3 to 4 mm in diameter, circular, smooth, glistening, edges entire. Color is tan to gray mauve. Old culture dark brown. Consistency butyrous.

Broth: Turbid with a white sediment.

Milk: Litmus slowly becomes blue. Slight reduction at bottom of tube. No clearing.

Nitrites produced from nitrates. Also ammonia and gas are produced in a synthetic nitrate medium. Asparagine, KNO_3 and $NH_4H_2PO_4$ can be utilized.

Indole not formed.

Hydrogen sulfide not formed.

Lipolytic action slight to moderate.

Acid from l-arabinose, d-xylose, rhamnose, glucose, d-galactose, fructose, d-lactose, maltose, and sucrose, glycerol, mannitol, and salicin. Alkali with sodium salts of acetic, citric, formic, hippuric, lactic, malic, maleic, succinic and tartaric acid.

Starch not hydrolyzed.

Aerobic.

Optimum temperature 30° to 33°C. Maximum 46°C. Minimum 5°C. or less.

Slight growth in broth plus 3.5 per cent salt.

Source: Isolated first by L. K. Jones and later by W. H. Burkholder from dying carnation plants from Spokane, Washington. Twelve isolates used in description.

Habitat: Pathogenic on roots and stalks of the carnation, *Dianthus caryophyllus*.

126. **Pseudomonas solanacearum** Erw. Smith. (*Bacillus solanacearum* Erw. Smith, U. S. Dept. Agr., Div. Veg. Phys. and Path., Bul. 12, 1896, 10; *Bacterium solanacearum* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 73; Erw. Smith, Bacteria in Relation to Plant Diseases, *3*, 1914, 178; *Phytomonas solanacearum* Bergey et al., Manual, 1st ed., 1923, 186.) From L. *solanum* nightshade; M. L. *Solanaceae*, a plant family.

Probable synonyms: Elliott (Bact. Plant Pathogens, 1930, 203) lists the following: *Bacillus nicotianae* Uyeda, Cent. f. Bakt., II Abt., *13*, 1904, 327; *Bacillus sesami* Malkoff and *Pseudomonas sesami* Malkoff, Cent. f. Bakt., II Abt., *16*, 1906, 664; *Bacillus musae* Rorer, Phytopath., *1*, 1911, 45; *Bacillus musarum* Zeman, Rev. Facul. Agr. Univ., La Plat, *14*, 1921, 17; *Erwinia nicotianae* Bergey et al., Manual, 1st ed., 1923, 172; *Phytomonas ricini* Archibald, Trop. Agr., Trinidad, *4*, 1927, 124.

Description taken from Elliott (*loc. cit.*).

Rods: 0.5 to 1.5 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: Nakata (Jour. Sci. Agr. Soc. Tokyo, *294*, 1927, 216) states there are two forms, one of which shows slight liquefaction. The other shows no liquefaction.

Agar colonies: Small, irregular, roundish, smooth, wet-shining, opalescent, becoming brown.

Broth: Slight pellicle. Broth turns brown.

Milk: Cleared without precipitation of casein.

Nitrites produced from nitrates.

Indole not formed.

Hydrogen sulfide not produced (Burkholder).

Glucose, sucrose, glycerol, sodium citrate, peptone, tyrosine, asparagine and glutanic acid are utilized (Mushin, Austral. Jour. Expt. Biol. and Med., *16*, 1938, 325).

Nitrogen sources utilized are ammonia, nitrates (KNO_3) asparagine, tyrosine, peptone and glutamic acid, but not potassium nitrite (Mushin, *loc. cit.*).

Starch not hydrolyzed.

Optimum temperature 35° to 37°C. Maximum 41°C. Minimum 10°C.

Pathogenicity readily lost in culture.

Source: Isolated from brown-rot of solanaceous plants.

Habitat: Soil pathogen in warm moist climates attacking numerous species of plants, especially potato, tobacco, and tomato.

126a. *Pseudomonas solanacearum* var. *asiatica* (Erw. Smith) Stapp. (*Bacterium solanacearum* var. *asiaticum* Erw. Smith, Bact. in Relation to Plant Diseases, *3*, 1914, 282; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 253; *Phytomonas solanacearum* var. *asiatica* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 414.) From Gr. *asiaticus*, asiatic.

Distinctive characters: Differs from *Pseudomonas solanacearum* in that it turns litmus milk and cream red.

Source: Isolated by J. A. Honing from diseased tobacco plants in Medan, Sumatra.

127. **Pseudomonas castaneae** (Kawamura) *comb. nov.* (*Bacterium castaneae* Kawamura, Ann. Phytopath. Soc. Japan, *3*, 1934, 15; *Phytomonas castaneae* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 343.) From M. L. *Castanea*, a generic name.

Rods: 0.8 to 1.2 by 1.0 to 1.8 microns. Motile with 1 to 5 polar flagella. Gram-negative.

Gelatin: Liquefied.

Beef agar colonies: White, circular, edges slightly undulate, viscid.

Milk: No coagulation. Peptonized.

Acid but not gas from glucose, sucrose and glycerol. No acid from lactose.

Optimum temperature 25° to 27°C. Maximum 35°C. Minimum 3°C.

Facultative anaerobe.

Habitat: Causes water-soaked spotting on leaves and shoots of chestnut, *Castanea*.

128. **Pseudomonas seminum** Cayley. (Cayley, Jour. Agr. Sci., *8*, 1917, 461; *Bacterium seminum* Stevenson, Foreign Plant Dis., U.S.D.A. Office of Sec'y., 1926, 141; *Phytomonas seminum* Bergey et al., Manual, 3rd ed., 1930, 272.) From L. *semen* (*seminus*) seed.

Rods: 1.0 by 4.0 to 5.0 microns. Spore-like bodies present. Capsules. Motile with a single flagellum. Gram-positive.

Gelatin: Rapid liquefaction.

Agar colonies: White, more or less circular, transparent, spreading.

Broth: Turbid. Pellicle.

Litmus milk: Milk becomes clear and apricot color.

Nitrites produced from nitrates.

Acid but not gas from glucose and sucrose. No acid from lactose.

Starch: No hydrolysis.

Optimum temperature 25°C.

Facultative anaerobe.

Source: Isolated from seeds, stems and pods of diseased peas in England.

Habitat: Pathogenic on peas.

129. **Pseudomonas passiflorae** (Reid) *comb. nov.* (*Phytomonas passiflorae* Reid, New Zealand Jour. Sci. and Tech., *22*, 1939, 264a.) From L. *passio*, passion; *flora*, flower; M. L. *Passiflora*, a generic name.

Rods: 0.2 to 0.5 by 1.2 to 3.2 microns. Motile with 1 to 5 polar flagella. Capsules present. Gram-negative.

Gelatin: Liquefied.

Beef-peptone agar colonies: Small, flat, smooth, dry, shining, translucent, grayish and butyrous.

Broth: Turbid in 4 days. Transient pellicle.

Milk: Slightly alkaline. No coagulation nor clearing.

Nitrites not produced from nitrates. No growth on synthetic nitrate agar.

Indole not formed.

Hydrogen sulfide not formed.

Acid reaction occurs in galactose, starch and sucrose. No gas.

Starch is not hydrolysed.

Source: From diseased leaves and fruit of the passion-fruit in New Zealand.

Habitat: Pathogenic on *Passiflora edulis*.

130. **Pseudomonas fabae** (Yu) *comb. nov.* (*Phytomonas fabae* Yu, Bull. of the Chinese Bot. Soc., *2*, 1936, 34.) From Latin, *faba* bean.

Rods: 0.8 to 1.1 by 1.1 to 2.8 microns. Motile with 1 to 4 polar flagella. Gram-negative.

Gelatin: Liquefied.

Nutrient agar colonies: Circular, entire, viscid, glistening, raised, smooth to wrinkled, white to salmon. Medium amber.

Broth: Turbid after 12 hours. Pellicle.

Milk: Growth slow. Clears.

Nitrites produced from nitrates.

Indole production slight.

Hydrogen sulfide not produced.

Acid but not gas from glucose. No acid nor gas developed from arabinose, xylose, fructose, galactose, sucrose, lactose, maltose, raffinose, dextrin, inulin, mannitol or adonitol in a 1 per cent Bacto-peptone broth.

Starch: Very weak diastatic action.

Optimum temperature 35°C. Maximum 37 to 38°C. Minimum 4°C. Thermal death point 52 to 53°C.

Aerobic.

Growth retarded in 2 per cent salt. Very slight growth in 3 per cent salt.

Source: From diseased broad beans at Nanking, China.

Habitat: Pathogenic on broad or Windsor bean, *Vicia faba*.

131. **Pseudomonas astragali** (Takimoto) *comb. nov.* (*Bacterium astragali* Takimoto, Jour. Plant Protect., *17*, 1930, 732; *Phytomonas astragali* Burkholder, in Manual, 5th ed., 1939, 197.) From M. L. *Astragalus*, a generic name.

Description translated by Dr. K. Togashi.

Rods: 0.7 to 0.8 by 1.2 to 2.2 microns. Motile, with 1 or 2 flagella. Gram-negative.

Gelatin: Liquefied.

Agar plates: Growth somewhat slow, colorless or grayish-white, entire margins, more or less aqueous, butyrous.

Uschinsky's medium: Growth vigorous, turbid, not viscid, ring, and sediment.

Milk: No coagulation of casein, slow digestion. Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide produced in small amount.

No acid or gas from glucose, sucrose, lactose and glycerol in broth.

Starch not hydrolyzed.

Temperature relations: Minimum below 5° and maximum 33°C. Thermal death point 50° to 51°C.

Aerobic.

Source: Species isolated from *Astragalus sp.*

Habitat: Causes a black leaf-spot of *Astragalus sp.*

132. **Pseudomonas columae** (Thornberry and Anderson) *comb. nov.* (*Phytomonas columae* Thornberry and Anderson, Phytopath., *27*, 1937, 948.) From the species, *Corylus colurna*.

Rods: 0.8 to 1.0 by 1.0 to 1.8 microns. Single, in pairs or chains. Capsules. Motile with 1 to 2 polar flagella. Gram-negative.

Gelatin: Liquified.

Glucose agar slants: Growth filiform, raised, dull, smooth, opaque and viscid.

Broth: Moderate turbidity. Ring.

Milk: Peptonization complete with acid production. No reduction of litmus nor coagulation.

Nitrites not produced from nitrates.

Indole not produced.

Hydrogen sulfide not produced.

No appreciable amount of gas from xylose, glucose, sucrose or glycerol.

Starch hydrolyzed.

Optimum temperature 21°C. Minimum 5°C. Maximum 35°C. Thermal death point 50°C.

Aerobic.

Source: From leaves and young stems of the Turkish hazelnut in Illinois.

Habitat: Pathogenic on the Turkish hazelnut, *Corylus colurna*.

133. **Pseudomonas maublancii** (Foex and Lansade) *comb. nov.* (*Bacterium maublancii* Foex and Lansade, Comp. rend. Acad. Sci. Paris, *202*, 1936, 2174; *Phytomonas maublancii* Burkholder, in Manual, 5th ed., 1939, 198.) Named for M. Maublanc, French colonial plant pathologist.

Rods: 0.4 by 1.3 microns. Motile with 1 to 3 polar flagella. Gram-negative.

Gelatin: Liquefied.

Gelatin colonies: Round, translucent, margins entire.

Broth: Thin pellicle.

Milk: Not coagulated; clears.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Carbohydrates not fermented.

Ammonia produced.

Growth in Fermi's solution, not in Uschinsky's solution.

Source: Isolated from rotting vascular and parenchymatic tissue of banana stalks.

Habitat: Causes a disease of the banana plant.

134. **Pseudomonas polygoni** (Thornberry and Anderson) *comb. nov.* (*Phytomonas polygoni* Thornberry and Anderson, Phytopath., *27*, 1937, 947.) From Gr. *polygonum*, knot-weed; M. L. *Polygonum*, a generic name.

Rods: 0.5 to 1.5 by 1.5 to 2.5 microns. Motile with 2 to 8 bi-polar flagella. Capsules. Gram-positive (?). Other species reported by these investigators as Gram-positive have proved to be Gram-negative on a retest (Burkholder).

Gelatin: Liquified. Brown.

Glucose agar slant: Abundant, filiform, flat, dull, smooth, pale olive-gray, butyrous. Medium turns brown.

Broth: Turbid. Pellicle.

Milk: Alkaline and clears. Litmus not reduced.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide not produced.

No appreciable amount of gas from carbohydrates.

Starch: No hydrolysis.

Optimum temperatures 18°C. Minimum 7°C. Maximum 35°C.

Aerobic.

Source: From diseased leaves of *Polygonum convolvulus* in Illinois.

Habitat: Pathogenic on black bindweed, *Polygonum convolvulus*.

135. **Pseudomonas iridicola** (Takimoto) Stapp. (*Bacterium iridicola* Takimoto, Fungi, Nippon Fungological Soc., *1*, 1931, 24; Stapp, Bot. Rev., *1*, 1935, 408; *Phytomonas iridicola* Burkholder, in Manual, 5th ed., 1939, 198.) From Gr. *iris* (*iridis*), iris, a rainbow; *-cola*, dweller.

Rods: 0.7 to 0.8 by 1.2 to 2 microns. Motile with 1 to 3 polar flagella. Gram-negative.

Gelatin: Liquefied.

Beef agar colonies: White, circular, raised or convex.

Milk: Clears without coagulation.

No acid or gas from carbohydrates.

Starch digested.

Optimum temperature 38°C. Minimum 4°C.

Source: Isolated from a brown leaf spot of iris.

Habitat: Pathogenic on *Iris tectorum* and *Iris japonica*.

136. **Pseudomonas levistici** Osterwalder. (Osterwalder, Cent. f. Bakt., II Abt., *25*, 1909, 260; *Bacterium levistici* Stevenson, Foreign Plant Dis., U. S. Dept. Agr., Office of Sec'y., 1926, 101; *Phytomonas levistici* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 373.) From M. L. *Levisticum*, a generic name.

Rods: 0.5 to 0.7 by 1.1 to 1.5 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: Colonies greenish-white. Liquefaction.

Nutrient agar: Good growth at room temperature. Yellowish-white.

Broth: Pellicle.

Indole formed.

No H_2S produced.

Source: Isolated from spots on the leaves of lovage.

Habitat: Pathogenic on lovage, *Levisticum officinale*.

137. **Pseudomonas radiciperda** (Javoronkova) Stapp. (*Bacterium radiciperda* Javoronkova, Bull. Plant Protect., Leningrad, Ser. II, *5*, no. 1, 1932, 161; Stapp, Bot. Rev., *1*, 1935, 408; *Phytomonas radiciperda* Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 401.) From L. *radix* (*radicis*), root; *perdo*, to destroy.

Description from Javoronkova, Rev. App. Myc., *11*, 1932, 652.

Rods: 0.8 by 1 to 2 microns. Capsules. Motile with 1 or 2 polar flagella. Gram-negative.

Gelatin: Liquefaction.

Beef-peptone agar colonies: Round, smooth, shining, white to pale yellow.

Milk: Peptonized.

Indole not formed.

No H_2S formed.

Acid but not gas from carbohydrates.

Optimum temperature 23° to 25°C.

Aerobic.

Habitat: Causes a root rot of red clover (*Trifolium pratense*), lentils (*Lens esculenta*) and lucerne.

138. **Pseudomonas melophthora** Allen and Riker. (Allen and Riker, Phytopath., *22*, 1932, 557; *Bacterium melophthorum* Allen and Riker, *ibid.*; *Phytomonas melophthora* Allen and Riker, *ibid.*) From Gr. *melum*, apple; *phthora*, destroyer.

Rods: 0.68 by 1.32 microns. Motile with 2 polar flagella. Gram-negative; Gram-positive cells appear in old cultures.

Gelatin: No liquefaction.

Nutrient agar plus 2 per cent glucose: Colonies appear in 36 hours. After 3 days colonies circular, smooth, glistening, convex; edges entire; light pink, but not constant.

Broth: Good growth. Pellicle and sediment.

Milk: Little change, if any.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S produced.

Acid from arabinose, glucose, galactose, fructose, sucrose and glycerol. No acid from lactose, maltose, dextrin and inulin.

Starch not hydrolyzed.

Optimum temperature 21° to 25°C.

Source: Description based on 7 cultures isolated from rotting apples and from apple maggots.

Habitat: Pathogenic on apples, and found with the apple maggot, *Rhagoletis pomonella*.

139. **Pseudomonas helianthi** (Kawamura) *comb. nov.* (*Bacterium helianthi* Kawamura, Ann. Phyt. Soc. Japan, *4*, 1934, 27; *Phytomonas helianthi* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 362.) From M. L. *Helianthus*, a generic name.

Probable synonym: *Phytomonas helianthi* var. *tuberosi* Thornberry and Anderson, Phytopath., *27*, 1937, 948.

Rods: 1 to 1.4 by 1.6 to 2.4 microns. Motile with a single polar flagellum. Gram-negative.

Gelatin: No liquefaction.

Beef agar colonies: White, circular, edges entire.

Broth: Turbid. Pellicle.

Milk: Peptonized. Litmus reduced.

Nitrates: Gas production.

Indole not produced.

No H_2S produced.

Acid but not gas from sucrose and glycerol. No acid from lactose and maltose.

Starch hydrolyzed.

Optimum temperature 27° to 28°C. Maximum 35.5°C. Minimum 12°C.

Good growth at pH 6.4. No growth pH 5.4 and pH 8.8.

Habitat: Pathogenic on sunflower, *Helianthus debilis*.

140. **Pseudomonas alboprecipitans** Rosen. (Rosen, Ann. Missouri Bot.

Garden, *9*, 1922, 383; *Bacterium albo-precipitans* Elliott, Bact. Plant Path., 1930, 89; *Phytomonas albopre cipitans* Bergey et al., Manual, 3rd ed., 1930, 277.) From Latin *albus*, white and *precipitans*, precipitating, referring to the white precipitate produced in culture.

Rods: 0.6 by 1.8 microns, occurring singly or in pairs. Capsules present. Motile with a polar flagellum. Gram-negative.

Gelatin: Not liquefied.

Nutrient agar colonies: White, circular, raised, smooth, sticky, with margins entire. Whitish discoloration of the medium.

Broth: Turbid in 24 hours. Heavy sediment in old cultures.

Milk: Becomes alkaline and slowly clears.

Nitrites produced from nitrates.

Indole not produced.

No H_2S produced.

Acid but not gas from glucose, fructose, glycerol and mannitol. No acid from lactose, maltose or sucrose.

Starch is hydrolyzed.

Optimum temperature 30° to 35°C. Maximum temperature 40°C. Minimum 0°C.

Aerobic.

Distinctive characteristics: White precipitate in culture media.

Source: Isolated a number of times from foxtail grass.

Habitat: Pathogenic on foxtail, *Chaetochloa lutescens* and other grasses.

141. **Pseudomonas petasitis** (Takimoto) *comb. nov.* (*Bacterium petasitis* Takimoto, Ann. Phyt. Soc. Japan, *2*, 1927, 55; *Phytomonas petasitis* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 393.) From M. L. *Petasites*, a generic name.

Rods: 0.8 to 1.1 by 1.1 to 1.7 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: No liquefaction.

Beef agar colonies: White, circular or ameboid, butyrous.

Broth: Strong turbidity. Pellicle.

Milk: Coagulated in 30 days.

Nitrites produced from nitrates with gas formation.

Indole not produced.

No H_2S produced.

No evident acid in peptone broth but gas from glucose, lactose and sucrose. Acid but not gas from glycerol.

Weak growth in broth plus 6 per cent salt.

Optimum temperature 27° to 30°C. Maximum 47°C. Minimum approximately 5°C.

Source: Isolated from brown to black lesions on *Petasites japonicus* in Japan.

Habitat: Pathogenic on leaves of *Petasites japonicus*.

142. **Pseudomonas lignicola** Westerdijk and Buisman. (De Iepenziekte, Arnhem, 1929, 51.) From Latin, *lignum*, wood; *-cola*, dweller.

Rods: Single or short chains. Motile with 1 to several polar flagella. Gram-negative.

Gelatin: No liquefaction.

Malt agar streaks: Milk white with a colorless edge.

Broth: Turbid with light pellicle.

Milk: No coagulation. No acid.

Nitrites not produced from nitrates.

Indole not formed.

Starch hydrolysis slight.

Optimum temperature ±25°C.

Source: From vessels of elm wood showing dark discoloration, in Holland.

Habitat: Pathogenic in elm wood.

143. **Pseudomonas andropogoni** (Erw. Smith) Stapp. (*Bacterium andropogoni* Erw. Smith, Bacteria in Relation to Plant Diseases, *2*, 1911, 63; Elliott and Smith, Jour. Agr. Res., *38*, 1929, 4; Stapp, in Sorauer, Handbuch der Pflanzenkrankheiten, *2*, 5 Auf., 1928, 27; *Phytomonas andropogoni* Bergey et al., Manual, 3rd ed., 1930, 276.) From M.

L. *Andropogon*, a generic name (a synonym of *Holcus*).

Description from Elliott and Smith (*loc. cit.*).

Rods: 0.64 by 1.76 microns. Motile with one to several bipolar flagella. Capsules. Gram-negative.

Gelatin: Feeble liquefaction or none.

Beef-extract agar colonies: Slow-growing, round, smooth, glistening, viscid, white.

Broth: Growth slow with moderate turbidity in 48 hours. A thin pellicle.

Milk: Alkaline and clears.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, arabinose, fructose and xylose. No acid from sucrose, maltose, lactose, raffinose, glycerol and mannitol.

Starch partially digested.

Optimum temperature 22° to 30°C. Maximum 37° to 38°C. Minimum 1.5°C.

Optimum pH 6.0 to 6.6. Maximum 8.3 to 8.6. Minimum 5.0.

Source: Elliott used for her description 4 cultures isolated from lesions on sorgo, sorghum and broom-corn.

Habitat: Pathogenic on sorghum, *Holcus sorghum*.

144. **Pseudomonas woodsii** (Smith) Stevens. (*Bacterium woodsii* Erw. Smith, Bact. in Relation to Plant Diseases, *2*, 1911, 62; Stevens, Plant Disease Fungi, New York, 1925, 39; *Phytomonas woodsii* Bergey et al., Manual, 3rd ed., 1930, 256.) Named for A. F. Woods, American plant pathologist.

Description from Burkholder and Guterman, Phytopath., *25*, 1935, 118.

Rods: 0.67 by 1.56 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: No liquefaction.

Beef-extract agar slants: Growth slow and scant, filiform, creamy, butyrous.

Broth: Turbid.

Milk: Becomes alkaline but otherwise little changed.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 601).

Acid but not gas from glucose, fructose, galactose, arabinose, xylose, rhamnose, lactose, glycerol and mannitol. Alkaline reaction from salts of acetic, citric, malic and succinic acids. Sucrose, maltose, salicin, and lactic and formic acids not fermented. Starch not hydrolyzed.

Slight growth in broth plus 3 per cent salt.

Aerobic.

Source: Isolated from water-soaked lesions on carnation leaves.

Habitat: Pathogenic on carnation, *Dianthus caryophyllus*.

145. **Pseudomonas panici-miliacei** (Ikata and Yamauchi) *comb. nov.* (*Bacterium panici-miliacei* Ikata and Yamauchi, Jour. Plant Protect., *18*, 1931, 35; *Phytomonas panici-miliacei* Burkholder, in Manual, 5th ed., 1939, 204.) From M. L. *Panicum miliaceum*.

Description translated by Dr. K. Togashi.

Rods: 0.8 to 1.1 by 1.8 to 2.6 microns. Motile, with a single flagellum. Gram-negative.

Gelatin: Not liquefied.

Potato-agar plates: Growth moderate, whitish, then tinged with light orange, undulating margins.

Broth: Turbid, white pellicle formed.

Milk: No coagulation and slow digestion. Alkaline.

Nitrites are produced from nitrates.

Indole not formed.

No H_2S produced.

No acid and no gas from sucrose, glucose, lactose, glycerol and sodium nitrate.

Starch not hydrolyzed.

Optimum temperature 30° to 35°C.

Facultative anaerobe.

Source: Species first isolated from millet, *Panicum miliaceum*.

Habitat: Causes a leaf stripe of *Panicum miliaceum*.

146. **Pseudomonas saliciperda** Lindeijer. (Lindeijer, Inaug. Diss., Univ. Amsterdam, 1932; Phytopath. Ztschr., *6*, 1933, 373; *Bacterium saliciperda* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 106; *Phytomonas saliciperda* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 408.) From L. *salix* (*salicis*), willow; *perdo*, to destroy.

Rods: 1.2 to 2.1 microns in length. Motile with a polar flagellum. Gram-negative.

Gelatin: No liquefaction.

Beef wort agar colonies: Gray-white.

Milk: No acid nor coagulation.

Nitrites produced (small amount) from nitrates.

Indole formation slight.

No gas from carbohydrates.

Starch not hydrolyzed.

Facultative anaerobe.

Source: Isolated from wilted branches of willow and pathogenicity proved.

Habitat: Pathogenic on willow, *Salix spp.*

147. **Pseudomonas eriobotryae** (Takimoto) Dowson. (*Bacterium eriobotryae* Takimoto, Jour. Plant Protect., *18*, 1931, 354; *Phytomonas eriobotryae* Burkholder, in Manual, 5th ed., 1939, 205; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 10.) From M. L. *Eriobotrya*, a generic name.

Translated by Dr. K. Togashi.

Rods: 0.7 to 0.9 by 2.2 to 3.0 microns. Motile, with 1 or 2 flagella. Gram-negative.

Gelatin: Not liquefied.

Agar-plates: Colonies appear after 3 days, white or hyaline, butyrous, margins entire.

Broth: Moderately turbid, pellicle powdery, ring formed.

Milk: No coagulation, peptonized slowly. Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S produced.

No acid or gas from glucose, sucrose, lactose and glycerol in broth.

Starch not hydrolyzed.

Temperature relations: Minimum below 4°C, optimum 25° to 26°C, and maximum 32°C. Thermal death point 51°C.

Aerobic.

Source: Species isolated from loquat, *Eriobotrya japonica*.

Habitat: Causes a bud rot of *Eriobotrya japonica*.

148. **Pseudomonas wieringae** (Elliott) *comb. nov.* (*Phytomonas betae* Wieringa, Nederl. Tijdschr. Hyg., Microbiol. en Serol., Leiden, *2*, 1927, 148; *Bacterium wieringae* Elliott, Man. Bact. Plant Pathogens, 1930, 264; *Phytomonas wieringae* Burkholder, in Manual, 5th ed., 1939, 206.) Named for K. L. Wieringa, plant pathologist of Holland.

Because *Bacterium betae* Chester (Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 53) may be a pseudomonad, the species name proposed by Elliott has been retained.

Description from Elliott (*loc. cit.*).

Rods: 0.5 to 2.0 microns. Motile with 1 to 5 polar flagella. Gram-negative.

Beef-agar colonies: Smooth, round, white to grayish, fluorescent.

Milk: Cleared in 5 days. Not coagulated.

Nitrites not produced from nitrates.

No gas from sugars.

Optimum temperature 28° to 30°C. Maximum 37°C. Minimum 4°C.

Source: Isolated from vascular rot of beets in Holland.

Habitat: Pathogenic on beets, *Beta vulgaris*.

Appendix I*: The following species are believed to belong in the genus *Pseudomonas* although descriptions are frequently incomplete.

Achromobacter pellucidum Harrison. (Canadian Jour. Res., *1*, 1929, 236.) Isolated from halibut. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 619.

Bacillus aurantiacus tingitanus Remlinger and Bailly. (Maroc Medical, No. 150, 1935; See Lasseur, Dupaix and Babou, Trav. Lab. Microbiol. Fac. Pharm. Nancy, Fasc. 8, 1935, 41.) From water. Dissociates readily. Related to *Pseudomonas fluorescens aureus* Zimmermann. See p. 645.

Bacillus cyaneofluorescens Zangemeister. (Cent. f. Bakt., I Abt., *18*, 1895, 321; *Pseudomonas cyaneofluorescens* Migula, Syst. d. Bakt., *2*, 1900, 906.) From blue milk.

Bacillus fluorescens nivalis Eisenberg. (Eine Gletscherbakterie, Schmelck, Cent. f. Bakt., *4*, 1888, 545; Eisenberg, Bakt. Diag., 3 Aufl., 1891, 77.) From the melting snow of a glacier. Probably a synonym of *Pseudomonas fluorescens*.

Bacillus lactis saponacei Weigmann and Zirn. (Cent. f. Bakt., *15*, 1894, 468.) From soapy milk.

Bacterium auxinophilum Jacobs. (Ann. Appl. Biol., *22*, 1935, 619.) A Gram-negative organism with a polar flagellum which liquefies gelatin rapidly.

Bacterium bosporum Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 259.) Decomposes cellulose. Single polar flagellum. From soil.

Bacterium briosii Pavarino. (Atti Ist. Bot. d. R. Univ. di Pavia, Ser. 2, *12*, 1910, 337.) The natural host is *Lycopersicon esculentum*. Pavarino (Rev. di Patol. Veg., *6*, 1913, 161) states that this organism and *Phytobacter lycopersicum* Groenewege (Meded. Rijks. Hoogere Land, Tuin- en Boschbouwschool, Dell 5, *5*, 1912, 217) should be considered identical. It closely resembles *Bacterium vesicatorium* Doidge (Jour. Dept. Agr. So. Africa, *1*, 1920, 718) according to Gardner and Kendrick (Jour. Agr. Res., *21*, 1921, 140).

Bacterium elaphorum Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 257.) Decomposes cellulose. Single polar flagellum. From soil.

Bacterium fraenkelii Hashimoto. (Zeit. f. Hyg., *31*, 1899, 88.) A pleomorphic polar flagellate bacterium. From milk.

Bacterium gummis Comes. (Comes, Napoli, Maggio 18, 1884, 14; see Comes, Atti d. R. Ist. d'incoraggiamento alli Sc., Ser. 3, *3*, 1884, 4; *Bacillus gummis* Trevisan, I generi e le specie delle Batteriacee, Milano, 1889, 17.) Pathogenic on grapes, *Vitis spp.*

Bacterium krameriani Pavarino. (Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis., Mat. et Nat., *20*, 1911, 233.) Pathogenic on the orchid, *Oncidium krameriani*.

Bacterium pusiolum Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 261.) Decomposes cellulose. Single polar flagellum. From manure.

Bacterium protozoides Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 263.) Decomposes cellulose. Single polar flagellum. From soil.

Pseudomonas acuta Migula. (Culture No. 11, Lembke, Arch. f. Hyg., *29*, 1897, 317; Migula, Syst. d. Bakt., *2*, 1900, 921.) From the intestine.

Pseudomonas alba Migula. (*Bacillus fluorescens albus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, I Reihe, 1890, 18; Migula, Syst. d. Bakt., *2*, 1900, 909.) From water. *Bacillus fluorescens non liquefaciens* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 145 may be identical according to Migula (*loc. cit.*).

Pseudomonas allii (Griffiths) Migula. (*Bacterium allium* Griffiths, Proc. Roy. Soc. Edinburgh, *51*, 1887, 40; Migula,

* Appendixes I and II prepared by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, July, 1943.

Syst. d. Bakt., *2*, 1900, 932.) From rotted onions.

Pseudomonas aquatilis Migula. (Tataroff, Inaug. Diss., Dorpat, 1891, 31; Migula, Syst. d. Bakt., *2*, 1900, 933.) From water. Said to form spores.

Pseudomonas aromatica Migula. (*Bacillus crassus aromaticus* Tataroff, Inaug. Diss., Dorpat, 1891, 27; Migula, Syst. d. Bakt., *2*, 1900, 880.) From water.

Pseudomonas aromatica var. *quercitopyrogallica* Kluyver, Hof and Boezaardt. (Enzymologia, *7* 1939, 28.)

Pseudomonas articulata Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1896, 462.) From the stomachs of birds.

Pseudomonas aucubicola Trapp. (Phytopath., *26*, 1936, 264.) Isolated from *Aucuba japonica*. Not pathogenic.

Pseudomonas aurea Migula. (*Bacillus fluorescens aureus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, I Reihe, 1890, 14; Migula, Syst. d. Bakt., *2*, 1900, 931.) From water.

Pseudomonas brassicae acidae Gruber. (Cent. f. Bakt., II Abt., *22*, 1909, 558). From sauerkraut. Identical with *Bacterium brassicae acidae* Conrad (Arch. f. Hyg., *29*, 1897, 75) according to Lehmann and Neumann (Bakt. Diag., 5 Aufl., *2* 1912, 380.)

Pseudomonas butyri Migula. (*Bacillus butyri fluorescens* Lafar, Arch. f. Hyg., *13*, 1891, 19; Migula, Syst. d. Bakt., *2*, 1900, 894.) From butter.

Pseudomonas calciphila Molisch. (Cent. f. Bakt., II Abt., *65*, 1925, 136.) From fresh water. Deposits $CaCO_3$.

Pseudomonas calco-acetica Clifton. (Enzymologia, *4*, 1937, 246.)

Pseudomonas capsulata Migula. (Syst. d. Bakt., *2*, 1900, 915; not *Pseudomonas capsulata* Bergey et al., Manual, 1st ed., 1923, 124.) Similar to *Pseudomonas macroselmis* Migula.

Pseudomonas caryocyanea (Dupaix) Beijerinck. (*Bacillus caryocyaneus* Dupaix, Thesis, Univ. of Nancy, 1933, 1; Beijerinck, see Dupaix, *ibid.*, 13; *Bacterium caryocyaneum* Dupaix, *ibid.*, 246.) Isolated from rotten willow wood, from yeast mash and beer-wort. Name appears first as *Bacillus caryocyaneus* on a culture sent by Beijerinck from Delft, Holland to the National Collection of Type Cultures, Lister Institute, London. Regarded by Dupaix as closely related to *Bacillus cyaneo-fluorescens* Zangemeister (Cent. f. Bakt., I Abt., *18*, 1895, 321; *Pseudomonas cyaneo-fluorescens* Migula, Syst. d. Bakt., *2*, 1900, 906); Der blaue Bacillus, Mildenberg (Cent. f. Bakt., II Abt., *56*, 1922, 309; *Pseudomonas mildenbergii* Bergey et al., Manual, 3rd ed., 1930, 172); and *Bacillus pyocyaneus* Gessard (Compt. rend. Acad. Sci. Paris, *94*, 1882, 536).

Pseudomonas catarrhalis Chester. (Bacillus der Hundestaupe, Jess, Cent. f. Bakt., II Abt., *25*, 1899, 541; Chester, Man. Determ. Bact., 1901, 308.) Isolated from catarrh in dogs.

Pseudomonas caviae Scherago. (Jour. Bact., *31*, 1936, 83; Jour. Inf. Dis., *60*, 1937, 245.) Cause of an epizootic septicemia in guinea pigs.

Pseudomonas chlorophaena Migula. (Syst. d. Bakt., *2*, 1900, 899.)

Pseudomonas coccacea Migula. (Culture No. 10, Lembke, Arch. f. Hyg., *29*, 1897, 317; Migula, Syst. d. Bakt., *2*, 1900, 924.) From the intestine.

Pseudomonas cohaerea (sic) (Wright) Chester. (*Bacillus cohaerens* Wright, Mem. Nat. Acad. Sci., *7*, 1895, 464; Chester, Man. Determ. Bact., 1901, 312.) From water.

Pseudomonas coli Migula. (Culture No. 8, Lembke, Arch. f. Hyg., *29*, 1897, 315; Migula, Syst. d. Bakt., *2*, 1900, 920.) From the intestine.

Pseudomonas colloides Migula. (*Bacillus fluorescens putidus colloides* Tataroff, Inaug. Diss., Dorpat, 1891, 40; Migula, Syst. d. Bakt., *2*, 1900, 902.) From water. Said to form spores.

Pseudomonas conradi Lehmann and Neumann. (Bakt. Diag., 5 Aufl., *2*, 1912, 394.) Red pigment.

Pseudomonas delabens (Wright) Chester. (*Bacillus delabens* Wright, Mem. Nat. Acad. Sci., *7*, 1895, 456; Chester, Man. Determ. Bact., 1901, 314.) From water.

Pseudomonas duplex Migula. (Culture No. 7, Lembke, Arch. f. Hyg., *29*, 1897, 314; Migula, Syst. d. Bakt., *2*, 1900, 922.) From the intestine.

Pseudomonas ellipsoidea Migula. (*Bacillus oogenes fluorescens β*, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 393; Migula, Syst. d. Bakt., *2*, 1900, 925.) From hens' eggs.

Pseudomonas ephemerocyanea Fuller and Norman. (Jour. Bact., *46*, 1943, 274.) From soil. Decomposes cellulose.

Pseudomonas erythra Fuller and Norman. (Jour. Bact., *46*, 1943, 276.) From soil. Decomposes cellulose.

Pseudomonas erythrospora (Cohn) Migula. (*Bacillus erythrosporus* Cohn, Beitr. z. Biol. d. Pflanzen, *3*, Heft 1, 1879, 128; Migula, in Engler and Prantl, Die naütrl. Pflanzenfam., *1*, 1a, 1895, 29.) From air, meat infusion and water. Said to form spores.

Pseudomonas fimbriata (Wright) Chester. (*Bacillus fimbriatus* Wright, Mem. Nat. Acad. Sci., *7*, 1895, 463; Chester, Man. Determ. Bact., 1901, 313.) From water.

Pseudomonas fluorescens exitiosus van Hall. (Ztschr. f. Pflanzenkr., *13*, 1903, 132.) Causes soft rot of shoots and bulbs of iris (*Iris spp.*).

Pseudomonas foliacea Chester. (*Bacillus fluorescens foliaceus* Wright, Mem. Nat. Acad. Sci., *7*, 1895, 439; Chester, Man. Determ. Bact., 1901, 324; *Bacillus fluorescens-foliaceus* Chester, *ibid.*) From water. Very similar to *Pseudomonas incognita* Chester.

Pseudomonas gasoformans Migula. (Ein neuer gasbildender *Bacillus*, Gärtner, Cent. f. Bakt., *15*, 1894, 1; Migula, Syst. d. Bakt., *2*, 1900, 883.) Gas bubbles in gelatin stab.

Pseudomonas gracilis Migula. (Syst. d. Bakt., *2*, 1900, 888.) Morphologically like *Pseudomonas fluorescens* Migula.

Pseudomonas granulata Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1896, 464.) From the stomach and intestine of birds.

Pseudomonas halestorgus Elazari-Volcani. (Ph.D. Thesis, Hebrew Univ., Jerusalem, 1940.) A halophilic pseudomonad from the Dead Sea.

Pseudomonas hydrosulfurea Migula. (*Bacillus oogenes hydrosulfureus β*, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 385; Migula, Syst. d. Bakt., *2*, 1900, 898.) From hens' eggs.

Pseudomonas iridis van Hall. (Van Hall, Thesis, Univ. Amsterdam, 1902 and Ztschr. f. Pflanzenkr., *13*, 1903, 129; *Bacterium iridis* Elliott, Man. Bact. Plant Path., 1930, 142; *Phytomonas iridis* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 369.) Causes a rot of bulbs and leaves of iris (*Iris spp.*).

Pseudomonas iris (Frick) Migula. (*Bacillus iris* Frick, Arch. f. path. Anat., *116*, 1889, 292; according to Eisenberg, Bakt. Diag., 3 Aufl., 1891, 148; Migula, Syst. d. Bakt., *2*, 1900, 931.)

Pseudomonas italica (Foà and Chiapella) Reinelt. (Quoted from Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 367.) Phosphorescent.

Pseudomonas javanica (Eijkmann) Migula. (*Photobacterium javanense* Eijkmann, Geneesk. Tijdschr. v. Nederl.-Indië, *32*, 1892, 109; Abst. in Cent. f. Bakt., *12*, 1892, 656; *Bacillus javaniensis* Dyar, Annals New York Acad. Sci., *8*, 1895, 359; *Bacterium javaniensis* Chester, Man. Determ. Bact., 1901, 170; *Photobacterium javanicum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 199; Migula, Syst. d. Bakt., *2*, 1900, 953.) From sea fish in Java. Blue-green luminescence.

Pseudomonas lactica Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 238.) From a vegetable infusion.

Pseudomonas lasia Fuller and Norman.

(Jour. Bact., *46*, 1943, 275.) From soil. Decomposes cellulose.

Pseudomonas lembkei Migula. (Culture No. 12, Lembke, Arch. f. Hyg., *29*, 1897, 318; Migula, Syst. d. Bakt., *2*, 1900, 896.) From the intestine.

Pseudomonas liquefaciens (Tataroff) Migula. (*Bacillus liquefaciens* Tataroff, Inaug. Diss., Dorpat, 1891, 29; Migula, Syst. d. Bakt., *2*, 1900, 876.) From water.

Pseudomonas listeri Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 260.) From a vegetable infusion.

Pseudomonas longa Migula. (*Bacillus fluorescens longus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, I Reihe, 1890, 20; Migula, Syst. d. Bakt., *2*, 1900, 907.) From water.

Pseudomonas macroselmis Migula. (*Bacillus fluorescens putidus* Tataroff, Inaug. Diss., Dorpat, 1891, 42; Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 29.) From water.

Pseudomonas maidis (Eisenberg) Migula. (*Bacillus maidis* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 119; Migula, Syst. d. Bakt., *2*, 1900, 877.) From corn grains soaked in water and from feces of pellagra patients.

Pseudomonas maschekii Migula. (Blaugrüner *Bacillus*, Maschek, Bakt. Untersuch. d. Leitmeritzer Trinkwasser, Jahresber. d. Oberrealschule zu Leitmeritz, 1887; Migula, Syst. d. Bakt. *2*, 1900, 916.) From water.

Pseudomonas melochlora (Winkler and Schrötter) Migula. (*Bacillus melochloros* Winkler and Schrötter, Ein neuer grünen Farbstoff entwickelnder Bacillus, Wien, 1890; Migula, Syst. d. Bakt., *2*, 1900, 893.) From caterpillar feces.

Pseudomonas mesenterica Migula. (*Bacillus fluorescens mesentericus* Tataroff, Inaug. Diss., Dorpat, 1891, 38; Migula, Syst. d. Bakt., *2*, 1900, 903.) From water.

Pseudomonas metalloides Migula. (*Bacillus rosaceus metalloides* Tataroff, Inaug. Diss., Dorpat, 1891, 65; not *Bacterium rosaceus metalloides* Dowdeswell, Ann. de Microgr., *1*, 1888–89, 310, see Heffernan, Cent. f. Bakt., II Abt., *8*, 1902, 689; *Pseudomonas rosacea* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 29; Migula, Syst. d. Bakt., *2*, 1900, 938.) Single flagellum. Red and yellow-red pigment. From water.

Pseudomonas minutissima Migula. (*Bacillus fluorescens liquefaciens minutissimus* Unna and Tommasoli, Monatsh. f. prakt. Dermat., *8*, 1889, 57; according to Eisenberg, Bakt. Diag., 3 Aufl., 1891, 76; Migula, Syst. d. Bakt., *2*, 1900, 891.) Found on human skin in cases of seborrhoic eczema.

Pseudomonas mobilis Migula. (Culture No. 9, Lembke, Arch. f. Hyg., *29*, 1897, 316; Migula, Syst. d. Bakt., *2*, 1900, 923.) From the intestine.

Pseudomonas monadiformis (Kruse) Chester. (*Bacillus coli mobilis* Messea, Riv. d'Igiene, Rome, 1890; *Bacillus monadiformis* Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 374; Chester, Man. Determ. Bact., 1901, 308.) From typhoid stools.

Pseudomonas mucidolens Levine and Anderson. (Jour. Bact., *23*, 1932, 337.) Causes musty odors in eggs. Also milk (Olsen and Hammer, Iowa State Coll. Jour. Sci., *9*, 1934, 125).

Pseudomonas mucidolens var. *tarda* Levine and Anderson. (Jour. Bact., *23*, 1932, 337.) Causes musty odors in eggs.

Pseudomonas nexibilis (Wright) Chester. (*Bacillus nexibilis* Wright, Mem. Nat. Acad. Sci., *7*, 1895, 441; Chester, Man. Determ. Bact., 1901, 309.) From water.

Pseudomonas nivalis Szilvinyi. (Cent. f. Bakt., II Abt., *94*, 1936, 216.) A red chromogen isolated from red snow in Austria.

Pseudomonas ochroleuca Migula. (*Bacillus* γ, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 396; Migula, Syst. d. Bakt., *2*, 1900, 897.) From hens' eggs.

Pseudomonas oogenes Migula. (*Bacillus oogenes hydrosulfureus* δ, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 386;

Migula, Syst. d. Bakt., *2*, 1900, 878.) Single flagellum. From hens' eggs.

Pseudomonas ovi Migula. (*Bacillus oogenes fluorescens* ε, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 395; Migula, Syst. d. Bakt., *2*, 1900, 924.) From hens' eggs.

Pseudomonas ovicola Migula. (*Bacillus oogenes fluorescens* γ, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 394; Migula, Syst. d. Bact., *2*, 1900, 925.) From hens' eggs.

Pseudomonas pallescens Migula. (*Bacillus viridis pallescens* Frick, in Virchow, Arch. f. path. Anat., *116*, 1889, 292; according to Eisenberg, Bakt. Diag., 3 Aufl., 1891, 154; Migula, Syst. d. Bakt., *2*, 1900, 927.) Source not given.

Pseudomonas pansinii Migula. (*Bacillus fluorescens non liquefaciens* Pansini, in Virchow, Arch. f. path. Anat., *122*, 1890, 452; Migula, Syst. d. Bakt., *2*, 1900, 926.)

Pseudomonas pelliculosa Migula. (*Bacillus oogenes fluorescens* δ, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 395; Migula, Syst. d. Bakt., *2*, 1900, 926.) From hens' eggs.

Pseudomonas pellucida Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1896, 465.) From the intestine of birds.

Pseudomonas plehniae Spieckermann and Thienemann. (Arch. f. Hyg., *74*, 1911, 110.) Isolated from carp. Pathogenic for many species of fish.

Pseudomonas plicata (Frankland and Frankland) Migula. (*Bacillus plicatus* Frankland and Frankland, Phil. Trans. Roy Soc. London, *178*, B, 1887, 273; Migula, Syst. d. Bakt., *2*, 1900, 881.) From air.

Pseudomonas pseudotyphosa Migula. (Typhusähnlicher Bacillus, Lustig, Diag. d. Bakt. d. Wassers, 1893, 16; Migula, Syst. d. Bakt., *2*, 1900, 893.) From water.

Pseudomonas pullulans (Wright) Chester. (*Bacillus pullulans* Wright, Mem. Nat. Acad. Sci., *7*, 1894, 445; Chester, Man. Determ. Bact., 1901, 315.) From water.

Pseudomonas protea Frost. (U. S. Public Health Ser., Hyg. Lab. Bull. 66, 1910, 27.) From filtered river water. Can be agglutinated by specific typhoid immune-serum.

Pseudomonas rosea Chester. (*Bacillus roseus vini* Bordas, Joulin and Rackowski, Compt. rend. Acad. Sci. Paris, *126*, 1898, 1550; Chester, Man. Determ. Bact., 1901, 327; not *Pseudomonas rosea* Migula, in Engler and Prantl, Die natürl. Pfllanzenfam., *1*, 1a, 1895, 30.) From wine. Said to form spores.

Pseudomonas (Hydrogenomonas) saccharophila Doudoroff. (Enzymologia, *9*, 1940, 50.) From stagnant water.

Pseudomonas sapolactica (Eichholz) De Rossi. (*Bacterium sapolacticum* Eichholz, Cent. f. Bakt., II Abt., *9*, 1902, 631; De Rossi, Microbiologia Agraria e Technica, Torino, 1927, 693.) Isolated from soapy milk.

Pseudomonas sericea Migula. (Seidenglänzender *Bacillus*, Tataroff, Inaug. Diss., Dorpat, 1891, 26; Migula, Syst d. Bakt., *2*, 1900, 882.)

Pseudomonas tenuis Migula. (*Bacillus fluorescens tenuis* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, I Reihe, 1890, 16; Migula, Syst. d. Bakt., *2*, 1900, 910.) From water.

Pseudomonas trommelschlägel (Ravenel) Chester. (*Bacillus trommelschlägel* Ravenel, Mem. Nat. Acad. Sci., *8*, 1896, 26; Chester, Man. Determ. Bact., 1901, 327.) From soil. Said to form spores.

Pseudomonas undulata Chester. (*Bacillus fluorescens undulatus* Ravenel, Mem. Nat. Acad. Sci., *8*, 1896, 20; Chester, Man. Determ. Bact., 1901, 328.) From soil. Said to form spores.

Pseudomonas virescens (Frick) Migula. (*Bacillus virescens* Frick, Arch. f. path. Anat., *116*, 1889, 292; Migula, Syst. d. Bakt., *2*, 1900, 916.) From green sputum.

Pseudomonas viridans (Symmers) Migula. (*Bacillus viridans* Symmers, Brit. Med. Jour., No. 1615, 1891, 1252; Abst. in Cent. f. Bakt., *12*, 1892, 165; Migula, Syst. d. Bakt., *2*, 1900, 890.) From water.

Pseudomonas viridescens Chester. (*Bacillus viridescens liquefaciens* Ravenel, Mem. Nat. Acad. Sci., *8*, 1896, 24; Chester, Man. Determ. Bact., 1901, 328.) From soil. Said to form spores.

Pseudomonas viridis Migula. (*Bacillis* der grünen Diarrhöe der Kinder, Lesage, Arch. d. Physiol. norm. et path., *20*, 1888, 212; see Eisenberg, Bakt. Diag., 3 Aufl., 1891, 238; Migula, Syst. d. Bakt., *2*, 1900, 886.) From intestine of children.

Pseudomonas weigmanni Migula. (Bakterie IV, Weigmann and Zirn, Cent. f. Bakt., *15*, 1894, 466; Migula, Syst. d. Bakt., *2*, 1900, 892.) From soapy milk.

Pseudomonas zörkendörferi Migula. (*Bacillus oogenes fluorescens* α, Zörkendörfer, Arch. f. Hyg., *16*, 1893, 392; Migula, Syst. d. Bakt., *2*, 1900, 897.) From hens' eggs.

Appendix II: The following polar flagellate organism has been described from activated sludge. H. Winogradsky has also described polar flagellate forms from the same source that form zoogloea (Compt. rend. Acad. Sci. Paris, *200*, 1935, 1887; Ann. Inst. Pasteur, *58*, 1937, 333).

Zoogloea ramigera Kruse *emend.* Butterfield. (Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *1*, 1896, 68; Butterfield, Public Health Reports, *50*, 1935, 671; Culture No. 50, Wattie, Pub. Health Reports, *57*, 1942, 1519.)

Rods: 1 by 2 to 4 microns, with rounded ends. Non-spore-forming. Capsules present. Motile with a single long polar flagellum. Gram-negative.

Gelatin: No liquefaction.

Grows better in aerated liquid media.

Agar: Scant growth.

Indole not formed.

No H_2S produced.

No acid or gas from carbohydrates.

Nitrites not produced from nitrates.

Optimum pH 7.0 to 7.4.

Optimum temperature 28° to 30°C. Good growth at 20° and at 37°C. Minimum temperature 4°C.

Strict aerobe.

Distinctive character: Oxidizes sewage.

Source: Isolated from activated sludge.

Habitat: Produces zoogloeal masses in activated sludge.

Genus II. Xanthomonas *Dowson**

(*Phytomonas* Bergey et al., Manual, 1st ed., 1923, 174; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 187.)

Cells usually monotrichous, with yellow, water-insoluble pigment. Proteins are usually readily digested. Milk usually becomes alkaline. Hydrogen sulfide is produced. Asparagin is not sufficient as an only source of carbon and nitrogen. Acid is produced from mono- and disaccharides. Mostly plant pathogens causing necrosis. From Gr. *xanthus*, yellow; *monas*, a unit; M. L. monad.

The type species is *Xanthomonas hyacinthi* (Wakker) Dowson.

Key to the species of genus Xanthomonas.

1. Colonies yellow.
    a. Gelatin liquefied.
        b. Starch hydrolysis feeble.
            c. Nitrites not produced from nitrates.
                1. *Xanthomonas hyacinthi.*
                2. *Xanthomonas pruni.*
                3. *Xanthomonas vitians.*

---

* Prepared by Prof. Walter H. Burkholder, Cornell Univ., Ithaca, N. Y., June, 1943.

cc. Nitrites produced from nitrates.

4. *Xanthomonas beticola.*
5. *Xanthomonas lactucae-scariolae.*
6. *Xanthomonas rubrilineans.*

bb. Starch hydrolysis strong.

c. Nitrites not produced from nitrates.

d. No brown pigment in beef-extract agar.

7. *Xanthomonas barbareae.*
8. *Xanthomonas begoniae.*
9. *Xanthomonas campestris.*
9a. *Xanthomonas campestris* var. *armoraciae.*
10. *Xanthomonas citri.*
11. *Xanthomonas corylina.*
12. *Xanthomonas cucurbitae.*
13. *Xanthomonas dieffenbachiae.*
14. *Xanthomonas holcicola.*
15. *Xanthomonas incanae.*
16. *Xanthomonas juglandis.*
17. *Xanthomonas lespedezae.*
18. *Xanthomonas malvacearum.*
19. *Xanthomonas pelargonii.*
20. *Xanthomonas phaseoli.*
20a. *Xanthomonas phaseoli* var. *sojense.*
21. *Xanthomonas plantaginis.*
22. *Xanthomonas ricinicola.*
23a. *Xanthomonas translucens* f. sp. *hordei.*
23b. *Xanthomonas translucens* f. sp. *undulosa.*
23c. *Xanthomonas translucens* f. sp. *secalis.*
23d. *Xanthomonas translucens* f. sp. *hordei-avenae.*
23e. *Xahthomonas translucens* f. sp. *cerealis.*
24. *Xanthomonas vasculorum.*
25. *Xanthomonas vesicatoria.*
25a. *Xanthomonas vesicatoria* var. *raphani.*

dd. Brown pigment produced in beef-extract media.

26. *Xanthomonas nakatae.*
20b. *Xanthomonas phaseoli* var. *fuscans.*

cc. Nitrites produced from nitrates.

27. *Xanthomonas papavericola.*

ccc. Ammonia formed in nitrate media.

28. *Xanthomonas alfalfae.*

bbb. Starch not hydrolyzed.

c. Nitrites produced from nitrates.

29. *Xanthomonas acernae.*

cc. Nitrites not produced from nitrates.

30. *Xanthomonas carotae.*
31. *Xanthomonas hederae.*
32. *Xanthomonas phormicola.*
25. *Xanthomonas vesicatoria.*

ccc. Ammonia formed in nitrate media.

33. *Xanthomonas geranii.*

bbbb. Starch hydrolysis not reported.
c. Nitrites produced from nitrates.
34. *Xanthomonas antirrhini.*
35. *Xanthomonas heterocea.*
cc. Nitrites not produced from nitrates.
36. *Xanthomonas gummisudans.*
37. *Xanthomonas lactucae.*
38. *Xanthomonas nigromaculans.*
aa. Gelatin not liquefied.
b. Starch not hydrolyzed.
39. *Xanthomonas oryzae.*
aaa. Gelatin not reported.
b. Starch hydrolyzed.
40. *Xanthomonas celebensis.*
2. Colonies whitish to cream.
a. Gelatin liquefied.
b. Starch hydrolyzed.
c. Nitrites produced from nitrates.
41. *Xanthomonas panici.*
42. *Xanthomonas proteomaculans.*
43. *Xanthomonas manihotis.*
cc. Nitrites not reported.
44. *Xanthomonas rubrisubalbicans.*
bb. Starch not reported.
45. *Xanthomonas cannae.*
46. *Xanthomonas zingiberi.*
47. *Xanthomonas conjaci.*

1. **Xanthomonas hyacinthi** (Wakker) Dowson. (*Bacterium hyacinthi* Wakker, Botan. Centralblatt, *14*, 1883, 315; *Bacillus hyacinthi* Trevisan, I generi e le specie delle Batteriacee, 1889; 19; *Pseudomonas hyacinthi* Erw. Smith, Bot. Gazette, *24*, 1897, 188; *Phytomonas hyacinthi* Bergey et al., Manual, 1st ed., 1923, 177; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 188.) From Gr. *hyacinthus*, the hyacinth; M. L. *Hyacinthus*, a generic name.

Description from Smith, Div. Veg. Phys. and Path., U. S. D. A. Bul. *26*, 1901, 40.

Rods: 0.4 to 0.6 by 0.8 to 2 microns. Motile with a polar flagellum. Filaments present. Gram-negative.

Gelatin: Slow liquefaction.

Agar colonies: Circular, flat, moist, shining, bright yellow. Media stained brown.

Milk: Casein is precipitated and digested. Tyrosine crystals produced.

Nitrites not produced from nitrates.

Indole: Slight production.

Hydrogen sulfide is produced.

Acid, no gas, from glucose, fructose, galactose, sucrose and maltose.

Starch: Hydrolysis slight.

Optimum temperature 28° to 30°C. Maximum 34° to 35°C. Minimum 4°C.

Aerobic, with the exception of maltose, where it is facultative anaerobic.

Habitat: Produces a yellow rot of hyacinth bulbs, *Hyacinthus orientalis.*

2. **Xanthomonas pruni** (Erw. Smith) Dowson. (*Pseudomonas pruni* Erw. Smith, Science, N. S. *17*, 1903, 456; *Bacterium pruni* Erw. Smith, Bacteria in Relation to Plant Dis., *1*, 1905, 171; *Bacillus pruni* Holland, Jour. Bact., *5*, 1920, 220; *Phytomonas pruni* Bergey et

al., Manual, 1st ed., 1923, 179; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *prunus*, plum; M. L. *Prunus*, a generic name.

Probable synonym: *Phytomonas cerasi wraggi* Sackett, Col. Agr. Exp. Sta. Rept., *38*, 1925, 17; *Pseudomonas cerasi wraggi*, *ibid.*; *Bacterium cerasi wraggi* Elliott, Bact. Plant Pathogens, 1930, 111.

Description from Dunegan, U. S. Dept. Agr., Tech. Bull. 273, 1932, 23.

Rods: 0.2 to 0.4 by 0.8 to 1.0 microns. Capsules. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Beef-extract agar colonies: Yellow, circular, smooth, convex, edges entire.

Broth: Turbid becoming viscid.

Milk: Precipitation of casein and digestion.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide not produced. Hydrogen sulfide produced (Burkholder).

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid from arabinose, xylose, glucose, fructose, galactose, mannose, maltose, lactose, sucrose, raffinose, melezitose.

Starch is hydrolyzed (slight).

Aerobic.

Optimum temperature 24° to 29°C. Maximum 37°C.

Source: Smith isolated the pathogen from Japanese plums.

Habitat: Pathogenic on plum (*Prunus salicina*), peach (*P. persica*), apricot (*P. armenicca*), etc.

3. **Xanthomonas vitians** (Brown) Starr and Weiss. (*Bacterium vitians* Brown, Jour. Agr. Res., *13*, 1918, 379; *Phytomonas vitians* Bergey et al., Manual, 1st ed., 1923, 183; *Pseudomonas vitians* Stapp, in Sorauer, Handb. d. Pflanzenkrank., *2*, 5 Aufl., 1928, 287; Starr and Weiss, Phytopath., *33*, 1943, 316.) From Latin, *vitians*, injuring, infecting.

Rods: Motile with bipolar flagella. Gram-negative.

Gelatin: Slow liquefaction.

Beef-extract agar colonies: Circular, smooth, thin, cream to cream-yellow.

Broth: Turbid with yellow ring.

Milk: Clears and turns alkaline.

Nitrites not produced from nitrates.

Indole: Feeble production.

Hydrogen sulfide: Feeble production.

Acid but not gas from glucose.

Starch: Feeble hydrolysis.

Optimum temperature 26° to 28°C. Maximum 35°C. Minimum 0°C.

Aerobic.

Source: Isolated from the stem of diseased lettuce plants from South Carolina.

Habitat: Pathogenic on lettuce, *Lactuca sativa*.

4. **Xanthomonas beticola** (Smith, Brown and Townsend) *comb. nov.* (*Bacterium beticolum* Smith, Brown and Townsend, U. S. Dept. Agr., Bur. Plant Ind., Bul. 213, 1911, 194; *Pseudomonas beticola* Holland, Jour. Bact., *5*, 1920, 224; *Phytomonas beticola* Bergey et al., Manual, 1st ed., 1923, 182.) From Latin, *beta*, beet; *-cola*, dweller.

Description from Brown, Jour. Agr. Res., *37*, 1928, 167, where the species is referred to as *Bacterium beticola* (Smith, Brown and Townsend) Potebnia.

Rods: 0.4 to 0.8 by 0.6 to 2.0 microns. Motile with 1 to 4 polar flagella. Capsules. Gram-variable.

Gelatin: Liquefaction.

Beef-agar slants: Moderate filiform growth, flat, glistening, yellow.

Broth: Turbid, yellow ring, abundant sediment.

Milk: Coagulation and peptonization.

Indole not formed.

Hydrogen sulfide formed.

Nitrites produced from nitrates.

Acid from glucose, sucrose, maltose, mannitol. No acid from lactose.

Starch hydrolysis feeble.

Optimum temperature 29°C. Maximum 39°C. Minimum 1.5°C.

Optimum pH 6.5. Maximum 9.0 to 9.5. Minimum 4.5 to 4.8.

Tolerates salt up to 9 per cent.

Aerobic.

Source: Isolated from galls on sugar beets collected in Colorado, Kansas, and Virginia.

Habitat: Produces gall on sugar beets and on garden beets.

NOTE: It is doubtful whether this species belongs in this genus.

5. **Xanthomonas lactucae-scariolae** (Thornberry and Anderson) *comb. nov.* (*Phytomonas lactucae-scariolae* Thornberry and Anderson, Phytopath., *27*, 1937, 109.) From *Lactuca scariola*, the host.

Rods: 0.5 to 1.0 by 1.0 to 1.5 microns. Motile with 1 or 2 polar flagella. Chains present. Capsules. Gram-negative.

Gelatin: Slow liquefaction.

Glucose agar colonies: Round, entire, finely granular, amber yellow.

Broth: Turbid. No pellicle. A yellow rim.

Milk: Slight acid, and peptonization.

Nitrites are produced from nitrates.

Hydrogen sulfide not formed.

No gas from carbon sources.

Starch: Slight diastatic activity.

Optimum temperature 25°C. Maximum 35°C. Minimum 7°C.

Aerobic.

Source: Isolated from necrotic lesions on wild lettuce.

Habitat: Pathogenic on wild lettuce, *Lactuca scariola*, but not on cultivated lettuce, *Lactuca sativa*.

6. **Xanthomonas rubrilineans** (Lee et al.) Starr and Burkholder. (*Phytomonas rubrilineans* Lee, Purdy, Barnum and Martin, Hawaiian Sugar Planters' Assoc. Bull., 1925, 25; *Pseudomonas rubrilineans* Stapp, in Sorauer, Handb. d. Pflanzenkrank., *2*, 5 Aufl., 1928, 35; *Bacterium rubrilineans* Elliott, Man. Bact. Plant Path., 1930, 195; Starr and Burkholder, Phytopath., *32*, 1942, 600.) From L. *ruber*, red; *lineans*, striping.

Rods: 0.7 by 1.67 microns. Motile with 1 or seldom more polar flagella. Gram-negative.

Gelatin: Liquefaction.

Agar (Beef-extract + glucose) colonies: Small, smooth, glistening, buff to yellow.

Broth: Turbid with pellicle. Sediment.

Milk: Casein precipitated and digested.

Nitrites are produced from nitrates.

Indole not produced.

Hydrogen sulfide not formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid from glucose, fructose, arabinose, xylose, lactose, sucrose, raffinose and mannitol.

Starch: Slight hydrolysis.

Growth range, pH 5.4 to pH 7.3.

Facultative anaerobe.

Source: Description from 3 cultures isolated from the red stripe lesions in sugar cane.

Habitat: Pathogenic on sugar cane.

7. **Xanthomonas barbareae** Burkholder. (Burkholder, Phytopath., *31*, 1941, 348; *Phytomonas barbareae* Burkholder, *ibid.*) From M. L. *Barbarea*, a generic name.

Rods: 0.4 to 0.95 by 1.0 to 3.15 microns. Motile with a single polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Beef-extract peptone colonies: Circular, yellow, smooth, butyrous, growth moderate.

Potato glucose agar: Growth abundant, pale yellow. Mucoid.

Broth: Turbid, yellow granular ring.

Milk: Soft curd, with clearing and production of tyrosine crystals. Litmus reduced.

Nitrates utilized but no nitrites formed. Asparagine and nitrites not utilized.

Hydrogen sulfide produced.

Indole not formed.

Lipolytic (Starr and Burkholder, *loc. cit.*).

Acid from glucose, galactose, xylose, maltose, sucrose, and glycerol. Alkali

produced from salts of malonic, citric, malic, and succinic acids. Rhamnose, salicin and hippuric acid salts not utilized.

Starch hydrolyzed.

Aerobic.

Distinctive characters: Similar to *Xanthomonas campestris* but does not infect cabbage, cauliflower or horseradish.

Source: From black rot of winter cress, *Barbarea vulgaris*.

Habitat: Pathogenic on leaves and stems of *Barbarea vulgaris*.

8. **Xanthomonas begoniae** (Takimoto) Dowson. (*Bacterium begoniae* Takimoto, Jour. Plant. Protect., *21*, 1934, 262; *Pseudomonas begoniae* Stapp, Arbeiten Biol. Reichsanst. f. Land- und Forstw., *22*, 1938, 392; *Phytomonas begoniae* Burkholder, in Manual, 5th ed., 1939, 162; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From M. L. *Begonia*, a generic name.

Probable synonyms: *Bacterium begoniae* Buchwald *nom. nud.*, Gartner-Tidende, *45*, 1933, 1; *Phytomonas flava begoniae* Wieringa, Tidschr. Plantziekt., *41*, 1935, 312; *Bacterium flavozonata* McCulloch, Jour. Agr. Res., *54*, 1937, 859 (*Xanthomonas flavozonatum* Dowson, *loc. cit.*).

Translated by Dr. K. Togashi.

Rods: 0.5 to 0.6 by 1.2 to 2.0 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: No liquefaction. Liquefaction (Wieringa, *loc. cit.*, McCulloch, *loc. cit.*, Dowson, *loc. cit.*, and Stapp, *loc. cit.*).

Potato agar colonies: Circular, convex, smooth, moist, shining, yellow.

Broth: Turbid. Yellow pellicle and precipitation.

Milk: No coagulation. Casein digested Alkaline.

Nitrites not produced from nitrates.

Indole not produced.

Hydrogen sulfide produced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Starch hydrolyzed (Dowson, Jour. Roy. Hort. Soc., *63*, 1938, 289).

No acid or gas in peptone broth from glucose, sucrose, lactose or glycerol. Acid from glucose, sucrose, lactose, mannitol and glycerol in peptone-free medium (McCulloch, *loc. cit.*).

Optimum temperature 27°C. Maximum 37°C. Minimum 1° to 3°C.

Source: Isolated from leaf spot of begonia.

Habitat: Pathogenic on *Begonia spp.*

9. **Xanthomonas campestris** (Pammel) Dowson. (*Bacillus campestris* Pammel, Iowa Agr. Exp. Sta. Bull. 27, 1895, 130; *Pseudomonas campestris* Erw. Smith, Cent. f. Bakt., II Abt., *3*, 1897, 284; *Bacterium campestris* (sic) Chester, Del. Col. Agr. Exp. Sta. Ann. Rept., *9*, 1897, 110; *Phytomonas campestris* Bergey et al., Manual, 1st ed., 1923, 176; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *campestris* of the field.

Description from McCulloch (Jour. Agr. Res., *38*, 1929, 278). Species is probably composed of several varieties. See descriptions by Mekta, Ann. Appl. Biol., *12*, 1925, 330; Paine and Nirula, Ann. Appl. Biol., *15*, 1928, 46; Wormald and Frampton, Ann. Rept. East. Mall. Res. Sta., 1926 and 1927, II Supplement, 1928, 108; and others.

Rods: 0.3 to 0.5 by 0.7 to 2.0 microns. Motile with a polar flagellum. Capsules. Gram-negative.

Gelatin: Liquefied.

Beef agar colonies: Wax yellow, round, smooth, shining, translucent, margins entire.

Broth: Turbid with yellow rim and sometimes a pellicle.

Milk: Casein digested with the formation of tyrosine crystals. Alkaline.

Nitrites not produced from nitrates.

Indole formation weak.

Hydrogen sulfide produced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid, no gas, from glucose, sucrose, lactose, glycerol and mannitol.

Starch is hydrolyzed.

Optimum temperature 28° to 30°C. Maximum 36°C.

Aerobic.

Distinctive characters: Causes a vascular infection in cabbage, cauliflower and rutabagas.

Source: Pammel (*loc. cit.*) first isolated the pathogen from diseased rutabagas.

Habitat: Pathogenic on cabbage, cauliflower and other related species.

9a. *Xanthomonas campestris* var. *armoraciae* (McCulloch) Burkholder. (*Bacterium campestre* var. *armoraciae* McCulloch, Jour. Agr. Res., *38*, 1929, 269; *Phytomonas campestris* var. *armoraciae* Bergey et al., Manual, 3rd ed., 1930, 251; Burkholder, Phytopath., *32*, 1942, 601.) From Gr. *Armoracia*, the horse radish.

Cultural characters same as *Xanthomonas campestris*.

Distinctive characters: Causes a leaf spot of horse radish. No vascular infection.

Source: Isolated from diseased horseradish leaves collected in Washington, D. C., Virginia, Connecticut, Iowa and Missouri.

Habitat: Pathogenic on horse radish and related species.

10. **Xanthomonas citri** (Hasse) Dowson. (*Pseudomonas citri* Hasse, Jour. Agr. Res., *4*, 1915, 97; *Bacterium citri* Doidge, Union So. Africa, Dept. Agr. Sci. Bul. 8, 1916, 20; *Bacillus citri* Holland, Jour. Bact., *5*, 1920, 218; *Phytomonas citri* Bergey et al., Manual, 1st ed., 1923, 181; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From M. L. *Citrus*, a generic name.

Rods: 0.5 to 0.75 by 1.5 to 2 microns, occurring in chains. Motile with a single polar flagellum. Gram-negative.

Gelatin: Liquefied.

Beef agar colonies: Appear in 36–48 hours, circular, smooth, raised, dull yellow.

Broth: Turbid in 24 hours. A yellow ring formed.

Milk: Casein is precipitated.

Nitrites not produced from nitrates.

Hydrogen sulfide produced (Reid, New Zealand Jour. Sci. and Tech., *22*, 1938, 60).

Indole not formed.

No gas from glucose, lactose or mannitol.

Starch hydrolyzed (Reid, *loc. cit.*).

Aerobic.

Optimum temperature, 25° to 34°C. Maximum 38°C. Minimum 10°C. (Okabe, Jour. Soc. Trop. Agr., *4*, 1932, 476).

Source: Isolated from canker on orange.

Habitat: Produces a canker on many species of *Citrus* and related plants.

11. **Xanthomonas corylina** Miller, Bollen, Simmons, Gross, and Barss. (Miller et al., Phytopath., *30*, 1940, 731; *Phytomonas corylina* Miller et al., *ibid.*) From Gr. *corylus*, the hazelnut; M. L. *corylina*, of the hazel nut.

Rods: 0.5 to 0.7 by 1.1 to 3.8 microns. Motile with a polar flagellum. Capsules. Gram-negative.

Gelatin: Liquefaction.

Nutrient glucose-agar streaks: Abundant growth, filiform, convex, glistening, smooth, opaque, pale lemon yellow, viscid.

Broth: Turbid. Ring formed in 2–5 days.

Milk: Enzymatic curd that is slowly digested. Litmus reduced. Crystal formation (Burkholder).

Nitrites not produced from nitrates.

Nitrogen sources utilized are peptone, aspartic acid, alanine, leucine, sodium ammonium phosphate, allantoin, tyrosine, uric acid and brucine.

Indole is not produced.

Hydrogen sulfide not produced on lead acetate agar. H_2S produced after Zobell and Feltham's method (Burkholder).

Selenium dioxide reduced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid, no gas from glucose, fructose, galactose, lactose, sucrose, maltose, xylose, raffinose, mannitol, glycerol, and starch. Alkali from salts of citric. lactic,

malic and succinic acids. Arabinose, rhamnose, dulcitol, salicin, inulin, and cellulose not utilized.

Starch is hydrolyzed.

Optimum temperature 28° to 32°C. Maximum 37°C. Minimum 5° to 7°C. Thermal death point 53° to 55°C.

pH range for growth: pH 5.2 to 10.5. Optimum pH 6 to 8.

Strict aerobe.

Distinctive characters: Cultural characters the same or similar to *Xanthomonas juglandis*. The two species do not cross-infect.

Source: 26 isolates from widely scattered filbert orchards in Oregon and Washington.

Habitat: Pathogenic on filberts (*Corylus avellana* and *C. maxima*).

12. **Xanthomonas cucurbitae** (Bryan) Dowson. (*Bacterium cucurbitae* Bryan, Science, *63*, 1926, 165; Bryan, Jour. Agr. Res., *40*, 1930, 389; *Phytomonas cucurbitae* Bergey et al., Manual, 3rd ed., 1930, 251; *Pseudomonas cucurbitae* Stapp, Bot. Rev., *1*, 1935, 408; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *curcurbita*, a gourd; M. L. *Cucurbita*, a generic name.

Rods: 0.45 to 0.6 by 0.5 to 1.3 microns. Motile, usually with a single polar flagellum. Gram-negative.

Gelatin: Liquefied.

Beef-agar slants: Growth moderate, mustard yellow, undulating margins, viscid to butyrous.

Broth: Moderately turbid. Ring and yellow sediment.

Milk: Precipitation of casein and digestion. Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide produced.

Acid from glucose, galactose, fructose, lactose, maltose, sucrose and glycerol. No acid from mannitol.

Starch is hydrolyzed.

Optimum temperature 25° to 30°C. Maximum 35°C.

Optimum pH 6.5 to 7.0. Limits of growth pH 5.8 to 9.0.

Slight growth in 5 per cent salt.

Aerobic.

Source: Species first isolated from squash.

Habitat: Causes a leaf spot of squash and related plants.

13. **Xanthomonas dieffenbachiae** (McCulloch and Pirone) Dowson. (*Phytomonas dieffenbachiae* McCulloch and Pirone, Phytopath., *29*, 1939, 962; *Bacterium dieffenbachiae* McCulloch and Pirone, *ibid.*; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 12.) From M. L. *Dieffenbachia*, a generic name.

Rods: 0.3 to 0.4 by 1.0 to 1.5 microns. Motile with a single polar flagellum. Capsules. Gram-negative.

Gelatin: Liquefied.

Beef-infusion peptone agar colonies: Slow growing, circular, flat, smooth, translucent. Butyrous. Massicot to Naples yellow.

Broth: Turbid. Yellow rim or slight pellicle.

Milk: Slow peptonization and formation of tyrosine crystals. Litmus reduced.

Nitrites not formed from nitrates

Indole not produced.

Hydrogen sulfide produced.

Acid from glucose, sucrose, lactose, galactose, fructose and glycerol. Growth but no acid in maltose and mannitol.

Starch moderately hydrolyzed.

Optimum temperature 30° to 31°C. Maximum 37° to 38°C. Minimum 5°C.

Aerobe.

Source: Seven isolates from diseased leaves of *Dieffenbachia picta*.

Habitat: Pathogenic on *Dieffenbachia picta*. Artificial infection of *Dracaena fragrans*.

14. **Xanthomonas holcicola** (Elliott) Starr and Burkholder. (*Bacterium holcicola* Elliott, Jour. Agr. Res., *40*, 1930, 972; *Phytomonas holcicola* Bergey et al., Manual, 4th ed., 1934, 271; *Pseudomonas*

holcicola Stapp, Bot. Rev., *1*, 1935, 407; Starr and Burkholder, Phytopath., *32*, 1942, 600.) From Gr. *holcus*, sorghum, *-cola*, dweller; M. L. *Holcus*, a generic name.

Rods: 0.75 by 1.58 microns. Motile with 1 or 2 polar flagella. Capsules. Gram-negative.

Gelatin: Liquefied.

Beef-infusion peptone agar colonies: Round, umbonate, glistening, smooth, translucent to opaque, wax yellow, butyrous.

Broth: Trace of growth in 24 hours. Later turbid with a slight ring.

Milk: Casein precipitated and peptonized. Alkaline.

Nitrite production doubtful.

Indole not produced.

Hydrogen sulfide is produced.

Lipolytic (Starr and Burkholder, *loc. cit.*).

Acid, no gas, from sucrose.

Starch is hydrolyzed.

Optimum temperature 28° to 30°C. Maximum 36° to 37°C. Minimum 4°C.

Optimum pH 7.0 to 7.5. Growth range pH 5.5 to 9.0.

Source: Isolated from many collections of sorghum leaves showing a streak disease.

Habitat: Pathogenic on leaves of *Holcus sorghum* and *H. halepensis*.

15. **Xanthomonas incanae** (Kendrick and Baker) Starr and Weiss. (*Phytomonas incanae* Kendrick and Baker, California Bull. 665, 1942, 10; Starr and Weiss, Phytopath., *33*, 1943, 316.) From its host plant *Matthiola incana*; L. *incanus*, quite gray or hoary.

Rods: 0.4 to 0.8 by 0.6 to 2.5 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefied.

Beef extract agar colonies: Round, smooth, convex or pulvinate, glistening, margin entire, picric yellow to amber color.

Broth: Turbid.

Milk: No coagulation. A clearing of the medium.

Nitrites not produced from nitrates.

Indole not formed.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid but no gas from glucose, lactose, sucrose, mannitol, d-galactose, xylose, d-mannose, raffinose, trehalose, and glycerol. No acid from maltose, l-arabinose, or rhamnose.

Starch not hydrolyzed. Starch hydrolyzed (Burkholder).

Tolerates 3 per cent salt.

Growth in beef broth at pH 4.4.

Aerobic.

Distinctive characters: Causes a disease of flowering stock but not of cabbage. Differs from *Xanthomonas campestris* in that it does not utilize l-arabinose, nor maltose.

Source: Four isolates from diseased plants of *Matthiola incana*.

Habitat: Pathogenic on flowering stocks.

16. **Xanthomonas juglandis** (Pierce) Dowson. (*Pseudomonas juglandis* Pierce, Bot. Gaz., *31*, 1901, 272; *Bacterium juglandis* Erw. Smith, Bacteria in Relation to Plant Dis., *1*, 1905, 171; *Bacillus juglandis* Holland, Jour. Bact., *5*, 1920, 218; *Phytomonas juglandis* Bergey et al., Manual, 3rd ed., 1930, 247; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *juglans* (*-andis*), the walnut; M. L. *Juglans*, a generic name.

Description taken from Miller et al., Phytopath., *30*, 1940, 731.

Rods: 0.5 to 0.7 by 1.1 to 3.8 microns. Motile with a polar flagellum. Capsules. Gram-negative.

Gelatin: Liquefaction.

Nutrient glucose-agar streaks: Abundant growth, filiform, convex, glistening, smooth, opaque, pale lemon yellow, viscid.

Broth: Turbid. Ring formed in 2 to 5 days.

Milk: Enzymatic curd that is slowly digested. Litmus reduced. Crystal formation (Burkholder).

Nitrites not produced from nitrates.

Nitrogen sources utilized are peptone, aspartic acid, alanine, leucine, sodium ammonium phosphate, allantoin, tyrosine uric acid and brucine.

Indole is not produced.

Hydrogen sulfide not produced on lead acetate agar. H_2S produced after Zobell and Feltham's method (Burkholder).

Selenium dioxide reduced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid, no gas from glucose, fructose, galactose, lactose, sucrose, maltose, xylose, raffinose, mannitol, glycerol, and starch. Alkali from salts of citric, lactic, malic and succinic acid. Arabinose, rhamnose, dulcitol, salicin, inulin, and cellulose not utilized.

Starch is hydrolyzed.

Optimum temperature 28° to 32°C. Maximum 37°C. Minimum 5° to 7°C. Thermal death point 53° to 55°C.

pH range for growth pH 5.2 to 10.5. Optimum pH 6 to 8.

Source: Isolated from black spots on the leaves and nuts of English walnuts, *Juglans regia.*

Habitat: Pathogenic on the walnut, *Juglans spp.*

17. **Xanthomonas lespedezae** (Ayers, Lefebvre and Johnson) *comb. nov.* (*Phytomonas lespedezae* Ayers, Lefebvre and Johnson, U. S. Dept. Agr. Tech. Bul. 704, 1939, 19.) From M. L. *Lespedeza*, a generic name.

Rods: 0.56 by 1.62 microns. Single, in pairs or occasional short chain. Motile with 1 polar flagellum. Gram-negative. Capsules.

Gelatin: Liquefied. Also egg albumin and blood serum.

Nutrient agar colonies: Circular, raised, glistening, translucent, and viscid. Yellow.

Broth: Turbid in 48 hours.

Milk: Peptonized and becomes alkaline.

Nitrites not produced from nitrates.

Indole is produced after 11 days.

Hydrogen sulfide is produced.

No gas in carbohydrates.

Starch hydrolyzed.

Aerobic.

Optimum temperature near 35°C. No growth at 5°C. or at 40°C.

Source: Isolated from diseased *Lespedeza spp.* collected in Virginia, New York and Illinois.

Habitat: Pathogenic on *Lespedeza spp.*

18. **Xanthomonas malvacearum** (Erw. Smith) Dowson. (*Pseudomonas malvacearum* Erw. Smith, U. S. Dept. Agr., Div. Veg. Phys. and Path., Bul. 28, 1901, 153; *Bacterium malvacearum* Erw. Smith, Bact. in Rel. to Plant Diseases, *1*, 1905, 171; *Bacillus malvacearum* Holland, Jour. Bact., *5*, 1920, 219; *Phytomonas malvacearum* Bergey et al., Manual, 1st ed., 1923, 178; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *malva*, mallows; M. L. *Malvaceae*, a family name.

Description from Elliott, Man. Bact. Plant Pathogens, 1930, 153; and Lewis, Phytopath., *20*, 1930, 723.

Rods: Motile with one polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Agar slants: Moderate growth, convex, smooth, glistening, pale yellow, wavy to irregular margins.

Broth: Slight to moderate turbidity. Sediment.

Milk: Casein precipitated and slowly digested.

Nitrites not produced from nitrates.

Hydrogen sulfide is produced (Burkholder).

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid but not gas from glucose, galactose, fructose, xylose, lactose, maltose, sucrose, raffinose, glycerol, inulin and glycogen. Alkaline reaction from salts of acetic, citric, lactic and succinic acids. No fermentation of arabinose, mannitol, dulcitol, salicin, and salts of formic, oxalic and tartaric acids (Lewis, *loc. cit*).

Starch hydrolyzed (Lewis, *loc. cit.*).

Optimum temperature 25° to 30°C. Maximum 36° to 38°C. (Elliott, *loc. cit.*).

Source: Isolated from angular leaf spot of cotton.

Habitat: Pathogenic on cotton wherever it is grown, causing a leaf spot, a stem lesion and a boll lesion.

19. **Xanthomonas pelargonii** (Brown) Starr and Burkholder. (*Bacterium pelargoni* Brown, Jour. Agr. Res., *23*, 1923, 372; *Pseudomonas pelargoni* Stapp, in Sorauer, Handb. d. Pflanzenkrank, *2*, 5 Aufl., 1928, 181; *Phytomonas pelargonii* Bergey et al., Manual, 3rd ed., 1930, 250; Starr and Burkholder, Phytopath., *32*, 1942, 600.) From Greek, *pelargus*, the stork; M. L. *Pelargonium*, a generic name for the stork's bill geranium.

Rods: 0.67 by 1.02 microns. Capsules. Motile with a polar flagellum. Gram-negative.

Gelatin: Slow liquefaction.

Beef-agar colonies: Cream-colored, glistening, round, with delicate internal markings.

Broth: Turbid in 24 hours. Incomplete pellicle.

Milk: Alkaline. Clearing in bands.

Nitrites not produced from nitrates.

Indole formation slight.

Hydrogen sulfide produced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Slight acid but not gas from glucose, sucrose and glycerol.

Starch hydrolysis feebly positive.

Optimum temperature 27°C. Maximum 35°C.

No growth in broth plus 3.5 per cent salt.

Aerobic.

Source: Isolated from spots on leaves of *Pelargonium* from District of Columbia, Maryland and New Jersey.

Habitat: Pathogenic on *Pelargonium spp.* and *Geranium spp.*

20. **Xanthomonas phaseoli** (Erw. Smith) Dowson. (*Bacillus phaseoli* Erw. Smith, Bot. Gaz., *24*, 1897, 192; A. A. A. S. Proc., *46*, 1898, 288; *Pseudomonas phaseoli* Erw. Smith, U. S. Dept. Agr., Div. Veg. Phys. and Path., Bul. 28, 1901, 1; *Bacterium phaseoli* Erw. Smith, Bact. in Rel. to Plant Dis., *1*, 1905, 72; *Phytomonas phaseoli* Bergey et al., Manual, 1st ed., 1923, 177; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From Gr. *phaseolus*, the bean; M. L. *Phaseolus*, a generic name.

Description from Burkholder, Cornell Agr. Exp. Sta. Mem. 127, 1930, 18; and Phytopath., *22*, 1932, 609.

Rods: 0.87 by 1.9 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Beef-extract agar colonies: Circular, amber yellow, smooth, butyrous, edges entire.

Broth: Turbid in 24 hours. Yellow ring.

Milk: Casein precipitated and digested. Alkaline. Tyrosine crystals formed.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide produced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid but not gas from glucose, galactose, fructose, arabinose, xylose, maltose, lactose, sucrose, raffinose and glycerol. Alkaline reaction from salts of acetic, malic, citric and succinic acids. Mannitol, dulcitol, salicin and formic and tartaric acids not fermented.

Starch is hydrolyzed.

Aerobic.

Very slight growth in beef broth plus 4 per cent salt (Hedges, Jour. Agr. Res., *29*, 1924, 243).

Distinctive character: Similar in culture to *Xanthomonas campestris*, *X. juglandis*, *X. vesicatoria*, etc., but they do not cross infect.

Habitat: Pathogenic on the bean (*Phaseolus vulgaris*), the hyacinth bean (*Dolichos lablab*), the lupine (*Lupinus polyphillus*), etc. Not pathogenic on the soy bean (*Glycine sp.*), nor cowpea (*Vigna sp.*).

20a. *Xanthomonas phaseoli* var. *sojensis* (Hedges) Starr and Burkholder. (*Bacterium phaseoli* var. *sojense* Hedges, Science, *56*, 1922, 11; Jour. Agr. Res., *29*, 1924, 229; *Phytomonas phaseoli* var. *sojense* Burkholder, Phytopath., *20*, 1930, 7; Starr and Burkholder, Phytopath., *32*, 1942, 600.) From M. L. the soy bean, *Soja*, a generic name; M. L. *sojensis*, of the soybean.

Synonyms: *Pseudomonas glycines* Nakano, Jour. Plant Protect. Tokyo, *6*, 1919, 39 (*Bacterium glycines* Elliott, Manual Bact. Plant Path., 1928, 133; *Phytomonas glycines* Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 358). (See Takimoto, Jour. Plant Protect. Tokyo, *18*, 1931, 29; and Okabe, Jour. Trop. Agr. Formosa, *4*, 1932, 473.)

Distinctive character: Differs from *Xanthomonas phaseoli* in that it infects the soy bean, *Glycine max*.

Source: Isolated from pustules on the leaves and pods of soy bean, both in America and in Japan.

Habitat: Pathogenic on the soy bean, *Glycine max* and the common bean, *Phaseolus vulgaris*.

20b. *Xanthomonas phaseoli* var. *fuscans* (Burkholder) Starr and Burkholder. (*Phytomonas phaseoli* var. *fuscans* Burkholder, Cornell Agr. Exp. Sta. Mem. 126, 1930, 22; Phytopath., *22*, 1932, 699; *Bacterium phaseoli* var. *fuscans* Okabe, Jour. Soc. Trop. Agr. Formosa, *5*, 1933, 161; *Pseudomonas phaseoli* var. *fuscans* Stapp, Bot. Rev., *1*, 1935, 407; Starr and Burkholder, Phytopath., *32*, 1942, 600.) From L. *fuscans*, producing a brown color.

Distinctive characters: Differs from *Xanthomonas phaseoli* in that it produces a deep brown color in beef-extract-peptone media and in tyrosine media. Action on maltose negative or feeble.

Source: Two cultures isolated; one from a diseased bean leaf (1924) and a diseased pod (1927) collected in Switzerland.

Habitat: Pathogenic on beans, *Phaseolus vulgaris*, and related plants.

21. **Xanthomonas plantaginis** (Thornberry and Anderson) *comb. nov.* (*Phytomonas plantaginis* Thornberry and Anderson, Phytopath., *27*, 1937, 947.) From Latin, *Plantago* (*-aginis*), plantain; M. L. *Plantago*, a generic name.

Rods: 0.6 to 1.0 by 1.0 to 1.8 microns. Occurring singly or in chains. Capsules. Motile with 1 to 2 polar flagella. Gram-negative.

Gelatin: Slight liquefaction.

Glucose agar slant: Growth moderate, filiform, raised, opaque, yellow and viscid.

Broth: Moderately turbid with ring.

Milk: Slight acidity, no reduction of litmus. Peptonization.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide not produced.

No appreciable amount of gas from carbohydrates.

Starch is hydrolyzed.

Optimum temperature 25°C. Minimum 12°C. Maximum 35°C. Thermal death point 50°C.

Aerobic.

Source: From diseased leaves of *Plantago lanceolata* in Illinois.

Habitat: Pathogenic on *Plantago spp.*

22. **Xanthomonas ricinicola** (Elliott) Dowson. (*Bacterium ricini* Yoshi and Takimoto, Jour. Plant Protect. Tokyo, *15*, 1928, 12; *Bacterium ricinicola* Elliott, Man. Bact. Plant Path., 1930, 193; *Phytomonas ricinicola* Burkholder, in Manual, 5th ed., 1939, 152; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190; *Xanthomonas ricini* Dowson, *ibid.*) From L. living on the castor bean; M. L. *Ricinus*, a generic name.

Rods: 0.4 to 0.9 by 1.3 to 2.6 microns. Capsules. Short chains. Motile with polar flagella. Gram-negative.

Gelatin: Liquefaction.

Nutrient agar colonies: Lemon yellow, changing to brown.

Milk: Slightly acid. No coagulation. Peptonization.

Nitrites not produced from nitrates.

Acid but not gas from lactose.

Starch hydrolyzed.

Optimum temperature 29° to 30°C. Maximum 39°C. Minimum 2.5°C.

Aerobic.

Source: Isolated from leaf-spot of castor-bean.

Habitat: Pathogenic on *Ricinus communis*.

23a. *Xanthomonas translucens* f. sp. *hordei* Hagborg. (Canadian Jour. of Res., *20*, 1942, 317.) From L. *translucens*, shining through, translucent, referring to the character of the lesion produced by this pathogen. Form name from *Hordeum*, a generic name.

Synonyms: *Bacterium translucens* Jones, Johnson and Reddy, Jour. Agr. Res., *11*, 1917, 637; *Pseudomonas translucens*, *ibid.*; *Phytomonas translucens* Bergey et al, Manual, 3rd ed., 1930, 252; *Xanthomonas translucens* Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.

Rods: 0.5 to 0.8 by 1 to 2.5 microns. Motile with a single polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Beef-peptone agar colonies: Round, smooth, shining, amorphous except for inconspicuous somewhat irregular concentric striations within, wax-yellow tinged with old gold; margin entire.

Broth: Turbidity becomes rather strong. Pellicle.

Milk: Soft coagulum and digestion. Milk clears. Tyrosine crystals produced.

Nitrites not produced from nitrates.

Indole: Slight formation.

Hydrogen sulfide produced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Ammonia from peptone.

Acid but not gas from glucose, d-fructose, d-mannose, d-galactose, sucrose, lactose, and sometimes salicin. No utilization of l-rhamnose, inositol, maltose, raffinose, inulin, d-mannitol, and dulcitol.

Starch hydrolyzed.

Optimum temperature 26°C. Maximum 36°C. Minimum 6°C.

Aerobic.

Distinctive characters: All forms of *Xanthomonas translucens* have the same cultural characters. They differ mainly in pathogenicity. This form is pathogenic on barley, *Hordeum spp.*; but not on oats, *Avena spp.*, rye, *Secale cereale* nor on wheat, *Triticum spp.*

Source: Isolated from leaves and seed of barley, *Hordeum vulgare*.

Habitat: Occurs naturally on barley.

23b. *Xanthomonas translucens* f. sp. *undulosa* (Smith, Jones and Reddy) Hagborg. (*Bacterium translucens* var. *undulosum* Smith, Jones and Reddy, Science, *50*, 1919, 48; *Pseudomonas translucens* var. *undulosa* Stapp, in Sorauer, Handb. d. Pflanzenk., *2*, 5 Auf., 1928, 17; *Phytomonas translucens* var. *undulosa* Hagborg, Canadian Jour. Res., *14*, 1936, 347; Hagborg, Canadian Jour. Res., *20*, 1942, 317.) From L. *unda*; M.L. *undulosus*, undulate, referring to the undulation of the colony.

Distinctive characters: Cultural characters same as all forms of *Xanthomonas translucens*. Pathogenic on wheat, *Triticium spp.*, barley, *Hordeum spp.* and rye, *Secale cereale* but not on oats, *Avena spp.*

Source: Isolated repeatedly from black chaff of wheat.

Habitat: Usually found on wheat causing the black chaff, and on rye.

23c. *Xanthomonas translucens* f. sp. *secalis* (Reddy, Godkin and Johnson) Hagborg. (*Bacterium translucens* var. *secalis* Reddy, Godkin and Johnson, Jour. Agr. Res., *28*, 1924, 1039; *Pseudomona translucens* var. *secalis* Stapp, in Sorauer, Handb. d. Pflanzenkr., *2*, 5 Aufl., 1928, 24; *Phytomonas translucens* var. *secalis* Burkholder, in Manual, 5th ed., 1939, 160;Hagborg, Canadian Jour.

Res., *20*, 1942, 317.) From M.L. *Secale*, a generic name. Distinctive characters: Cultural characters same as other forms of *Xanthomonas translucens*. This form pathogenic on rye *Secale cereale*, but not on *Triticum spp.*, *Hordeum spp.* nor *Avena spp.*

Source: Isolated from leaf spot on rye, *Secale cereale*.

Habitat: Pathogenic on rye.

23d. *Xanthomonas translucens* f. sp. *hordei-avenae* Hagborg. (Canadian Jour. Res., *20*, 1942, 317.) From M. L. *Hordeum* and *Avena*, generic names.

Distinctive characters: Cultural characters same as other forms of *Xanthomonas translucens*. Pathogenic on barley, *Hordeum spp.* and oats, *Avena spp.*, but not on wheat, *Triticium spp.*, nor rye, *Secale cereale*.

Source: Isolated 6 times from barley at various places in Canada.

Habitat: Occurs naturally on barley.

23e. *Xanthomonas translucens* f. sp. *cerealis* Hagborg. (Canadian Jour. Res., *20*, 1942, 317.) From L., of cereal.

Distinctive characters: Cultural characters same as other forms of *Xanthomonas translucens*. Pathogenic on wheat, *Triticum spp.*; oats, *Avena spp.*; barley, *Hordeum spp.*; and rye, *Secale cereale*.

Source: Isolated from wheat in Canada.

Habitat: Occurs naturally on wheat.

24. **Xanthomonas vasculorum** (Cobb) Dowson. (*Bacillus vascularum* (sic) Cobb, Agr. Gaz. of New South Wales, *4*, 1893, 777; Abst. in Cent. f. Bakt., II Abt., *1*, 1895, 41; *Bacterium vascularum* Migula, Syst. d. Bakt., *2*, 1900, 512; *Pseudomonas vascularum* Erw. Smith, U. S. Dept. Agr., Div. Veg. Phys. and Path., Bul. 28, 1901, 153; *Phytomonas vascularum* Bergey et al., Manual, 1st ed., 1923, 179; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *vasculum*, a small vessel; M. L. the vascular system.

NOTE: Erw. Smith (Bact. in Rel. to Plant Dis., *3*, 1914, 88) states that probably Spegazzini (El Polville de la Cana de Azucar, June, 1895, La Plata, Supl. Rev. Azuc., Buenos Aires, No. 16, 1895) reported the disease caused by *Xanthomonas vasculorum* but that *Bacillus sacchari* Spegazzini which he claimed to be the pathogen, was a saprophyte.

Description from Smith (*loc. cit.*, 54).

Rods: 0.4 by 1.0 microns. Motile with a polar flagellum. Gram-variable.

Gelatin: Liquefaction feeble. Liquefaction good (Burkholder).

Beef-extract agar colonies: Pale yellow, smooth, glistening, not noticeably viscid.

Broth: Good growth.

Milk: Alkaline.

Nitrites not produced from nitrates.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid but not gas from glucose, fructose and glycerol.

Starch hydrolyzed (Burkholder).

Optimum temperature 30°C. Maximum 35° to 37.5°C (Elliott, *loc. cit.*).

Habitat: Pathogenic on sugar cane, *Saccharum officinarum*, causing a bacterial gummosis.

25. **Xanthomonas vesicatoria** (Doidge) Dowson. (*Bacterium vesicatorium* Doidge, Jour. Dept. Agr , S. Africa, *1*, 1920, 718; also Ann. Appl. Biol., *7*, 1921, 428; *Pseudomonas vesicatoria* Stapp, in Sorauer, Handb. d. Pflanzenkrank., *2*, 5 Aufl., 1928, 259; *Phytomonas vesicatoria* Bergey et al., Manual, 3rd ed., 1930, 253; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *vesica*, a blister; M. L. *vesicatorius*, causing blisters.

Synonyms: Gardner and Kendrick (Phytopath., *13*, 1923, 307) list *Pseudomonas exitiosa* Gardner and Kendrick (Phytopath., *11*, 1921, 55; *Bacterium exitiosum* Gardner and Kendrick, Jour. Agr. Res., *21*, 1921, 141; *Phytomonas exitiosa* Bergey et al., Manual, 1st ed., 1923, 183) and an unnamed species, Higgins (Phytopath, *12*, 1922, 513).

Rods: 0.6 to 0.7 by 1.0 to 1.5 microns

Motile with a polar flagellum. Capsules. Gram-positive. Gram-negative (Gardner and Kendrick; and Higgins).

Gelatin: Liquefaction.

Nutrient agar colonies: Good growth. Circular, wet-shining, Naples yellow, edges entire.

Milk: Casein precipitated and slowly digested. Tyrosine crystals.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide produced (Burkholder).

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid but not gas from glucose, fructose, sucrose, lactose, galactose, glycerol and dextrin.

Certain strains hydrolyze starch, others do not (Burkholder and Li, Phytopath., *31*, 1941, 753).

Optimum temperature 30°C.

Source: Isolated from spotted tomato fruits in South Africa.

Habitat: Pathogen on tomatoes, *Lycopersicon esculentum* and peppers, *Capsicum annuum*.

25a. *Xanthomonas vesicatoria* var. *raphani* (White) Starr and Burkholder. (*Bacterium vesicatoria* var. *raphani* White, Phytopath., *20*, 1930, 653; *Phytomonas vesicatoria* var. *raphani* Burkholder, in Manual, 5th ed., 1939, 154; Starr and Burkholder, Phytopath., *32*, 1942, 600.) From M. L. *Raphanus*, the radish, a generic name.

Distinctive characters: Cultural characters similar to *Xanthomonas vesicatoria*, but differs in that it is able to attack radishes, turnips, and other crucifers. Differs from *Xanthomonas campestris* in that it does not cause a vascular disease, and differs from *Xanthomonas campestris* var. *armoraciae* in that it is not pathogenic on horseradish.

Source: Isolated from leaf spots of radish and turnips in Indiana.

Habitat: Pathogenic on radish, turnips, and other crucifers; and on tomato and pepper.

26. **Xanthomonas nakatae** (Okabe) Dowson. (*Bacterium nakatae* Type B, Okabe, Jour. Soc. Trop. Agr., Formosa, *5*, 1933, 161; *Phytomonas nakatae* Burkholder, in Manual, 5th ed., 1939, 154; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 12.) Named for Nakata, the Japanese plant pathologist.

Rods: 0.3 to 0.4 by 1.1 to 2.5 microns. Capsules. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefaction. Brown color.

Beef-extract agar colonies: Amber yellow, round, smooth, glistening, margins entire. Brown.

Broth: Moderate turbidity with yellow ring. Medium turns brown.

Milk: Casein is precipitated and digested. Tyrosine crystals. Brown color.

Nitrites not produced from nitrates.

Indole not formed.

Slight amount H_2S produced.

Acid but not gas from glucose, sucrose, maltose and lactose.

Starch: Strong diastatic action.

Optimum temperature 30° to 32°C. Maximum 39°C. Minimum 10°C.

No growth in beef extract broth plus 2 per cent salt.

Aerobic.

Distinctive character: Differs from Type A in that it produces a brown pigment in culture. (Description of Type A not seen.)

Source: Isolated from water-soaked to brown leaf spots on jute.

Habitat: Pathogenic on jute, *Corchorus capsularis*.

27. **Xanthomonas papavericola** (Bryan and McWhorter) Dowson. (*Bacterium papavericola* Bryan and McWhorter, Jour. Agr. Res., *40*, 1930, 9; *Phytomonas papavericola* Bergey et al., Manual, 4th ed., 1934, 266; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *papaver*, poppy; *-cola*, dweller; M. L. *Papaver*, a generic name.

Rods: 0.6 to 0.7 by 1 to 1.7 microns. Chains. Capsules. Motile with a single polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Beef agar colonies: Mustard yellow to primuline yellow, circular, margins entire.

Broth: Turbidity prompt with a yellow ring and an incomplete pellicle.

Milk: Soft coagulation, peptonization and production of tyrosine crystals.

Nitrates: A weak reaction for nitrites after 10 days.

Indole not formed.

Hydrogen sulfide is produced.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid but not gas from glucose, galactose, fructose, sucrose, lactose, maltose, glycerol and mannitol.

Starch is hydrolyzed.

Optimum temperature 25° to 30°C. Maximum 35°C.

No growth in broth plus 5 per cent salt.

Aerobic.

Source: Isolated from black spots on leaves, buds and pods of poppy.

Habitat: Pathogenic on poppy, *Papaver rhoeas*.

28. **Xanthomonas alfalfae** (Riker et al.) Dowson. (*Bacterium alfalfae* Riker, Jones and Davis, Jour. Agr. Res., *51*, 1935, 177; *Phytomonas alfalfae* Riker et al., *ibid.*; *Pseudomonas alfalfae* Riker et al., *ibid.*; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 11.) From Spanish, of alfalfa.

Rods: 0.45 by 2.4 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefied.

Nutrient agar stroke: Growth abundant, filiform, smooth, glistening, butyrous, pale yellow.

Broth: Turbid in 24 hours. Light sediment.

Milk: Casein is precipitated and digested.

Ammonia formed slowly in a nitrate medium.

Carbohydrates: No acid in yeast broth plus sugars.

Starch is hydrolyzed.

Aerobic.

Optimum temperature 24° to 32°C. Maximum below 36°C. Minimum below 4°C.

Source: Six single cell cultures isolated from diseased alfalfa.

Habitat: Pathogenic on the leaves of alfalfa, *Medicago sativa*.

29. **Xanthomonas acernea** (Ogawa) *comb. nov.* (*Pseudomonas acernea* Ogawa, Ann. Phyt. Soc. Japan, *7*, 1937, 123; *Phytomonas acernea* Ark, Phytopath., *29*, 1939, 968.) From L. *acerneus*, of the maple.

Rods: 0.2 to 0.6 by 0.5 to 1.2 microns. Motile with one polar flagellum. Gram-negative.

Gelatin: Liquified.

Agar colonies: Round, smooth, convex, white to citron yellow, glistening, translucent with amorphous structure.

Broth: Turbid.

Milk: Slowly cleared, slightly acid. No coagulation.

Nitrites produced from nitrates.

Hydrogen sulfide produced.

No gas produced in peptone water plus sugars.

Starch not hydrolyzed.

Optimum temperature about 32°C. Thermal death point 59°C.

Aerobic.

Source: From diseased leaves of *Acer trifidum* in Japan.

Habitat: Causes a disease in *Acer spp.* and in *Aesculus turbinata* and *Koelreuteria paniculata*.

30. **Xanthomonas carotae** (Kendrick) Dowson. (*Phytomonas carotae* Kendrick, Jour. Agr. Res., *49*, 1934, 504; *Pseudomonas carotae* Kendrick, *ibid.*; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *carota*, the carrot.

Rods: 0.42 to 0.85 by 1.38 to 2.75 microns. Motile with 1 or 2 polar flagella. Gram-negative.

Gelatin: Liquefied.

Potato glucose agar: Colonies round, smooth, glistening, margins entire, straw yellow in color.

Milk: Casein precipitated and milk cleared; alkaline.

Nitrites not produced from nitrates.

Indole not formed.

Acid, no gas, from glucose, *d*-galactose, xylose, *d*-mannose, *l*-arabinose, sucrose, lactose, raffinose, trehalose, *d*-mannitol and glycerol. No acid from maltose and rhamnose.

Starch not hydrolyzed.

Optimum temperature 25° to 30°C.

Tolerates 4 per cent salt at pH 7.

Aerobic.

Source: Two original isolations from diseased carrots and a reisolation from inoculated carrots were used for the description.

Habitat: Pathogenic on leaves of *Daucus carota* var. *sativa.*

31. **Xanthomonas hederae** (Arnaud) Dowson. (*Bacterium hederae* Arnaud, Compt. rend. Acad. Sci., Paris, *171*, 1920, 121; *Phytomonas hederae* Burkholder and Guterman, Phytopath., *22*, 1932, 783; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From L. *hedera*, ivy; M. L. *Hedera*, a generic name.

Description taken from Burkholder and Guterman (*loc. cit.*).

Rods: 0.6 by 2.13 microns. Motile with a single polar flagellum. Gram-negative.

Gelatin: Liquefied.

Beef-extract-agar slants: Growth good, filiform, amber yellow, butyrous.

Broth: Turbid.

Milk: Casein is precipitated and digested. Milk becomes alkaline.

Nitrites not produced from nitrates.

Hydrogen sulfide is formed.

Indole not formed.

Not lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid from glucose, fructose, galactose, xylose, sucrose, lactose and glycerol. Alkali from salts of acetic, citric, lactic, malic and succinic acids. The following are not utilized: arabinose, rhamnose, maltose, salicin, starch, cellulose and formic acid.

Aerobic, facultative.

Source: Isolated from diseased ivy leaves.

Habitat: Pathogenic on ivy, *Hedera helix.*

32. **Xanthomonas phormicola** (Takimoto) Dowson. (*Bacterium phormicola* Takimoto, Jour. Plant Protect., *20*, 1933, 777; *Phytomonas phormicola* Burkholder, in Manual, 5th ed., 1939, 159; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 12.) From M. L. *Phormium*, a generic name.

Description translated by Dr. K. Togashi.

Rods: 0.5 to 0.6 by 1 to 2 microns. Motile, with a single flagellum. Gram-negative.

Gelatin: Liquefied.

Agar colonies: Light yellow, then waxy yellow; butyrous, then viscid.

Broth: Turbid, pellicle formed.

Milk: Casein coagulated slowly and precipitated, then digested. Alkaline.

Nitrites not produced from nitrates.

Indole not formed.

Hydrogen sulfide produced.

No gas from sucrose, glucose, lactose and glycerol.

No acid from various sugars in broth.

Optimum temperature about 29°C. Maximum 39°C. Minimum about 0°C.

Aerobic.

Source: Species isolated from New Zealand flax, *Phormium tenax.*

Habitat: Causes a leaf stripe of *Phormium tenax.*

33. **Xanthomonas geranii** (Burkholder) Dowson. (*Phytomonas geranii* Burkholder, Phytopath., *27*, 1937, 560; Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 190.) From Greek, *geranos*, crane; M. L. *Geranium*, a generic name.

Rods: 0.75 to 2.0 microns. Motile with a single polar flagellum. Gram-negative.

Gelatin: Liquefied.

Beef-extract agar slants: Moderate to good filiform growth, glistening, primuline yellow. Develops in 24 hours.

Broth: Turbid in 24 hours. No pellicle but a moderate sediment.

Milk: Becomes clear with a heavy casein precipitate. Peptonization with crystal formation.

Nitrates reduced to ammonia.

Indole not formed.

Hydrogen sulfide formed.

Lipolytic (Starr and Burkholder, Phytopath., *32*, 1942, 600).

Acid from glucose, galactose, fructose, xylose, rhamnose, lactose, sucrose, raffinose and glycerol. Alkaline reaction from salts of citric, malic, malonic and succinic acid. No growth in arabinose or formic, hippuric, maleic or tartaric acid.

Starch not hydrolyzed.

Aerobe.

Distinctive characters: Pathogenic on *Geranium spp.*, not on the house geranium, *Pelargonium hortorum*. In culture similar to *Xanthomonas pelargonii*.

Source: Three cultures isolated from *Geranium sanguineum*.

Habitat: Pathogenic on *Geranium sanguineum*, *G. maculatum*, *G. pratense* and *G. sylvaticum*.

34. **Xanthomonas antirrhini** (Takimoto) Dowson. (*Pseudomonas antirrhini* Takimoto, Bot. Mag. Tokyo, *34*, 1920, 257; *Bacterium antirrhini* Elliott, Man. Bact. Plant Path., 1930, 93; *Phytomonas antirrhini* Magrou, in Hauduroy et al., Dict. d. bact. path., Paris, 1937, 331; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 11.) From Gr. *antirrhinum*, snapdragon; M. L. *Antirrhinum*, a generic name.

Description from Elliott (*loc. cit.*).

Rods: 0.3 to 0.4 by 0.8 to 1.2 microns. Motile with polar flagella. Capsules. Gram-negative.

Gelatin: Liquefied.

Agar colonies: Round, glistening, white, later yellow.

Milk: Coagulated and casein digested.

Nitrites are produced from nitrates.

No gas produced.

Aerobic.

Optimum temperature 26° to 27°C. Maximum 34°C.

Habitat: Causes a leaf spot of *Antirrhinum majus*.

35. **Xanthomonas heterocea** (Vzoroff) *comb. nov.* (*Phytomonas heterocea* Vzoroff, Bull. North Caucasian Plant Prot. Sta. Roztoff-on-Don, *6–7*, 1930, 263; *Bacterium heteroceum* Burgwitz, Phytopathogenic bacteria, Leningrad, 1935, 135.) From Gr. *heterus*, another, different.

Description taken from Rev. App. Myc., *10*, 1931, 628.

Rods: 0.4 to 0.6 by 1.0 to 2.0 microns. Motile. Gram-negative.

Gelatin: Slow liquefaction.

Agar colonies: Round, convex, smooth, semi-transparent, glistening, yellow to amber, 2 mm. in diameter. Pitted surface.

Milk: No coagulation. At first acid, later alkaline.

Nitrites produced from nitrates.

Indole not formed.

Hydrogen sulfide produced.

Acid from glucose, galactose, arabinose, xylose, sucrose, maltose, salicin, glycerol and mannitol. Does not ferment lactose, inulin, ethyl alcohol, esculin, adonitol or dulcitol.

Optimum temperature 25° to 30°C.

Source: Isolated from diseased tobacco in the North Caucasus.

Habitat: Pathogenic on *Nicotiana tabacum*.

36. **Xanthomonas gummisudans** (McCulloch) Starr and Burkholder. (*Bacterium gummisudans* McCulloch, Phytopath., *14*, 1924, 63; also Jour. Agr. Res., *27*, 1924, 229; *Pseudomonas gummisudans* Stapp, in Sorauer, Handb. d. Pflanzenkrank., *2*, 5 Aufl., 1928, 54; *Phytomonas gummisudans* Bergey et al., Manual, 2nd ed., 1925, 201; Starr and Burkholder, Phytopath., *32*, 1942, 600.) From L. *gummi*, gum; *sudans*, sweating, dripping.

Rods: 0.6 to 0.8 by 1 to 2.8 microns.

Capsules. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefied.

Beef-peptone agar colonies: Amber yellow, circular, transparent, smooth, with definite margins.

Broth: Moderately turbid with a yellow ring.

Milk: Soft curd which is digested with formation of tyrosine crystals.

Nitrites not produced from nitrates.

Indole not produced.

Hydrogen sulfide produced.

Lipolytic (Starr and Burkholder, *loc. cit.*).

Acid from glucose and sucrose.

Optimum temperature 30°C. Maximum 36°C. Minimum 2°C.

Aerobic.

Source: From gummy lesions on gladiolus leaves.

Habitat: Pathogenic on leaves of gladioli.

37. **Xanthomonas lactucae** (Yamamoto) Dowson. (*Bacterium lactucae* Yamamoto, Jour. Plant Protect., *21*, 1934, 532; *Phytomonas lactucae* Bergey et al., Manual, 5th ed., 1939, 163; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 12.) From L. *lactuca*, lettuce; M. L. *Lactuca*, a generic name.

Description translated by Dr. K. Togashi.

Rods: 0.6 to 0.8 by 1.75 to 2.8 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: Liquefaction slow.

Agar colonies: Circular, convex, margin entire, surface smooth, wet-shining, yellow.

Broth: Turbid. Ring and pellicle.

Milk: Slow peptonization.

Nitrites not produced from nitrates.

Indole not produced.

Hydrogen sulfide produced.

Acid, no gas, from glucose, sucrose, and lactose in bouillon; no acid from glycerol in bouillon.

Optimum temperature 28°C. Maximum 35°C. Minimum below 2°C.

Aerobic.

Source: Isolated from leaf spot of lettuce.

Habitat: Pathogenic on leaves of asparagus lettuce, *Lactuca sativa* var. *angustata*.

38. **Xanthomonas nigromaculans** (Takimoto) Dowson. (*Bacterium nigromaculans* Takimoto, Jour. Plant Protect., Tokyo, *14*, 1927, 522; *Phytomonas nigromaculans* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 387; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 12.) From L. *niger*, black; *maculans*, spotting.

Description translated by Dr. K. Togashi.

Rods: 0.6 to 0.9 by 1.5 to 2.8 microns. Motile with 1 or 2 polar flagella. Gram-negative.

Gelatin: Liquefaction.

Agar colonies: Yellow, circular, margins entire, smooth, glistening.

Broth: Growth moderate with yellow pellicle.

Milk: Coagulation and digestion of the casein.

Nitrites not produced from nitrates.

Indole not produced.

No acid or gas from glucose, sucrose, lactose, mannitol and glycerol in peptone water.

Optimum temperature 27° to 28°C. Maximum 33°C. Minimum 0°C.

Aerobic.

Source: Isolated from lesions on leaf and petioles of burdock.

Habitat: Pathogenic on leaves and petioles of *Arctium lappa*, the burdock.

39. **Xanthomonas oryzae** (Uyeda and Ishiyama) Dowson. (*Pseudomonas oryzae* Uyeda and Ishiyama, Proc. Third Pan-Pacific Sci. Congr., Tokyo, *2*, 1926, 2112; *Bacterium oryzae* Nakata, see Elliott, Man. Bact. Plant Path., 1930, 172; *Phytomonas oryzae* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 388; Dowson, Trans. Brit.

Mycol. Soc., *26*, 1943, 12.) From Gr. *oryza*, rice; M. L. *Oryza*, a generic name.

Probable synonym: *Pseudomonas itoana* Tochinai, Ann. Phytopath. Soc. Japan, *2*, 1932, 456; *Bacterium itoanum* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 74; *Phytomonas itoana* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 370.

Rods: 0.5 to 0.8 by 1.0 to 2.0 microns. Motile with a polar flagellum. Gram-negative.

Gelatin: No liquefaction.

Nutrient agar colonies: Round, smooth, glistening, wax yellow.

Milk: Slightly acid.

Nitrites are not produced from nitrates.

Hydrogen sulfide produced.

Acid but no gas from glucose, lactose and sucrose.

Optimum temperature 26° to 30°C.

Strict aerobe.

Source: Isolated from a leaf blight of rice.

Habitat: Pathogenic on rice, *Oryza sativa*.

40. **Xanthomonas celebensis** (Gäumann) Dowson. (*Pseudomonas celebensis* Gäumann, Ztschr. f. Pflanzenkrank., *33*, 1923, 11; Meded. Inst. voor Plantenziek., Buitenzorg, *59*, 1923, 17; *Bacterium celebense* Elliott, Man. Bact. Plant Path., 1930, 108; *Phytomonas celebensis* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 343; Dowson, Trans. Brit. Mycol. Soc., *26*, 1943, 11.) From M. L. of the island Celebes.

Rods: 0.9 by 1.5 microns. Motile by a polar flagellum. Gram-negative.

Agar colonies: Grayish yellow.

Broth: Thin pellicle.

Milk: Coagulated and cleared.

Nitrites not produced from nitrates.

Sodium selenite: Brick red.

Starch is hydrolyzed.

Source: From vascular bundles of diseased bananas in Celebes.

Habitat: Causes the blood disease of banana.

41. **Xanthomonas panici** (Elliott) *comb. nov.* (*Bacterium panici* Elliott, Jour. Agr. Res., *26*, 1923, 157; *Pseudomonas panici* Stapp, in Sorauer, Handb. d. Pflanzenkrank., *2*, 5 Aufl., 1928, 27; *Phytomonas panici* Bergey et al., Manual, 3rd ed., 1930, 269.) From M. L. *Panicum*, a generic name.

Rods: 0.69 by 1.66 microns. Capsules. Motile by 1 or rarely 2 polar flagella. Gram-negative.

Gelatin: Liquefaction slow.

Beef agar colonies: Round, white, smooth, glistening, margins at first entire, later undulate.

Broth: Moderate turbidity in 24 hours. Thin pellicle. Medium brownish.

Milk: Alkaline and clears.

Nitrites are produced from nitrates.

Indole not produced.

Hydrogen sulfide produced.

No gas from carbohydrates.

Starch: Hydrolysis moderate.

Optimum temperature 33°C. Maximum 45°C. Minimum 5°C.

Optimum pH 6.15 to 6.3. pH range 5.4 to 10.0.

Aerobic.

Distinctive characters: Differs from *Pseudomonas andropogoni* in that it liquefies gelatin, produces nitrites from nitrates, and does not infect sorghum and broom corn.

Source: Isolation from water soaked lesions on leaves, sheaths and culms of millet collected in Wisconsin and in S. Dakota.

Habitat: Pathogenic on proso millet, *Panicum miliaceum*.

42. **Xanthomonas proteamaculans** (Paine and Stansfield) *comb. nov.* (*Pseudomonas proteamaculans* Paine and Stansfield, Ann. Appl. Biol., *6*, 1919, 38; *Phytomonas proteamaculans* Bergey et al., Manual, 3rd ed., 1930, 247; *Bacterium proteamaculans* Elliott, Man. Bact. Plant Path., 1930, 186.) From M. L. *Protea*, a generic name; *maculans*, spotting.

Rods: 0.6 to 0.8 by 0.8 to 1.6 microns.

Motile with 1 to 3 polar flagella. Gram-positive.

Gelatin: Liquefaction.

Agar slant: Growth wet-shining, dirty white with a faint yellow tinge.

Broth: Turbid in 24 hours. Slight ring.

Milk: Acid with soft curd after 2 days. Later a separation of whey.

Nitrites are produced from nitrates.

Acid and gas from glucose, sucrose and mannitol. No acid or gas from lactose.

Starch: Slight hydrolysis.

Source: Repeated isolation from a leaf-spot of *Protea* in England.

Habitat: Pathogenic on *Protea cynaroides*.

43. **Xanthomonas manihotis** (Arthaud-Berthet) *comb. nov.* (*Bacillus manihotus* Arthaud-Berthet by Bondar, Chacaras and Quintaes *5* (4), 1912, 15; *Bacillus manihot* Bondar (and Arthaud-Berthet), Bol. Agric., São Paulo, *16*, 1915, 513; *Bacterium manihotus* Drummond and Hipolito, Ceres, *2*, 1941, 298; *Phytomonas manihotis* Viegas, Rev. d. Agr., Pieracicaba, *15*, 1940, 475.) From M. L. *Manihotus*, a generic name.

Description from Burkholder, Phytopath., *32*, 1942, 147.

Rods: 0.35 to 0.93 by 1.4 to 2.8 microns. Gram-negative and mostly non-motile. One isolate showed a few cells with 1 polar flagellum. Amaral (Instit. Biol., São Paulo, Arq., *13*, 1942, 120) states that the species is motile with one polar flagellum.

Gelatin: Liquefaction.

Beef-extract-peptone agar: Streaks raised, ivory-color, smooth, shiny, with edges entire.

Potato-glucose agar: Growth abundant, white to hyaline, very mucoid.

Broth: Turbid with a whitish granular ring.

Litmus milk: Litmus reduced and milk clears. With return of color, litmus is purple.

Indole not formed.

Hydrogen sulfide is formed.

Nitrites produced from nitrates (Drummond and Hipolito, *loc. cit.*).

Asparagine not used as a nitrogen and carbon source. No growth in nitrate synthetic broth.

Weak growth but slight acid production in synthetic medium plus glucose, d-galactose, d-fructose, d-xylose, maltose and sucrose. No growth in rhamnose, l-arabinose, d-lactose, glycerol, mannitol and salicin. Good growth with alkaline reaction in same medium plus salts of the following acids: acetic, citric, malic, maleic and succinic. The salts of formic, hippuric, lactic and tartaric acids were not utilized.

Starch not hydrolyzed. Amaral (*loc. cit.*) finds hydrolysis.

Lipolytic action slight.

Aerobic.

Optimum temperature 30°C. Maximum 38°C. Minimum 5°C.

Source: First isolated from the cassava, *Manihotus utilissima* in Brazil.

Habitat: Produces a wilt disease on various species of *Manihotus*.

44. **Xanthomonas rubrisubalbicans** (Christopher and Edgerton) *comb. nov.* (*Phytomonas rubrisubalbicans* Christopher and Edgerton, Jour. Agr. Res., *41*, 1930, 266; *Bacterium rubrisubalbicans* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 105.) From L. *ruber*, red; *subalbicans*, nearly white.

Rods: Short with polar flagella. Capsules. Gram-negative.

Gelatin: No liquefaction.

Bacto-glucose agar colonies: Circular, glistening, viscid, milky gray to buff. Margins translucent, entire.

Broth: Turbid after 24 hours. Pellicle and a ropy sediment.

Indole produced.

Hydrogen sulfide produced.

No gas from carbohydrates.

Starch hydrolyzed.

Optimum temperature 30°C.

Optimum pH 6.8 to 8.0.

Source: Isolated many times from mottled stripe of sugar cane in Louisiana.

Habitat: Pathogenic on sugar cane, Johnson's grass and sorghum.

45. **Xanthomonas cannae** (Bryan) *comb. nov.* (*Bacterium cannae* Bryan, Jour. Agr. Res., *21*, 1921, 152; *Phytomonas cannae* Bergey et al., Manual, 1st ed., 1923, 188; *Pseudomonas cannae* Stapp, in Sorauer, Handb. d. Pflanzenkrank., *2*, 5 Aufl., 1928, 65.) From Gr. *canna*, a reed; M. L. *Canna*, a generic name.

Rods: 0.5 to 0.7 by 1.0 to 2.0 microns. Motile with 1 to 3 polar flagella. Capsules. Gram-negative.

Gelatin: Slow liquefaction.

Agar streaks: Filiform, white, moist, with thin margins and granular centers.

Broth: Turbid, heavy sediment.

Milk: Alkaline and clears.

Nitrites are produced from nitrates.

Indole not produced.

Hydrogen sulfide produced.

Optimum temperature 35°C. Maximum 40°C. Minimum 5°C.

Aerobic.

Source: Isolated from diseased canna leaves collected in Washington, D. C. and in Illinois.

Habitat: Causes disease in *Canna indica*.

46. **Xanthomonas zingiberi** (Uyeda) *comb. nov.* (Uyeda, Cent. f. Bakt., II Abt., *17*, 1907, 383; *Pseudomonas zingiberi* Uyeda, Rept. Imp. Agr. Exp. Sta., Japan, No. 35, 1908, 114; *Bacterium zingiberi* Nakata, see Elliott, Man. Bact. Plant Path., 1930, 266; *Phytomonas zingiberi* Magrou, in Hauduroy, et al., Dict. d. Bact. Path., Paris, 1937, 437.) From L. *zingiberis*, ginger; M. L. *Zingiber*, a generic name.

Description from Stapp, in Sorauer, Handb. d. Pflanzenkrank., *2*, 5 Aufl., 1928, 65.

Rods: 0.5 to 1.1 by 0.75 to 1.8 microns. Non-motile at first, later a polar flagellum. Gram-negative.

Gelatin: Liquefaction.

Agar colonies: White.

Milk: Coagulation and peptonization of the casein.

Nitrites are produced from nitrates.

Indole not formed.

Hydrogen sulfide is formed.

No gas from glucose.

Optimum temperature 28°C. Maximum 40°C. Minimum 5°C.

Source: Isolated from ginger plant showing a rot at the base of the sprouts.

Habitat: Pathogenic on ginger, *Zingiber officinale*.

47. **Xanthomonas conjaci** (Uyeda) *comb. nov.* (*Pseudomonas conjac* Uyeda, Bot. Mag. Tokyo, *24*, 1910, 182; *Bacterium conjac* Elliott, Man. Bact. Plant Path., 1930, 121; *Phytomonas conjac* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 347.) From M. L. *conjac*, the specific name of the plant which this species attacks.

Description from Elliott (*loc. cit.*).

Rods: 0.75 to 1.0 by 1.5 microns. Motile with 1 to 4 polar flagella. Gram-positive.

Gelatin colonies: Circular to irregular, light yellow.

Broth: Pellicle formed.

Milk: Coagulation.

Conjac: Liquefied.

Nitrites produced from nitrates.

Indole produced.

Hydrogen sulfide produced.

Gas from glucose.

Favorable temperature 24°C.

Habitat: Pathogenic on *Amorphophallus konjac*.

Appendix I:* The following organisms placed in the genus *Pseudomonas* apparently belong in *Xanthomonas*. Some may even be plant pathogens although they were

---

* Prepared by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, July, 1943.

isolated from water, soil and similar sources. Pigment is usually yellow and is not water-soluble.

Key to yellow and other chromogenic species in genus **Pseudomonas.**

1. Colonies yellow.
    a. Gelatin liquefied.
        b. Nitrites produced from nitrates.
            c. Acid and gas produced from glucose.
                1. *Pseudomonas fermentans.*
            cc. Acid but no gas from glucose.
                2. *Pseudomonas trifolii.*
                3. *Pseudomonas xanthe.*
            ccc. Action on glucose not recorded.
                4. *Pseudomonas caudata.*
        bb. Nitrites not produced from nitrates.
            c. Litmus milk acid or ferment lactose.
                5. *Pseudomonas perlurida.*
                6. *Pseudomonas iridescens.*
            cc. Litmus milk not coagulated. Yellow sediment.
                7. *Pseudomonas turcosa.*
            ccc. Litmus milk slimy, alkaline.
                8. *Pseudomonas ochracea.*
    aa. No liquefaction of gelatin.
        b. Nitrites produced from nitrates.
            c. Litmus milk, slow coagulation.
                9. *Pseudomonas cerevisiae.*
            cc. Litmus milk, acid but no digestion.
                10. *Pseudomonas arguta.*
            ccc. No growth in litmus milk.
                11. *Pseudomonas subcreta.*
            cccc. Action on litmus milk, not recorded.
                12. *Pseudomonas pictorum.*
        bb. Nitrites not produced from nitrates.
            c. Butter colored pellicle on litmus milk.
                13. *Pseudomonas lacunogenes.*
            cc. No surface pellicle.
                14. *Pseudomonas segnis.*
2. Colonies on gelatin blue center surrounded by yellow zone with peripheral green zone.
    a. Gelatin liquefied.
        b. Nitrites produced from nitrates.
                15. *Pseudomonas lemonnieri.*

1. **Pseudomonas fermentans** von Wolzogen Kühr. (von Wolzogen Kühr, Cent. f. Bakt., II Abt., *85*, 1932, 228; *Flavobacterium fermentans* Bergey et al., Manual, 4th ed., 1934, 155.) From Latin, *fermento*, to ferment.

Rods: 0.4 to 0.6 by 1.7 to 3.4 microns, with rounded ends, occurring singly and in pairs. Motile, with a single or occasionally 2 or 3 polar flagella. Gram-negative.

Gelatin colonies: Circular, grayish, with rapid liquefaction.

Gelatin stab: Liquefaction crateriform.

Agar colonies: Circular, slightly convex, opaque, gray by reflected, and light-brown by transmitted light.

Agar slant: Gray, becoming yellowish.

Broth: Turbid with pellicle.

Litmus milk: Acid.

Potato: Gray to yellowish growth.

Indole is formed.

Nitrites produced from nitrates.

Acid and visible gas from glucose, lactose and sucrose.

Acetylmethylcarbinol is formed.

Ammonia is formed from peptone and asparagin.

Hydrogen sulfide is formed.

Starch is hydrolyzed.

Lipase is formed. Catalase positive.

Aerobic, facultative.

Optimum temperature 37°C.

Distinctive character: Produces gas in lactose fermentation tubes.

Source: Ten cultures from the larvae of a midge (*Chironomus plumosus*) and from filtered water.

Habitat: Unknown.

2. **Pseudomonas trifolii** Huss. (Huss, Cent. f. Bakt., II Abt., *19*, 1907, 68; *Flavobacterium trifolii* Bergey et al., Manual, 1st ed., 1923, 111.) From Latin, *tres* (*tri-*), three; *folium*, leaf; M. L. *Trifolium*, clover.

Possible synonym: *Bacillus annulatus* Wright. (Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 443; *Pseudomonas annulata* Chester, Man. Determ. Bact., 1901, 315; Relationship to *Bacillus annulatus* Zimmermann uncertain. Die Bakt. unserer Trink- und Nutzwässer, Chemnitz, II Reihe, 1890, 30; *Flavobacterium annulatum* Bergey et al., Manual, 1st ed., 1923, 110.)

According to Mack (Cent. f. Bakt., II Abt., *95*, 1936, 218) the following organism is to be regarded as identical with *Pseudomonas trifolii: Bacillus mesentericus aureus* Winkler (Cent. f. Bakt., II Abt., *5*, 1899, 577) regarded by Burri (Cent. f. Bakt., II Abt., *10*, 1902, 756) and Düggeli (Cent. f. Bakt., II Abt., *12*, 1904, 602) as identical with the organism which Düggeli (*loc. cit.*) names *Bacterium herbicola aureum*. The organism studied as *Bacterium herbicola* by Hüttig (Cent. f. Bakt., II Abt., *84*, 1931, 231) is not regarded as identical with the Burri and Düggeli organism by Mack. Beijerinck (Cent. f. Bakt., II Abt., *15*, 1905, 366) states that *Bacillus herbicola* of Burri and Düggeli is identical with his *Bacillus anglomerans* (Botan. Ztg., 1888, 749). If so, this binomial has priority.

Rods: 0.5 to 0.7 by 0.75 to 2.0 microns, occurring singly, in pairs and in chains. Motile, possessing a single polar flagellum. Gram-negative.

Gelatin colonies: Convex, smooth, moist, glistening, grayish-yellow.

Gelatin stab: Napiform liquefaction.

Agar colonies: Small, circular, grayish, becoming brownish-yellow.

Agar slant: Yellowish, becoming brownish-yellow streak, lacerate margin.

Broth: Turbid, with grayish-yellow pellicle and sediment.

Litmus milk: Slowly coagulated; alkaline; with yellow ring.

Potato: Thick, yellowish, flat, smooth, glistening.

Hydrogen sulfide produced.

Indole is formed.

Acid from glucose, sucrose, xylose, arabinose, and mannitol. No acid from lactose.

Nitrites produced from nitrates.

Cultures have an agreeable odor.

Volutin formed.

Aerobic, facultative.

Optimum temperature 33° to 35°C.

Source: Isolated from clover hay.

Habitat: Evidently a common organism on the leaves of plants.

3. **Pseudomonas xanthe** Zettnow. (Zettnow, Cent. f. Bakt., I Abt., Orig., *77*, 1915, 220; *Flavobacterium zettnowii* Bergey et al., Manual, 1st ed., 1923, 112; *Flavobacterium xanthium* (sic) Bergey et al., Manual, 3rd ed., 1930, 145.) From Gr. *xanthus*, yellow.

Rods: 0.5 to 0.6 by 0.4 to 1.4 microns. Motile, possessing a single or occasionally two or more very long (20 microns) polar flagella. Gram-negative.

Gelatin colonies: Circular, yellow, granular.

Gelatin stab: Pale-yellow surface growth. Brownish yellow under surface colonies. Saccate liquefaction.

Agar slant: Dark yellow, glistening, with dark yellow sediment in water of condensation. Pigment not water-soluble.

Broth: Turbid.

Litmus milk: Slightly acid. Litmus reduced.

Potato: Grayish yellow to brownish growth.

Indole formed.

Nitrites are produced from nitrates.

Acid formed in glucose.

Starch hydrolyzed.

Blood serum not liquefied.

Aerobic, facultative.

Optimum temperature 30°C.

Source: Air contamination.

4. **Pseudomonas caudata** (Wright) Conn. (*Bacillus caudatus* Wright, Memoirs Nat. Acad. Sci., 7, 1895, 444; *Bacterium caudatus* Chester, Annual Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 107; Conn, Jour. Agr. Res., *16*, 1919, 313; *Flavobacterium caudatum* Bergey et al., Manual, 1st ed., 1923, 109.) From Latin, *cauda*, tail.

Rods: Long, granular, slender, occurring singly, in pairs and in chains. Appear like cocci in old cultures. Motile, possessing a polar flagellum (Conn). Gram-negative.

Gelatin colonies: Yellow, translucent, smooth, undulate.

Gelatin stab: Villous growth in stab. Crateriform liquefaction.

Agar slant: Yellow to orange, glistening, translucent, slightly spreading. May lose power to form pigment.

Broth: Turbid, with yellow sediment.

Litmus milk: Unchanged.

Potato: Dark yellow, raised, rough, spreading.

Indole not formed.

Nitrites and ammonia produced from nitrates.

Ammonia produced from peptone.

Starch is digested.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Water.

5. **Pseudomonas perlurida** Kellerman et al. (Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 516; also McBeth, Soil Sci., *1*, 1916, 472; *Cellulomonas perlurida* Bergey et al., Manual, 1st ed., 1923, 163.)

Rods: 0.4 by 1.0 micron. Motile with one to three polar flagella. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Moderate, flat, faint yellow growth.

Broth: Turbid in 5 days.

Litmus milk: Acid. Peptonization after 16 days.

Potato: Scant yellow growth with bleaching along line of growth.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia is produced.

Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from Virginia, Louisiana and Missouri.

Habitat: Soil.

5a. *Pseudomonas perlurida* var. *virginiana* Kellerman et al. (*loc. cit.*). Does not grow on potato and liquefies gelatin rapidly.

Source: Soil from Virginia.

6. **Pseudomonas iridescens** Stanier. (Jour. Bact., *43*, 1941, 542.) From Latin, iridescent.

Rods: 0.2 to 0.3 by 1.5 to 7.0 microns, average length 5.0 to 6.0 microns, occurring singly. Non-motile. Gram-negative.

Sea water gelatin stab: Filiform growth. Liquefaction by some strains.

Sea water agar colonies: Concave, 2 to 3 mm in diameter, smooth, glistening, translucent, pale yellow, edge irregular. After 2 to 3 days a marked iridescence. Later colonies rough, opaque, bright yellow, sunken central portion with translucent periphery.

Sea water agar slant: Growth spreading, smooth, glistening, translucent, pale yellow, iridescent, butyrous.

Sea water broth: Turbid, light yellow, granular pellicle.

Indole not formed.

Nitrites not produced from nitrates.

Hydrogen sulfide not produced.

Catalase positive.

Urease negative.

Acid from xylose, glucose, galactose, lactose, maltose, sucrose and cellobiose. No acid from arabinose. Starch and cellulose are attacked.

Aerobic.

Optimum temperature 23°C. Minimum 5°C. Maximum 30°C.

Salt range: 0.25 to 6.0 per cent. Optimum 1.0 to 4.0 per cent.

Source: Sea water.

Habitat: Common along the coast of the North Pacific.

7. **Pseudomonas turcosa** (Zimmermann) Migula. (*Bacillus turcosa* Zimmermann, Bakt. unserer Trink- und Nutzwässer, Chemnitz, *2*, 1894, 32; Migula, Syst. d. Bakt. *2*, 1900, 937; *Flavobacterium turcosum* Bergey et al., Manual, 1st ed., 1923, 111.) From M. L. *turcois*, turquoise.

Rods: 0.5 by 1.05 to 1.82 microns, occurring singly. A short polar flagellum (Migula). Gram-negative.

Gelatin colonies: Small, translucent, yellow.

Gelatin stab: Small, yellow, convex surface growth, with slight brownish tint. Liquefaction, with grayish to greenish color in liquefied portion.

Agar slant: Abundant, glistening, greenish to sulfur yellow streak.

Broth: Slightly turbid with yellow sediment.

Litmus milk: No coagulation. Yellow sediment.

Potato: Clear chromium yellow growth over entire surface.

Indole is not formed.

Nitrites not produced from nitrates.

Acid from glucose. Slight action on sucrose.

Aerobic, facultative.

Optimum temperature 30°C.

Source: Isolated by Tataroff from a well in Dorpat (Die Dorpaten Wasserbakterien, Inaug. Diss., 1891, 52, No. 24).

Habitat: Water, sea water.

8. **Pseudomonas ochracea** (Zimmermann) Chester. (*Bacillus ochraceus* Zimmermann, Bakt. unserer Trink- und Nutzwässer, Chemnitz, *1*, 1890, 60; Chester, Determinative Bacteriology, 1901, 316; *Flavobacterium ochraceum* Bergey et al., Manual, 1st ed., 1923, 110; *Chromobacterium ochraceum* Topley and Wilson, Princ. Bact. and Immun., *1*, 1931, 405.) From Greek, *ochros*, pale yellow.

Rods: 0.7 to 0.8 by 1.2 to 4.5 microns, occurring in pairs and longer chains. Slow undulatory motion (Zimmermann). Polar flagella (Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 255). Gram-negative.

Gelatin colonies: Pale yellow to golden, ochre yellow, slightly raised, with slightly fringed margin, granular.

Gelatin stab: Yellowish to yellow-gray surface growth. Infundibuliform liquefaction. Pale yellow to ochre yellow sediment.

Agar colonies: Thin, flat, yellowish, smooth.

Agar slant: Thin, yellowish-gray to ochraceous growth.

Broth: Slightly turbid, with pale yellow sediment.

Litmus milk: Medium becomes slimy; alkaline.

Potato: Ochre-yellow streak.

Indole is formed.

Nitrites not produced from nitrates.
Hydrogen sulfide is formed.
Aerobic, facultative.
Optimum temperature 35°C.
Source: Chemnitz tap water.
Habitat: Water.

9. **Pseudomonas cerevisiae** Fuhrmann. (Fuhrmann, Cent. f. Bakt., II Abt., *16*, 1906, 309; *Flavobacterium cerevisiae* Bergey et al., Manual, 1st ed., 1923, 111.) From Latin, *cerevisia*, beer.

Rods: Straight and slightly curved, 0.6 by 1.5 to 2.0 microns, occurring singly and in chains. Motile, possessing tuft, four to six polar flagella. Gram-negative.

Gelatin colonies: Circular, white, slightly contoured, becoming brownish-yellow.

Gelatin stab: Slight yellowish growth in stab. No liquefaction.

Agar colonies: Thin, spreading, contoured.

Agar slant: Moist, glistening, thin, pale yellow, spreading, contoured.

Litmus milk: Slow coagulation.

Potato: Yellowish-brown, spreading growth.

Indole not formed.
Nitrites produced from nitrates.
No gas from glucose.
Aerobic, facultative.
Optimum temperature 30°C.
Source: Isolated from beer.
Habitat: Unknown.

10. **Pseudomonas arguta** McBeth. (McBeth, Soil Science, *1*, 1916, 465; *Cellulomonas arguata* (sic) Bergey et al., Manual, 1st ed., 1923, 164.) From Latin, *arguo*, to show.

Rods: 0.3 by 0.8 micron. Motile with one or two polar flagella. Gram-negative.

Gelatin stab: Moderate, yellowish growth. No liquefaction in 30 days.

Agar colonies: Circular, slightly convex, soft, grayish-white, granular, entire.

Agar slant: Scant, grayish-white growth.

Potato agar slant: Moderate, yellowish, glistening.

Broth: Turbid.

Ammonia cellulose agar: Enzymatic zone 2 to 3 mm in 30 days.

Filter paper broth: Paper is reduced to loose flocculent mass which disintegrates very readily on slight agitation. More rapid decomposition when the broth contains ammonium sulfate, potassium nitrate, peptone or casein as sources of nitrogen.

Litmus milk: Acid, not digested.
Potato: No growth.
Indole not formed.
Nitrites produced from nitrates.
Ammonia not produced.

Acid from glucose, maltose, lactose, starch. No acid from glycerol, mannitol or sucrose.

Aerobic, facultative.
Optimum temperature 20°C.
Source: Isolated twice from California soils.
Habitat: Soil.

11. **Pseudomonas subcreta** McBeth and Scales. (McBeth and Scales, Bur. Plant Industry, U. S. Dept. Agr., Bul. 266, 1913, 37; *Cellulomonas subcreta* Bergey et al., Manual, 1st ed., 1923, 164.) From Latin, *sub*, under, imperfect; *creta* chalk.

Rods: 0.3 by 1.4 microns. Motile with one to five polar flagella. Gram-negative.

Gelatin stab: Filiform growth, no liquefaction.

Cellulose agar: No surface growth. Moderate, generally faint yellow growth in medium, area of growth sunken.

Agar slant: Glistening, smooth, moist, vitreous to faint yellow.

Starch agar: Enzymatic zone 2 to 4 mm.
Broth: No growth.
Litmus milk: No growth.

Potato: Growth scanty, concave due to slight liquefaction, white to faint yellow. Bleached around growth.

Indole not formed.

Trace of nitrites produced from nitrates.

Ammonia not produced.

Acid from glucose, lactose, maltose,

sucrose and starch. No acid from glycerol or mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Habitat: Soil.

12. **Pseudomonas pictorum** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 89; *Achromobacter pictorum* Bergey et al., Manual, 3rd ed., 1930, 217.) From Latin, *picti*, the Picts of Eastern Scotland.

Rods: 0.5 to 0.8 by 1.5 to 5.0 microns. Motile usually with a single polar flagellum. Gram-negative.

Gelatin colonies: Circular, greenish-yellow, convex, smooth, glistening, entire.

Gelatin stab: No liquefaction.

Agar colonies: Circular, yellow, convex, smooth, glistening, entire.

Agar slant: Filiform, yellow, convex, smooth, glistening, entire.

Broth: Turbid.

Nitrites produced from nitrates.

Starch not hydrolyzed.

Acid from glucose and maltose.

Attacks phenol.

Aerobic, facultative.

Optimum temperature 25°C.

Source: One culture from soil.

Habitat: Soil.

13. **Pseudomonas lacunogenes** Goresline. (Jour. Bact., *26*, 1933, 447.) From Latin *lacuno*, dimple and *genero*, to produce.

Short rods: 0.2 to 0.3 by 1.0 to 1.2 microns, with pointed ends, occurring singly or in pairs. Motile with a single polar flagellum from 2 to 15 microns in length. Gram-negative.

Plain gelatin stab: No growth.

Nutrient gelatin stab: Growth brownish-yellow, half-way down stab, heavier at surface. No liquefaction.

Nutrient agar colonies: Small, yellow; surface of the agar pitted or dimpled. After 5 days colonies 5 to 7 mm in diameter, orange-yellow, slightly raised, surrounded by a depression.

Nutrient agar slant: Growth heavy, light orange-yellow; consistency of warm butter; edge entire, slightly raised. Shallow depression formed on each side of streak. Agar softened beneath growth.

Nutrient broth: Turbid in 48 hours. Light orange-yellow pellicle; considerable viscous sediment.

Litmus milk: Alkaline; butter-colored pellicle. Reduction in bottom of tube after 10 days. No curd. No digestion.

Potato: Growth moderate, orange-yellow, smooth. No darkening.

Indole not formed.

Nitrites not produced from nitrates.

Starch agar plates not hydrolyzed.

Utilizes arabinose, galactose, lactose, fructose, maltose, melezitose, raffinose, starch, xylose, glucose, mannose, sucrose, pectin, rhamnose, salicin and dextrin. No growth in dulcitol, erythritol, glycerol, sorbitol, mannitol or inulin.

Limits of pH: 5.4 to 10.0.

Temperature relations: Optimum 28°C. Good growth at 25°C. Moderate growth at 20° and at 37°C. No growth at 10° and at 42°C.

Facultative anaerobe.

Distinctive characters: Softens agar; considerable change in viscosity of agar due to this digestion; utilization of ammonium sulfate as nitrogen source.

Source: Three cultures isolated from an experimental trickling filter receiving creamery wastes.

Habitat: Probably widely distributed in nature.

14. **Pseudomonas segnis** Goresline. (Jour. Bact., *26*, 1933, 452.) From Latin *segne*, non-energetic.

Short rods: 0.2 to 0.3 by 1.0 to 1.2 microns, with pointed ends, occurring singly or in pairs. Motile with a single polar flagellum. Gram-negative.

Plain gelatin stab: No growth.

Nutrient gelatin stab: Growth yellow, half-way down stab, best at surface. No liquefaction.

Nutrient agar colonies: Very small, light yellow; surface pitted. After 5 days colonies 5 mm in diameter.

Nutrient agar slant: Growth heavy, orange-yellow, consistency of warm butter; edge entire, slightly raised; slight depression formed on each side of growth. Agar softened beneath growth.

Nutrient broth: Turbid in 48 hours. No pellicle or surface growth. Moderate amount of sediment. Old cultures with a yellow ring at surface and occasionally a loose membrane.

Litmus milk: Slightly alkaline after 10 days. No reduction. No surface growth.

Potato: Scant yellow-orange growth. No darkening.

Indole not formed.

Nitrites not produced from nitrates.

No H_2S produced.

Starch not hydrolyzed.

Utilizes arabinose, glucose, galactose, lactose, fructose, maltose, mannose, xylose, sucrose, melezitose and raffinose.

Limits of pH: 5.8 to 9.0.

Temperature relations: Optimum 28°C. Good growth at 25°C. Moderate growth at 20° and at 37°C. No growth at 10° and at 42°C.

Facultative anaerobe.

Distinctive characters: Softens agar; considerable change in viscosity of agar due to this digestion.

Source: Isolated from an experimental trickling filter receiving creamery wastes.

Habitat: Probably widely distributed in nature.

15. **Pseudomonas lemonnieri** (Lasseur) *comb. nov.* (*Bacillus lemonnieri* Lasseur, Compt. rend. Soc. Biol. Paris, *74*, 1913, 47; Bul. de la Soc. des Sci. de Nancy, 1924; *Flavobacterium lasseuri* Bergey et al., Manual, 3rd ed., 1930, 144.) Named for Prof. G. le Monnier, a French scientist.

Rods: 0.5 to 0.7 by 1.0 to 2.0 microns, occurring singly and in pairs. Motile with a single polar flagellum. Gram-negative.

Gelatin colonies (glucose): Circular with blue center, a granular, yellow zone and a peripheral blue zone. Rapid liquefaction with blue crystals.

Gelatin stab: Liquefied.

Agar colonies: Circular, yellowish, lobate margin.

Agar slant: Yellowish streak, smooth, glistening.

Broth: Turbid with thin pellicle.

Litmus milk: After 48 hours the surface of the milk becomes yellow to cream color turning blue. A soft coagulum is formed.

Potato: Raised growth, Prussian blue in color, with variations.

Indole is not formed.

Nitrites produced from nitrates.

Aerobic, facultative.

Optimum temperature 22° to 25°C.

Habitat: Water.

Appendix II:* The following inadequately described species may belong to the genus *Xanthomonas*.

Bacterium citri deliciosae Passalacqua. (Rev. Pat. Veg., *24*, 1934, 27.) Isolated from *Citrus sp.*

Bacterium malvacearum var. *barbadense* Evelyn. (Ann. Rept. Agric. Barbados for 1926–27, 1928, 15.) Isolated from cotton.

Pseudomonas amaranti (sic) Smith. (U. S. Dept. Agr., Div. Veg. Phys. and Path. Bull., *28*, 1901, 153; *Bacterium amaranthi* Smith, Bact. in Relation to Plant Dis., *3*, 1914, 148; *Phytomonas amaranthi* Bergey et al., Manual, 1st ed., 1923, 186.) Isolated from diseased amaranthus. Growth in culture similar to *Xanthomonas campestris* and *Xanthomonas hyacinthi*.

Pseudomonas alutacea Migula. (Ledergelber *Bacillus*, Tataroff, Die Dorpater Wasserbakterien, Inaug. Diss., Dorpat,

* Prepared by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, July, 1943.

1891, 61; Migula, Syst. d. Bakt., *2*, 1900, 936.) Isolated from water.

Pseudomonas graveolans Migula. (*Bacillus aquatilis graveolens* Tataroff, Die Dorpater Wasserbakterien, Inaug. Diss., Dorpat, 1891, 48; Migula, Syst. d. Bakt., *2*, 1900, 934.) Isolated from water. Not *Pseudomonas graveolens* Levine and Anderson (Jour. Bact., *23*, 1932, 343) isolated from musty eggs, and by Olsen and Hammer (Iowa State Coll. Jour. Sci., *9*, 1934, 125) from milk.

Pseudomonas resinacea Migula. (Harzfarbener *Bacillus*, Tataroff, Die Dorpater Wasserbakterien, Inaug. Diss., Dorpat, 1891, 64; Migula, Syst. d. Bakt., *2*, 1900, 935.) Isolated from water.

Xanthomonas taraxaci Niederhauser. (Phytopath., *33*, 1943, 961.) Pathogenic on Russian dandelion (*Taraxacum kok-saghz*).

Genus III. Methanomonas *Orla-Jensen.**

(Cent. f. Bakt., II Abt., *22*, 1909, 311.)

Cells monotrichous, capable of obtaining energy from oxidation of methane to CO_2 and water.

The type species is *Methanomonas methanica* (Söhngen) Orla-Jensen.

1. **Methanomonas methanica** (Söhngen) Orla-Jensen. (*Bacillus methanicus* Söhngen, Cent. f. Bakt., II Abt., *15*, 1906, 513; Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 311.) From methane.

Short rods: 0.5 to 0.8 by 2.0 to 3.0 microns, motile in young cultures by means of a single flagellum. In older cultures nearly spherical. Can be cultivated in an atmosphere composed of one part CH_4 and two parts air on washed agar containing the necessary inorganic salts. The growth is membranous.

At the end of two weeks, the organisms changed an atmosphere containing 225 ml. CH_4 and 321 ml. O_2 to the following:

CH_4	0 ml.
CO_2	78 ml.
O_2	172 ml.

In addition, 21 ml. CO_2 was dissolved in the liquid.

Habitat: Presumably widely distributed in soil.

Genus IV. Acetobacter *Beijerinck.*†

(Proc. Kon. Akad. v. Wetenschapp., Amsterdam, *2*, 1900, 495.)

Acetobacter aceti first appeared (Kral's Sammlung v. Mikroorg., Prague, 1898, 4) as a synonym of *Bacterium aceti* Hansen. Beijerinck (*loc. cit.*) mentions *Acetobacter aceti* in a footnote of a later paper. The genus name *Acetobacter* was accepted by Fuhrmann (Beiheft Bot. Centralbl., Orig., *19*, 1905, 8) and others. From Latin, *acetum*, vinegar; *bactrum*, rod.

Synonyms: ?*Ulvina* Kützing, Algae aquae dulcis, etc., 11th decade, 1837; *Mycoderma* Thompson, Ann. d. Chem. u. Pharmacie, *83*, 1852, 89; ?*Umbina* Naegeli, Bericht über die Verhandlungen der bot. Section der 33 Versammlung deutscher Naturforscher. und Arzter. Bot. Ztg., 1857, 760; *Bacterium* Lanzi, N. Giorn. bot. ital., 1876, 257; *Torula* Saccardo, Atti Soc. Ven. Trent., *5*, 1878, 315; *Bacteriopsis* (in part) Trevisan, Atti Accad. Fisio-Medico-Statistica Milano, Ser. 4, *3*, 1885, 103; *Micrococcus* Maggi, Jour. Microg., 10, 1886; *Bacillus* Schroeter, Kryptogamen Flora von Schlesien, *3*, 1, 1886, 161; *Termobacterium* Zeidler, Cent. f. Bakt., II Abt., *2*, 1896, 739; *Acetobac-*

* Prepared by Prof. D. H. Bergey, Philadelphia, Pennsylvania, December, 1922.

† Revised by Dr. C. D. Kelly, McGill Univ., Montreal, P. Q., Canada, July, 1938; further revision by Dr. Reese H. Vaughn, Univ. of California, Berkeley, California June, 1943.

terium Ludwig, in abstract of Hoyer's Inaug. Diss., Cent. f. Bakt., II Abt., *4*, 1898, 867; *Acetimonas* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 312.

In addition, the sub-generic names *Euacetobacter* and *Acetogluconobacter* have been proposed by Asai, Jour. Agr. Soc. Japan, *11*, 1935, 502. The genus *Gluconobacter* and the sub-genera *Eugluconobacter* and *Gluconoacetobacter* Asai (*loc. cit.*) may be synonyms in whole or in part.

Individual cells ellipsoidal to long and rod-shaped, occurring singly, in pairs, or in short or long chains. Motile with polar flagella, or non-motile. Involution forms may be spherical, elongated, filamentous, club-shaped, swollen, curved or even branched. Young cells Gram-negative; old cells often Gram-variable. Obligate aerobes; as a rule strongly catalase positive, sometimes weakly so. Oxidize various organic compounds to organic acids and other oxidation products which may undergo further oxidation. Common oxidation products include acetic acid from ethyl alcohol, gluconic and sometimes ketogluconic acid from glucose, dihydroxyacetone from glycerol, sorbose from sorbitol, etc. Nutritional requirements vary from simple to complex. Development generally best in yeast infusion or yeast autolysate media with added ethyl alcohol or other oxidizable substrate. Optimum temperature variable with the species. Widely distributed in nature where they are particularly abundant in plant materials undergoing alcoholic fermentation; of importance to man for their role in the completion of the carbon cycle and for the production of vinegar.

The type species is *Acetobacter aceti* (Kützing) Beijerinck.

Key to species of genus **Acetobacter.**

I. Oxidize acetic acid to carbon dioxide and water.
  A. Capable of utilizing ammonium salts as a sole source of nitrogen (Hoyer's solution).*
    1. *Acetobacter aceti.*
  B. Do not utilize ammonium salts as a sole source of nitrogen.*
    1. Forms a thick, zoogloeal, cellulose membrane on the surface of liquid media.
      2. *Acetobacter xylinum.*
    2. Do not form a thick, zoogloeal membrane on the surface of liquid media.
      3. *Acetobacter rancens.*
      3a. *Acetobacter pasteurianum.*
      3b. *Acetobacter kuetzingianum.*

II. Do not oxidize acetic acid.
  A. Form pigments in glucose media.
    1. Dark brown to blackish pigment.
      4. *Acetobacter melanogenum.*
    2. Pink to rose pigment.
      5. *Acetobacter roseum.*
  B. Do not form pigments.
    1. Optimum temperature 30° to 35°C.
      6. *Acetobacter suboxydans.*
    2. Optimum temperature 20° to 25°C.
      7. *Acetobacter oxydans.*

---

* It is not known with certainty whether *Acetobacter pasteurianum* and *Acetobacter kuetzingianum* are capable of using inorganic nitrogen as a sole source of nitrogen for growth. However, since these two species are among those first described it is advisable to retain them for the present. See *Acetobacter rancens* Beijerinck.

1. **Acetobacter aceti** (Kützing) Beijerinck. (*Ulvina aceti* Kützing, Algae aquae dulcis etc., 11th decade, 1837; *Mycoderma aceti* Thompson, Ann. d. Chem. u. Pharmacie, *83*, 1852, 89; *Umbina aceti* Naegeli, Bericht über die Verhandlingen der bot. Section der 33 Versammlung deutscher Naturforscher und Arzter. Bot. Ztg., 1857, 760; *Bacterium aceti* Lanzi, N. Giorn. bot. ital., 1876, 257; *Torula aceti* Saccardo, Atti Soc. Ven. Trent., *5*, 1878, 315; *Bacteriopsis aceti* Trevisan, Atti della Accademia Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 103; *Micrococcus aceti* Maggi, Jour. Microg., *10*, 1886; *Bacillus aceti* Schroeter, Kryptogamen Flora von Schlesien, *3*, 1, 1886, 161; *Bacillus aceticus* Flügge, Die Mikroorganismen, 1886, 313; Beijerinck, Kral's Sammlung v. Mikroorg., Prague, 1898, 7; Beijerinck, Proc. Kon. Akad. v. Wetensch., Amsterdam, *2*, 1900, 495; *Bacterium hansenianum* Chester, Man. Determ. Bact., 1901, 126.) From Latin *acetum*, vinegar.

Rods: 0.4 to 0.8 by 1.0 to 2.0 microns, occurring singly and in long chains, frequently showing large club-shaped forms. Stain yellow with iodine solution. Motility variable. Motile cells possess a single polar flagellum (Vaughn, Jour. Bact., *46*, 1943, 394). Forms large, shiny colonies on beer gelatin containing 10 per cent sucrose.

Forms slimy pellicle on fluid media, or ring or turbidity without pellicle.

Acid from glucose, ethyl alcohol, propyl alcohol and glycol. No acid from arabinose, fructose, galactose, sorbose, sucrose, maltose, lactose, raffinose, dextrin, starch, glycogen, inulin, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, glycerol, erythritol, mannitol, dulcitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Distinctive characters: Marked oxidative power causing rapid and complete oxidation of substrate as glucose or ethyl alcohol; ability to utilize inorganic nitrogen salts as a sole source of nitrogen (Hoyer, Inaug. Diss., Leiden, 1898, 43; Beijerinck, Cent. f. Bakt., II Abt., *4*, 1898, 215); growth and oxidative activity in association with fermenting yeasts (Vaughn, Jour. Bact., *36*, 1938, 360).

Optimum temperature 30°C. Growth occurs between 10° and 42°C.

Habitat: Vinegar; souring fruits, vegetables and beverages.

2. **Acetobacter xylinum** (Brown) Holland. (*Bacterium xylinum* Brown, Jour. Chem. Soc., London, *49*, 1886, 439; Holland, Jour. Bact., *5*, 1920, 216; *Bacillus xylinus* Holland, *ibid.*, 221.) From Gr. *xylinus*, wooden (in reference to the cellulose in the membrane).

Rods, about 2 microns long, occurring singly and in chains. The cells have a slimy envelope which gives the cellulose reaction.

A film forms on the surface of liquids. This film becomes cartilagenous and falls to the bottom. This zoogloeal film forms on all liquid media in which growth occurs; the nature of the medium influences the thickness of the film which may vary from 1 to 250 millimeters.

X-ray pattern studies made by Khouvine, Champetier and Sutra (Compt. rend. Acad. Sci. Paris, *194*, 1932, 208) and by Barsha and Hibbert (Can. Jour. Research, *10*, 1934, 170) have shown that the cellulose contained in the membranes formed by *Acetobacter xylinum* is identical with cotton cellulose.

Acid from glucose, ethyl alcohol, propyl alcohol and glycol. No acid from arabinose, fructose, galactose, maltose, lactose, raffinose, dextrin, starch, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, mannitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Distinctive character: The production of thick, leathery, zoogloeal cellulosic membranes on the surface of liquids.

Optimum temperature 28°C.

Habitat: Vinegar; souring fruits, vegetables and beverages.

3. **Acetobacter rancens** Beijerinck. (*Bacterium rancens* Beijerinck, Cent. f. Bakt., II Abt., *4*, 1898, 211; Beijerinck, Kral's Sammlung v. Microorg., Prague, 1898, 4.) From L. *rancens*, being rancid.

Beijerinck (*loc. cit.*) in a footnote stated that "two of the many varieties of *B. rancens* have been described by Henneberg under the names of *B. oxydans* and *B. acetosum.* Hansen erroneously called this species *B. aceti* as did Brown. Neither Hansen nor Brown knew *B. aceti* Pasteur." No further morphological description is given.

The following description is taken in part from a study of a culture of *Acetobacter rancens* received from Kluyver (Vaughn).

Rods with the usual morphological appearance of cultures of acetic acid bacteria. Gram-negative. Motility variable. Motile cells possess a single polar flagellum (Vaughn, Jour. Bact., *46*, 1943, 394). Involution forms commonly appear as filaments and enlarged cells.

Wort agar slant: Growth abundant, butyrous, pale-buff in color in one week.

Yeast infusion, glucose, calcium carbonate slant: Growth abundant, butyrous and cream-colored in one week.

With petri dish cultures well isolated colonies are large, smooth and butyrous on either medium.

Broth cultures containing peptone or yeast infusion form a mucilaginous, slimy pellicle. Beijerinck (*loc. cit.*) called this polysaccharide pellicle, cellulose-like and intimated that the mucilaginous material in the pellicle was somewhat different from that produced by *Acetobacter xylinum*. The pellicle material stained blue when treated with iodine and hydroiodic acid.

Acid from glucose, ethyl alcohol, propyl alcohol, butyl alcohol, glycol, adonitol, mannitol and sorbitol. No acid from numerous other compounds tested.

Distinctive character: Production of a thin, mucilaginous, slimy, polysaccharide membrane on the surface of liquids as compared with the thick, true cellulose membrane of *Acetobacter xylinum* grown under the same conditions. Beijerinck (*loc. cit.*) reported the production of a cellulose-like membrane with some cultures of *Acetobacter rancens*.

Source: Isolated from shavings in the quick vinegar process.

Habitat: Found in fermented grain mash, malt beverages, mother of vinegar.

Beijerinck (Cent. f. Bakt., II Abt., *4*, 1898, 211) thought that the next two species were hardly more than varieties of *Acetobacter rancens*.

3a. *Acetobacter pasteurianum* (Hansen) Beijerinck. (*Mycoderma pasteurianum* Hansen, Compt. rend. d. Trav. d. Lab. d. Carlsberg, *1*, 1879, 96; *Bacterium pasteurianum* Zopf, Die Spaltpilze, 2 Aufl., 1884, 49; Beijerinck, Kral's Sammlung v. Microörg., Prague, 1898, 7.) Named for Pasteur, the French chemist and bacteriologist.

Rods: 0.4 to 0.8 by 1.0 micron, occurring singly and in chains, at times showing thick, club-shaped forms. Motility variable. Motile cells possess a single polar flagellum (Vaughn, Jour. Bact., *46*, 1943, 394). Stains blue with iodine.

Wort gelatin colonies: Small, circular, entire, gray, slimy.

Forms a dry, wrinkled folded pellicle on double beer with one per cent alcohol.

Meat infusion gelatin: Widespread, later rosette form, toothed.

Acid from glucose, ethyl alcohol, propyl alcohol and glycol. No acid from arabinose, fructose, galactose, sorbose, sucrose, maltose, lactose, raffinose, dextrin, starch, glycogen, inulin, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, glycerol, erythritol, mannitol, dulcitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Optimum temperature 30°C. Growth occurs between 5° and 42°C.

Habitat: Vinegar; beer and beer wort.

3b. *Acetobacter kuetzingianum* (Hansen) Bergey et al. (*Bacterium kuetzingianum* Hansen, Compt. rend. d. Trav. d. Lab. d. Carlsberg, *3*, 1894, 191; Bergey et al., Manual, 1st ed., 1923, 35.) Named for Kuetzing, the German botanist.

Short, thick rods, occurring singly. Rarely forming chains of notable length. Capsule stained blue with iodine and with potassium iodide. Non-motile.

Double beer gelatin colonies: Small, entire, with vermiform surface.

Wort gelatin colonies: Small, entire, with surface free of wrinkles.

Double beer: Forms a rather thick, folded pellicle. Distinguished from *Acetobacter aceti* in showing heavier growth above the surface of the media.

Acid from glucose, ethyl alcohol, propyl alcohol and glycol. No acid from arabinose, fructose, galactose, sorbose, sucrose, maltose, lactose, raffinose, dextrin, starch, glycogen, inulin, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, glycerol, erythritol, mannitol, dulcitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Optimum temperature 34°C, maximum 42°C, minimum 6 to 7°C.

Habitat: Beer. Found in double beer.

4. **Acetobacter melanogenum** Beijerinck. (Cent. f. Bakt., II Abt., *29*, 1911, 175.) From Greek *melas* (*melan*), black; *-genes*, producing.

Rods: Non-motile or motile. Motile cells possess a single polar flagellum (Vaughn, Jour. Bact., *46*, 1943, 394).

Gelatin: Apparent liquefaction probably caused by acid, not an enzyme. When held on artificial media for some time, the power of liquefying gelatin is lost, probably due to a slower production of acid. Deep brown pigment produced; gelatin becomes insoluble in boiling water and in trypsin solution.

Beer- or wort-gelatin plates: Characteristic dark brown, wide-spreading, diffuse areas.

Tap water-agar-glucose-peptone-potassium phosphate-iron citrate-chalk medium: In 24 hours at 30°C, black, spreading, diffuse areas.

Utilizes peptone as a source of nitrogen. Produces the pigment from peptone only if maltose or glucose is present as a source of carbon. When grown in glucose-peptone broth with $CaCO_3$ at 25° to 30°C, black pigment is produced after several weeks, and the carbonate is changed to calcium gluconate.

Pigment: The pigment causing the brown coloration is an aromatic substance which is blackened by iron salts. Reduces alkaline solutions of silver and mercury, blackening them.

Oxidizes mannitol and sorbitol to fructose and sorbose. Does not attack sucrose and fructose. Much gluconic acid is produced. Acid from glucose and maltose. Acetic acid produced from alcohol.

Distinctive character: The formation of dark brown to black pigment in media containing a suitable substrate; particularly glucose.

Source: Isolated from beer.

Habitat: Causes light-colored beer to become darker brown. It is a very strong beer-vinegar bacterium. Also found in souring fruits.

5. **Acetobacter roseum** Vaughn. (*Bacterium hoshigaki* var. *rosea* Takahashi and Asai, Cent. f. Bakt., II Abt., *82*, 1930, 390; *Acetobacter hoshigaki* Bergey et al., Manual, 4th ed., 1934, 39; Vaughn, Wallerstein Lab. Communications, *5*, No. 14, 1942, 20.) From Latin, *rosa*, rose.

Rods: 0.7 to 0.9 by 1.5 to 1.8 microns, generally occurring singly, at most in pairs, often in chains. Non-motile. Pellicle on fluid media yields no starch or cellulose reaction.

Koji (a mixture of rice and mold spores used to start fermentation of Japanese bread and saké) extract agar colonies: Small, granular, circular, glistening, umbonate, becoming brownish.

Wort agar colonies: Circular, milky-white, becoming brownish in center and yellowish at periphery.

Glucose saké agar: Circular, milky-white, granular, umbonate, entire.

Hoshigaki (dried persimmons) extract agar: Circular, milky-white, granular, becoming yellowish-brown in the center and grayish-white at the periphery.

Koji extract agar streak: Grayish-white, glistening with ciliate margin, becoming purple brown to brown.

Koji extract: Turbid with thin film, ascending on wall of tube.

Bouillon: Turbid with ring formation.

Yeast infusion glucose agar: Colonies similar to those on wort agar.

Yeast infusion glucose broth: Turbid with thin, ascending film.

Red color produced on saké wort agar and all media containing calcium carbonate.

Acid from glucose, fructose, galactose, arabinose, glycerol, mannitol, ethyl and propyl alcohol. No acid from maltose, sucrose, lactose, raffinose, dextrin, starch, inulin, sorbitol, glycogen, isodulcitol and methyl alcohol.

Forms gluconic acid from glucose.

Aerobic.

Optimum temperatures 30° to 35°C; maximum 40° to 41°C; minimum 10° to 15°C.

Thermal death point 50°C for 5 minutes.

Distinctive character: The formation of a rose to red pigment in suitable media; particularly those containing glucose and calcium carbonate.

Source: Isolated from fermenting mash of dried persimmons (hoshigaki), and souring figs and dates.

NOTE: Vaughn, Wallerstein Lab. Communications, *5*, No. 14, 1942, 20, has proposed the name *Acetobacter roseum* to replace the name *Acetobacter hoshigaki*. As originally described, this organism was given the name *Bacterium hoshigaki* var. *rosea* by Takahashi and Asai (*loc. cit.*) without the authors having first named and described the species *Bacterium hoshigaki*. The Japanese word "hoshigaki" has been used in a confusing manner viz. Takahashi and Asai, *loc. cit.* (*Bacterium industrium* var. *hoshigaki*) and Takahashi and Asai, Jour. Agr. Chem. Soc. Japan, *9*, 1933, 351 and Cent. f. Bakt., II Abt., 87, 1933, 385 (*Bacterium hoshigaki* var. *glucuronicum* I, II and III). None of these Japanese names are in the form of true binomials.

6. **Acetobacter suboxydans** Kluyver and de Leeuw. (Paper read at the convention of the Dutch Society of Microbiology, Utrecht, December, 1923, see Tijdschrift v. Vergelijkende Geneeskunde, *10*, Afl. 2–3, 1924.) From L. *sub*, under, less; Gr. *oxys*, sharp, acid; *dans*, giving, i.e. less acid giving; less oxidizing.

Short rods: Occurring singly or in chains. Non-motile. Morphologically like *Acetobacter rancens*.

Forms very thin, hardly visible pellicle on fluid media.

Wort agar colonies: Very small, circular, slightly yellow.

Acid from ethyl alcohol, propyl alcohol, glycol, glucose, glycerol and sorbitol.

Optimum temperature 30°C.

Distinctive character: Partial oxidation of substrates as indicated by the formation of calcium 5-keto gluconate crystals on the surface of agar slants containing glucose and calcium carbonate.

Source: Isolated from spoiled beer.

Habitat: Beer.

7. **Acetobacter oxydans** (Henneberg) Bergey et al. (*Bacterium oxydans* Henneberg, Cent. f. Bakt., II Abt., *3*, 1897, 223; *Bacillus oxydans* Migula, Syst. d. Bakt., *2*, 1900, 800; Bergey et al., Manual, 1st ed., 1923, 36.) From Gr. *oxys*, sharp, acid; *dans*, giving.

Rods: 0.8 to 1.2 by 2.4 to 2.7 microns, occurring singly and in chains. Motile

cells possess a single polar flagellum (Vaughn, Jour. Bact., *46*, 1943, 394). The chains show bud-like swellings.

Gelatin colonies: Circular, becoming irregular in shape with peculiar ramifications.

Acid from arabinose, fructose, glucose, galactose, sucrose, maltose, raffinose, dextrin, ethyl alcohol, propyl alcohol, erythritol, mannitol, glycol and glycerol. No acid from sorbose, lactose, starch, glycogen, inulin, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, dulcitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Optimum temperature 18° to 21°C.

Distinctive characters: Low optimum temperature for growth and oxidation of substrates; and the ability to oxidize a large number of substrates.

Habitat: Beer.

Appendix: The following species have been described, but until more comparative studies have been made, no change in nomenclature is recommended or advisable.

1. **Acetobacter zeidleri** Beijerinck. (*Termobacterium aceti* Zeidler, Cent. f. Bakt., II Abt., *2*, 1896, 739; *Bacterium zeidleri* Beijerinck, *Acetobacter zeidleri* Beijerinck, Kral's Sammlung v. Mikroorg., Prague, 1898, 7; *Bacillus zeidleri* Migula, Syst. d. Bakt., *2*, 1900, 801; *Acetobacter lindneri* Bergey et al., Manual, 1st ed., 1923, 36.) Named for A. Zeidler, who first isolated this species.

Rods, occurring singly and in chains, showing large sausage-shaped involution forms. Motile with a single polar flagellum (Zeidler, Cent. f. Bakt., II Abt., *4*, 1898, 669).

Wort gelatin: Small, circular, slightly granular, yellowish-brown, entire colonies. No liquefaction.

Dirty, yellowish-brown pellicle on liquid media.

Wort gelatin slant: Strongly glistening, transparent, whitish in center, smooth, very weakly liquefied.

Potato: Very scant growth.

Acid from glucose, ethyl alcohol, propyl alcohol and glycol. No acid from arabinose, fructose, galactose, maltose, lactose, raffinose, dextrin, glycogen methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, glycerol, mannitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Beer wort.

2. **Acetobacter acetosum** (Henneberg) Bergey et al. (*Bacterium acetosum* Henneberg, Cent. f. Bakt., II Abt., *3*, 1897, 223; Bergey et al., Manual, 1st ed., 1923, 36.) From Latin, *acetum*, vinegar.

Rods: 0.4 to 0.8 by 1.0 micron, occurring singly and in chains. Non-motile. Stains yellow with iodine.

On beer, yeast water and glucose solutions a firm, coherent, uniform, smooth, white film that becomes folded (Henneberg, Gärungsbakt., *2*, 1926, 201).

Acid from glucose, galactose, ethyl alcohol, and propyl alcohol. No acid from arabinose, fructose, sorbose, sucrose, maltose, lactose, raffinose, dextrin, starch, glycogen, inulin, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, glycerol, erythritol, mannitol, dulcitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Optimum temperature 28°C, maximum 36°C, minimum 8°C (Henneberg, Cent. f. Bakt., II Abt., *4*, 1898, 14).

Habitat: Beer.

3. **Acetobacter ascendens** (Henneberg) Bergey et al. (*Bacterium ascendens* Henneberg, Zeitschr. f. deutsche Essigind., Berlin, No. 19 to 23, 1898, 145; also see Cent. f. Bakt., II Abt., *4*, 1898, 933; Bergey et al., Manual, 1st ed., 1923, 37.) From Latin, *ascendo*, pp. *ascendens*, ascending.

Rods, occurring singly, rarely in chains.

Non-motile. Do not give the cellulose reaction with iodine solution.

Glucose gelatin colonies: Dry, white, with white area surrounding the colony.

Fluid cultures have a tough pellicle rising on the wall of the flask.

Acid from ethyl alcohol, propyl alcohol and glycol. No acid from arabinose, fructose, glucose, galactose, sucrose, maltose, lactose, raffinose, dextrin, starch, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, glycerin, mannitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Optimum temperature 31°C.

Habitat: Isolated from vinegar and from red wine.

4. **Acetobacter plicatum** Fuhrmann. (Beihefte z. bot. Centralbl., Orig., *19*, 1905, 8.) Description given in Cent. f. Bakt., II Abt., *15*, 1906, 377. From *plicatus*, folded.

Rods: 0.55 to 0.7 by 0.75 to 0.9 microns when grown on agar at 28° to 30°C. Young streak cultures 0.4 to 0.6 by 1.4 to 1.6 microns with homogeneous staining when grown on beef-extract-gelatin at 22°C. 0.5 by 1.5 to 1.7 microns with uneven staining (polar) when grown on wine gelatin. At about 40°C the organisms form swollen and greatly elongated forms. Non-motile.

Agar slant: Pale yellowish, translucent growth.

Alcohol-free beer with glucose and sucrose: Turbid with thick pellicles.

Potato: Growth limited.

Ferments alcohol to form acetic acid.

Optimum temperature 28° to 30°C.

Habitat: Wine.

5. **Acetobacter acetigenum** (Henneberg) Bergey et al. (*Bacterium acetigenum* Henneberg, Cent. f. Bakt., II Abt., *4*, 1898, 14; *Bacillus acetigenum* Migula, Syst. d. Bakt., *2*, 1900, 801; Bergey et al., Manual, 1st ed., 1923, 35.) From Latin, producing vinegar.

Rods, occurring singly and in pairs. 0.8 to 1.2 by 1.2 to 1.4 microns. Motile. Cells give a cellulose reaction with H_2SO_4 and iodine.

Glucose gelatin colonies: Raised, grayish, slimy.

Fluid cultures show a tough, slimy pellicle.

Acid from glucose, ethyl alcohol, propyl alcohol and glycol. No acid from arabinose, fructose, galactose, sorbose, sucrose, maltose, lactose, raffinose, dextrin, starch, glycogen, inulin, methyl alcohol, isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol, glycerol, erythritol, mannitol, dulcitol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Optimum temperature 33°C. Thermal death point 43° to 45°C for 5 minutes.

Habitat: Vinegar.

6. **Acetobacter industrium** (Henneberg) Bergey et al. (*Bacterium industrium* Henneberg, Zeitschr. f. deutsche Essigindustrie, Berlin, 1898; Cent. f. Bakt., II Abt., *4*, 1898, 933; *Bacillus industrius* Migula, Syst. d. Bakt., *2*, 1900, 801; Bergey et al., Manual, 1st ed., 1923, 36.) From Latin *industrius*, diligent.

Rods: 0.3 to 0.8 by 2.4 to 20 microns, occurring singly and in chains. No distinct color produced with iodine. Motile.

Forms pellicle on fluid culture media.

Acid from arabinose, fructose, glucose, galactose, sucrose, maltose, lactose, raffinose, starch, dextrin, ethyl alcohol, propyl alcohol, glycol, glycerol and mannitol. No acid from isopropyl alcohol, butyl alcohol, isobutyl alcohol, amyl alcohol and acetaldehyde (Henneberg, Die deutsch. Essigind., *2*, 1898, 147).

Aerobic.

Optimum temperature 23°C. Maximum 35°C. Minimum 8°C.

Habitat: Beer wort.

7. **Bacterium schuezenbachii** Henneberg. (Die deutsche Essigind., No. 11–18, 1906; also Cent. f. Bakt., II Abt., *17*, 1906, 790.) Named for Schüzenbach, the inventor of the German quick vinegar process.

Rods: 0.3 to 0.4 by 1.0 to 3.6 microns, occurring singly, in pairs and chains. The cells are round, oval or elongated, not infrequently sickle-shaped or irregularly bent with rounded or pointed ends. Not stained with iodine. Non-motile.

Wort gelatin colonies: Round, shiny, transparent with yellowish-brown centers.

A non-coherent film produced on the surface of liquid media.

Acid from arabinose, fructose, glucose, galactose, maltose, lactose, dextrin, ethyl alcohol, propyl alcohol, glycerol and erythritol. Small amount of acid from sucrose and raffinose. No acid from mannitol (Henneberg, Handbuch d. Gärungsbakt., *2*, 1925, 239).

Temperature relations: Optimum 25° to 27.5°C. Scant growth at 34° to 35°C and 13° to 15°C. No growth at 37° and 7.5°C.

Source: Isolated from vinegar in the quick vinegar process.

Habitat: Produces acetic acid in quick vinegar process.

8. **Bacterium xylinoides** Henneberg. (Die deutsche Essigind., No. 11 to 18, 1906; also Cent. f. Bakt., II Abt., *17*, 1906, 794.) From Greek, woody.

Rods: 0.5 to 0.8 microns (round cells) and 0.5 to 1.2 microns (long forms), occurring singly, in pairs or chains, cells round and as short and long rods. The thick membrane like that produced by *Acetobacter xylinum* gives the reaction for cellulose with iodine and sulfuric acid, but the thin membrane does not.

Wort gelatin: Colonies are produced like drops of water, often with light brown kernels in the center.

Wort gelatin streak: Growth transparent at first, later whitish.

Three types of membrane on fluid media are formed by this species and all three may even be found on a culture at one time. A thin, firm, coherent membrane like that of *Bacterium orleanense* may be formed or one that is voluminous, scumlike (like coagulated egg-white), coherent, somewhat slimy and finally thick like that of *Bacterium xylinum*. Also a membrane may be formed that is intermediate in type.

Acid from arabinose, glucose, galactose, sucrose, maltose, ethyl alcohol, propyl alcohol, glycerol and erythritol. Small amount of acid from fructose and mannitol.

Temperature relations: Optimum 28°C. Slight growth at 14°C. No growth at 6°C.

Source: Isolated from wine vinegar from the Rhine and other sections.

Habitat: Found in vinegar made by the Orleans method.

9. **Bacterium orleanense** Henneberg. (Die deutsche Essigind., No. 11–18, 1906; also Cent. f. Bakt., II Abt., *17*, 1906, 792.) Latinized, of Orleans.

Rods: 0.4 to 0.5 by 1.2 to 2.1 microns, occurring singly or in chains. The cells are round, elongated or as involution forms, with straight or curved cells appearing. Not stained with iodine. Non-motile.

Wort gelatin: Colonies irregular in form, whitish in color, about 1 mm. in diameter in 2 days.

Wort gelatin streak: Growth often slimy, transparent, liquid mass with yellowish-brown sediment.

Wort agar streak: Some strains form isolated, moist, slimy, transparent colonies and on the water of condensation isolated whitish colonies are formed. Other strains form a coherent, transparent coating with a light brown precipitate later and individual, distinct, round colonies of the same color.

Characteristic of this species is the firm coherent film on the surface of liquid media.

Acid from arabinose, glucose, galactose, maltose, lactose, raffinose, dextrin, ethyl alcohol, propyl alcohol, glycerol, erythritol and mannitol. Small amount of acid from fructose and sucrose (Henneberg, Handbuch d. Gärungsbakt., *2*, 1926, 239).

Temperature relations: Optimum 20° to 30°C. Slight growth at 35° to 36°C and 14° to 15°C. No growth at 39° and at 7° to 8°C.

Source: Isolated from vinegar in the quick vinegar process.

Habitat: Can be used both in the quick or German process and the Orleans method of making vinegar.

10. **Bacterium vini acetati** Henneberg. (Die deutsche Essigind., No. 11–18, 1906; also Cent. f. Bakt., II Abt., *17*, 1906, 797.) From Latin *vinum*, wine and *acetum*, vinegar.

Rods: 0.3 to 0.8 by 0.8 to 2.0 microns, occurring singly, in pairs and sometimes as short chains of three; cell round, oval or slightly elongated, and rarely moderately long forms. Streptococcus-like cells are found on older agar cultures and spindle forms in beer gelatin with 10 per cent sucrose.

Wort gelatin: Round, moist, shiny, transparent colonies with whitish sediment in the center.

The film on liquid media is not strongly coherent and the liquid is cloudy.

Acid from arabinose, fructose, glucose, galactose, sucrose, maltose, raffinose, dextrin, ethyl alcohol, propyl alcohol, glycerol and erythritol. No acid from lactose (Henneberg, Handbuch d. Gärungsbakt., *2*, 1925, 239).

Optimum temperature 28° to 33°C.

Source: Wine vinegar.

Habitat: Found in vinegar made by the Orleans method for wine vinegar.

11. **Bacterium curvum** Henneberg. (Die deutsche Essigind., No. 11–18, 1906; also Cent. f. Bakt., II Abt., *17*, 1906, 791.) From Latin, *curvus*, bent.

Rods: 0.4 to 0.5 by 2.0 to 2.4 microns, occurring singly or in pairs, cells usually oval or elongated, not infrequently sickle-shaped, with rounded or pointed ends. Not stained with iodine solution. Non-motile.

Wort gelatin: Transparent, round colonies with raised center and edge, frequently whitish and dry.

A non-coherent scanty pellicle is formed on the surface of liquid media which sinks readily and the liquid is quite turbid.

Forms round white islands on the surface of wort with 3 per cent alcohol.

In old cultures on beer are to be found numerous smooth light brown raised colonies about 1 mm in diameter on the uniform transparent base of the surface membrane.

Acid from arabinose, glucose, raffinose, dextrin, ethyl alcohol, propyl alcohol, glycerol and erythritol. Small amount of acid from fructose, galactose and mannitol. No acid from sucrose, maltose and lactose (Henneberg, Handbuch d. Gärungsbakt., *2*, 1925, 239).

Temperature relations: Optimum 25° to 30°C. Scant growth at 16° to 17°C. No growth at 7° to 8°C. Growth at 35°C. No growth at 39°C.

Source: Isolated from vinegar in the quick vinegar process.

Habitat: Produces acetic acid in the quick vinegar process.

12. **Acetobacter viscosum** Shimwell. (*Bacterium aceti viscosum* Day and Baker, Cent. f. Bakt., II Abt., *36*, 1913, 433; *Bacillus aceti viscosum* Day and Baker, *ibid.*, 437; Also see Baker, Day and Hulton, Jour. Inst. Brewing, —, 1912, 651; Shimwell, Jour. Inst. Brewing, *42* (N. S. *32*), 1936, 586.) From Latin, viscous or slimy.

Rods: 0.4 by 1.2 microns which produce ropiness in beer. No capsules observed. Non-motile as a rule. Weakly Gram-positive.

Source: From ropy beer.

13. **Acetobacter capsulatum** Shimwell. (Jour. Inst. Brewing, *42* (N. S. *32*), 1936, 585.) From Latin, capsulated.

Coccoid rods, 0.8 to 1.0 micron in malt extract media. 0.6 to 1.5 microns in other media. Produce ropiness in beer. Capsulated. Motile. Gram-negative.

Source: From ropy beer.

14. **Acetobacter gluconicum** (Hermann).* (*Bacterium gluconicum* Hermann, Biochem. Zeit., *192*, 1928, 198; also see Hermann, Biochem. Zeit., *205*, 1929, 297 and Hermann and Neuschul, Biochem. Zeit., *233*, 1931, 129.)

It is unfortunate that an organism so well described must be placed with other species of uncertain standing. However, this organism is so closely related to the other organisms described in the literature that further study is necessary.

Source: From kombucha, a mixture of fungi and bacteria from tea infusions.

15. **Acetobacter turbidans** Cosbie, Tošić and Walker. (Jour. Inst. Brewing, *48*, 1942, 82.)

This beer vinegar bacterium is characterized by the production of intense turbidity in beer and ale. The description given does not, at present, warrant recognition of the organism as a new species.

Source: From beer.

16. **Bacterium dihydroxyacetonicum** Virtanen and Bärlund. (Biochem. Zeit., *169*, 1926, 170.)

There is no adequate description of this bacterium, and it is doubtful whether it can be properly evaluated since various species of *Acetobacter* also possess the ability to produce dihydroxyacetone from glycerol. Consideration of this as a *nomen nudem* was indicated by Virtanen to Vaughn in a personal communication in 1938.

Source: From beet juice.

17. **Acetobacter peroxydans** Visser 't Hooft. (Inaug. Diss., Delft, 1925, 98.)

The exact taxonomic position of this bacterium will not be clear until further comparative studies have been made.

Source: From hydrogen peroxide solutions.

Genus V. **Protaminobacter** *den Dooren de Jong.*†

(Bijdrage tot de kennis van het mineralisatieproces. Thesis, Rotterdam, 1926, 159.) From M. L., protamine and Latin, *bactrum*, rod.

Cells motile or non-motile. Capable of dissimilating alkylamins. Pigmentation frequent. Soil or water forms.

The type species is *Protaminobacter alboflavum* den Dooren de Jong.

Key to the species of genus **Protaminobacter.**

I. Non-motile. Gelatin colonies light yellow to colorless.
   1. *Protaminobacter alboflavum.*

II. Motile. Gelatin colonies red.
   2. *Protaminobacter rubrum.*

1. **Protaminobacter alboflavum** den Dooren de Jong. (Thesis, Rotterdam, 1926, 159; also see Cent. f. Bakt., II Abt., *71*, 1927, 218.) From Latin *albus*, white; *flavus*, yellow.

Rods: Non-motile. Gram-negative.

* It is uncertain at present who first used this combination.

† Prepared by Prof. D. H. Bergey, Philadelphia, Pennsylvania, June, 1929; further revision by Prof. Robert S. Breed, New York State Experiment Station, Geneva New York, April, 1943.

Gelatin colonies: Circular, dry, light yellow or colorless.

Gelatin stab: No liquefaction.

Agar colonies: Circular, opaque, pigment bright red, yellow, light gray or colorless.

Amine agar colonies: Circular, white to dark yellow.

See table below for list of organic substances utilized.

TABLE I.—*Organic Substances Utilized as a Source of Carbon by Varieties of* ***Protaminobacter alboflavum***

ORGANIC ACIDS	α	β	γ	δ
Acetic	+	+	+	+
Valerianic	+	+	0	+
α-crotonic	+	+	+	+
Undecyclic	0	0	0	+
Lactic	+	0	0	+

Hippuric acid	+	0	0	0
ALCOHOL				
Ethyl	+	+	+	+
SUGAR				
Glucose	+	+	+	0

AMINES	α	β	γ	δ
Ethyl	+	+	+	+
Diethyl	+	+	0	0
Propyl	+	+	+	+
Isopropyl	0	+	0	0
Dipropyl	+	+	0	0
Tripropyl	+	0	0	0
Butyl	+	0	+	0
Isobutyl	+	+	+	+
Diisobutyl	+	+	0	0
Amyl	+	+	+	+
Diamyl	0	+	0	0
Ethanol	+	+	+	+
Glucosamin	+	+	+	0
Benzyl	+	0	+	0

Catalase is formed.

Aerobic, facultative.

Optimum temperature 30°C.

Habitat: Soil and water.

NOTE: The author recognizes four varieties of this species which he differentiates on the basis of organic substances attacked (see Table) and pigment produced. Variety α shows light yellow growth on gelatin, bright red on agar and yellow on amine agar. Variety β is light yellow on gelatin, yellow on agar and dark yellow on amine agar. Variety γ is light yellow on gelatin, light gray on agar and yellow on amine agar. Variety δ is colorless on gelatin and agar and white on amine agar.

2. **Protaminobacter rubrum** den Dooren de Jong. (Thesis, Rotterdam, 1926, 159; also see Cent. f. Bakt., II Abt., *71*, 1927, 218.) From Latin, *ruber*, red.

Rods: Motile with single polar flagellum (Weaver, Samuels and Sherago, Jour. Bact., *35*, 1938, 59). Gram-negative.

Gelatin colonies: Circular, red, dry.

Gelatin stab: No liquefaction.

Agar colonies: Circular, red, opaque.

Amine agar colonies: Circular, dark red.

The following organic acids are attacked: Acetic, lactic, β-oxybutyric, glycerinic, succinic, malonic, formic, methyl formic, glutaric, maleinic, fumaric, malic, tartaric, citric and quinic.

The following amino compounds are attacked: Sarcosin, betain, hippuric acid, asparagine, propionamid, capronamid, lactamid, succinamid, allantoin and uric acid.

Glucose is fermented.

Catalase is formed.

Aerobic, facultative.

Optimum temperature 30°C.

Habitat: Soil and water.

Genus VI. Mycoplana *Gray and Thornton.**

(Cent. f. Bakt., II Abt., *73*, 1928, 82.) From Greek, *mykēs*, fungus; *planē*, a wanderer or traveller.

Cells branching, especially in young cultures. Frequently banded when stained. Capable of using phenol and similar aromatic compounds as a sole source of energy. Grow well on standard culture media.

Type species *Mycoplana dimorpha* Gray and Thornton.

Key to the species of genus Mycoplana.

I. Gelatin not liquefied.
   1. *Mycoplana dimorpha.*

II. Gelatin liquefied.
   2. *Mycoplana bullata.*

1. **Mycoplana dimorpha** Gray and Thornton. (Cent. f. Bakt., II Abt., *73*, 1928, 82.) From Greek, *di*, two; *morphos*, forms.

Short, curved and irregular rods, 0.5 to 0.7 by 1.25 to 4.5 microns, showing branching especially in young cultures. †Motile, with long polar flagella. Gram-negative.

Gelatin colonies: Circular, buff, smooth, resinous, entire.

Gelatin stab: No liquefaction. Growth filiform.

Agar colonies: Circular, buff, convex, smooth, glistening, entire.

Agar slant: Filiform, white, convex, glistening, entire.

Broth: Turbid, with surface ring.

Nitrites not produced from nitrates but gas evolved in fermentation tubes.

Starch hydrolyzed.

No acid from carbohydrate media.

Attacks phenol.

Aerobic.

Optimum temperature below 30°C.

Source: One strain isolated from soil.

Habitat: Probably in soil.

2. **Mycoplana bullata** Gray and Thornton. (Cent. f. Bakt., II Abt., *73*, 1928, 83.) From Latin, *bullatus*, furnished with a boss or knob.

Rods, curved and irregular, branching, 0.8 to 1.0 by 2.25 to 4.5 microns. †Motile with polar flagella. Gram-negative.

Gelatin colonies: Circular, buff, smooth, glistening, edge diffuse. Partially liquefied.

Gelatin stab: Saccate liquefaction.

Agar colonies: Circular, white, convex, smooth, glistening, entire.

Agar slant: Filiform, white, convex, smooth, glistening, entire.

Broth: Turbid.

Nitrites not produced from nitrates. Gas, presumably N, in fermentation tubes.

Starch not hydrolyzed.

No acid from carbohydrate media.

Attacks phenol.

Aerobic.

Optimum temperature below 30°C.

Source: Two strains isolated from soil.

Habitat: Probably in soil.

---

* Prepared by Prof. D. H. Bergey, Philadelphia, Pennsylvania, June, 1929.

† The original statements regarding the flagellation of these species are contradictory. The first reads "Polar, peritrichous; the second "Polar or peritrichous". Drawings given usually indicate peritrichous rather than polar flagellation. Further study is needed before these species can be properly placed in relation to other known species.—Editors.

TRIBE II. SPIRILLEAE KLUYVER AND VAN NIEL.

(Cent. f. Bakt., II Abt., *94*, 1936, 346.)

More or less spirally curved cells.

Key to the genera of tribe **Spirilleae.**

I. Generally motile by means of a single polar flagellum.
  A. Short, bent rods occurring singly or united into spirals.
    Genus I. *Vibrio*, p. 192.
  B. Slightly curved rods of variable length. Strict anaerobes which reduce sulfates to hydrogen sulfide.
    Genus II. *Desulfovibrio*, p. 207.
  C. Cells oxidize cellulose forming oxycellulose. Growth on ordinary culture media is feeble.
    1. Long, slightly curved rods with rounded ends.
      Genus III. *Cellvibrio*, p. 209.
    2. Short, curved rods with pointed ends.
      Genus IV. *Cellfalcicula*, p. 211.
II. Generally motile by means of a tuft of polar flagella. Cells of varying thickness, and length and pitch of spiral, forming either long curves or portions of a turn.
  A. Oxidize inorganic sulfur compounds. Cells contain free sulfur granules.
    Genus V. *Thiospira*, p. 212.
  B. Not as above.
    Genus VI. *Spirillum*, p. 212.

Genus I. **Vibrio** *Müller.**

(Müller, Vermium terrestrium et fluviatilum, *1*, 1773, 39; *Pacinia* Trevisan, Atti d. Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 83; *Microspira* Schroeter, in Cohn, Kryptogamen-Flora von Schlesien, *3*, 1, 1886, 168; *Pseudospira* De Toni and Trevisan, Sylloge Fungorum, *8*, 1889, 1018; *Photobacterium* Beijerinck, Arch. néerl. d. sci. exactes, *23*, 1889, 401; *Liquidovibrio* Orla-Jensen, Cent. f. Bakt. II Abt., *22*, 1909, 333; *Solidovibrio* Orla-Jensen, *ibid.; Dicrospira* Enderlein, Sitzber. Ges. naturf. Freunde, Berlin, 1917, 313.) From Latin, *vibro*, vibrate.

Cells short, curved, single or united into spirals. Motile by means of a single polar flagellum which is usually relatively short; rarely, two or three flagella in one tuft. They grow well and rapidly on the surface of standard culture media. Aerobic to anaerobic species. Mostly water forms, a few parasites.

The type species is *Vibrio comma* (Schroeter) Winslow et al.

Key to the species of genus **Vibrio.**

I. Gelatin liquefied.
  A. Nitrites produced from nitrates.
    1. Indole is formed.
      a. Milk not coagulated.
        1. *Vibrio comma.*
        2. *Vibrio berolinensis.*
      aa. Milk coagulated.
        3. *Vibrio metschnikovii.*

---

* Revised by Prof. D. H. Bergey, Philadelphia, Pennsylvania, April, 1937; partial revision by Capt. Wm. C. Haynes, Sn.C., Fort Bliss, Texas, July, 1943 and by Lt. Col. A. Parker Hitchens, University of Pennsylvania, Philadelphia, Penna., December, 1943.

2. Indole not formed.
   a. Milk not coagulated.
      4. *Vibrio tyrogenus.*
      5. *Vibrio xenopus.*

B. Nitrites not produced from nitrates.
1. Indole is formed.
   a. Milk coagulated, peptonized.
      6. *Vibrio piscium.*
2. Indole not formed.
   a. Milk acid, coagulated.
      7. *Vibrio proteus.*
      8. *Vibrio wolfii.*
      9. *Vibrio sputigenus.*
      10. *Vibrio liquefaciens.*
   aa. Milk not coagulated.
      b. Growth on potato thin, barely visible.
         11. *Vibrio strictus.*
      bb. No growth on potato.
         12. *Vibrio aquatilis.*
   aaa. Action on milk not reported.
      b. Acid from glucose. Attacks naphthalene.
         13. *Vibrio neocistes.*
      bb. No acid from carbohydrates. Attacks naphthalene.
         14. *Vibrio cuneatus.*
      bbb. No acid from carbohydrates. Liquefies agar.
         15. *Vibrio granii.*

II. Gelatin not liquefied.

A. Nitrites produced from nitrates.
1. Acid and gas from glucose.
   16. *Vibrio leonardii.*
2. Acid but not gas from glucose. Liquefies agar.
   17. *Vibrio agarliquefaciens.*

B. Nitrites not produced from nitrates.
1. Acid from glucose.
   18. *Vibrio cyclosites.*
2. No acid from carbohydrates.
   19. *Vibrio percolans.*

C. Nitrite production not reported.
1. Requires the addition of ammonium sulfate for growth. Ammonium sulfate agar liquefied.
   20. *Vibrio andoi.*
2. Do not require ammonium sulfate for growth.
   a. Indole not formed.
      b. Microaerophilic, becoming aerobic.
         21. *Vibrio fetus.*
      bb. Aerobic, facultative.
         22. *Vibrio pierantonii.*

1. **Vibrio comma** (Schroeter) Winslow et al. (Kommabacillus, Koch, Berliner klin. Wochenschr., *21*, 1884, 479; *Spirillum cholerae asiaticae* Zopf, Die Spaltpilze, 3 Aufl., 1885, 69; *Pacinia choleraeasiaticae* Trevisan, Atti d. Accad.

Fisio-Med.-Statistica in Milano, Ser. 4, *3*, 1885, 84; *Microspira comma* Schroeter, in Cohn, Kryptogamen Flora v. Schlesien, *3*, 1, 1886, 168; *Vibrio cholerae* Neisser, Arch. f. Hyg., *19*, 1893, 199; *Vibrio cholerae asiaticae* Pfeiffer, in Flügge, Die Mikroorganismen, *2*, 1896, 527; Winslow et al., Jour. Bact., *5*, 1920, 204; *Bacillus cholerae* Holland, Jour. Bact., *5*, 1920, 217; *Bacillus comma* Holland, *ibid.*, 218; *Spirillum cholerae-asiaticae* Holland, *ibid.*, 225; *Vibrio cholerae-asiaticae* Holland, *ibid.*, 226.) From Latin, comma.

Slightly curved rods, 0.3 to 0.6 by 1.0 to 5.0 microns, occurring singly and in spiral chains. Cells may be long, thin and delicate or short and thick. May lose their curved form on artificial cultivation. Motile, possessing a single polar flagellum. Gram-negative.

Gelatin colonies: Small, yellowish-white.

Gelatin stab: Rapid napiform liquefaction.

Agar colonies: Circular, whitish-brown, moist, glistening, translucent, slightly raised, entire.

Agar slant: Brownish-gray, moist, glistening.

McConkey's medium: Good growth, colonies colorless when young, soon pinkish, medium becomes darker red.

Broth: Slightly turbid, with fragile, wrinkled pellicle and flocculent precipitate.

Peptone water: Characteristic rapid growth, chiefly at surface, where after 6 to 9 hours, a delicate membrane is formed; little turbidity, deposit apparently derived from pellicle (Topley and Wilson, Princip. Bact. and Immun., 2nd ed., 1936, 388). Readily isolated from the surface film of 0.1 per cent peptone water.

Litmus milk: Alkaline at the top and slightly acid at bottom; generally not coagulated; peptonized; reduced.

Potato: Dirty-white to yellowish, moist, glistening, spreading.

Blood serum: Abundant growth, sometimes slow liquefaction.

Blood agar: The blood pigment is digested forming a greenish zone around colonies; a true soluble hemolysin is not formed (the El Tor vibrio also digests blood pigment but in addition produces a soluble hemolysin. Otherwise it is said to be indistinguishable from the typical cholera vibrio).

Indole is formed.

Nitrites produced from nitrates.

Cholera-red reaction, which depends on production of indole and reduction of nitrates is positive.

Hydrogen sulfide is formed.

Acid but not gas from glucose, fructose, galactose, maltose, sucrose and mannitol. Slowly from glycerol. Does not attack lactose, inulin or dulcitol.

Group I of Heiberg (Classification of *Vibrio cholerae* and Cholera-like Vibrios. Copenhagen, 1935) ferments mannose and sucrose but not arabinose.

Hydrolyzes starch actively in alkaline media.

High alkali but low acid tolerance; optimum pH 7.6 to 8.0; for isolation on Dieudonne's medium pH 9.0 to 9.6.

Aerobic, grows best in abundant oxygen; under strict anaerobiosis may fail to grow altogether.

Optimum temperature 37°C. Maximum 42°C. Minimum 14°C.

Source: From intestinal contents of cholera patients in Egypt and India.

Habitat: Intestinal contents of cholera patients and carriers.

The relationships existing among the cholerigenic and non-pathogenic water vibrios, although studied intensively, have not yet been completely defined. As a working scheme, based on somatic (O) and flagellar (H) antigen studies, Gardner and Vankatraman (Jour. Hyg., *35*, 1935, 262–282) suggest the following

Cholera group of vibrios.
(Biochemically similar. Common H antigen.)

O-sub-group I.

Non-hemolytic (goat cells). Cholera vibrios. Types—original, variant and middle.

Hemolytic (goat cells). El Tor vibrios. Types—original and variant (?middle).

O sub-groups II, III, IV, V, VI and individual races (mostly hemolytic). Paracholera, cholera-like, and some El Tor vibrios.
(Types within sub-groups underlined.)

Linton (Bact. Rev., *4*, 1940, 275) has outlined a classification of the vibrios based upon their protein and polysaccharide structures. Using chemical methods, it was found that one polysaccharide and one protein was commonly obtained from each strain of vibrio; when exceptions occurred, it was invariably noted that the strain was undergoing dissociation. Given a single protein and polysaccharide in each vibrio, it was possible to divide the strains into six groups, which were numbered in the order of their discovery as shown in the table.

A chemical grouping of the cholerigenic and water vibrios.

Group	Protein Type	Polysaccharide Type
I	I	I
II	I	II
III	II	II
IV	II	I
V	II	III
VI	I	III

The strains of Groups I and II possess the same protein and different polysaccharides. These are derived from cases of cholera and have the serological and biochemical characteristics of O-Group I, *Vibrio cholera*. Group I strains are more common than those of Group II, which have, however, been isolated from epidemics with a high mortality. The phospholipid fraction is common to both types when isolated in the early part of an epidemic, but is not found in strains of other groups. The harmless water vibrios, which are so heterogeneous serologically (Taylor and Ahuja, Indian Jour. Med. Res., *26*, 1938, 8–32) form a single chemical group with a homogeneous structure. They fall into Group III, which differs in its protein structure from the authentic cholera vibrios, and resembles Group II in its polysaccharide. The vibrios of Group IV, which came from El Tor and from chronic vibrio carriers are believed on epidemiological grounds to be harmless, although serological methods have failed to distinguish them from cholerigenic vibrios. Group V, which, like III and IV, contains protein II, consists, like Group IV, of strains from chronic vibrio carriers. Group VI strains are only rarely isolated in nature and representatives of this group are generally found among collections of old laboratory strains. They appear to be the result of polysaccharide variation from Group I

after long-continued growth on artificial media.

2. **Vibrio berolinensis** Neisser. (Arch. f. Hyg., *19*, 1893, 200; *Microspira berolinensis* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 33.) From M. L., the genitive of *Berolina*, the Latin name for Berlin.

Curved rods, somewhat smaller than *Vibrio comma*. Frequently occurring in pairs. Motile, possessing a polar flagellum. Pleomorphic. Gram-negative.

Gelatin colonies: Small, grayish, slightly granular, fragmented.

Gelatin stab: Slow, napiform liquefaction.

Agar slant: Grayish-yellow, moist, glistening.

Broth: Turbid, with gray pellicle.

Litmus milk: No coagulation, no acid.

Potato: Brownish streak.

Indole is formed.

Nitrites produced from nitrates.

Not pathogenic for mice, pigeons or guinea pigs.

Aerobic, facultative.

Optimum temperature 37°C. Minimum above 10°C. Maximum less than 60°C.

Source: Isolated from filtered Spree river water.

3. **Vibrio metschnikovii** Gamaléia. (Gamaléia, Ann. Inst. Pasteur, *2*, 1888, 482; *Pacinia metschnikoffi* Trevisan, I generi e le specie delle Batteriacee, 1889, 23; *Spirillum metschnikovi* Sternberg, Man. of Bact., 1893, 511; *Vibrio nordhafen* Pfuhl, Ztschr. f. Hyg., *22*, 1894, 234; *Microspira metschnikoffii* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 33.) Named for Metschnikoff, Russian bacteriologist.

Probable synonyms: *Vibrio schuylkiliensis* Abbott, Jour. Exp. Med., *1*, 1896, 424 (*Microspira schuylkiliensis* Chester, Manual Determ. Bact., 1901, 334); *Vibrio danubicus* Heider, Cent. f. Bakt., *14*, 1893, 341 (*Microspira danubica* Migula in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 33; *Spirillum danubicum* Holland, Jour. Bact., *5*, 1920, 225).

Curved rods, somewhat shorter and thicker than *Vibrio comma*. Motile. Gram-negative.

Gelatin colonies: Like those of *Vibrio comma*.

Gelatin stab: Rapid, napiform liquefaction.

Agar slant: Yellowish, plumose, moist, glistening.

Broth: Turbid, with thin, white pellicle.

Litmus milk: Acid, coagulated (eighth day); not peptonized.

Potato: Delicate, brownish growth.

Indole is formed.

Nitrites produced from nitrates.

Pathogenic for pigeons, fowls, and guinea pigs.

Aerobic, facultative.

Optimum temperature 37°C. Maximum less than 45°C.

Source: Isolated from fowl dead of a choleraic disease.

Habitat: The intestinal contents of chickens, pigeons and other animals suffering from a cholera-like disease.

4. **Vibrio tyrogenus** (Flügge) Holland. (Käsespirillen, Deneke, Deutsch. med. Wochnschr., *11*, 1885, 33; *Spirillum tyrogenum* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 386; *Pacinia denekei* Trevisan, I generi e le specie delle Batteriacee, 1889, 23; *Microspira tyrogena* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 33; Holland, Jour. Bact., *5*, 1920, 225; *Vibrio denekei* Hauduroy et al., Dict. d. Bact. Path., 1937, 541.) From Greek *tyros*, cheese; *genes*, produced from.

Curved rods, rather smaller and more slender than *Vibrio comma*, often very long, closely wound spirals. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Small, gray, granular, entire.

Gelatin stab: Rapid, saccate liquefaction.

Agar slant: Yellowish-white, plumose, glistening.

Broth: Turbid.

Litmus milk: Not coagulated.

Potato: No growth.

Indole not formed.

Slight production of nitrites from nitrates.

Aerobic, facultative.

Optimum temperature 30°C.

Source: Isolated from cheese.

5. **Vibrio xenopus** Schrire and Greenfield. (Trans. Royal Soc. So. Africa, *17*, 1930, 309.) From *Xenopus*, a genus of African toads.

Spiral forms, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin stab: Slow, crateriform liquefaction.

Agar colonies: Small, white, glistening, slimy, entire.

Agar slant: Grayish-white, slimy, entire.

Broth: Turbid with flocculent sediment.

Litmus milk: Unchanged.

Potato: Not reported.

Indole is not formed.

Nitrites are produced slowly from nitrates.

Blood serum is peptonized.

Starch is not hydrolyzed.

Acid from glucose, fructose, maltose, glycerol and sorbitol.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Found in abscess of pectoral muscle of African toad.

6. **Vibrio piscium** David. (Cent. f. Bakt., I Abt., Orig., *102*, 1927, 46.) From Latin *piscis*, fish.

Curved rods: 0.3 to 0.5 by 2.0 microns. Motile with a single polar flagellum. Gram-negative.

Gelatin colonies: Circular, granular, opaque.

Gelatin stab: Napiform liquefaction.

Agar colonies: Yellowish, circular, smooth, entire, iridescent.

Agar slant: Light yellow, transparent streak.

Broth: Slight turbidity, with thin pellicle.

Litmus milk: Soft coagulum. Peptonized, alkaline.

Potato: Brownish-red streak.

Indole is formed.

Nitrites not produced from nitrates.

Hydrogen sulfide formed.

No action in sugar media.

Pathogenic for frogs.

Aerobic, facultative.

Optimum temperature 18° to 20°C.

Habitat: Causes epidemic infection in fish.

7. **Vibrio proteus** Buchner. (Kommabacillus der cholera nostras, Finkler and Prior, Deutsche med. Wochenschr., 1884, 632; Buchner, Sitzungsber. d. Gesel. f. Morph. u. Physiol., München, Heft 1, 1885, 10; *Pacinia finkleri* Trevisan, Atti d. Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 84; *Microspira finkleri* Schroeter, in Cohn, Krytogamen-Flora von Schlesien, *3*, 1, 1886, 168; *Spirillum finkleri* Crookshank, Man. of Bact., 3rd ed., 1890, 282; *Microspira protea* Chester, Manual of Determinative Bacteriology, 1901, 338; *Vibrio finkleri* Holland, Jour. Bact., *5*, 1920, 225.) From Greek, *Proteus*, a marine deity who had the power of assuming any shape he chose.

Curved rods: 0.4 to 0.6 by 2.4 microns, often pointed at both ends. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Small, gray, circular, granular, entire.

Gelatin stab: Rapid, saccate liquefaction.

Agar slant: Dirty grayish, plumose.

Broth: Turbid, with fetid odor.

Litmus milk: Slightly acid; coagulated; peptonized.

Potato: Grayish, slimy layer.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 30°C.

Source: Isolated from feces of patients suffering from cholera nostras.

Habitat: Intestinal contents in cholera nostras and cholera infantum.

8. **Vibrio wolfii** (Migula) Bergey et al. (*Bacillus choleroides* Wolf, Münch. med. Wochenschr., *40*, 1893, 693; *Microspira wolfii* Migula, Syst. d. Bakt., *2*, 1900, 1001; not *Microspira choleroides* Migula, *loc. cit.*, 992; Bergey et al., Manual, 1st ed., 1923, 80.) Named for Wolf, who first isolated this organism.

Curved rods and S-shaped forms. Motile. Gram-negative.

Gelatin colonies: Small, grayish-white, spreading.

Gelatin stab: Infundibuliform liquefaction.

Agar slant: Gray, moist layer.

Broth: Turbid, with gray pellicle.

Litmus milk: Acid; coagulated.

Potato: Yellowish-white layer.

Blood serum: Rapid liquefaction.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Isolated from cervical secretions in chronic endometritis.

9. **Vibrio sputigenus** (Migula) Bergey et al. (Vibrio aus Sputum, Brix, Hyg. Rundschau, *4*, 1894, 913; *Microspira sputigena* Migula, Syst. d. Bakt., *2*, 1900, 981; Bergey et al., Manual, 1st ed., 1923, 80.) From Latin, *spuo* (*sputus*), sputum; *-genes*, produced from.

Slightly curved rods, about the same size and form as *Vibrio comma*, occurring singly, occasionally three or four in a chain. Motile. Possessing a polar flagellum. Gram-negative.

Gelatin colonies: Small, circular, slightly granular, yellowish, becoming brownish.

Gelatin: Crateriform liquefaction.

Agar slant: Grayish-white, moist.

Broth: Turbid, no pellicle formed.

Litmus milk: Acid; coagulated.

Potato: Thin, gray layer, spreading.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Isolated from sputum.

10. **Vibrio liquefaciens** (Migula) Bergey et al. (Bonhoff, Arch. f. Hyg., *19*, 1893, 248; *Microspira liquefaciens* Migula, Syst. d. Bakt., *2*, 1900, 990; Bergey et al., Manual, 1st ed., 1923, 81.) From Latin, *liquefacio*, to make liquid.

Comma and S-shaped rods. Motile. Gram-negative.

Gelatin colonies: Circular, with irregular margin, surrounded by a rose-colored zone.

Gelatin stab: Slow, napiform liquefaction.

Agar slant: Smooth, grayish, plumose.

Broth: Turbid, with heavy grayish pellicle.

Litmus milk: Acid; coagulated.

Potato: Moist, brownish layer.

Indole is not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 37°C.

Habitat: Water.

11. **Vibrio strictus** Kutscher. (Ztschr. f. Hyg., *19*, 1895, 469.) From Latin *stringo* (*strictus*), constricted.

Markedly curved rods, of about twice the size of *Vibrio comma*. Motile. Gram-negative.

Gelatin colonies: Small, circular, yellowish, with serrate margin.

Gelatin stab: Slow, napiform to saccate liquefaction.

Agar slant: Growth plumose, moist.

Broth: Turbid, with gray pellicle.

Litmus milk: Not coagulated.
Potato: Thin, barely visible layer.
Blood serum is slowly liquefied.
Indole is not formed.
Nitrites not produced from nitrates.
Pathogenic for guinea pigs.
Aerobic, facultative.
Optimum temperature 37°C.
Habitat: Water.

12. **Vibrio aquatilis** Günther. (Deutsche med. Wochenschr., 1892, 1124; *Microspira aquatilis* Migula, System der Bakterien, *2*, 1900, 993.) From Latin, *aquaticus*, living in water.

Curved rods, like *Vibrio comma*. Motile, possessing a polar flagellum. Gram-negative.

Gelatin colonies: Circular, brownish, finely granular, entire.

Gelatin stab: Crateriform liquefaction.
Agar slant: Moist, grayish, glistening.
Broth: Slightly turbid.
Litmus milk: Not coagulated.
Potato: No growth.
Indole not formed.
Nitrites not produced from nitrates.
Aerobic, facultative.
Optimum temperature 30°C.
Habitat: Water.

13. **Vibrio neocistes** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 92.) From Greek *néos*, new and *kistē* box or ark. Here used as the equivalent of Newark, the name of a city in England.

Curved rods: 0.5 to 1.0 by 1.0 to 4.0 microns. Motile with one to three polar flagella. Gram stain not recorded.

Gelatin colonies: Liquefied.

Gelatin stab: Liquefied. Medium reddened.

Agar colonies: Circular or amoeboid, buff to brownish, convex, smooth, glistening, entire.

Agar slant: Filiform, fluorescent, raised, smooth, glistening, undulate.

Broth: Turbid.
Nitrites not produced from nitrates.
Starch not hydrolyzed.
Acid from glucose.
Attacks naphthalene.
Aerobic, facultative.
Optimum temperature.
Habitat: Soil.

14. **Vibrio cuneatus** Gray and Thornton. (Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 92.) From Latin, *cuneo* (*cuneatus*) wedge.

Curved rods: 1.0 by 1.0 to 3.0 microns, the cells tapering at one extremity. Motile with one to five polar flagella. Gram-negative.

Gelatin colonies: Liquefied.

Gelatin stab: Liquefied.

Agar colonies: Circular to amoeboid, white to buff, flat to convex, smooth, translucent, border entire.

Agar slant: Filiform, whitish, smooth, glistening.

Indole not recorded.
Nitrites not produced from nitrates.
Starch not hydrolyzed.
No acid from carbohydrate media.
Attacks naphthalene.
Aerobic, facultative.
Optimum temperature 30° to 35°C.
Source: One strain isolated from soil from Rothamsted, England.
Habitat: Soil.

15. **Vibrio granii** (Lundestad) Stanier. (*Bacterium granii* Lundestad, Cent. f. Bakt., II Abt., *75*, 1928, 330; *Achromobacter granii* Bergey et al., Manual, 3rd ed., 1930, 222; Stanier, Jour. Bact., *42*, 1941, 538.) Named for Prof. H. H. Gran, who first detected agar-liquefying bacteria.

Rods: 0.6 to 0.8 by 1.4 to 2.4 microns, with rounded ends, occurring singly, in pairs, and at times in short chains. Motile. Polar flagellate (Stanier, *loc. cit.*). Gram-negative.

Fish-gelatin colonies: Punctiform, black, glistening.

Fish-gelatin stab: Slow, crateriform liquefaction.

Sea-weed agar colonies: Circular, flat

opaque, glistening, white, slimy, entire. Agar is dissolved.

Fish-agar slant: Flat, white, elevated, glistening, undulate. Liquefied.

Broth: Turbid with grayish-white, slimy sediment.

Indole not formed.

Nitrites not produced from nitrates.

Starch usually hydrolyzed.

No action on sugars.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Sea water of Norwegian Coast.

Habitat: Presumably sea water and on sea weeds.

16. **Vibrio leonardii** Métalnikov and Chorine. (Ann. d. l'Inst. Pasteur, *42*, 1928, 1647.) Named for Leonard.

Curved rods with rounded ends, 0.5 to 1.0 by 2.0 to 3.0 microns. Motile with 1 to 3 polar flagella. Gram-negative.

Gelatin stab: No liquefaction.

Agar colonies: Small, transparent, circular, having a characteristic odor.

Broth: Turbid, with thin pellicle.

Litmus milk: No coagulation, acid, with reduction of litmus.

Potato: Slight, colorless growth.

Indole not formed.

Nitrites produced from nitrates.

Blood serum not liquefied.

Hydrogen sulfide formed.

Acid and gas from glucose, fructose, galactose, lactose, sucrose and mannitol. No acid or gas from maltose or glycerol.

Aerobic, facultative.

Optimum temperature 30°C.

Habitat: Highly pathogenic for insects as *Galleria mellonella* L. (bee moth), and *Pyrausta nubialis* Hübn. (European corn borer).

17. **Vibrio agarliquefaciens** (Gray and Chalmers) Bergey et al. (*Microspira agar-liquefaciens* Gray and Chalmers, Ann. Appl. Biol., *11*, 1924, 325; Manual, 4th ed., 1934, 119.) From Latin, *liquefacio*, liquefying; Malay, *agar*, a jelly from seaweeds.

Short curved rods, usually c-shaped, with occasional s-shaped and coccoid forms. Cells 2.0 microns long by 0.5 to 0.7 micron broad; 3.0 to 5.0 microns long in division stages. Coccoid forms stained, 0.5 to 0.7 micron long. Motile with a single polar flagellum. Gram stain not reported.

Gelatin stab: Very slight surface growth after one month; the streak then shows a beaded line. No liquefaction.

Agar colonies: Surface colonies appear as a whitish growth in a depression, surrounded by a white ring. The colony is later surrounded by a ring of liquid agar. Deep colonies show a clear area and may be irregular, oval or angular.

Agar slant: A deep groove is cut along the inoculation streak, whitish growth along sides. The gel is later much weakened.

Broth: Slightly turbid. No pellicle.

Acid from glucose, lactose and maltose. No acid from sucrose or glycerine.

Utilizes ammonia salts as a source of nitrogen.

Decomposes cellulose and agar. The presence of one per cent glucose prevents the liquefaction of agar.

Nitrites produced from nitrates.

Starch is hydrolyzed.

Aerobic.

Temperature relations: Optimum 25° C., will grow at 16° but not at 34°C.

Habitat: Soil.

18. **Vibrio cyclosites** Gray and Thornton. (Gray and Thornton, Cent. für Bakt., II Abt., *73*, 1928, 92.) From Greek *kyklos*, circle or ring; *sītéō*, to eat; M. L. *cyclosites*, feeding on rings, i.e. ring compounds.

Curved rods: 0.5 to 1.0 by 1.5 to 4.0 microns. Motile with a single polar flagellum. Gram-negative.

Gelatin colonies: Circular, buff to brown, flat, smooth, glistening, entire.

Gelatin stab: No liquefaction.

Agar colonies: Circular to irregular, pale buff (later greenish), smooth, entire.

Agar stab: Filiform, greenish buff, raised, smooth, undulate.

Broth: Turbid.
Indole not reported.
Nitrites not produced from nitrates.
Starch not hydrolyzed.
Acid from glucose.
Attacks phenol and *m*-cresol.
Aerobic, facultative.
Optimum temperature 30° to 35°C.
Habitat: Soil.

19. **Vibrio percolans** Mudd and Warren. (Jour. of Bact., *8*, 1923, 447.) From Latin, *percolo* (*percolatus*), filtering.

Curved rods: 0.3 to 0.4 by 1.5 to 1.8 microns, occurring singly or in short chains. Pleomorphic. Actively motile by means of 1 to 3 polar flagella. Gram-negative.

Gelatin stab: No liquefaction.

Agar colonies: Circular, slightly convex, amorphous, entire.

Agar slant: Bluish-white, glistening, streak.

Broth: Turbid. Pellicle, sediment.
Litmus milk: Unchanged.
Potato: White, slimy streak.
Indole not formed.
Nitrites not produced from nitrates.
Blood serum not liquefied.
Starch not hydrolyzed.
No action on carbohydrates.
Passes through bacterial filters.
Aerobic, facultative.
Optimum temperature 30°C.
Non-pathogenic.
Source: Isolated from hay infusion.
Habitat: Water.

20. **Vibrio andoi** Aoi and Orikura. (Cent. f. Bakt., II Abt., *74*, 1928, 331.) Named for Andoi, a Japanese scientist.

Curved rods, with more or less tapering ends, c- or s-shaped, 0.5 to 0.8 by 1.5 to 2.5 microns. Motile, with a single polar flagellum. Gram-negative.

Gelatin: No growth.
Agar media: No growth.
Broth: No growth.
Litmus milk: No growth.
Potato: No growth.

Ammonium sulfate agar colonies: Punctiform, circular, concave, surrounded with clear zone.

Ammonium sulfate agar slant: Grayish, becoming straw-yellow, sinking into the medium as the agar liquefies.

Cellulose media: No growth.
Starch hydrolyzed.

Glucose, fructose, galactose, mannose, xylose and "honyak" are fermented.

Xylan is decomposed.
Cellobiose is decomposed.
Aerobic, facultative.

Optimum temperature 25°C. Minimum 8°C. Maximum 37°C.

Source: Rotted stable manure.

Habitat: Presumably decomposing organic matter.

21. **Vibrio fetus** Smith and Taylor. (*Spirillum* causing abortion in sheep, MacFadyean and Stockman, Rept. Dept. Comm. Ministry Agric. on Epizootic Abortion, London, 1909, 156; *ibid.*, 1913, 111; *Spirillum* associated with infectious abortion, Smith, Jour. Exp. Med., *28*, 1918, 701; Smith and Taylor, *ibid.*, *30*, 1919, 299; *Spirillum fetus* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 552; *Vibrio foetus ovis* Buxton, First Rept. of Director, Univ. Cambridge Instit. Animal Pathol., 1929–1930, 47.) From L. *foetus*, fetus.

Curved rods: The smallest forms appear as minute curved s-shaped lines, other forms very long; 0.2 to 0.5 by 1.5 to 5.0 microns. Motile by means of one, rarely two, polar flagella. Occasionally forms capsules. Granules present in older cultures. Gram-negative.

Gelatin: No growth.

Agar slant: No surface growth by freshly isolated strains. Laboratory strains produce a scanty, grayish-white, glistening surface growth.

Subsurface agar colonies: Small, yellow, opaque.

Broth: A viscid ring pellicle may appear, faint clouding of the medium occurs; a filmy, stringy deposit may settle out.

Litmus milk: No growth

Potato: No growth.

Indole not formed.

Nitrite production not reported.

Blood serum slant: Feeble growth. No liquefaction.

No gas from carbohydrates. No change or slightly acid from glucose, lactose and sucrose.

Optimum temperature 37°C. Withstands 55°C for 5 minutes.

Aerobic or microaerophilic.

Pathogenesis: Causes abortion in cattle.

Source: Twenty-two strains isolated from the placentas or fetuses of cows having abortion.

Habitat: Causes abortion in cattle.

22. **Vibrio pierantonii** (Zirpolo) Meissner. (*Bacillus pierantonii* Zirpolo, Boll. Soc. nat. Napoli, *30*, 1918, 206; Meissner, Cent. f. Bakt., II Abt., *67*, 1926, 200.) Named for Pierantoni, an Italian bacteriologist.

Rods: 0.5 by 1.5 microns, with rounded ends. Motile with one to three polar flagella. Gram-negative.

Gelatin colonies: Circular, and irregularly lobulate.

Gelatin stab: No liquefaction.

Agar colonies: Circular, light green, smooth, entire.

Glycerin agar slant: Slightly luminous streak.

Broth: Turbid, with pellicle.

Indole not formed.

Acid from glucose and maltose. Some strains also attack lactose, sucrose and mannitol.

Best growth in alkaline media.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Isolated from the photogenic organ of the cephalopod *Sepiola intermedia* Naef.

Appendix:* The following species have also been listed in the literature. Many are inadequately described.

Microspira bonhoffii Migula. (Bonhoff, Arch. f. Hyg., *19*, 1893, 252; Migula, Syst. d. Bakt., *2*, 1900, 1008.) From water.

Microspira canalis Migula. (*Spirillum saprophiles* γ and *Vibrio saprophiles* γ Weibel, Cent. f. Bakt., *2*, 1887, 469; Migula, Syst. d. Bakt., *2*, 1900, 1004; *Microspira cloaca* Chester, Man. Determ. Bact., 1901, 341.) Possibly identical with *Microspira saprophiles* Migula, *Microspira weibelii* Migula, *Vibrio surati* Ford, *Vibrio smithii* Ford. From sewage.

Microspira coprophila Migula. (Group 3, No. 6, Kutscher, Ztschr. f. Hyg., *19*, 1895, 475; Migula, Syst. der Bakt., *2*, 1900, 986.) From fecal matter.

Microspira maasei (v. Hoff) Migula. (*Spirillum maasei* v. Hoff, Cent. f. Bakt., I Abt., *21*, 1897, 797; Migula, Syst. d. Bakt., *2*, 1900, 978.) Possibly a variety of *Vibrio comma* Winslow et al. From Rotterdam tap water.

Microspira milleri Migula. (Miller, Deutsche med. Wehnschr., *11*, 1885, 138; Migula, Syst. d. Bakt., *2*, 1900, 981; *Spirillum milleri* Holland, Jour. Bact., *5*, 1920, 225; *Vibrio milleri* Holland, *ibid.*) Probably identical with *Vibrio proteus* according to Migula. From dental caries.

Microspira murmanensis Issatchenko. (Recherches sur les microbes de l'océan glacial arctique (in Russian), Petrograd, 1914, 240.) From sea water.

Microspira saprophiles Migula. (Heuvibrio β, Weibel, Cent. f. Bakt., *2*, 1887, 469; *Vibrio saprophiles* β Weibel, Cent. f. Bakt., *4*, 1888, 225; Migula, Syst. d. Bakt., *2*, 1900, 1006; *Microspira weibeli* Chester, Man. Determ. Bact., 1901, 230.) Probably identical with *Microspira cloaca* Chester and *Vibrio surati* Ford. From sewage.

Microspira tyrosinatica Beijerinck. (Kon. Akad. Wetenschappen, Amsterdam, *13*, 1911, 1068.) From sewage.

Microspira weibelii Migula. (*Vibrio*

*** Prepared by Mr. Wm. C. Haynes, New York State Experiment Station, Geneva, New York, Jan., 1939; Revised by Capt. Wm. C. Haynes, Sn. C., Fort Bliss, Texas, July, 1943.**

saprophiles α Weibel, Cent. f. Bakt., *2*, 1887, 465; *ibid.*, *4*, 1888, 225; Migula, Syst. d. Bakt., *2*, 1900, 1005; *Microspira saprophile* Chester, Manual Determ. Bact., 1901, 341; *Vibrio saprophiles* Ford, Textb. of Bakt., 1927, 356.) Possibly identical with *Microspira cloaca* Chester, *Vibrio surati* Ford, *Vibrio smithii* Ford. From sewage.

Spirillum lipoferum Beijerinck. (Cent. f. Bakt., II Abt., *63*, 1925, 353; *Chromatium lipoferum* Bergey et al., Manual, 3rd ed., 1930, 531.) From garden earth and sewage. Giesberger (Beiträge zur Kenntnis der Gattung *Spirillum* Ehbg., Inaug. Diss., Delft, 1936, 64) regards this organism as a *Vibrio*. Has a single polar flagellum.

Spirillum nasicola Trevisan. (Nasenschleimvibrio, Weibel, Cent. f. Bakt., *2*, 1887, 465; Trevisan, I generi e le specie delle Batteriacee, 1889, 24; *Vibrio nasalis* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 213; *Spirillum nasale* Sternberg, Man. of Bact., 1893, 697; *Spirosoma nasale* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1 a, 1895, 31.) From human nasal mucus.

Spirillum parvum Esmarch. (Cent. f. Bakt., I Abt., Orig., *32*, 1902, 565; also see Zettnow, *ibid.*, *78*, 1916, 1; *Vibrio parvus* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 494.) From decaying organic matter.

Vibrio albensis Lehmann and Neumann. (Elbe vibrio, Dunbar, Deutsch. med. Wochnschr., *19*, 1893, 799; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 340; *Microspira dunbari* Migula, Syst. d. Bakt., *2*, 1900, 1013; *Photospirillum dunbari* Miquel and Cambier, Traité de Bact., Paris, 1902, 881; *Photobacterium dunbari* Ford, Textb. of Bakt., 1927, 621.) From water of the river Elbe. Phosphorescent.

Vibrio amylocella Gray. (Canad. Jour. Res., *17*, 1939, 154.) Decomposes cellulose. Produces glucose from starch. From soil.

Vibrio anguillarum Bergman. (Ber. a. d. k. Bayr. Biolog. Versuchstat., München, *2*, 1909.) From an infectious disease of eels.

Vibrio aureus Weibel. (Weibel, Cent. f. Bakt., *4*, 1888, 225, 257, 281; *Spirillum aureum* Trevisan, I generi e le specie delle Batteriacee, 1889, 24; *Spirillum aureum* Sternberg, Man. of Bact., 1893, 700; *Spirosoma aureum* Migula, Syst. d. Bakt., *2*, 1900, 958.) Possibly identical with *Vibrio flavus* Weibel and *Vibrio flavescens* Weibel. From sewage.

Vibrio beijerinckii Stanier. (Jour. Bact., *42*, 1941, 527–554.) Marine agar-digesting vibrio.

Vibrio buccalis Prévot. (Vibrion B, Repaci, Compt. rend. Soc. Biol., Paris, 1909, 630; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 82.) Anaerobe. From the buccal cavity.

Vibrio bulbosa Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 237.) Decomposes cellulose. From soil.

Vibrio cardii Klein. (Cent. f. Bakt., I Abt., Orig., *38*, 1905, 173.) Possibly identical with *Vibrio cuneatus* Gray and Thornton and *Vibrio marinus* Ford. From the mussel (*Cardium edule*).

Vibrio castra Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 241.) Decomposes cellulose. From soil.

Vibrio choleroides α and *β* Bujwid. (Cent. f. Bakt., *13*, 1893, 120; *Microspira choleroides* Migula, Syst. d. Bakt., *2*, 1900, 992.) Probably a less vigorous strain of *Vibrio comma* Winslow et al. according to Chester, Man. Determ. Bact., 1901, 337. From water.

Vibrio chrysanthemoides Lehmann and Neumann. (Spirillum-like organism, Jones, Cent. f. Bakt., II Abt., *14*, 1904, 459; Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 493.) From five samples of tap water and sewage.

Vibrio crassus (Veillon and Repaci) Prévot. (*Spirillum crassum* Veillon and Repaci, Ann. Inst. Past., *26*, 1912, 306; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 85.) Anaerobe. From the buccal cavity.

Vibrio crassus var. D, Prévot. (Spirille

D, Repaci, Ann. Inst. Past., *26*, 1912, 550; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 86.) Anaerobe. From the buccal cavity.

Vibrio crasteri Hauduroy et al. (Craster, in Violle, Le Choléra, Masson édit., 1919; Hauduroy et al., Dict. d. Bact. Path., 1937, 541.) Isolated from healthy persons. Resembles *Vibrio comma*.

Vibrio cucumis Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 243.) Decomposes cellulose. From soil.

Vibrio devorans Beijerinck. (Cent. f. Bakt., II Abt., *11*, 1903, 598.) From water.

Vibrio drennani Chalmers and Waterfield. (Drennan, Jour. Inf. Dis., *14*, 1914, 251; Chalmers and Waterfield, Jour. Trop. Med., *19*, 1916, 165.) Colonies white, turning dark brown. From feces.

Vibrio flavescens Weibel. (Cent. f. Bakt., *4*, 1888, 225, 257, 281; *Spirillum flavescens* Trevisan, I generi e le specie delle Batteriacee, 1889, 24; *Spirillum flavescens* Sternberg, Man. of Bact., 1893, 700; *Spirosoma flavescens* Migula, Syst. d. Bakt., *2*, 1900, 959.) Possibly identical with *Vibrio aureus* Weibel and *Vibrio flavus* Weibel. From sewage.

Vibrio flavus Weibel. (Cent. f. Bakt., *4*, 1888, 225, 257, 281; *Spirillum flavum* Trevisan, I generi e le specie delle Batteriacee, 1889, 24; *Spirillum flavum* Sternberg, Man. of Bact., 1893, 700; *Spirosoma flavum* Migula, Syst. d. Bakt., *2*, 1900, 959.) Possibly identical with *Vibrio aureus* Weibel and *Vibrio flavescens* Weibel. From sewage.

Vibrio fuscus Stanier. (Jour. Bact., *42*, 1941, 540.) Marine agar-digesting vibrio.

Vibrio gauducheau Hauduroy et al. (Gauducheau, in Violle, Le Choléra, Masson édit., 1919; Hauduroy et al., Dict. d. Bact., 1937, 543.) From the blood of a fever patient. Resembles *Vibrio comma*.

Vibrio ghinda Pfeiffer. (Pasquale, Gior. med. d. r. esercito, 1891; Pfeiffer, in Flügge, Die Mikroörganismen, *2*, 1896, 590; *Microspira ghinda* Migula, Syst. d. Bakt., *2*, 1900, 996.) From water.

Vibrio grossus (Migula) Ford. (Vibrio No. 1, Kutscher, Ztschr. f. Hyg., *20*, 1895, 46; *Microspira grossa* Migula, Syst. d. Bakt., *2*, 1900, 1012; Ford, Textb. of Bact., 1927, 343.) From liquid manure.

Vibrio halobicus desulfuricans Horowitz-Wlassowa and Sonntag. (Arb. a. d. Staatl. wissensch. Nahrungsmittel-Institut 1931 (Russian); see Ztschr. f. Unters. d. Lebensm., *62*, 1931, 597.) A halophilic vibrio found in salted sardines, anchovies and other marine fish.

Vibrio helcogenes Fischer. (Cent. f. Bakt., *14*, 1894, 73; *Microspira helcogenes* Migula, Syst. d. Bakt., *2*, 1900, 978.) From descriptions, indistinguishable from *Vibrio proteus* according to Chester, Man. Determ. Bact., 1901, 339. From feces.

Vibrio hyos Ford. (Vibrio No. 3, Kutscher, Ztschr. f. Hyg., *20*, 1895, 46; *Spirillum mobile* Migula, Syst. d. Bakt., *2*, 1900, 1020; Ford, Textb. of Bact., 1927, 342.) Isolated from liquid manure.

Vibrio iners Besson, Ranque and Senez. (Compt. rend. Soc. Biol. Paris, *79*, 1918, 1097.) From the feces of persons having dysentery.

Vibrio intermedius (Migula) Ford. (Group V, No. 9 of cholera-like vibrios, Kutscher, Ztschr. f. Hyg., *20*, 1895, 481; *Microspira intermedia* Migula, Syst. d. Bakt., *2*, 1900, 967; Ford, Textb. of Bact., 1927, 342.) Possibly identical with *Vibrio berolinensis* Neisser. From water.

Vibrio ivanoff Pfeiffer. (Ivanoff, Ztschr. f. Hyg., *15*, 1893, 134; Pfeiffer, in Flügge, Die Mikroörganismen, *2*, 1896, 592.) Probably a variety of *Vibrio comma* Winslow et al. according to Chester, Man. Determ. Bact., 1901, 337. From feces of a cholera patient.

Vibrio jejuni Jones, Orcutt and Little. (Jour. Exp. Med., *53*, 1931, 853.) From small intestine of calves suffering from diarrhea.

Vibrio kegallensis Hauduroy et al.

(Dict. d. Bact. Path., 1937, 544.) From water.

Vibrio klimenko Hauduroy et al. (Klimenko, in Violle, Le Choléra, Masson édit., 1919; Hauduroy et al., Dict. d. Bact. Path., 1937, 544.) Resembles *Vibrio comma*. From the intestine.

Vibrio leidensis Horst. (Inaug. Diss., Leiden, 1921; abst. in Cent. f. Bakt., I Abt., Ref., *73*, 1922, 282.) From a liver abscess.

**Vibrio lingualis* Eisenberg. (Zungenbelag-Vibrio, Weibel, Cent. f. Bakt., *4*, 1888, 227; Eisenberg, Bakt. Diag., 3 Aufl., 1891, 212; *Spirillum linguae* Sternberg, Man. of Bact., 1893, 697; *Spirosoma linguale* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1 a, 1895, 31.) From deposit on the tongue.

Vibrio lissabonensis Pestana-Bettencourt. (Cent. f. Bakt., *16*, 1894, 401.) According to Chantemesse identical, or nearly so, with *Vibrio proteus*. From descriptions, indistinguishable from *Vibrio proteus* according to Chester, Man. Determ. Bact., 1901, 339. From feces of a cholera patient.

Vibrio malamoria Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 930, 250.) Decomposes cellulose. From soil.

Vibrio marinus (Russell) Ford. (*Spirillum marinum* Russell, Ztschr. f. Hyg., *11*, 1891, 165; *Microspira marina* Migula, Syst. d. Bakt., *2*, 1900, 1002; Ford, Textb. of Bact., 1927, 347.) From sea water. Closely resembles *Vibrio cuneatus* Gray and Thornton and *Vibrio cardii* Klein.

Vibrio massauah Pfeiffer. (Pasquale, Gior. med. d. r. esercito, 1891; Pasquale, Baumgarten's Jahresberichte, *7*, 1891, 336; Pfeiffer, in Flügge, Die Mikroörganismen, *2*, 1896, 589; *Microspira massauah* Migula, Syst. d. Bakt., *2*, 1900, 963; *Spirillum massauah* Chester, Manual Determ. Bact., 1901, 343; *Spirillum massowah* Holland, Jour. Bact., *5*, 1920, 225; *Vibrio massowah* Holland, *ibid.*) From feces of a cholera patient.

Vibrio mulieris Prévot. (Man. de Classif. des Bact. Anaér., Paris, 1940, 84.) Anaerobe. From the female genital tract.

Vibrio napi Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 252.) Decomposes cellulose. From soil.

Vibrio n'dianka Hauduroy et al. (Thiroux, in Violle, Le Choléra, Masson édit., 1919; Hauduroy et al., Dict. d. Bact. Path., 1937, 546.) Isolated from a patient having a cholera-like disease.

Vibrio pericoma Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 256.) Decomposes cellulose. From soil.

Vibrio polymorphus Prévot. (Spirochete B, Repaci, Ann. Inst. Past., *26*, 1912, 544; *Vibrio pseudospirochaeta B*, Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, 1936, 852; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 83.) Anaerobe. From the buccal cavity.

Vibrio polymorphus var. peritriche Prévot. (Spirochete C, Repaci, Ann. Inst. Past., *26*, 1912, 548; *Vibrio pseudospirochaeta C*, Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, 1936, 854; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 84.) Anaerobe. From the buccal cavity.

Vibrio portuensis (Migula) Ford. (Der portuenser Vibrio, Jorge, Cent. f. Bakt., I Abt., *19*, 1896, 277; *Microspira portuensis* Migula, Syst. d. Bakt., *2*, 1900, 1007; Ford, Textb. of Bact., 1927, 353.) From water.

Vibrio prima Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 235.) Decomposes cellulose. From soil.

Vibrio pseudospirochaeta Prévot. (Spirochete A, Repaci, Ann. Inst. Past., *26*, 1912, 539; *Vibrio pseudospirochaeta A*, Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, 1936, 849; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 83.) Anaerobe. From the buccal cavity.

Vibrio putridus Prévot. (Vibrion C, Repaci, Compt. rend. Soc. Biol. Paris,

* See *Nocardia lingualis* Chalmers and Christopherson.

1909, 630; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 83.) Anaerobe. From the buccal cavity.

Vibrio pyogenes (Doerr) Lehmann and Neumann. (Eiterspirillum, Mezinescu, Cent. f. Bakt., I Abt., Orig., *35*, 1904, 201; *Spirillum pyogenes* Doerr, Cent. f. Bakt., I Abt., Orig., *38*, 1905, 15; Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 493.) From pus in a case of pyelitis calculosa. Non-motile.

Vibrio ranicula Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 248.) Decomposes cellulose. From soil.

Vibrio rigensis Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 254.) Decomposes cellulose. From soil.

Vibrio rubicundus Gottron et al. (Gottron, Weaver and Sherago, Jour. Bact., *43*, 1942, 61.) From a trickling filter.

Vibrio septicus Kolle. (Kolle and Schümann in Kolle and Wassermann, Handb. d. path. Mikroörg., 2 Aufl., *4*, 1912, 101.) Identical with *Vibrio comma* culturally and morphologically. From a cholera-like disease.

Vibrio smithii (Migula) Ford. (Smith, Cent. f. Bakt., *10*, 1891, 177; *Microspira smithii* Migula, Syst. d. Bakt., *2*, 1900, 1006; Ford, Textb. of Bact., 1927, 340.) Possibly identical with *Microspira saprophiles* Migula, *Microspira weibelii* Migula, *Microspira cloaca* Chester and *Vibrio surati* Ford. From abscesses of large intestine of swine.

Vibrio spermatozoides Löffler. (Cent. f. Bakt., *7*, 1890, 638.) From kohlrabi infusions.

Vibrio sputigenus (Miller) Prévot. (*Spirillum sputigenum* Miller, Die Mikroorg. d. Mundhöhle, 2nd ed., 1892; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 85; not *Vibrio sputigenus* Bergey et al., Manual, 1st ed., 1923, 80.) Anaerobe. From the buccal cavity.

Vibrio sputigenus var. *minutissimus* Prévot. (Muhlens, Cent. f. Bakt., I Abt., *48*, 1909, 523; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 85.) Anaerobe. From the buccal cavity.

Vibrio sputorum Prévot. (Man. de Classif. des Bact. Anaér., Paris, 1940, 85.) Anaerobe. Isolated from a case of bronchitis.

Vibrio stationis Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 239.) Decomposes cellulose. From soil.

Vibrio stomatitis Prévot. (Vibrion A, Repaci, Compt. rend. Soc. Biol. Paris, 1909, 630; Prévot, Man. de Classif. des Bact. Anaér., Paris, 1940, 82.) Anaerobe. From the buccal cavity.

Vibrio subtilissimus (Migula) Ford. (Spirillum No. 1, Kutscher, Ztschr. f. Hyg., *20*, 1895, 46; *Spirillum tenerrimum* Lehmann and Neuman, Bakt. Diag., *2*, 1896, 346; *Spirillum subtilissimum* Migula, Syst. d. Bakt., *2*, 1900, 1020; Ford, Textb. of Bact., 1927, 341.) Regarded by Kutscher as being probably identical with the organism found by Smith (Cent. f. Bakt., *16*, 1894, 324) in swine dung. Resembles *Vibrio strictus*.

Vibrio suis Ford. (Vibrio No. 2, Kutscher, Ztschr. f. Hyg., *20*, 1895, 46; *Spirillum coprophilum* Migula, Syst. d. Bakt., *2*, 1900, 1019; not *Microspira coprophila* Migula, *loc. cit.*, 986; Ford, Textb. of Bact., 1927, 341.) From liquid manure.

Vibrio surati (Lamb and Paton) Ford. (*Spirillum surati* Lamb and Paton, Arch. Int. Med., *12*, 1913, 259; *Treponema surati* Brumpt, Nouveau Traité de Médecine, Paris, *4*, 1922, 514; Ford, Textb. of Bact., 1927, 337.) Isolated from a case of vegetative endocarditis. Closely resembles *Vibrio smithii* Ford, *Microspira weibelii* Migula, *Microspira saprophiles* Migula and *Microspira cloaca* Chester.

Vibrio synthetica Kalninš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 245.) Decomposes cellulose. From soil.

Vibrio tenuis Veillon and Repaci.

(Ann. Inst. Past., *26*, 1912, 300.) Anaerobe. From the buccal cavity.

Vibrio terrigenus Günther. (Cent. f. Bakt., *16*, 1894, 746; *Spirillum terrigenum* Migula, Syst. d. Bakt., *2*, 1900, 1017; *Microspira terrigena* Chester, Man. Determ. Bact., 1901, 341.) Closely related to *Vibrio tonsillaris* Stephens and Smith. From soil.

Vibrio tonsillaris Stephens and Smith. (Cent. f. Bakt., *19*, 1896, 929; *Microspira tonsillaris* Migula, Syst. d. Bakt., *2*, 1900, 1009.) Closely related to *Vibrio terrigenus* Günther. From buccal cavity.

Vibrio toulonensis Hauduroy et al. (Vibrion, Defressine and Cazeneuve, in Violle, Le Choléra, Masson édit., 1919; Hauduroy et al., Dict. d. Bact. Path., 1937, 547.) From mussel beds in the bay of Toulon.

Vibrio xylitica Kalniņš. (Latvijas Ūniversitātes Raksti, Serija I, No. 11, 1930, 232.) Decomposes cellulose. From soil.

Genus II. Desulfovibrio *Kluyver and van Niel.**

(Cent. f. Bakt., II Abt., *94*, 1936, 369; *Sporovibrio* Starkey, Arch. f. Mikrobiol., *9*, 1938, 300.) From M. L. *desulfo*, an abbreviation of the poorly constructed word desulfofication, used to indicate reduction of sulfur compounds by bacteria; *vibrio*, vibrio.

Slightly curved rods of variable length, usually occurring singly but sometimes in short chains which have the appearance of spirilla. Swollen pleomorphic forms are common. Actively motile by means of a single polar flagellum. Strict anaerobes which reduce sulfates to hydrogen sulfide. Found in sea water, marine mud, fresh water, and soil.

The type species is *Desulfovibrio desulfuricans* (Beijerinck) Kluyver and van Niel.

1. **Desulfovibrio desulfuricans** (Beijerinck) Kluyver and van Niel. (*Bacterium hydrosulfureum ponticum* Zelinsky, Proc. Russ. Phys. and Chem. Soc., *25*, 1893, 298; *Spirillum desulfuricans* Beijerinck, Cent. f. Bakt., II Abt., *1*, 1895, 1: *Bacillus desulfuricans* Saltet, Cent. f. Bakt., II Abt., *6*, 1900, 648; *Microspira desulfuricans* Migula, Syst. d. Bakt., *2*, 1900, 1016; Kluyver and van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 369; *Vibrio desulfuricans* Holland, Jour. Bact., *5*, 1920, 225; *Sporovibrio desulfuricans* Starkey, Koninkl. Nederland. Akad. v. Wetenschappen, Proc., *41*, 1938, 425; also in Arch. f. Microbiol., *9*, 1938, 268.) From M. L. present part. *desulfurico,* sulfur reducing.

Slightly curved rods, 0.5 to 1.0 by 1 to 5 microns, usually occurring singly but sometimes in pairs and short chains which cause them to look like spirilla. Swollen pleomorphic forms are common. Older cells appear black due to precipitated ferric sulfide. Actively motile, possessing a polar flagellum. Gram-negative. Stains readily with carbol fuchsin.

Grows best in freshwater media. Fails to develop in sea water upon initial isolation.

Produces opalescent turbidity in absence of oxygen in mineral media enriched with sulfate and peptone.

Media containing iron salts blackened. Bacteria found associated with precipitated ferrous sulfide.

Peptone-glucose agar colonies (in absence of air): Small, circular, slightly raised, dull, entire, soft in consistency.

Gelatin not liquefied.

Peptone, asparagine, glycine, alanine, aspartic acid, ethanol, propanol, butanol,

* Prepared by Dr. Claude E. ZoBell, Scripps Institution of Oceanography, La Jolla, California, Jan., 1943.

glycerol, glucose, lactate, succinate and malate known to be utilized as hydrogen donors.

Produces up to 500 ml. H_2S per liter.

Nitrites not produced from nitrates.

Reduces sulfate to hydrogen sulfide. Also reduces sulfites, sulfur, thiosulfates and hyposulfites.

Optimum pH 6 to 7.5, limits pH 5 to 9.

Optimum temperature 25 to 30° C. Maximum 35 to 40° C.

Anaerobic.

Habitat: Soil, sewage, water.

2. **Desulfovibrio aestuarii** (van Delden) *comb. nov.* (*Microspira aestuarii* van Delden, Cent. f. Bakt., II Abt., *11*, 1904, 81; *Vibrio desulfuricans* (halophilic strain) Baars, Over Sulfaatreductie door Bakterien, Diss. Delft, 1930, 164 pp.) From Latin, *aestuarium*, estuary.

Morphologically indistinguishable from *Desulfovibrio desulfuricans* described above, although it has a greater tendency to pleomorphism, and is slightly larger. Motile, possessing a polar flagellum. Gram-negative.

Grows preferentially in media prepared with sea water or 3 per cent salt mineral solution enriched with sulfate and peptone. According to Baars (*loc. cit.*) the marine species can be acclimatized to tolerate hypotonic salt solutions but Rittenberg (Studies on Marine Sulphate-Reducing Bacteria, Thesis, Univ. of Calif., 1941, 115 pp.) was unable to confirm this observation. Likewise Rittenberg was unable to acclimatize *D. aestuarii* to tolerate temperatures exceeding 45° C or to produce endospores.

Produces faint turbidity in absence of oxygen in sea water enriched with sulfate and peptone. Organisms most abundant in sediment.

Agar colonies: Small, circular, slightly raised, darker centers, entire, soft consistency.

Gelatin not liquefied.

Peptone, asparagine, glycine, alanine, glucose, fructose, ethanol, butanol, glycerol, acetate, lactate and malate known to be utilized in presence of sulfate.

Reduces sulfate to hydrogen sulfide. Also reduces sulfites, sulfur, thiosulfates and hyposulfites.

Produces up to 950 ml. H_2S per liter.

Nitrites not produced from nitrates.

Optimum temperature 25° to 30° C. Maximum 35° to 40° C.

Optimum pH 6 to 8, limits pH 5.5 to 8.5.

Anaerobic.

Habitat: Sea water, marine mud, brine and oil wells.

3. **Desulfovibrio rubentschickii** (Baars) *comb. nov.* (*Vibrio rubentschickii* Baars, Over Sulfaatreductie door Bakterien, Diss. Delft, 1930, 164 pp.) Named for L. Rubentschick.

Slightly curved rods, 0.5 to 1.0 by 1 to 5 microns, usually occurring singly, sometimes in pairs and short chains. Actively motile, possessing a polar flagellum. Gram-negative. Morphologically indistinguishable from *Desulfovibrio desulfuricans*.

Reduces sulfate to hydrogen sulfide. Also reduces sulfites, sulfur, thiosulfates and hyposulfites.

Culturally and physiologically like *D. desulfuricans* except that *D. rubentschickii* utilizes propionic acid, butyric acid, valeric acid, palmitic acid, stearic acid, galactose, sucrose, lactose and maltose.

Anaerobic.

Habitat: Soil and ditch water.

Appendix: The following species has also been regarded as belonging in this genus.

Vibrio thermodesulfuricans Elion. (Cent. f. Bakt., II Abt., *63*, 1924, 58); *Vibrio desulfuricans* (thermophilic strain) Baars, Over Sulfaatreductie door Bakterien, Diss. Delft, 1930, 164 pp.; *Sporovibrio desulfuricans* Starkey (Koninkl. Nederland. Akad. u. Wetenschappen, Proc., *41*, 1938, 425, also see Arch. f.

Microbiol., *9*, 1938, 268.) A thermophilic sulfate-reducing anaerobe which grows at 30 to 65°C. and which, according to Starkey, produces endospores. Elion described *Vibrio thermodesulfuricans* (Cent. f. Bakt., II Abt., *63*, 1924, 58) which grows at temperatures no lower than 30 to 40°C. and has an optimum of 55°C. Morphologically it is much like *Desulfovibrio desulfuricans* and *D. aestuarii* although the thermophilic form is shorter, more rod-like, less motile and more pleomorphic. According to Baars (*loc. cit.*), *Vibrio thermodesulfuricans* Elion can be acclimatized to grow at lower temperatures and it is found abundantly in environments where the temperature has never been as high as 30°C. This observation is confirmed by Starkey (Arch. f. Microbiol., *9*, 1938, 268) who found further that the thermophilic form found in nature or developed by acclimatization to higher temperatures produces endospores. However, spore-formation appears to be the exception rather than the rule. The pleomorphic, peritrichous, sporogenous, sulfate-reducer is more rod-like than the asporogenous cultures and many cells of the sporogenous cultures are Gram-positive whereas asporogenous cultures of *Desulfovibrio desulfuricans* are Gram-negative, all of which leaves a question whether the sporogenous sulfate-reducer is a *Bacillus* or a *Desulfovibrio*. Rittenberg (Studies on Marine Sulfate-reducing Bacteria, Thesis, Univ. Calif., 1941, 115 pp.) was unable to adapt the marine sulfate reducer to grow at low salinities or at high temperatures, nor could it be induced to form spores.

Desulfovibrio halohydrocarbonoclasticus Zobell (U. S. Patent No. 2,413,278; Science News Letter, Jan. 11, 1947.) From oil bearing rocks.

Genus III. **Cellvibrio** *Winogradsky.**

(Ann. Inst. Pasteur, *43*, 1929, 577.) From M. L. cell, an abbreviation for cellulose; *vibrio*, vibrio.

Long slender rods, slightly curved, with rounded ends, show deeply staining granules which appear to be concerned in reproduction. Monotrichous. Most species produce a yellow or brown pigment with cellulose. Oxidize cellulose, forming oxycellulose. Growth on ordinary culture media is feeble. Found in soil.

The type species is *Cellvibrio ochraceus* Winogradsky.

Key to the species of genus **Cellvibrio.**

I. No growth on glucose or starch agar.
  A. Ochre-yellow pigment produced on filter paper.
    1. *Cellvibrio ochraceus.*

II. Growth on glucose and starch agar.
  A. Poor growth on starch agar.
    1. Cream-colored pigment which becomes brown with age is produced on filter paper.
      2. *Cellvibrio flavescens.*
  B. Abundant growth on starch agar.
    1. Scanty growth on glucose agar.
      a. Intense yellow pigment produced on filter paper.
        3. *Cellvibrio fulvus.*
    2. Abundant growth on glucose agar.
      a. No pigment produced on filter paper.
        4. *Cellvibrio vulgaris.*

---

* Revised by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, Sept., 1937; no change. July, 1943.

1. **Cellvibrio ochraceus** Winogradsky. (Ann. Inst. Pasteur, *43*, 1929, 549, 601.) From Greek, *ōchra*, yellow ochre; M. L. like ochre, yellow.

Plump, curved rods with rounded ends, 2.0 to 4.0 microns long, rarely occurring as spirals. Chromatic granule frequently found in center. Motile with a single flagellum. Gram-negative.

Produces diffuse, light ochre-colored, mucilaginous colonies on cellulose silica gel medium.

No action or growth on plain agar. No growth on peptone, glucose, starch or tragacanth gum agar.

Filter paper streaks: Entire paper colored ochre-yellow in 48 hrs.

Aerobic, facultative.

Optimum temperature 20°C.

Distinctive character: Rapid ochre-colored growth.

Habitat: Soil. Disintegrates vegetable fibers.

2. **Cellvibrio flavescens** Winogradsky. (Ann. Inst. Pasteur, *43*, 1929, 608.) From Latin, part. adj. of *flavesco*, to turn yellow or golden.

Plump, curved rods, flexuous, with rounded ends, 0.5 by 2.5 to 5.0 microns. Shows metachromatic granules. Motile with a single flagellum. Gram-negative.

Produces diffuse, cream-colored growth becoming brownish; mucilaginous colonies on cellulose silica gel medium.

Good growth on peptone agar. Colonies 1 mm in 4 days. Grows poorly on glucose, starch and gum agars.

Filter paper streaks: Almost as rapid in growth as *Cellvibrio ochraceus* and colors entire paper in 2 to 3 days.

Aerobic, facultative.

Optimum temperature 20°C.

Distinctive characters: Smaller, less curved rods that grow on a greater variety of media than *Cellvibrio ochraceus*, but do not attack cellulose as readily.

Source: Isolated from a pile of old damp sawdust.

Habitat: Soil. Disintegrates vegetable fibers.

3. **Cellvibrio fulvus** Stapp and Bortels. (Culture Y, Dubos, Jour. Bact., *15*, 1928, 230; Stapp and Bortels, Cent. f. Bakt., II Abt., *90*, 1934, 42.) From Latin, *fulvus*, reddish yellow.

Slightly curved rods: 0.3 to 0.4 by 1.5 to 3.0 microns. Show involution forms. Motile by means of a single polar flagellum. Gram-negative.

Cellulose is decomposed. Grows on filter paper with an intense egg-yellow color which in older cultures may deepen to rust brown.

Glucose agar: Very scanty growth.

Sucrose agar: Very slight growth.

Maltose agar: Abundant yellow growth.

Lactose agar: Fairly abundant yellow growth.

Starch agar: Very abundant, bright yellow growth which later turns brown.

Nutrient broth: No growth.

Temperature relations: Optimum 25° to 30°C. Minimum 5°C. Maximum 32° to 35°C. No growth at 37°C. Thermal death point 39° to 40°C.

Aerobic.

Source: Isolated from forest soil in Germany and from soil in the United States.

Habitat: Widely distributed in soils.

4. **Cellvibrio vulgaris** Stapp and Bortels. (Culture Co, Dubos, Jour. Bact., *15*, 1928, 230; Stapp and Bortels, Cent. f. Bakt., II Abt., *90*, 1934, 44.) From Latin, *vulgaris*, common.

Curved rods: 0.3 by 2.9 to 4.0 microns. Shows involution forms. Motile by means of a single polar flagellum. Gram-negative.

Cellulose is decomposed. Grows on filter paper without the formation of pigment.

Glucose agar: Abundant growth. No pigment.

Sucrose agar: Abundant slightly yellow growth.

Maltose agar: Abundant yellowish growth.

Lactose agar: Very heavy growth.

Starch agar: Very abundant yellowish growth.

Nutrient broth: No growth.

Temperature relations: Optimum 25° to 30°C. Minimum 5°C. Maximum 32° to 35°C. No growth at 37°C. Thermal death point 44° to 45°C.

Aerobic.

Source: Isolated from forest soil in Germany and from soils in the United States.

Habitat: Widely distributed in soils.

Genus IV. **Cellfalcicula** *Winogradsky.**

(Ann. Inst. Pasteur, *43*, 1929, 616.) From M. L. cell, an abbreviation for cellulose; Latin dim., *falcicula*, a small sickle.

Short rods or spindles, not exceeding 2.0 microns in length, with pointed ends, containing metachromatic granules. Old cultures show coccoid forms. Monotrichous. Oxidize cellulose, forming oxycellulose. Growth on ordinary culture media is feeble. Soil bacteria.

The type species is *Cellfalcicula viridis* Winogradsky.

1. **Cellfalcicula viridis** Winogradsky. (Ann. Inst. Pasteur, *43*, 1929, 616.) From Latin, *viridis*, green.

Plump, small spindles, 0.7 by 2.0 microns, with rounded ends. Motile with a single flagellum. Gram-negative.

Produces diffuse green, mucilaginous colonies on cellulose silica gel medium.

Filter paper streaks: Rapid spreading growth colored green in 3 days at 30°C.

Hydrocellulose agar: Growth rapid, green; minute yellowish-green, mucous colonies on streaking.

No growth on peptone, glucose, starch or gum agar.

Aerobic, facultative.

Optimum temperature 20°C.

Habitat: Soil.

2. **Cellfalcicula mucosa** Winogradsky. (Ann. Inst. Pasteur, *43*, 1929, 621.) From Latin, *mucosus*, mucous.

Plump, curved spindles, with slightly pointed ends. Motile with a single polar flagellum. Contain a single chromatic granule. Gram-negative.

Produces diffuse, cream-colored, mucilaginous colonies on cellulose silica gel medium.

Hydrocellulose agar: Abundant grayish growth.

No growth on peptone, glucose, starch or gum agar.

Aerobic, facultative.

Optimum temperature 20°C.

Habitat: Soil.

3. **Cellfalcicula fusca** Winogradsky. (Ann. Inst. Pasteur, *43*, 1929, 622.) From Latin, *fuscus*, dark, tawny.

Plump, curved spindles, 0.5 by 1.2 to 2.5 microns, with slightly pointed ends and a central chromatic granule. Motile with a single polar flagellum. Gram-negative.

Produces diffuse, brownish, slightly marbled or veined colonies on cellulose silica gel medium.

Filter paper streak: Paper becomes a partially transparent, dry, non-mucilaginous pellicle adherent to gel.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Isolated from a pile of old damp sawdust.

Habitat: Probably rotting wood.

---

* Revised by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, Sept., 1937; no change, July, 1943.

Genus V. **Thiospira** *Vislouch.**

(Jour. de Microbiologie, *1*, 1914, 50; *Sulfospirillum* Kluyver and van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 396.) From Greek, *theion*, sulfur; *speira*, coil.

Colorless, motile, slightly bent rods, somewhat pointed at the ends, with granules of sulfur within the cells and a small number of flagella at the ends.

The type species is *Thiospira winogradskyi* (Omelianski) Vislouch.

1. **Thiospira winogradskyi** (Omelianski) Vislouch. (*Thiospirillum winogradskyi* Omelianski, Cent. f. Bakt., II Abt., *14*, 1905, 769; *Thiospirillum granulatum* Molisch, Cent. f. Bakt., II Abt., *33*, 1912, 55; Vislouch, Jour. de Microbiologie (Russian), *1*, 1914, 50; *Sulfospirillum winogradskyi* Kluyver and van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 397.) Named for Winogradsky, the Russian bacteriologist.

Large, sulfur spirilla, somewhat pointed at the ends, 2 to 2.5 microns thick, to 50 microns long. Numerous granules of sulfur. Very motile, with one to two polar flagella.

Habitat: Curative mud.

2. **Thiospira bipunctata** (Molisch) Vislouch. (*Spirillum bipunctatum* Molisch, Cent. f. Bakt., II Abt., *33*, 1912, 55; Vislouch, Jour. de Microbiologie (Russian), *1*, 1914, 50.) From Latin, *bi*, two; *punctum*, points.

Small, slightly bent sulfur spirilla, markedly pointed at the ends, 6.6 by 14 microns long, 1.7 to 2.4 microns wide (in the center of the cell). Both ends are filled more or less with large volutin (metachromatic) granules. Several minute granules of sulfur are present in the clear center and sometimes at the ends. Old cells possess one flagellum at each end; young cells have a flagellum at one end.

Habitat: Sea and salt waters.

Genus VI. **Spirillum** *Ehrenberg.*†

(Ehrenberg, Abhandlungen d. Berl. Akad., 1830, 38; *Spirosoma* Migula, Arb. bakt. Inst. Karlsruhe, *1*, 1894, 237; *Dicrospirillum* Enderlein, Sitzber. Gesell. naturf. Freunde, Berlin, 1917, 313.) From Greek, *speira*, a spire or coil.

Cells form either long screws or portions of a turn. Volutin granules are usually present. Usually motile by means of a tuft of polar flagella (5–20) which may occur at one or both ends of the cells. Aerobic, growing well on ordinary culture media, except for one saprophyte and the pathogenic species. These have not yet been cultivated. Usually found in fresh and salt water containing organic matter.

The type species is *Spirillum undula* (Müller) Ehrenberg.

Key to the species of genus **Spirillum.**

I. One micron or less in diameter.
  1. Volutin granules present.
    a. Slow to rapid liquefaction of gelatin.
      b. Grayish to brown growth on potato.
        1. *Spirillum undula.*

---

* Prepared by Prof. D. H. Bergey, Philadelphia, Penn., October, 1922.

† Revised by Prof. D. H. Bergey, Philadelphia, Pennsylvania, April, 1937; further revision by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, June, 1943, based on Monograph by Giesberger, Inaug. Diss., Utrecht, Nov. 30, 1936.

bb. Light yellowish-orange growth on potato.

2. *Spirillum serpens.*

aa. No liquefaction of gelatin. Of small size (0.5 micron in diameter).

b. Colonies on agar white becoming brownish black and slightly wrinkled.

3. *Spirillum itersonii.*

bb. Colonies on agar white and smooth.

4. *Spirillum tenue.*

2. No volutin granules observed.

b. Single flagellum.

5. *Spirillum virginianum.*

bb. Tuft of flagella.

6. *Spirillum minus.*

II. Over one micron in diameter.

1. Grows poorly on peptone agar and potato.

7. *Spirillum kutscheri.*

2. Not positively known to have been cultivated on artificial media. Very evident volutin granules.

8. *Spirillum volutans.*

3. Cells more or less deformed by fat drops.

9. *Spirillum lipoferum.*

1. **Spirillum undula** (Müller) Ehrenberg. (*Vibrio undula* Müller, Animalcula infusoria et marina, 1786; Ehrenberg, Infusionstierchen, 1838; *Spirillum undula minor* Kutscher, Cent. f. Bakt., I Abt., *18*, 1895, 614.) From Latin, *undulatus*, wave-like.

Stout threads, 0.9 micron in diameter, with one-half to three turns. The wave lengths are 6 microns. Width of spiral, 3.0 microns. Tufts of three to nine flagella at each pole. Volutin granules present. Gram-negative.

Gelatin colonies: The surface colonies are circular, granular, greenish-yellow, entire.

Gelatin stab: Thick, white, rugose surface growth. Very slow liquefaction.

Agar colonies: Grayish-white, smooth.

Broth: Turbid.

Potato: Grayish-brown growth.

Indole not formed.

Catalase positive.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 25°C.

Cohn (Beitrage z. Biol. d. Pflanzen, *1*, Heft 2, 1875, 132) reports that he could not distinguish this organism from *Vibrio prolifer* Ehrenberg.

Habitat: Putrid and stagnant water.

2. **Spirillum serpens** (Müller) Winter. (*Vibrio serpens* Müller, Animalcula infusoria et marina, 1786, 43; Winter, in Rabenhorst's Kryptogamen-Flora, *1*, Die Pilze, 1884, 63.) From Latin, *serpens*, serpent.

Long, curved rods with two to three wave-like undulations, 0.8 to 1.0 micron in diameter; wave length, 8 to 9 microns. Width of spiral 1.5 to 1.8 microns. Volutin granules in cytoplasm. Motile, possessing tufts of flagella at both poles. Gram-negative.

Gelatin colonies: Yellowish to brownish, granular, entire.

Gelatin stab: Yellowish surface growth. Slow liquefaction.

Agar colonies: Heavy cream-colored growth.

Agar slant: Grayish, with yellowish center, granular, entire.

Broth: Turbid.

Litmus milk: Unchanged.

Potato: Clear orange-yellow growth

Indole not formed.

Catalase positive.
Nitrites not produced from nitrates.
Aerobic, facultative.
Optimum temperature 35°C.
Habitat: Stagnant water.

3. **Spirillum itersonii** Giesberger. (Inaug. Diss., Utrecht, 1936, 46 and 57.) Named for van Iterson, the Dutch bacteriologist.

The smallest of the spirilla isolated from water. First observed by van Iterson (Proc. Kon. Akad. v. Wetensch. Amsterdam, *5*, 1902, 685).

Small spirals, 0.5 micron in diameter. Wave length, 3 to 3.5 microns. Spiral width, 1 to 1.5 microns. Motile with bipolar tufts of flagella. Gram-negative.

Grows readily on peptone agar. White colonies becoming brownish black, and slightly wrinkled.

Gelatin stab: No liquefaction.

Brownish-orange growth on potato.

Volutin granules may be present.

Catalase is produced.

Acid from glucose, fructose, ethyl alcohol, n-propyl alcohol, n-butyl alcohol, and glycerol. Utilizes acetic, propionic, n-butyric, tartaric, fumaric, lactic, citric, and succinic acids.

Grows well in peptone broth. Also utilizes ammonia compounds.

Anaerobic growth in the presence of nitrates when organic or ammonia nitrogen is also available.

Optimum temperature: 30°C.

Source: Isolated from water.

Habitat: Water.

4. **Spirillum tenue** Ehrenberg. (Infusionstierchen, 1838; see Bonhoff, Arch. f. Hyg., *26*, 1896, 162.) From Latin, *tenuis*, thin.

Slender spirals. Diameter 0.7 micron. Wave lengths 4.5 to 5.0 microns. Width of spiral 1.5 to 1.8 microns.

Actively motile in peptone water with tufts of flagella at each pole. Volutin granules present. Gram-negative.

Agar colonies: White, smooth.

Peptone agar slant: Heavy growth.

Gelatin stab: No liquefaction.

Catalase positive.

Potato: Light brown growth.

Acid from glucose and fructose. Slight acid from several other sugars and glycerols. Utilizes salts of acetic, propionic, n-butyric, tartaric, lactic, citric, malic, and succinic acids.

Ammonia compounds are used as a source of nitrogen.

Optimum temperature, 30°C.

Source: Found in putrefying vegetable matter.

Habitat: Putrefying materials.

5. **Spirillum virginianum** Dimitroff. (Jour. of Bact., *12*, 1926, 19.) From M. L. genitive of Virginia.

Spirals consisting of ½ to 3 complete turns in young cultures, older cultures showing 7 turns. 0.6 to 0.9 by 3 to 11 microns. Motile with a single polar flagellum on one or both ends. Gram-negative.

Gelatin colonies: Entire, convex, circular, moist, colorless.

Gelatin stab: Growth along entire stab. No liquefaction. (Dimitroff, *loc. cit.*) Active liquefaction. (Giesberger, Inaug. Diss., Utrecht, 1936, 65.)

Agar colonies: Dew drop, convex, entire, moist, colorless.

Agar slant: Dew drop, isolated colonies.

Broth: Cloudy, no flocculation.

Uschinsky's protein-free medium: Abundant growth.

Litmus milk: No growth.

Loeffler's blood serum: Convex, isolated dew drop colonies. No liquefaction.

Lead acetate agar: No H_2S.

Voges-Proskauer and methyl red negative.

No volutin granules observed (Giesberger, *loc. cit.*, p. 60).

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

No acid or gas from carbohydrates.

(Dimitroff, *loc. cit.*). Utilizes lactates and citrates (Giesberger, *loc. cit.*).

Aerobic, facultative.

Optimum temperature 35°C.

Source: Isolated from mud on an oyster shell.

Habitat: Probably muddy bottom of brackish water.

6. **Spirillum minus** Carter. (Carter, Sci. Mem. Med. Officers Army India, *3*, 1887, 45; *Spirillum minor* Carter, *ibid.*; *Spirochaeta laverani* Breinl and Kinghorn, Mem. Liverpool Sch. Trop. Med., *21*, 1906, 55; *Spirochaeta muris* Wenyon, Jour. Hyg., *6*, 1906, 580; *Spirochaeta muris* var. *virginiana* MacNeal, Proc. Soc. Exper. Biol. and Med., *4*, 1907, 125; *Spirochaeta muris* var. *galatziana* Mezincescu, Compt. rend. Soc. Biol. Paris, *66*, 1909, 58; *Treponema muris* Moore, Principles of Microbiology, 1912, 414; *Spirochaeta morsus muris* Futaki, Takaki, Taniguchi and Osumi, Jour. Exp. Med., *25*, 1917, 33; *Spirochaeta petit* Row, Ind. Jour. Med. Res., *5*, 1917, 386; *Spironema muris* Noguchi, Jour. Exp. Med., *27*, 1918, 584; *Spirochaeta japonica* Dujarric de la Rivière, Ann. de Méd., *5*, 1918, 184; *Spirochaeta morsusmuris* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 447; *Spiroschaudinnia morsusmuris* Castellani and Chalmers, *ibid.*; *Spirochaeta sodoku* Troisier, 1920, according to Pettit, Contribution à l'Étude des Spirochétidés, Vanves, II, 1928, 231; *Treponema japonicum* Brumpt, Nouveau Traité de Médecine, Paris, *4*, 1922, 505; *Treponema morsus muris* Brumpt, *ibid.*, 506; *Treponema minor* Brumpt, *ibid.*, 507; *Treponema laverani* Brumpt, *ibid.*, 507; *Treponema sodoku* Brumpt, *ibid.*, 514; *Spirochaeta pettiti* Row, Jour. Trop. Med. and Hyg., *25*, 1922, 364; *Treponemella muris* San Giorgi, Pathologica rivista, *14*, 1922, 461; *Borrelia muris* Bergey et al., Manual, 2nd ed., 1925, 435; *Spirillum minus* var. *morsus muris* Ruys, Cent. f. Bakt., I Abt., Orig., *103*, 1927, 270; *Spirillum minus* var. *muris* Ruys, *ibid.*; *Spironema minor* Ford, Textb. of Bact., 1927, 962; *Spironema laverani* Ford, *ibid.*, 963; *Spironema muris* var. *virginiana* Ford, *ibid.*, 963; *Spirella morsusmuris* Noguchi, in Jordan and Falk, Newer Knowledge Bact. and Immun., 1928, 497; *Spirella muris* Noguchi, *ibid.*) From Latin, *minus*, less.

Description taken from Adachi, Jour. Exp. Med., *33*, 1921, 647 and Giesberger, Inaug. Diss., Delft, 1936, 67.

Short thick cells: 0.5 by 3.0 microns, having 2 or 3 windings which are thick, regular and spiral. Actively motile by means of bipolar tufts of flagella. Gram-negative.

Has not been cultivated on artificial media.

Aerobic, facultative.

Pathogenic for man, monkeys, rats, mice and guinea pigs.

This species is regarded by some as a spirochaete. Because of its habitat and wide distribution it has been described under many different names. It is possible that some of these names indicate varieties or even separate species. See Beeson (Jour. Amer. Med. Assoc., *123*, 1943, 332) for important literature.

Source: Found in the blood of rats and mice.

Habitat: The cause of rat-bite fever. Widely distributed.

7. **Spirillum kutscheri** Migula. (*Spirillum undula majus* Kutscher, Cent. f. Bakt., I Abt., *18*, 1895, 614; Migula, Syst. d. Bakt., *2*, 1900, 1024.) Named for Kutscher, the German bacteriologist who first isolated the organism.

Stout threads, 1.5 microns in diameter. Wave lengths 10.5 to 12.5 microns. Width of spiral, 3 to 4.5 microns. May lose their spiral form on continued cultivation. Motile with tufts of flagella at the poles. Gram-negative.

Gelatin colonies: Transparent, round, surface colonies. Deep colonies, dark brown.

Gelatin stab: Slow liquefaction.

Agar colonies grow poorly, granular. Deep colonies yellowish-green to dark brown.

Agar slant: Delicate, transparent growth.

Potato: Limited growth.

Volutin present.

Catalase positive.

Utilizes malic and succinic acids.

Grows well on peptone broth. Also utilizes ammonia compounds.

Optimum temperature, 22° to 27°C.

Source: Isolated from putrid materials and liquid manure.

Habitat: Putrefying liquids.

8. **Spirillum volutans** Ehrenberg. (Prototype, *Vibrio spirillum* Müller, Animalcula infusoria, 1786; Ehrenberg, Die Infusionstierchen als Volkommene Organismen, 1838.) From M. L. volutin.

Spirals 1.5 microns in diameter. Wave length, 13 to 15 microns, width of spiral, 4 to 5 microns. The largest of the spirilla. Slightly attenuated ends. Motile, possessing a tuft of ten to fifteen flagella at each pole. Dark granules of volutin in the cytoplasm. Gram-negative.

Migula (Syst. d. Bakt., *2*, 1900, 1025) reports that this species has not been cultivated on artificial media, and that the cultures so described by Kutscher (Ztschr. f. Hyg., *20*, 1895, 58) are of a different species which Migula names *Spirillum giganteum*. Vahle (Cent. f. Bakt., II Abt., *25*, 1910, 237) later describes the cultural characters of an organism which he regards as identical with Kutscher's organism. Giesberger (Inaug. Diss., Delft, 1936, 65) saw what he felt was the true *Spirillum volutans* but could not cultivate it.

Optimum temperature 35°C.

Habitat: Stagnant water.

9. **Spirillum lipoferum** Beijerinck. (*Azotobacter spirillum* Beijerinck, Kon. Akad. Wetensch. Amsterdam, *30*, 1923, 431 quoted from Giesberger, Inaug. Diss., Delft, 1936, 24; *Spirillum lipoferum* Beijerinck, Cent. f. Bakt., II Abt., *63*, 1925, 353; *Chromatium lipoferum* Bergey et al., Manual, 3rd ed., 1930, 531.) From Greek, *lipos*, fat; Latin, *fero*, to bear.

Curved cells with one-half to one spiral turn, containing minute fat droplets. These may deform the cells. Motile with lophotrichous flagella. Gram-negative.

Calcium malate agar colonies: Circular, small, transparent, dry. The malate is oxidized to calcium carbonate. Cells contain fat drops.

Peptone agar colonies: More abundant development. Cells lack fat drops and are typically spirillum in form.

Glucose peptone broth: Cells actively motile with large fat drops.

Fixes atmospheric nitrogen in partially pure cultures, i.e., free from *Azotobacter* and *Clostridium* (Beijerinck, *loc. cit.*). Schröder (Cent. f. Bakt., II Abt., *85*, 1932, 17) failed to find fixation of nitrogen when she used cultures derived from a single cell.

Aerobic.

Optimum temperature 22°C.

Beijerinck regards this as a transitional form between *Spirillum* and *Azotobacter*. Giesberger (*loc. cit.*, p. 64–65) thinks it a *Vibrio*.

Habitat: Garden soil.

Appendix:* The following additional species have been mentioned in the literature. Many are inadequately described. Some may not belong here.

---

* Prepared by Mr. Wm. C. Haynes, New York State Experiment Station, Geneva, New York, Jan., 1939; Revised by Capt. Wm. C. Haynes, Sn. C., Fort Bliss, Texas July, 1943.

Spirella canis Duboscq and Lebailly. (Compt. rend. Acad. Sci. Paris, *154*, 1912, 835.) From the stomach of a dog.

Spirillum amyliferum Van Tieghem. (Bull. Soc. botan. de France, *26*, 1879, 65.) Said to produce spores. Ford (Textb. of Bact., 1927, 364) thinks this organism was probably a spirochaete because of its mode of division. Found in frog spawn fungus of sugar factories.

Spirillum attenuatum Warming. (Om nogle ved Danmarks Kyster levende Bakterier. Kjobenhavn, 1876; *Spirosoma attenuatum* Migula, Syst. d. Bakt., *2*, 1900, 959.) Ford (*loc. cit.*, 363) states that this incompletely described organism would now be regarded either as a spirillum or as a spirochaete. From sea coast of Denmark.

Spirillum cardiopyrogenes Sardjito. (Geneesk. Tijdschr. voor Ned.-Indie, *72*, 1932, 1359; *ibid.*, *73*, 1933, 822.) From blood of a patient with pericarditis.

Spirillum colossus Errera. (Rec. trav. bot. Bruxelle, *5*, 1902; Abst. in Cent. f. Bakt., II Abt., *9*, 1902, 608.) A giant form isolated from brackish sea water. Probably the same as *Spirillum volutans* Ehrenberg.

Spirillum concentricum Kitasato. (Cent. f. Bakt., *3*, 1888, 73.) Found in putrefying blood.

Spirillum crassum Veillon and Repaci. (Ann. Inst. Past., *26*, 1912, 300.) Described as having peritrichous flagella. From lung lesions in human tuberculosis.

Spirillum endoparagogicum Sorokin. (Cent. f. Bakt., *1*, 1887, 465.) Described as producing spores in old cultures. From rain water in bark of poplar tree.

Spirillum giganteum Migula. (*Spirillum volutans* Kutscher, Ztschr. f. Hyg., *20*, 1895, 58; Migula, Syst. d. Bakt., *2*, 1900, 1025.) From putrefying liquids.

Spirillum hachaizae Kowalski. (Cent. f. Bakt., *16*, 1894, 324; *Spirillum hachaizicum* Kowalski, *ibid.*, 324; *Spirochaeta hachaizae* Castellani and Chalmers, Man. Trop. Med., 1st ed., 1910, 316; *Treponema hachaizae* Brumpt, Nouveau Traité de Médecine, Paris, *4*, 1922, 495.) Found in feces of cholera patients and also of healthy individuals.

Spirillum kolkwitzii Vislouch. (Jour. de Microbiol. (Russian), *1*, 1914, 50.)

Spirillum leucomclaenum Perty. (Zur Kenntniss kleinster Lebensformen. Berne, 1852. Also see Koch, Mitt. Kais. Gesundheitsamte, *1*, 1881, 48.) From stagnant water.

Spirillum monospora Dobell. (Quart. Jour. Micr. Sci., *52*, 1908, 121.) Described as producing spores. From large intestine of frogs and toads.

Spirillum nigrum Rist. (Thèse méd., Paris, 1898; see Cent. f. Bakt., I Abt., *30*, 1901, 299.) Strict anaerobe from pus.

Spirillum ostreae Noguchi. (Jour. Exp. Med., *34*, 1921, 295.) From oysters.

Spirillum periplaneticum Kunstler and Gineste. (Compt. rend. Soc. Biol. Paris, *61*, 1906, 135.) From the intestine of the cockroach, *Periplaneta americana*.

Spirillum pyogenes Mezincescu. (Cent. f. Bakt., I Abt., Orig., *35*, 1904, 201; *Spirochaeta pyogenes* Blanchard, Semaine Méd., *26*, 1906, 1; *Treponema pyogenes* Brumpt, Nouveau Traité de Médecine, Paris, *4*, 1922, 511.) From a case of pyelitis calculosa.

Spirillum rappini De Toni and Trevisan. (Spirochaete, Rappin, Contr. à l'Étude d. Bactér. de la Bouche à l'État normal, 1881, 68; De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1009.) From the stomach of a dog.

Spirillum recti physeteris Beauregard. (Compt. rend. Acad. Sci. Paris, *125*, 1897, 255.) From ambergris.

Spirillum rugula (Müller) Winter. (*Vibrio rugula* Müller, Animalcula infusoria, 1786; Cohn, Beitrage z. Biol. d. Pflanz., *1*, Heft 2, 1872, 178; Bonhoff, Arch. f. Hyg., *26*, 1896, 162; Winter, Die Pilze, in Rabenhorst's Kryptogamen-Flora, 1884.) Prazmowski found spores, but it is not certain his cultures were pure. Bonhoff also observed spores, but

concluded that they were due to contaminating organisms (Ford, Textb. of Bact., 1927, 360). From water.

Spirillum sporiferum Migula. (Syst. d. Bakt., *2*, 1900, 1028.) Produces spores. The spirals in which the spore formation is beginning are like *Spirillum leucomelaenum* Perty (Ford, *loc. cit.*, 336). Giesberger (*loc. cit.*, p. 60) places this and other so-called spore-forming spirilla in *Sporospirillum* Orla-Jensen (Cent. f. Bakt., II Abt., *22*, 1909, 340). From a bean infusion.

Spirillum sputigenum Miller. (Die Mikroörganismen der Mundhöhle. Leipzig, 1892; Deutsche med. Wchnschr., *32*, 1906, 1 and 348.) Hoffman and Prowazek (Cent. f. Bakt., I Abt., Orig., *41*, 1906, 741) claim that *Spirillum sputigenum* has peritrichous flagella. Giesberger (*loc. cit.*, 63) places this in *Selenomonas* Prowazek (Cent. f. Bakt., I Abt., Orig., *70*, 1913, 36). Muhlens (Cent. f. Bakt., I Abt., Orig., *48*, 1909, 525) reports 1 to 3 flagella, the majority of the organisms having apparently a single thick flagellum (a bunch of flagella) on the concave side (Ford, *loc. cit.*, 367). Anaerobic. From the buccal cavity.

Spirillum stomachi Lehmann and Neumann. (*Spirillum* Form α, β, γ, δ Salomon, Cent. f. Bakt., I Abt., *19*, 1896, 433; Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 362.) Found in stomach of dog, cat and rat.

Paraspirillum vejdovskii Dobell. (Arch. f. Protistenk., *24*, 1911, 97.) Found only once in fresh water containing *Oscillatoria*. Flagellate flexible spiral cells described as possessing a nucleus. This may be a protozoan.

Spirobacillus gigas Certes. (Bull. Soc. Zool. France, *14*, 1889, 322; abst. in Ann. de Microgr., *2*, 1889–1890, 137.) From water.

Vibriothrix tonsillaris Tunnicliff and Jackson. (Organism from Actinomyces-like granules, Tunnicliff, Jour. Inf. Dis., *38*, 1926, 366; Tunnicliff and Jackson, *ibid.*, *46*, 1930, 12.) From tonsillar granules. May be identical with *Leptothrix asteroide* Mendel and as a Gram-negative, anaerobe may belong in *Bacteroides* according to Rosebury (Bact. Rev., *8*, 1944, 202).

Vibriothrix zeylanica (Castellani) Castellani. (*Spirillum zeylanicum* Castellani Jour. Ceylon Branch Brit. Med. Assoc., 7, 1910, 5 and Philipp. Jour. Sci., *5*, No. 2, Sect. B., Medical Sciences, July, 1910; *Vibrio zeylanicus* Castellani, 1913, *Bacillus zeylanicus* Castellani, 1913 and *Vibriothrix zeylanica* Castellani, 1917, quoted from Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 1069; *Spirobacillus zeylanicus* Castellani, Spagnuolo and Russo, Bull. Soc. Path. Exot., *11*, 1918, 271.) Motile. Gram-negative. From cases of dysenteric enteritis in Ceylon. This is the type species of the genus *Vibriothrix* Castellani (see Castellani and Chalmers, *loc. cit.*, 1068).

FAMILY III. AZOTOBACTERIACEAE BERGEY, BREED AND MURRAY.*

(Preprint, Manual, 5th ed., October, 1938, v and 71.)

Cells without endospores. Relatively large rods or even cocci, sometimes almost yeast-like in appearance. The type of flagellation in this genus has been definitely established as peritrichous. Gram-negative. Obligate aerobes, usually growing in a film on the surface of the culture medium. Capable of fixing atmospheric nitrogen when provided with carbohydrate or other energy source. Grow best on media deficient in nitrogen. Soil and water bacteria.

There is a single genus.

Genus I. **Azotobacter** *Beijerinck.*

(Beijerinck, Cent. f. Bakt., II Abt., *7*, 1901, 567; *Azotomonas* Orla-Jensen, Cent. f. Bakt., II Abt., *24*, 1909, 444.)

The definition is identical with that of the family. From Gr. *azous*, not living. French, *azote*, nitrogen; Gr. *baktron*, rod, stick.

The type species is *Azotobacter chroococcum* Beijerinck.

1. **Azotobacter chroococcum** Beijerinck. (Cent. f. Bakt., II Abt., *7*, 1901, 567 and *9*, 1902, 3; *Bacillus azotobacter* Löhnis and Hanzawa, Cent. f. Bakt., II Abt., *42*, 1914, 1; *Bacillus chroococcus* Buchanan, General Syst. Bact., Baltimore, 1925, 194.) From Gr. *chroa*, color; *coccos*, grain; M. L. sphere.

According to Löhnis and Smith (Jour. Agr. Res., *23*, 1923, 401) *Azotobacter beijerinckii* Lipman (New Jersey Agr. Exp. Sta. Rept., *25*, 1904, 247), *Azotobacter woodstownii* Lipman (*ibid.*), *Azotobacter smyrnii* Lipman and Burgess (Cent. f. Bakt., II Abt., *44*, 1915, 504) and *Azotobacter hilgardii* Lipman (Science, *29*, 1909, 941) are identical with *Azotobacter chroococcum*. Greene (Soil Sci., *39*, 1935, 327) studied *Azotobacter chroococcum* and *Azotobacter beijerinckii* by chemical analyses and found the chemical composition of the cells to be practically identical, but different from that of *Azotobacter vinelandii* and *Azotobacter agile*. Smith (private communication) feels that *Azotobacter beijerinckii* is a non-pigmented rough strain of *Azotobacter chroococcum*.

Grows in absence of organic nitrogen.

Rods: 2.0 to 3.0 by 3.0 to 6.0 microns, occurring in pairs and packets and occasionally in chains. The cells show three or four refractile granules. The organisms are surrounded by a slimy membrane of variable thickness, usually becoming brownish in older cultures, due possibly to the conversion of tyrosine to melanin. The coloring matter is insoluble in water, alcohol, ether and chloroform. Motile by means of numerous peritrichous flagella (Hofer, Jour. Bact., *47*, 1944, 415.) Gram-negative.

Gelatin colonies: Very small, circular, yellow, granular, later becoming yellowish-brown.

Gelatin stab: Only slight growth in the stab. No liquefaction.

Mannitol agar stab: Gray, may become brownish.

Nutrient broth: No growth even in the presence of glucose; peptone utilized with difficulty.

Litmus milk: Becoming clearer in 10 to 14 days.

Potato: Glossy, barely visible, slimy

* Revised by Dr. A. W. Hofer, New York State Experiment Station, Geneva, New York, June, 1938; further revision by Dr. A. W. Hofer, July, 1943.

to wrinkled; may become yellowish, brownish-yellow or chocolate brown.

The organism fixes atmospheric nitrogen and gives off CO_2, utilizing glucose and sucrose. Other generally used carbon compounds are fructose, maltose, mannitol, inulin, dextrin, galactose, arabinose, starch, glycerol, ethyl alcohol, acetate, butyrate, citrate, lactate, malate, propionate and succinate.

Nitrate: Improves growth in amounts less than 1 gm. per liter; greater amounts are toxic.

Fixes nitrogen moderately actively.

Chemical analysis: Four-day cultures grown upon mannitol agar (Greene, 1935), when dried, are found to contain less than 0.5 per cent of hemicelluloses, less than 20 per cent of crude protein, less than 5 per cent of ash, and more than 30 per cent of lignin-like materials. The nitrogen fraction contains less than 1 per cent of amide nitrogen, less than 1 per cent of humin nitrogen and about 1 per cent of basic nitrogen.

Aerobic.

Optimum temperature 25°C. to 28°C.

Distinctive characters: Inability to grow in peptone media, even in the presence of glucose; frequent occurrence of a dark brown or black pigment.

Source: Isolated from soil.

Habitat: Occurs naturally in the majority of neutral or alkaline field soils.

2. **Azotobacter agile** Beijerinck. (Cent. f. Bakt., II Abt., 7, 1901, 577.) From L. *agilis*, agile, quick.

In studies on the chemical composition of cells Greene (Soil Sci., *39*, 1935, 327) found *Azotobacter vinelandii* Lipman (New Jersey Agr. Exp. Sta. Rept., *24*, 1903, 238) to be very similar to *Azotobacter agile* Beijerinck. Smith and Löhnis (Jour. Agr. Res., *23*, 1923, 401) agree and state furthermore that the two are identical; they believe also that *Azotobacter vitreum* Löhnis and Westermann (Cent. f. Bakt., II Abt., *22*, 1908, 234) is another synonym of *Azotobacter agile*. Smith (private communication) states that *Azotobacter vitreum* is a very weak growing, smooth strain of *Azotobacter agile*. Kluyver and van Reenen (Arch. Mikrobiol., *4*, 1933, 299) feel that a distinction should be made between *Azotobacter agile* and *Azotobacter vinelandii*. In regard to the former, Kluyver and van den Bout (Arch. Mikrobiol., 7, 1936, 263) suggest that it be further subdivided into *Azotobacter agile* and *Azotobacter agile* var. *atypica*, the latter referring to an *Azotobacter agile* form that fails to produce pigment.

Rods: 4 to 6 microns in length, almost spherical. Actively motile by means of numerous peritrichous flagella (Hofer, *loc. cit.*). Some strains are reported to be non-motile. Gram-negative.

Grows in absence of organic nitrogen.

Gelatin: No liquefaction.

Mannitol agar colonies: Circular, grayish white, translucent with whitish center.

Washed agar colonies: Show slight bluish-green fluorescence.

Mannitol agar slant: Grayish, translucent, fluorescent.

Plain agar slant: Yellowish-white, smooth, glistening, translucent with opaque center.

Broth: Turbid, with sediment.

Litmus milk: Becoming clear in 10 to 14 days.

Potato: Yellowish-white, slimy, becoming yellowish-brown.

In the presence of organic acids, a greenish or reddish pigment is formed.

The organism fixes atmospheric nitrogen actively, and gives off CO_2.

Aerobic.

Chemical analysis: Four-day cultures grown upon mannitol agar (Greene, 1935), when dried, contain more than 4 per cent of hemicelluloses, more than 45 per cent of crude protein, more than 7 per cent of ash, and less than 4 per cent of lignin-like materials. The nitrogen fraction contains more than 1 per cent amide nitrogen, more than 1 per cent humin

nitrogen, and 2 per cent or more of basic nitrogen.

Optimum temperature 25°C to 28°C.

Distinctive characters: Lack of a brown pigment; occasional fluorescence; growth in peptone broth containing glucose.

Source: Originally isolated from canal water at Delft.

Habitat: Occurs in water and soil.

3. **Azotobacter indicum** Starkey and De. (Soil Sci. *47*, 337, 1939.) From L. *indicus*, of India.

Rods: Ellipsoidal, from 0.5 to 1.2 by 1.7 to 2.7 microns when grown on nitrogen free glucose agar. One of the distinctive characteristics is the presence of two large, round, highly refractive bodies in the cells, one usually at each end. Motile by means of numerous peritrichous flagella (Hofer, *loc. cit.*). Gram-negative.

The organism grows slowly but in time produces large amounts of slime. Has high acid tolerance, since it grows from pH 3 to 9.

Sucrose or glucose agar plates: Colonies are colorless, round, very much raised, and uniformly turbid, having much the appearance of heavy starch paste. After two weeks, a buff to light brown color develops.

Mannitol agar slant: Grows very poorly.

Peptone agar slant with 0.5 per cent glucose: Limited grayish growth.

Nutrient broth: No growth.

Liquid media generally: Turbidity with some sediment.

Fixes atmospheric nitrogen readily with either glucose or sucrose as source of energy.

Aerobic.

Optimum temperature: 30°C.

Distinctive characters: Tolerance of acidity, wide limits of pH tolerated, abundant slime production, large globules of fat within cells.

Source: Soils of India.

Habitat: Soils.

Appendix I: The relationship of the following species to the species placed in *Azotobacter* is not yet entirely clear.

Genus Azotomonas *Stapp.*

(Cent. f. Bakt., II Abt., *102*, 1940, 18; not *Azotomonas* Orla-Jensen, Cent. f. Bakt., II Abt., *24*, 1909, 484.)

Rod to coccus-shaped aerobic bacteria, motile by means of 1 to 3 polar flagella. No endospores. No fat-like reserve food granules in the cells. Form acid and gas from glucose, and other sugars and alcohols. Form indole. Chemo-heterotrophic. Many carbon compounds other than sugars used as sources of energy. Active in the fixation of atmospheric nitrogen. Live in soil. From Gr. *azous*, not living, French, *azote*, nitrogen; Greek, *monas*, a unit; M. L. monad.

The type species is *Azotomonas insolita.*

Azotomonas insolita Stapp. (Abstracts of Communications, Third Internat. Congr. for Microbiol., Sect. VIII, 1939, 306; abst. in Proc. Soil Sci. Soc. of America, *4*, 1939, 244; Cent. f. Bakt., II Abt., 102, 1940, 1.) From Latin *insolitus*, unusual.

Coccoid rods: 0.6 to 1.2 by 0.6 to 1.8 microns. Motile with one to three polar flagella. Gram-negative.

Gelatin: No liquefaction.

Agar slant: Glistening white growth.

Agar colonies: Flat, whitish, edge entire. Weakly fluorescent.

Broth: Strong turbidity. Sediment. Pellicle.

Milk: No change.

Potato: Growth somewhat dry, not slimy, dirty gray, spreading.

Nitrites produced from nitrates.

Fixes nitrogen.

Ammonium salts utilized.

Acid and gas from adonitol, arabinose, dextrin, glucose, galactose, glycerine, inositol, lactose, fructose, maltose, mannitol, mannose, raffinose, rhamnose, salicin, sorbitol, starch, sucrose and xylose.

Starch is hydrolyzed.

Hydrogen sulfide produced.

Optimum temperature 25° to 30°C. Minimum 7° to 9.5°C. Maximum 48°C. Good growth at 37°C. Thermal death point 60°C.

Limits of pH 3.3 to 9.5.

Aerobic.

Source: From a mixture of chopped cotton husks and rice hulls.

Habitat: Soil.

FAMILY IV. RHIZOBIACEAE CONN.

(Jour. Bact., *36*, 1938, 321.)

Cells without endospores, rod-shaped, sparsely flagellated (one polar or lateral flagellum, or 2 to 4 peritrichous ones); some species non-motile. Usually Gram-negative. One genus (*Chromobacterium*) produces a violet pigment. Grow aerobically on ordinary culture media containing glucose. Glucose and sometimes other carbohydrates are utilized, without appreciable acid formation. Saprophytes, symbionts and pathogens. The latter are usually plant pathogens forming abnormal growths on roots and stems.

Key to genera of family **Rhizobiaceae.**

I. Cells capable of fixing free nitrogen when growing symbiotically on the roots of *Leguminosae*.

Genus I. *Rhizobium*, p. 223.

II. Either plant pathogens which attack roots or produce hypertrophies on stems; or free-living non-chromogenic soil or water forms. Do not fix nitrogen.

Genus II. *Agrobacterium*, p. 227.

III. Usually free-living soil and water forms which produce a violet chromogenesis.

Genus III. *Chromobacterium*, p. 231.

Genus I. **Rhizobium** *Frank.**

(*Phytomyxa* Schroeter, in Cohn, Kryptogamen-Flora von Schlesien, *3*, 1886, 134; Frank, Ber. d. deut. bot. Gesellsch., *7*, 1889, 380; *Rhizobacterium* Kirchner, Beitr. z. Biol. d. Pflanzen, *7*, 1895, 221; *Rhizomonas* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 328.) From Greek *rhiza*, root; *bios*, life.

Rods: 0.5–0.9 by 1.2–3.0 microns. Motile when young, commonly changing to bacteroidal forms (a) upon artificial culture media containing alkaloids or glucosides, or in which acidity is increased; or (b) during symbiosis within the nodule. Gram-negative. Aerobic, heterotrophic, growing best with extracts of yeast, malt or other plant materials. Nitrates may be reduced to nitrites. Nitrites are not utilized. Gelatin is not liquefied or is very slightly liquefied after long incubation. Optimum temperature 25°C. This group is capable of producing nodules on the roots of *Leguminosae*, and of fixing free nitrogen during this symbiosis.

The type species is *Rhizobium leguminosarum* Frank.

Key to the species of genus **Rhizobium.**

1. Litmus milk alkaline.
   a. Formation of serum zone in milk.
      b. Moderate growth, slight acid reaction on yeast water agar plus mono-, di- and trisaccharides.
         c. Causes formation of root nodules on species of the genera *Lathyrus*, *Pisum*, *Vicia* and *Lens*. Bacteroids irregular with x, y, star-, and club-shaped forms; rods peritrichous when young.
            1. *Rhizobium leguminosarum*.
         cc. Causes formation of root nodules on *Phaseolus vulgaris*, *P. multiflorus* and *P. angustifolius*. Bacteroids vacuolated rods, few branched forms; young cells peritrichous.
            2. *Rhizobium phaseoli*.

---

* The genus *Rhizobium* was revised by Dr. and Mrs. O. N. Allen under the direction of Prof. E. B. Fred and Prof. I. L. Baldwin, Univ. of Wisconsin, Madison, Wis., Jan., 1938; further revision by Dr. O. N. Allen, Jan., 1943.

ccc. Causes formation of nodules on species of genus *Trifolium*. Bacteroids pear-shaped, swollen, vacuolated. Pentoses usually not fermented.

3. *Rhizobium trifolii.*

aa. No serum zone formed in milk.

b. Scant growth, alkaline reaction on yeast water agar plus most carbohydrates.

c. Causes formation of nodules on species of genus *Lupinus* and on *Ornithopus sativus*. Bacteroids vacuolated, rods seldom branched.

4. *Rhizobium lupini.*

cc. Causes formation of nodules on *Soja max*. Bacteroids long slender rods, seldom vacuolated or branched; young cells monotrichous.

5. *Rhizobium japonicum.**

2. Litmus milk acid.

a. Formation of serum zone in milk.

b. Moderate growth, slight acid reaction on yeast water agar plus mono-, di- and trisaccharides.

c. Causes formation of root nodules on species of the genera *Melilotus*, *Medicago*, and *Trigonella*. Bacteroids club-shaped, branched, young cells peritrichous.

6. *Rhizobium meliloti.*

1. **Rhizobium leguminosarum** Frank *emend.* Baldwin and Fred. (Frank, Landwirtschäftliche Jahrbücher, *19*, 1890, 563; *Rhizobium polymorphum* Dangeard, *Rhizobium fabae* Dangeard, Le Botaniste, Sér. *16*, 1926, 192–194; Baldwin and Fred, Jour. Bact., *17*, 1929, 146.) From Latin, of the legume family (*Leguminosae*).

NOTE: The following binomials have been used for species of this genus. The names given were used by their authors to cover one or more of the species here recognized as belonging to the genus *Rhizobium*. Where a question mark (?) is used it indicates that the species was too poorly described to be recognizable today. *Schinzia cellulicola* Frank, 1877 (all species) Leunis, Synopsis der drei Naturreiche. 2 Theil, Botanik, III Abt., Kryptogamen, Sec. 914, 1877, 1944; *Schinzia leguminosarum* Frank (all species), Bot. Ztg., *37*, 1879, 377; *Phytomyxa leguminosarum* Schroeter (all except *Rhizobium lupini*), in Cohn, Kryptogamen-Flora von Schlesien, *3*, I, 1886, 135; *Bacillus radicicola* Beijerinck (all species), Bot. Ztg., *46*, 1888, 726; *Bacillus fabae* Beijerinck (from broad bean) and *Bacillus ornithopi* Beijerinck (from serradella), Bot. Ztg., *48*, 1890, 837; *Cladochytrium tuberculorum* Vuillemin (all species?), Ann. Sci. Agron. Franc. et Étrang., *5*, I, 1888, 193; *Bacterium radicicola* Prazmowski (all species), Landw. Vers. Sta., *37*, 1890, 204; *Rhizobium mutabile* Schneider (several species) *Rhizobium curvum* Schneider (?), *Rhizo-*

* No specific name has been proposed for the organism causing the formation of nodules on plants that are members of the so-called "cowpea" group. Data showing possible inter-relationships of certain plant species of the soybean and cowpea cross-inoculation groups prompted Walker and Brown (Soil Science, *39*, 1935, 221–225) to propose a consolidation of the two groups to be recognized as being inoculated by a single species, *Rhizobium japonicum*. Results obtained recently by Reid and Baldwin (Proc. Soil Sci. Soc. Amer. for 1936, *1*, 1937, 219) show these inter-relationships to include the lupine group also.

bium frankii var. *majus* and var. *minus* Schneider (?), *Rhizobium nodosum* Schneider (?), *Rhizobium dubium* Schneider (?), Bul. Torrey Bot. Club, *19*, 1892, 213; *Rhizobium sphaeroides* Schneider (?), Ber. deut. bot. Gesell., *12*, 1894, 16; *Bacillus tuberigenus* Gonnermann and *Micrococcus tuberigenus* Gonnermann, Landw. Jahrb., *23*, 1894, 654, 657, are thought by Fred, Baldwin and McCoy (University of Wisconsin, Studies in Science, No. 5, 1932, 140) not to be true nodule organisms and to be too poorly described to be recognizable today; *Rhyzobium pasteurianum* Mazé (all species), Ann. Inst. Pasteur, *13*, 1899, 146; *Pseudorhizobium ramosum* Hartleb (?) (Chem. Zeit., *24*, 1900, 887) (used for noninfective culture claimed by Stutzer (Mitt. Landw. Inst. Breslau, *1*, Heft 3, 1900, 63) to be genuine root nodule organism); *Rhizobium radicicola* Hiltner and Störmer (several species) and *Rhizobium beijerinckii* Hiltner and Störmer (from lupine, serradella and soy bean), Arb. Biol. Abt. f. Land-u. Forstwirthschaft a. K. Gesundheitsamte, *3*, 1903, 269; *Pseudomonas radicicola* Moore (all species), U. S. Dept. Agr. Bur. Plant Ind., Bul. 71, 1905, 27; *Rhizomonas beijerinckii* Orla-Jensen and *Rhizomonas radicicola* Orla-Jensen (see Hiltner and Störmer), Cent. f. Bakt., II Abt., *22*, 1909, 328; *Bacillus* or *Bacterium radicicola* Löhnis and Hansen (peritrichous species), Jour. Agr. Research, *20*, 1921, 554; *Rhizobium radicicolum* Bergey et al., Manual, 1st ed., 1923, 40 (monotrichous species); *Rhizobium loti* Dangeard (from lotus), *Rhizobium simplex* Dangeard (from sainfoin), *Rhizobium torulosum* Dangeard (from Scotch broom), Le Botaniste, Sér. *16*, 1926, 195–197.

Rods: 0.5 to 0.9 by 1.2 to 3.0 microns. Motile with peritrichous flagella. Bacteroids commonly irregular with x, y, star- and club-shaped forms. Vacuolate forms predominate. Gram-negative.

Growth on mannitol agar is rapid, with tendency to spread. Streak is raised, glistening, semi-translucent, white, slimy and occasionally viscous. Considerable gum is formed.

Slight acid production from glucose, galactose, mannose, lactose and maltose.

Aerobic.

Optimum temperature 25°C.

Source: Root nodules on *Lathyrus*, *Pisum* (pea), *Vicia* (vetch) and *Lens* (lentil).

Habitat: Widely distributed in soils where the above mentioned legumes are grown

2. **Rhizobium phaseoli** Dangeard. (Le Botaniste, Sér. *16*, 1926, 197.) From Latin, *phaseolus*, bean; M. L. *Phaseolus*, a generic name.

Rods: Motile with peritrichous flagella. Bacteroids are usually rod-shaped, often vacuolated with few branched forms. Usually smaller than in *Rhizobium leguminosarum* and *R. trifolii*. Gram-negative.

Growth on mannitol agar is rapid with tendency to spread. Streak inoculation is raised, glistening, semi-translucent, white, slimy. Occasionally mucilaginous but this character is not so marked as in *Rhizobium trifolii*.

Very slight acid formation from glucose, galactose, mannose, sucrose and lactose.

Aerobic.

Optimum temperature 25°C.

Source: Root nodules of *Phaseolus vulgaris* (kidney bean), *P. angustifolius* (bean) and *P. multiflorus* (scarlet runner). (Burrill and Hansen, Ill. Agr. Exp. Sta. Bul. 202, 1917, 137.)

Habitat: Widely distributed in the soils in which beans are grown.

3. **Rhizobium trifolii** Dangeard. (Le Botaniste, Sér. *16*, 1926, 191.) From M. L. *Trifolium*, a generic name.

Rods: Motile with peritrichous flagella. Bacteroids from nodules are pear-shaped, swollen and vacuolated. Rarely x and y shapes. Gram-negative.

Growth on mannitol agar is rapid. The colonies are white becoming turbid with age. Frequently mucilaginous. Streak cultures transparent at first. Growth mucilaginous later flowing down the agar slant and accumulating as a slimy mass at the bottom. Produces large amounts of gum.

Slight acid production from glucose, galactose, mannose, lactose and maltose.

Aerobic.

Optimum temperature 25°C.

Source: Root nodules of species of *Trifolium* (clover).

Habitat: Widely distributed in the soils where clover grows.

4. **Rhizobium lupini** (Schroeter) Eckhardt, Baldwin and Fred. (*Phytomyxa lupini* Schroeter, in Cohn, Kryptogamen-Flora von Schlesien, *3*, I, 1886, 135; *Rhizobium minimum* Dangeard, Le Botaniste, Sér. *16*, 1926, 198; Eckhardt, Baldwin and Fred, Jour. Bact., *21*, 1931, 273.) From Latin, *Lupinus*, lupine.

Rods: Motile with flagella 1 to 4, usually 2 or 3. Bacteroids are vacuolate rods, seldom if ever branched. Gram-negative.

Growth on yeast water, mannitol agar is scant to moderate with alkaline reaction.

Beef-peptone gelatin: Little growth with extremely slow liquefaction.

On galactose an alkaline reaction serves to differentiate *Rhizobium lupini* from all fast-growing rhizobia (*R. phaseoli*, *R. meliloti*, *R. trifolii*, and *R. leguminosarum*). An initial alkaline reaction followed more quickly by an acid reaction on rhamnose and xylose separates *R. lupini* from slow-growing *R. japonicum* and the *Rhizobium sp.* from cow pea.

In general *Rhizobium lupini* produces slight to moderate acidity on pentose sugars and no change or alkaline reaction on hexoses, disaccharides and trisaccharides.

Litmus milk: No serum zone, no reduction, and a slight alkaline reaction.

Meager growth on potato and parsnip slants, and carrot agar.

Aerobic.

Optimum temperature 25°C.

Source: Root nodules on *Lupinus* (lupine), *Serradella* and *Ornithopus*.

Habitat: Widely distributed in soils in which these legumes grow.

5. **Rhizobium japonicum** (Kirchner) Buchanan. (*Rhizobacterium japonicum* Kirchner, Beiträge zur Biol. d. Pflanzen, *7*, 1895, 213; *Pseudomonas japonica* Löhnis and Hansen, *Bacterium japonicum* Löhnis and Hansen, Jour. Agr. Res., *20*, 1921, 551; *Rhizobium sojae* Dangeard, Le Botaniste, Sér. *16*, 1926, 200; Buchanan, Proc. Iowa Acad. Sci., *33*, 1926, 81.) From M. L., of Japan.

Rods: Motile with monotrichous flagella. Bacteroids of nodules are long and slender with only occasional branched and swollen forms. Gram-negative.

Growth on mannitol agar is slow and scant. The streak is slightly raised, glistening, opaque, white, butyrous, with little gum formation.

Pentose sugars give better growth than the hexoses.

Little if any acid formed from carbohydrates. Acid slowly formed from xylose and arabinose.

Aerobic.

Optimum temperature 25°C.

Source: Root nodules on *Soja max* (soy bean).

Habitat: Widely distributed in soils where soy beans are grown.

6. **Rhizobium meliloti** Dangeard. (Le Botaniste, Sér. *16*, 1926, 194.) From Greek, *melilot*, a kind of clover; M. L., *Melilotus*.

Rods: Motile with peritrichous flagella. Bacteroids club-shaped and branched. Gram-negative.

Growth on mannitol agar is fairly rapid. The streak is raised, glistening, opaque, pearly white, butyrous. Considerable gum is formed.

Acid from glucose, galactose, mannose and sucrose.

Aerobic.

Optimum temperature 25°C.

Source: Root nodules of *Melilotus* (sweet clover), *Medicago*, and *Trigonella*.

Habitat: Widely distributed in soils in which these legumes grow.

NOTE: See Monograph on Root Nodule Bacteria and Leguminous Plants by E. B. Fred, I. L. Baldwin and Elizabeth McCoy, University of Wisconsin Studies in Science, Madison, No. 5, 1932, xx + 343 pp. for a more complete discussion of this group with an extensive bibliography.

Genus II. Agrobacterium *Conn.**

(Jour. Bact., *44*, 1942, 359.) From Greek, *agrus*, a field; M.L., *bacterium*, a small rod.

Small, short rods which are typically motile with 1 to 4 peritrichous flagella (if only one flagellum, lateral attachment is as common as polar). Ordinarily Gram-negative. On ordinary culture media, they do not produce visible gas nor sufficient acid to be detectable by litmus. In synthetic media, enough CO_2 may be produced to show acid with brom thymol blue, or sometimes with brom cresol purple. Gelatin is either very slowly liquefied or not at all. Free nitrogen cannot be fixed; but other inorganic forms of nitrogen (nitrates or ammonium salts) can ordinarily be utilized. Optimum temperature, 25° to 30°C. Habitat: Soil, or plant roots in the soil; or the stems of plants where they produce hypertrophies.

The type species is *Agrobacterium tumefaciens* (Smith and Townsend) Conn.

Key to the species of genus Agrobacterium.

I. Plant pathogens. Produce browning of mannitol-calcium-glycerophosphate agar. Nitrate reduction weak or none.

A. Nitrite produced from nitrate to a slight extent. Galls produced on plant roots.
1. *Agrobacterium tumefaciens*.

B. Nitrite not produced from nitrate.

1. Pathogenic to apples.
2. *Agrobacterium rhizogenes*.

2. Pathogenic to raspberries and blackberries.
3. *Agrobacterium rubi*.

II. Not pathogenic to plants. Produces browning in mannitol-calcium-glycerophosphate agar. Nitrate reduction vigorous, with disappearance of the nitrate.
4. *Agrobacterium radiobacter*.

1. **Agrobacterium tumefaciens** (Smith and Townsend) Conn. (*Bacterium tumefaciens* Erw. Smith and Townsend, Science, N. S. *25*, 1907, 672; *Pseudomonas tumefaciens* Stevens, The Fungi which Cause Plant Disease, 1913, 35; *Bacillus tumefaciens* Holland, Jour. Bact., *5*, 1920, 220; not *Bacillus tumefaciens* Wilson, Lancet, *1*, 1919, 675; *Phytomonas tumefaciens* Bergey et al., Manual, 1st ed., 1923, 189; Conn, Jour. Bact., *44*, 1942, 359.) From Latin *tumefaciens*, swelling up, producing a tumor.

Probable synonyms: *Bacillus ampelopsorae* Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 983; *Bacillus ampelopsorae* Trevisan *emend.* Cavara, Staz. Sperim. Agara. Ital. Modena, *30*, 1897, 483; see Elliott, Bact. Plant Pathogens, 1930, 235.

---

* Prepared by Prof. H. J. Conn, New York State Experiment Station, Geneva, New York, September, 1943.

Among the synonyms listed in previous editions of the Manual has been *Polymonas tumefaciens* Lieske, Cent. f. Bakt., I Abt., Orig., *108*, 1928, 118. This is only a partial synonym, however, as its author described it as the cause of animal and human cancer, of which he regarded crown-gall of plants as merely a phase: for the origin of this theory, see Smith and Townsend, Sci., N.S. *25*, 1907, 671, and Smith, Jour. Cancer Res., *7*, 1922, 1–105.

Description taken from the following: Riker, Banfield, Wright, Keitt and Sagen, Jour. Agr. Res., *41*, 1930, 507; Sagen, Riker and Baldwin, Jour. Bact., *28*, 1934, 571; Hendrickson, Baldwin and Riker, Jour. Bact., *28*, 1934, 597.

Rods: 0.7 to 0.8 by 2.5 to 3.0 microns, occurring singly or in pairs. Capsules. Motile with 1 to 4 flagella. Gram-negative.

Agar colonies: Small, white, circular, smooth, glistening, translucent, entire.

Broth: Slightly turbid, with thin pellicle.

Litmus milk: Slow coagulation. Litmus reduced. Neutral to alkaline.

Nitrites produced from nitrates to a very slight extent.

Indole: Slight amount.

Slight acid from glucose, fructose, arabinose, galactose, mannitol and salicin.

Starch not hydrolyzed.

Optimum temperature 25° to 28°C.

Facultative anaerobe.

Distinctive characters: Causes a gall formation parenchymatous in character which because of its soft nature is subject to injury and decay.

Agrobacterium tumefaciens strongly absorbs congo red and aniline blue in contrast to little or no absorption by *A. rhizogenes*. *A. tumefaciens* makes abundant growth on sodium selenite agar and calcium glycerophosphate medium with mannitol in contrast to no growth or a very slight trace by *A. rhizogenes* (Hendrickson et al., Jour. Bact., *28*, 1934, 597).

Source: Isolated from galls on plants.

Habitat: Causes galls on Paris daisy and cross-inoculable on over 40 families.

2. **Agrobacterium rhizogenes** (Riker et al.) Conn. (*Bacterium rhizogenes* Riker, Banfield, Wright, Keitt and Sagen, Jour. Agr. Res., *41*, 1930, 536; *Phytomonas rhizogenes* Riker et al., *ibid.*, 536; *Pseudomonas rhizogenes* Riker et al., *ibid.* 536; Conn, Jour. Bact., *44*, 1942, 359.) From Greek, *rhiza*, root; *genes*, producing.

Rods: 0.4 by 1.4 microns, occurring singly. Motile with one to 4 flagella. Encapsulated. Not acid-fast. Gram-negative.

Gelatin: No liquefaction.

Agar colonies: Circular, smooth, convex, finely granular; optical characters, translucent through gray to almost white.

Agar slant: Moderate, filiform, translucent, raised, smooth, slimy.

Broth: Turbid, with heavy pellicle.

Litmus milk: Acid, slow reduction.

Indole not formed.

Nitrites not produced from nitrates.

Acid but not gas from arabinose, xylose, rhamnose, glucose, galactose, mannose, maltose, lactose, salicin and erythritol. No acid or gas from fructose, sucrose, raffinose, melezitose, starch, dextrin, inulin, aesculin, dulcitol or mannitol.

Starch not hydrolyzed.

Optimum temperature 20° to 28°C.

Aerobic.

Distinctive characters: *Agrobacterium rhizogenes* differs from *Agrobacterium tumefaciens* by stimulating root formation instead of soft parenchymatous crown galls. *A. rhizogenes* lacks ability of *A. tumefaciens* to utilize simple nitrogenous compounds as KNO_3. *A. rhizogenes* absorbs congo red and brom thymol blue slightly and aniline blue not at all. Will not grow on sodium selenite agar (see *A. tumefaciens* for response to same materials). Does not infect tomato.

Sources: Description made from ten cultures isolated from hairy-root of apple and other plants.

Habitat: Pathogenic on apple, etc.

3. **Agrobacterium rubi** (Hildebrand) Starr and Weiss. (*Phytomonas rubi* Hildebrand, Jour. Agr. Res., *61*, 1940, 694; *Bacterium rubi* Hildebrand, *ibid.*, 694; *Pseudomonas rubi* Hildebrand, *ibid.*, 694; Banfield, Phytopath., *20*, 1930, 123; Pinckard, Jour. Agr. Res., *50*, 1935, 933; Starr and Weiss, Phytopath., *33*, 1943, 316.) From Latin, *rubus*, blackberry bush; M. L., *Rubus*, a generic name.

Rods: 0.6 by 1.7 microns. Singly, in pairs or short chains. Motile with 1 to 4 flagella. Gram-negative.

Gelatin: No liquefaction.

Potato-mannitol-agar slants: Growth slow, moderate, filiform, white to creamy-white, with butyrous consistency later becoming leathery.

Broth: Turbid in 36 to 48 hours.

Milk: A slight serum-zone, pink color, acid and curd formed.

Nitrites not produced from nitrates.

Ferric ammonium citrate, uric acid, oxamide, succinimide, l-asparagine, l-tyrosine, l-cystine, d-glutamic acid and yeast extract can be used as a source of nitrogen (Pinckard, *loc. cit.*).

Hydrogen sulfide not formed.

Indole not formed.

Acid from glucose, d-galactose, d-mannose, d-fructose, d-xylose, d-arabinose, sucrose, and maltose. None from lactose (Pinckard, *loc. cit.*).

Starch not hydrolyzed.

Optimum temperature 28°C. Minimum 8°C. and maximum 36°C. (Pinckard, *loc. cit.*).

Distinctive characters. Differs from *Agrobacterium tumefaciens* in that it does not utilize nitrates, and grows much more slowly on ordinary media. Infects only members of the genus *Rubus*. Starr and Weiss (Phytopath., *33*, 1943, 317) state that this species unlike *Agrobacterium tumefaciens* and *Agrobacterium rhizogenes* does not utilize asparagin as a sole source of carbon and nitrogen.

Source: Isolated by Banfield (*loc. cit.*) and by Hildebrand (*loc. cit.*) from raspberry canes, *Rubus spp.*

Habitat: Pathogenic on black and purple cane raspberries, and blackberries, and to a lesser extent on red raspberries.

4. **Agrobacterium radiobacter** (Beijerinck and van Delden) Conn. (*Bacillus radiobacter* Beijerinck and van Delden, Cent. f. Bakt., II Abt., *9*, 1902, 3; *Bacterium radiobacter* Löhnis, Cent. f. Bakt., II Abt., *14*, 1905, 589; *Rhizobium radiobacter* Pribram, Klassifikation der Schizomyceten, Leipzig, 1933,53; *Achromobacter radiobacter* Bergey et al., Manual, 4th ed., 1934, 230; *Alcaligenes radiobacter* Conn, in Manual, 5th ed., 1939, 97; Conn, Jour. Bact., *44*, 1942,359.) From Latin, *radius*, the spoke of a wheel; Latin, *bactrum*, a rod.

Small rods, 0.15 to 0.75 by 0.3 to 2.3 microns, occurring singly, in pairs and under certain conditions, in star-shaped clusters. Motile with one to four flagella. Prevailingly Gram-negative; but an occasional culture is variable.

Nutrient gelatin stab: No liquefaction.

Agar slant: Flat, whitish slimy layer.

Mannitol-calcium-glycerophosphate-agar streak plates: Abundant, raised, slimy growth surrounded by a brown halo with an outer zone of white precipitate (Riker et al., Jour. Agr. Res., *41*, 1930, 524).

Broth: Turbid; with heavy ring or pellicle if veal infusion is present.

Litmus milk: Serum zone with pellicle in one week; usually turns a chocolate brown in 2 weeks; same in plain milk, but with less browning.

Potato: Raised slimy mass becoming brownish; potato may be browned.

Nitrates disappear (assimilated or reduced).

Starch not hydrolyzed.

No organic acid or visible gas from sugars; nearly all sugars, glycerol and

mannitol are utilized with the production of CO_2.

Optimum temperature 28°C. Minimum near 1°C. Maximum 45°C.

Aerobic.

Media containing KNO_3, K_2HPO_4, and glycerol, ethyl or propyl alcohol become alkaline to phenol red. (Sagen, Riker and Baldwin, Jour. Bact., *28*, 1934, 571.)

Growth occurs in special alkaline media of pH 11.0 to 12.0 (Hofer, Jour. Amer. Soc. Agron., *27*, 1935, 228).

Hydrogen sulfide produced if grown in ZoBell and Feltham's medium (Jour. Bact., *28*, 1934, 169).

Distinctive characters: Browning of mannitol-calcium-glycerophosphate agar. Inability to cause plant disease or to produce nodules on roots of legumes. Complete utilization (disappearance of nitrate) in the peptone-salt medium of Riker et al. (Jour. Agr. Res., *41*, 1930, 529) and failure to absorb congo red (*ibid.*, 528).

The species bears at least superficial resemblances to certain *Rhizobium spp.*, but may be distinguished from them by the first two characters listed above, and the following in addition: Growth at a reaction of pH 11–12. Heavy ring or pellicle formation on veal infusion broth. H_2S production in the mannitol-tryptone medium of ZoBell and Feltham (*loc. cit.*). Production of milky white precipitate on nitrate-glycerol-soil-extract agar.

Source: Isolated from soil.

Habitat: Soil, around the roots of plants, especially legumes.

NOTE: Palacios and Bari (Proc. Indian Acad. Sci., *3*, 1936, 362; Abs. in Cent. f. Bakt., II Abt., *95*, 1937, 423) have described *Bacillus concomitans* as a symbiont from legume nodules that has no power to fix nitrogen although it is very much like legume nodule bacteria (*Rhizobium spp.*). This organism resembles *Agrobacterium radiobacter*.

Appendix: The following species probably belong in *Agrobacterium*, but are not sufficiently well described to make their relationship certain.

1. **Agrobacterium gypsophilae** (Brown) Starr and Weiss. (*Bacterium gypsophilae* Brown, Jour. Agr. Res., *48*, 1934, 1109; *Pseudomonas gypsophilae* Stapp, Bot. Rev., *1*, 1935, 407; *Phytomonas gypsophilae* Stapp, *ibid.*, 407; Starr and Weiss, Phytopath., *33*, 1943, 316.) From M. L., *Gypsophila*, a generic name.

Rods: 0.2 to 0.8 by 0.4 to 1.4 microns. Motile with 1 to 4 flagella. Capsules. Gram-negative.

Gelatin: Liquefaction slow, beginning after 1 month.

Beef-infusion agar colonies: Circular, Naples yellow, smooth or rough, butyrous.

Broth: Turbid in 24 hours.

Milk: Coagulation and peptonization.

Nitrites are produced from nitrates.

Indole not produced.

Hydrogen sulfide: A trace may be produced.

Acid but not gas from glucose, sucrose, maltose, mannitol and glycerol. No acid from lactose.

Starch not hydrolyzed.

Aerobic, facultative.

Distinctive characters: Differs from *Xanthomonas beticola* in starch hydrolysis, H_2S production, and will not cross-inoculate with this species.

Source: Isolated from several galls on *Gypsophila*.

Habitat: Produces galls in *Gypsophila paniculata* and related plants.

2. **Bacterium pseudotsugae** Hansen and Smith. (Hansen and R .E. Smith, Hilgardia, *10*, 1937, 576; *Phytomonas pseudotsugae* Burkholder, in Manual, 5th ed., 1939, 209.) From M. L., *Pseudotsuga*, a generic name.

Rods: 0.5 to 1.5 by 1.9 to 3.9 microns. Probably motile; type of flagellation doubtful. Gram-negative.

Gelatin: Liquefied.

Nutrient agar slant: Growth scanty, flat, glistening, smooth, translucent, whitish.

Broth: Growth slight. No sediment.

Milk: No acid.

Nitrites produced from nitrates.

Hydrogen sulfide production slight.

Acid but not gas from glucose, fructose, galactose and maltose. No acid or gas from lactose, sucrose or glycerol.

Starch not hydrolyzed.

Facultative aerobe.

Source: Isolated from galls on Douglas fir in California.

Habitat: Pathogenic on Douglas fir, *Pseudotsuga taxifolia*.

Genus III. **Chromobacterium** *Bergonzini.**

(Ann. Societa d. Naturalisti in Modena, Ser. 2, *14*, 1881, 153.) Greek, *chroma*, color; M. L., *bacterium*, a small rod.

Rods, 0.4 to 0.8 by 1.0 to 5.0 microns. Motile with 1 to 4 or more flagella. Gram-negative. A violet pigment is formed which is soluble in alcohol, but not in water or chloroform. Grow on ordinary culture media, usually forming acid from glucose, sometimes from maltose, not from lactose. Gelatin is liquefied. Indole is not produced. Nitrate usually reduced to nitrite. Optimum temperature 20–25°C. but some grow well at 37°C. Usually saprophytic soil and water bacteria.

The type species is *Chromobacterium violaceum* (Schroeter) Bergonzini.

Key to the species of genus **Chromobacterium.**

I. Motile rods. Single flagellum.
 A. Acid from glucose and maltose. No acid from sucrose. Nitrites produced from nitrates. No growth at 37°C.
  1. *Chromobacterium violaceum.*

II. Motile rods. Flagella generally peritrichous.
 A. Acid from glucose. Nitrites generally not produced from nitrates. Good growth at 37°C.
  2. *Chromobacterium ianthinum.*
 B. Generally no acid from glucose. Nitrites produced from nitrates. No growth at 37°C.
  3. *Chromobacterium amethystinum.*

1. **Chromobacterium violaceum** (Schroeter) Bergonzini. (*Bacteridium violaceum* Schroeter, Beiträge z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 126; *Micrococcus violaceus* Cohn, Beiträge z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 157; *Cromobacterium violaceum* (sic) Bergonzini, Ann. Societa d. Naturalisti in Modena, Ser. 2, *14*, 1881, 153; *Bacillus violaceus* Schroeter, Kryptogamen-Flora von Schlesien, *3*, 1886, 157; *Streptococcus violaceus* Trevisan, I generi e le specie delle Batteriacee, 1889, 31; *Pseudomonas violacea* Migula, Arb. a. d. Bakt. Inst. Karlsruhe, *1*, 1894, 237; *Bacterium violaceum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 58; see 2 Aufl., *2*, 1899, 262.) From Latin, *violaceus*, violet-colored.

NOTE: *Bacterium ianthinum* Zopf (Die Spaltpilze, 1885, 68) has been regarded as identical with the above organism by Schroeter (Kryptogamen-Flora von Schlesien, *3*, 1, 1886, 157), and by Leh-

* Adapted by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York from Cruess-Callaghan and Gorman, Scientific Proc. Royal Dublin Society, *21*, 1935, 213 in Jan. 1938; further revision, July, 1945 by Robert S. Breed with the assistance of Capt. W. C. Tobie, Sn. C., Old Greenwich, Conn.

mann and Neumann (Bakt. Diag., 1 Aufl., *2*, 1896, 266; also 7 Aufl., *2*, 1927, 463). Lehmann and Neumann (*loc. cit.*) also consider *Bacillus violaceus laurenticus* Lustig (Diagnostik der Bakterien des Wassers, 1893, 103) as being identical with *Bacterium violaceum.*

Slender rods: 0.8 to 1.0 by 2.0 to 5.0 microns, occurring singly and in chains. Motile, with a single flagellum. Gram-negative.

Gelatin colonies: Circular, gray, entire margin, assuming a violet color in the center.

Gelatin stab: Infundibuliform liquefaction with violet sediment in fluid.

Agar colonies: Whitish, flat, glistening, moist, becoming violet.

Agar slant: Deep, violet, moist, shiny spreading growth.

Broth: Slightly turbid, with violet ring and ropy sediment.

Litmus milk: Violet pellicle. Digestion. Alkaline.

Potato: Limited, dark violet growth.

Löffler's blood serum: Slowly liquefied.

Indole not formed.

Nitrites produced from nitrates.

Acid from glucose and usually from maltose. No acid from lactose or sucrose.

Aerobic, facultative.

Optimum, temperature 25° to 30°C. No growth at 37°C. Slight growth at 2° to 4°C.

Source: Originally grown on slices of cooked potato exposed to air contamination, and incubated at room temperature.

Habitat: Water.

2. **Chromobacterium ianthinum** (Zopf) Holland. (*Bacterium ianthinum* Zopf, Die Spaltpilze, 2 Aufl., 1884, 62; *Bacillus janthinus* Flügge, Die Mikroorganismen, 1886, 291; *Bacteridium ianthinum* Schroeter, Kryptogamen Flora von Schlesien, *3*, 1, 1886, 157; *Pseudomonas ianthina* Migula, Syst. d. Bakt., *2*, 1900, 941; *Pseudomonas janthina* Chester, Man. Determ. Bact., 1901, 317; Holland, Jour. Bact., *5*, 1920, 222.) From Greek, *ianthinus*, violet-blue.

Rods: 0.5 to 0.8 by 1.5 to 5.0 microns, occurring singly. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, yellow, becoming violet.

Gelatin stab: White to violet surface growth. Infundibuliform liquefaction.

Agar colonies: Creamy center, violet margin.

Agar slant: Yellowish, moist, glistening, becoming deep violet.

Broth: Turbid, with light violet pellicle.

Litmus milk: Slow coagulation with violet cream layer. Litmus decolorized from below.

Potato: Violet to violet-black, spreading growth.

Indole not formed.

Nitrites generally not produced from nitrates.

Acid from glucose. No acid from maltose, lactose and sucrose.

Aerobic, facultative.

Optimum temperature 30°C. Grows well at 37°C. No growth at 2 to 4°C.

Source: Originally grown on pieces of pig's bladder floated on badly contaminated water.

Habitat: Water and soil. This may be the species that causes a fatal septicemia in animals and man. See *Chromobacterium violaceum manilae.*

3. **Chromobacterium amethystinum** (Chester) Holland. (*Bacillus membranaceus amethystinus* Eisenberg, Bakt. Diag., 1891, 421; *Bacterium amethystinus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 117; *Bacterium membranaceus amethystinus* Chester, *ibid.*, 138; *Bacillus amethystinus* Holland, Jour. Bact., *5*, 1920, 217; not *Bacillus amethystinus* Chester, *loc. cit.*, 262; Holland, *loc. cit.*, 222; *Bacterium membranaceum amethystinum* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 463; *Bacterium violaceum amethystinum* Cruess-Callaghan and Gorman, Sci. Proc. Royal Dublin Society, *21*, 1935, 219.) From Greek, bluish-violet, amethyst.

Rods: 0.5 to 0.8 by 1.0 to 1.4 microns, occurring singly. Motile with a single or occasionally with peritrichous flagella. Gram-negative.

Gelatin colonies: Thin, bluish, becoming violet, crumpled.

Gelatin stab: Heavy, violet-black pellicle. Liquefied.

Agar colonies: Deep violet, surface rugose.

Agar slant: Thick, moist, yellowish-white, becoming violet with metallic luster.

Broth: Pellicle with violet sediment, fluid becoming violet.

Litmus milk: Violet pellicle. Digestion turning alkaline.

Potato: Deep violet, rugose spreading growth.

Indole not formed.

Nitrites produced from nitrates.

Usually no acid from glucose, maltose and sucrose. No acid from lactose.

Aerobic, facultative.

Optimum temperature 30°C. No growth at 37°C. Good growth in 7 days at 2 to 4°C.

Original source: Found once by Jolles in spring water from Spalato.

Habitat: Water.

Appendix: The following organisms have been assigned to this genus or are believed to belong here. Additional comparative studies are badly needed.

Bacillus cyaneo-fuscus Beijerinck. (Beijerinck, Bot. Ztung., *49*, 1891, 704; *Bacterium cyanofuscus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 116 and 132.) From black glue, blue Edam cheese, water and soil.

Bacillus lacmus Schroeter. (Schroeter in Cohn, Kryptogamen-Flora von Schlesien, *3*, 1, 1889, 158.) In greenhouse on fresh paint.

Bacillus lilacinus Macé. (Traité Pratique Bact., 6ᵉ éd., *2*, 1913, 416.) From water.

Bacillus membranaceus amethystinus mobilis Germano. (Germano, Cent. f. Bakt., *12*, 1892, 516; *Bacillus amethystinus mobilis* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 313; *Bacterium amethystinus mobilis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 117; *Bacterium membranaceus mobilis* Chester, *ibid.*, 138.) *Pseudomonas amethystina* Migula, Syst. d. Bakt., *2*, 1900, 944; *Bacillus amethystinus* Chester, Man. Determ. Bact., 1901, 262.) From dust.

Bacillus pavoninus Forster. (Forster, in van der Sleen, Sur l'examen bactériologique qualitatif de l'eau. Arch. Teyler, Sér. 2, Tome 4, 3 partie, 1894, No. 59, Haarlem, Heritiere Loosjes. Also see Godfrin, Thése, Nancy, 1934, 46.) Causes blue discoloration of Edam cheese.

Bacillus polychromogenes Chamot and Thiry. (Bacille polychrome, Thiry, Compt. rend. Soc. Biol., Paris, *48*, 1896, 885; Chamot and Thiry, Bot. Gaz., *30*, 1900, 378.) From well water at Nancy. Probably a *Pseudomonas* (Tobie, personal communication).

Bacillus violaceus Frankland and Frankland. (Frankland and Frankland, Ztschr. f. Hyg., *6*, 1888, 394; *Pseudomonas pseudoianthina* Migula, Syst. d. Bakt., *2*, 1900, 942.) Isolated from tap water. Said to produce spores.

Bacillus violaceus laurentius Jordan. (Jordan, Mass. State Bd. Health Rept., 1890, 838; *Bacterium violaceus laurentius* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 117; *Pseudomonas laurentia* Migula, Syst. d. Bakt., *2*, 1900, 944; *Bacillus violaceus* Chester, Man. Determ. Bact., 1901, 262; *Chromobacterium violaceum laurentium* Ford, Textb. Bact., 1927, 470.) Isolated from sewage effluent.

Bacillus violaceus lutetiensis Kruse. (Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 311; *Bacillus lutetiensis* Chester, Man. Determ. Bact., 1901, 306; *Chromobacterium violaceum lutetiense* Ford, Textb. Bact., 1927, 470.) From water.

Bacillus violaceus sartoryi Waeldele. (Thèse, Pharm. Strasbourg, 1938, 55.)

From dental pus. Said to form spores.

Bacterium cristallino violaceum Cholkevitch. (Cholkevitch, 1922, quoted from Godfrin, Contribution a l'étude des bactéries bleues et violettes. Thése, Nancy, 1934, 93.) From peat.

Chromobacterium bamptonii Bergey et al. (*Bacillus membranaceus amethystinus II*, Bampton, Cent. f. Bakt., I Abt., Orig., *71*, 1913, 137; Bergey et al., Manual, 1st ed., 1923, 119; *Chromobacterium membranaceum amethystinum II* Ford, Textb. Bact., 1927, 473.) From water.

Chromobacterium coeruleum (Voges) Bergey et al. (*Bacillus coeruleus* Voges, Cent. f. Bakt., *14*, 1893, 303; *Bacterium coeruleus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 117; *Pseudomonas coerulea* Migula, Syst. d. Bakt., *2*, 1900, 945; Bergey et al., Manual, 1st ed., 1923, 120.) From water.

Chromobacterium cohaerens Grimes. (Sci. Proc. Royal Dublin Society, *19*, 1930, 381.) From well water.

Chromobacterium hibernicum Grimes. (Sci. Proc. Royal Dublin Society, *19*, 1930, 381.) From well water.

Chromobacterium lividum (Voges) Holland. (Plagge and Proskauer, Zeitsch. f. Hyg., *2*, 1887, 463; *Bacillus lividus* Voges, Cent. f. Bakt., *14*, 1893, 303; relationship to *Bacillus lividus* Zimmermann uncertain. Die Bakt. unserer Trink- und Nutzwässer, Chemnitz, *2*, 1894, 18; *Bacillus violaceus berolinensis* Kruse, in Flugge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 311; *Bacterium lividus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 117; *Bacillus berolinensis* Chester, Man. Determ. Bact., 1901, 305; Holland, Jour. Bact., *5*, 1920, 215.) From water.

Chromobacterium maris-mortui Elazari-Volcani. (Studies on the Microflora of the Dead Sea, Thesis, Hebrew Univ., Jerusalem, 1940, vii and 76.) From the Dead Sea.

Chromobacterium membranaceum Bergey et al. (*Bacillus membranaceus amethystinus I*, Bampton, Cent. f. Bakt., I Abt., Orig., *71*, 1913, 135; Bergey et al., Manual, 1st ed., 1923, 119; *Chromobacterium membranaceum amethystinum I* Ford, Textb. Bact., 1927, 472.) From water.

Chromobacterium membranaceum amethystinum III Ford. (Ford, Textb. Bact., 1927, 474; *Bacillus membranaceus amethystinus III* Bampton, Cent. f. Bakt., I Abt., Orig., *71*, 1913, 138.) From water.

Chromobacterium membranaceum amethystinum IV Ford. (Ford, Textb. Bact., 1927, 474; *Bacillus membranaceus amethystinus IV* Bampton, Cent. f. Bakt., I Abt., Orig., *71*, 1913, 138.) From water.

Chromobacterium smithii (Chester) Bergey et al. (*Bacillus coeruleus* Smith, Medical News, *2*, 1887, 758; *Bacterium coeruleus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 118; *Pseudomonas smithii* Chester, Man. Determ. Bact., 1901, 318; *Chromobacterium coeruleum* Ford, Textb. Bact., 1927, 475; not *Chromobacterium coeruleum* Bergey et al., Manual, 1st ed., 1923, 120; Bergey et al., *ibid.*, 121.) From water.

Chromobacterium violaceum manilae Ford. (*Bacillus violaceus manilae* Woolley, U. S. Dept. Int., Bur. Govt. Labs. Bull. 15, 1904 and Bull. Johns Hopkins Hosp., *16*, 1905, 89; Ford, Textb. Bact., 1927, 471.) Isolated from fatal septicemias in water buffalo (Woolley) and man (Schattenberg and Harris, Jour. Bact., *44*, 1942, 509). More likely to be a variety of *Chromobacterium ianthinum* which grows at 37°C. than of *C. violaceum* which does not grow at 37°C.

Chromobacterium viscofucatum (Harrison and Barlow) Bergey et al. (*Bacterium viscofucatum* and *Bacillus viscofucatus* Harrison and Barlow, Cent. f. Bakt., II Abt., *15*, 1905, 517; Trans. Royal Soc. Canada, 2nd Ser., *11*, 1905; Bergey et al., Manual, 1st ed., 1923, 119.) From oily butter. Probably a non-motile *Pseudomonas* (Tobie, personal communication).

Chromobacterium viscosum Grimes. (Cent. f. Bakt., II Abt., *72*, 1927, 367.) From butter.

Pseudomonas pseudoviolacea Migula. (Syst. d. Bakt., *2*, 1900, 943.) From river water.

FAMILY V. MICROCOCCACEAE PRIBRAM.*

(Jour. Bact., *18*, 1929, 385.)

Cells without endospores except in *Sporosarcina*. Cells in their free condition spherical; during division somewhat elliptical. Division in two or three planes. If the cells remain in contact after division, they are frequently flattened in the plane of last division. They occur singly, in pairs, tetrads, packets or irregular masses. Motility rare. Generally Gram-positive. Many species form a yellow, orange, pink or red pigment. Most species are preferably aerobic, producing abundant growth on ordinary culture media, but capable of slight anaerobic growth. A few species are strictly anaerobic. Metabolism heterotrophic. Carbohydrates are frequently fermented to acid. Gelatin is often liquefied. Facultative parasites and saprophytes. Frequently live on the skin, in skin glands or skin gland secretions of *Vertebrata*.

Key to the genera of family Micrococcaceae.

I. Cells occur in plates, groups or in irregular packets and masses, never in chains. Pigment, when present, is yellow, orange or red. Gram-positive to Gram-negative.

Genus I. *Micrococcus*, p. 235.

II. On the animal body and in special media cells occur as tetrads. In ordinary media cells may occur in pairs and irregular masses. White to pale yellow.

Genus II. *Gaffkya*, p. 283.

III. Cells occur in regular packets. Yellow or orange pigment usually formed.

Genus III. *Sarcina*, p. 285.

Genus I. Micrococcus *Cohn.**

(Cohn, Beiträge z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 153; *Microsphaera* Cohn, Arch. f. path. Anat., *55*, 1872, 237; not *Microsphaera* Léveillé, Ann. Sci. Nat. Bot., Sér. 3, *16*, 1851, 381; *Ascococcus* Cohn, Beiträge z. Biol. d. Pflanzen, *1*, Heft 3, 1875, 154; *Pediococcus* Balcke, Wchnschr. f. Brauerei, *1*, 1884, 183; *Merista* Van Tieghem, Traité de Botanique, Paris, 1884, 1114; *Staphylococcus* Rosenbach, Mikroorganismen bei den Wundinfektions-krankheiten des Menschen, 1884, 27; *Monococcus* Miller, Deutsch. med. Wchnschr., *12*, 1886, No. 8, 117; *Botryomyces* Bollinger, Deutsch. Ztschr. f. Tiermed., *13*, 1887, 77; *Urococcus* Miquel, Ann. Microg., *1*, 1888, 518; *Galactococcus* Guillebeau, Jahrb. d. Schweiz, *4*, 1890, 32; *Rhodococcus* Zopf, Ber. d. deutsch. Bot. Gesellsch., Berlin, *9*, 1891, 28; *Pyococcus* Ludwig, Lehrb. d. niederen Kryptog., 1892, 27; *Planococcus* Migula, Arb. Bakt. Inst. Karlsruhe, *1*, 1894, 236; *Carphococcus* Hohl, Cent. f. Bakt., II Abt., *9*, 1902, 338; *Albococcus* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 541; *Aurococcus* Winslow and Rogers, *ibid.*, 540; *Pedioplana* Wolff, Cent. f. Bakt., II Abt., *18*, 1907, 9; *Melococcus* Nedrigailov, Charkov Med. Zurnal, *4*, 1907, 301; *Solidococcus*, *Liquidococcus*, *Indolococcus* and *Peptonococcus* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 332; *Planomerista* Vuillemin, Ann. Mycol., *11*, 1913, 525; *Tetracoccus* Orla-Jensen (in part), The Lactic Acid Bacteria, 1919, 76.) From Greek *micrus*, small; *coccus*, a grain; M. L., a sphere.

Cells in plates or irregular masses (never in long chains or packets). Gram-positive to Gram-negative. Growth on agar usually abundant, some species form no

---

* The genera *Micrococcus* and *Staphylococcus* have been combined and completely revised by Prof. G. J. Hucker, New York State Experiment Station, Geneva, New York, March, 1943 so far as the aerobic species are concerned. Dr. Ivan C. Hall, Presbyterian Hospital, New York City, revised the anaerobic section, January, 1944.

pigment but others form yellow or less commonly orange, or red pigment. Glucose broth slightly acid, lactose broth generally neutral. Gelatin frequently liquefied, but not rapidly. Facultative parasites and saprophytes.

The type species is *Micrococcus luteus* (Schroeter) Cohn.

Key to the species of genus **Micrococcus.**

1. Aerobic to facultative anaerobic species.
   I. No pink or red pigment on agar media.
      A. Nitrites not produced from nitrates.
         1. Utilize $NH_4H_2PO_4$ as sole source of nitrogen.*
            a. Yellow pigment on agar media. Not acido-proteolytic.
               1. *Micrococcus luteus.*
            aa. No pigment produced. Not acido-proteolytic.
               b. Utilizes urea as a sole source of nitrogen.**
                  2. *Micrococcus ureae.*
               bb. Does not utilize urea.
                  3. *Micrococcus freudenreichii.*
            aaa. Acido-proteolytic in litmus milk.
               8. *Micrococcus caseolyticus.*
         2. Do not utilize $NH_4H_2PO_4$ as sole source of nitrogen.
            a. Yellow pigment produced.
               4. *Micrococcus flavus.*
            aa. No pigment produced.
               5. *Micrococcus candidus.*
      B. Nitrites produced from nitrates.
         1. Utilize $NH_4H_2PO_4$ as sole source of nitrogen.
            a. Yellow pigment on agar media. Not acido-proteolytic.
               b. Gelatin liquefied.
                  6. *Micrococcus conglomeratus.*
               bb. Gelatin not liquefied.
                  7. *Micrococcus varians.*
            aa. Usually not chromogenic. Actively acido-proteolytic in litmus milk.
               8. *Micrococcus caseolyticus.*
         2. Do not utilize $NH_4H_2PO_4$ as sole source of nitrogen.
            a. Gelatin liquefied. Ferment mannitol.
               b. Abundant orange growth on agar media.
                  9a. *Micrococcus pyogenes* var. *aureus.*
               bb. Abundant white growth on agar media.
                  9b. *Micrococcus pyogenes* var. *albus.*
               bbb. Yellow growth on agar media.
                  10. *Micrococcus citreus.*
            aa. Gelatin not liquefied or very slowly liquefied.
               b. Abundant orange to white growth on agar media. Ferments mannitol.
                  11. *Micrococcus aurantiacus.*
               bb. Scant white translucent growth on agar media. Does not ferment mannitol.
                  12. *Micrococcus epidermidis.*

---

* That is, will grow and produce acid (sometimes slowly) on slants containing 1.5 per cent washed agar, 0.1 per cent ammonium phosphate, 1.0 per cent glucose, 0.02 per cent potassium chloride, 0.02 per cent magnesium sulfate. Add brom-cresol-purple as an indicator (Hucker, N. Y. State Exper. Sta., Tech. Bul. 100, 1924, 25; Tech. Bul. 101, 1924, 36–40); Manual Pure Culture Study of Bacteria. Soc. Amer. Bact., Geneva, N. Y., Leaflet II, 9th ed., 1944, 14.)

** Substitute 0.1 per cent urea for the ammonium phosphate in the above medium.

II. Pink or red pigment on agar media.
  A. Gelatin liquefied, slowly. Produces rose-colored pigment.
    13. *Micrococcus roseus.*
  B. Gelatin not liquefied.
    1. Non-motile.
      a. Produces cinnabar-colored pigment on gelatin.
        14. *Micrococcus cinnabareus.*
      aa. Produces light, flesh-colored pigment on agar slant. Ferments glycerol and mannitol.
        15. *Micrococcus rubens.*
      aaa. Produces brick-colored pigment on agar slant. Does not ferment glycerol and mannitol.
        16. *Micrococcus rhodochrous.*
    2. Motile. Produces red pigment.
      17. *Micrococcus agilis.*

2. Anaerobic species.
  I. Forms gas from nitrogenous media.
    A. Acid from glucose.
      18. *Micrococcus aerogenes.*
    B. No acid from glucose.
      1. No blackening of colonies in deep agar.
        19. *Micrococcus asaccharolyticus.*
      2. Hydrogen sulfide formed. Deep agar colonies become black.
        20. *Micrococcus niger.*
  II. No gas formed from nitrogenous media.
    A. Acid from glucose.
      1. Acid from lactose.
        21. *Micrococcus grigoroffi.*
      2. No acid from lactose.
        22. *Micrococcus anaerobius.*

1. **Micrococcus luteus** (Schroeter) Cohn. (*Bacteridium luteum* Schroeter, Beitr. z. Biol. d. Pflan., *1*, Heft 2, 1872, 119; Cohn, *ibid.*, 153.) From Latin, *luteus* golden-yellow.

Spheres: 1.0 to 1.2 microns, occurring in pairs and fours. Non-motile. Gram-positive.

Gelatin colonies: Yellowish-white to yellow, raised, with undulate margin.

Gelatin stab: No liquefaction.

Agar colonies: Small, yellowish, glistening, raised.

Agar slant: Citron-yellow, smooth.

Broth: Clear, with yellowish sediment.

Litmus milk: Usually slightly acid, not coagulated.

Potato: Thin, glistening, citron-yellow growth.

Indole not formed.

Nitrites not produced from nitrates.

Acid from glucose, sucrose and mannitol. No acid from lactose.

Starch not hydrolyzed.

Ammonia produced from peptone.

Utilizes $NH_4H_2PO_4$ as a source of nitrogen.

Saprophytic.

Aerobic.

Optimum temperature 25°C.

Source: Isolated by Schroeter from dust contaminations on cooked potato.

Habitat: Found in skim milk and dairy products, and on dust particles.

2. **Micrococcus ureae** Cohn. (Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 158; not *Micrococcus ureae* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 169; *Merista ureae* Prazmowski, Biol. Cent., *8*, 1888, 301; *Streptococcus ureae* Trevisan, I generi e le specie delle Bat-

teriacee, Milan, 1889, 31; *Urococcus ureae* Beijerinck, Cent. f. Bakt., II Abt., 7, 1901, 52; *Albococcus ureae* Kligler, Jour. Infect. Dis., *12*, 1943, 442; *Staphylococcus ureae* Holland, Jour. Bact., *5*, 1920, 225.) From Greek, *urum*, urine; M. L., *urea*, urea.

See *Micrococcus liquefaciens* Migula in the appendix for references to the gelatin-liquefying form of the species.

Spheres: 0.8 to 1.0 micron, occurring singly, in pairs and in clumps. Never in chains. Non-motile. Gram-variable.

Gelatin colonies: Small, white, translucent, slimy, becoming fissured.

Gelatin stab: Slight, white growth. Very slow or no liquefaction.

Agar colonies: White, slightly raised.

Agar slant: Grayish-white, raised, glistening, butyrous.

Broth: Turbid, with viscid sediment.

Litmus milk: Slightly alkaline; litmus slowly reduced.

Milk: Acid.

Potato: Slight, grayish to pale olive growth.

Indole not formed.

Nitrites not produced from nitrates.

Urea fermented to ammonium carbonate.

Acid produced from glucose, lactose, sucrose and mannitol.

Starch not hydrolyzed.

Ammonium salts are utilized.

Ammonia produced from peptone.

Saprophytic.

Aerobic.

Optimum temperature 25°C.

Source: Isolated from fermenting urine.

Habitat: Found in stale urine and in soil containing urine.

3. **Micrococcus freudenreichii** Guillebeau. (Landwirtsch. Jahrb. d. Schweiz, *5*, 1891, 135.) Named for E. v. Freudenreich, Swiss bacteriologist.

Synonyms: *Micrococcus acidi lactis* Krueger, Cent. f. Bakt., 7, 1890, 464 (*Micrococcus acidi lactis liquefaciens* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 409; *Micrococcus acidi lactici liquefaciens* Sternberg, Man. of Bact., 1893, 601; *Micrococcus acidilactis* Migula, Syst. d. Bakt., *2*, 1900, 112; *Micrococcus acidificans* Migula, *ibid.*); *Micrococcus lactis viscosus* Sternberg, Man. of Bact., 1893, 604; *Micrococcus amarifaciens* Migula, Syst. d. Bakt., *2*, 1900, 100; *Coccus lactis viscosi* Gruber, Cent. f. Bakt., II Abt., *9*, 1902, 790 (*Micrococcus lactis viscosi* Löhnis, Cent. f. Bakt., II Abt., *18*, 1907, 144); *Micrococcus lactis albidus* Conn, Esten and Stocking, Storrs Agr. Exp. Sta. 18th Ann. Rept., 1906, 91.

Spheres: 2.0 microns in diameter, occuring singly and in clumps, rarely in short chains. Non-motile. Gram-positive.

Milk gelatin colonies: Small, white, opaque.

Milk gelatin stab: Infundibuliform liquefaction.

Agar colonies: White, slimy.

Agar streak: White, smooth.

Broth: Turbid, with white sediment.

Litmus milk: Acid; coagulated; peptonized.

Potato: Moderate white to yellow streak.

Indole not formed.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Ammonia produced from peptone.

Does not utilize urea as a source of nitrogen.

Acid from glucose, lactose and sucrose. Some strains form acid from mannitol; others from glycerol.

Saprophytic.

Aerobic.

Optimum temperature 20°C.

Habitat: Milk and dairy utensils.

4. **Micrococcus flavus** Trevisan. (*Micrococcus flavus liquefaciens* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 174; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 34; *Micrococcus flavus-liquefaciens* Chester, Man. Determ. Bact., 1901, 99.) From Latin, *flavus*, yellow.

Spheres: 0.8 to 0.9 micron, occurring

singly, in clumps, and occasionally in fours. Occasionally cultures are found that are motile with a single flagellum. Otherwise non-motile. Gram-variable.

Gelatin colonies: Small, circular, yellowish to yellowish-brown, somewhat serrate margin, granulated, sharply contoured.

Gelatin stab: Yellow, wrinkled surface growth with slow, crateriform liquefaction.

Agar colonies: Small, pale yellowish, homogeneous, entire.

Agar slant: Canary-yellow, somewhat dry, wrinkled, raised, entire.

Broth: Turbid with yellowish ring and sediment.

Litmus milk: Slightly acid, soft coagulum formed, with slight reduction; slowly peptonized.

Potato: Slight, canary-yellow growth.

Indole is not formed.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Acid is generally formed from glucose and lactose. Sucrose, glycerol and mannitol generally not fermented.

Ammonium salts are utilized.

Ammonia produced from peptone.

Non-pathogenic.

Aerobic.

Optimum temperature 25°C.

Source: Original source not given.

Habitat: Found in skin gland secretions, milk, dairy products, and dairy utensils.

5. Micrococcus candidus Cohn. (Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 160; *Staphylococcus candidus* Holland, Jour. Bact., *5*, 1920, 223.) From Latin *candidus*, shining white.

Spheres: 0.5 to 0.7 micron, occurring singly. Non-motile. Gram-positive.

Gelatin colonies: White, granular, with irregular or entire margin.

Gelatin stab: White surface growth. Filiform. No liquefaction.

Agar colonies: Punctiform, white, smooth, entire, iridescent.

Agar slant: Smooth, white, glistening, iridescent.

Broth: Turbid, with pellicle.

Litmus milk: Slightly acid; not coagulated.

Potato: Thick, porcelain white, glistening.

Indole not produced.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Ammonia produced from peptone.

Ammonium salts not utilized.

Acid from glucose, sucrose, lactose and glycerol.

Non-pathogenic.

Aerobic.

Optimum temperature 25°C.

Source: Originally appeared as white colonies on cooked potato exposed to dust contaminations.

Habitat: Found in skin secretions, milk and dairy products.

6. Micrococcus conglomeratus Migula. (Citronengelber Diplococcus, Bumm, Der Mikroorganismen der gonorrhoischen Schleimhauterkrankungen, 1 Aufl., 1885, 17; *Micrococcus citreus conglomeratus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 182; *Diplococcus citreus conglomeratus* Bumm, *ibid.*, 2 Aufl., 1887; *Neisseria citrea* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; *Merismopedia citreus conglomeratus* Dyar, Ann, N. Y. Acad. Sci., *8*, 1895, 352; Migula, Syst. d. Bakt., *2*, 1900, 146; not *Micrococcus conglomeratus* Weichselbaum, 1887, see Trevisan, *loc. cit.*, 33; *Micrococcus citreus* Winslow and Winslow, Systematic Relationships of the Coccaceae, 1908, 218.) From Latin, *conglomeratus*, rolled together, crowded.

Spheres: 0.8 to 1.2 microns, occurring singly, in pairs, in fours, and in large clumps. Non-motile. Gram-variable.

Gelatin colonies: Small, circular, yellow with radiate margin.

Gelatin stab: Slow crateriform liquefaction.

Agar colonies: Luxuriant, moist, sulfur yellow.

Agar slant: Light yellow, plumose, slightly rugose, somewhat dull, raised center and transparent margin.

Broth: Turbid, with light orange ring and sediment.

Milk: Generally acid but not sufficient to curdle.

Potato: No growth.

Indole not formed.

Nitrites produced from nitrates.

Blood not hemolyzed.

Starch not hydrolyzed.

Acid from glucose and lactose generally, sometimes from sucrose. Mannitol and glycerol generally not fermented.

Ammonia produced from peptone.

Utilizes $NH_4H_2PO_4$ as a source of nitrogen.

Resistant to drying and heat.

Non-pathogenic.

Aerobic.

Optimum temperature 25°C.

Source: Found in gonorrhoeal pus and dust.

Habitat: Infections, milk, dairy products, dairy utensils, water, common.

7. **Micrococcus varians** Migula. (*Merismopedia flava varians* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 346; Migula, Syst. d. Bakt., *2*, 1900, 135; *Merismopedia flava-varians* Chester, Man. Determ. Bact., 1901, 103; *Micrococcus lactis varians* Conn, Esten and Stocking, Storrs Agr. Exp. Sta. Rept. for 1906, 121.) From Latin, *varians* varying.

Spheres: 0.8 to 1.0 micron, occurring singly, in pairs and in fours. Occasionally cultures are found that are motile with a single flagellum. Otherwise non-motile. Gram-variable.

Gelatin colonies: Small, circular, whitish to yellow, capitate, moruloid.

Gelatin stab: Scant growth. No liquefaction.

Agar colonies: Small, yellow, raised, glistening.

Agar slant: Plumose, yellow, variegated.

Broth: Turbid, with yellow, granular sediment.

Litmus milk: Acid; coagulated on boiling.

Potato: Raised, dry, bright-yellow, glistening.

Indole not formed.

Nitrites produced from nitrates.

Acid from glucose, lactose, sucrose, raffinose and frequently from glycerol and mannitol. No acid from salicin or inulin.

Starch not hydrolyzed.

Ammonia produced from peptone.

Utilizes $NH_4H_2PO_4$ as a source of nitrogen.

Saprophytic.

Aerobic.

Optimum temperature 25°C.

Source: Original strains found in a contaminated jar of sterilized milk.

Habitat: Has been found in body secretions, dairy products, dairy utensils, dust and water, including sea water.

8. **Micrococcus caseolyticus** Evans. (Evans, Jour. Inf. Dis., *18*, 1916, 455; *Micrococcus casei* Hucker, N. Y. Agr. Exp. Sta. Tech. Bull. 102, 1924, 17; Probably *Micrococcus casei* Holland, Jour. Bact., *5*, 1920, 223.)

Identical in part with *Micrococcus casei acidoproteolyticus I* and *II* Gorini, Rev. Gén. du Lait, *8*, 1910, 337; *Tetracoccus liquefaciens* Orla-Jensen, The Lactic Acid Bacteria, 1919, 80 (*Micrococcus casei liquefaciens* Orla-Jensen, Doktordisputats, 1904; *Tetracoccus casei liquefaciens* Orla-Jensen, The Lactic Acid Bacteria, 1919, 80; *Micrococcus liquefaciens* Holland, Jour. Bact., *5*, 1920, 224. Also see references under *Streptococcus liquefaciens*.) From Latin, *caseus*, cheese, casein; and Greek, *lyticus*, able to dissolve; M. L., dissolving, digesting.

Spheres, variable in size, occurring in clumps. Non-motile. Gram-positive.

Gelatin stab: Liquefaction generally

begins after first day and continues rapidly.

Agar colonies: Yellow to orange (Evans, *loc. cit.*), pearly white (Hucker, *loc. cit.*).

Agar stroke: Yellow to orange (Evans, *loc. cit.*), pearly white (Hucker, *loc. cit.*), luxuriant growth.

Broth: Generally grows with smooth turbidity although certain strains give heavy precipitate with clear supernatant fluid.

Litmus milk: Acid, peptonized. Whey generally clear.

Potato: Scanty white growth. Certain strains may show yellow pigment.

Indole not formed.

Nitrites usually produced from nitrates.

Acid from glucose, lactose, maltose, mannitol and glycerol. No action on raffinose.

Forms dextrorotary lactic acid (Orla-Jensen, 1919, *loc. cit.*).

Asparagin and urea decomposed by some strains.

Utilizes $NH_4H_2PO_4$ as a source of nitrogen.

Optimum temperature 22°C.

Aerobic.

Saprophytic.

Source: Eight cultures from bovine udder.

Habitat: Milk and dairy products, especially cheese, dairy utensils.

9a. **Micrococcus pyogenes** var. **aureus** (Rosenbach) Zopf. (*Staphylococcus pyogenes aureus* Rosenbach, Mikroorganismen bei den Wundinfectionskrankheiten des Menschen, Wiesbaden, 1884, 19; *Staphylococcus aureus* Rosenbach, *ibid.*, 27; *Micrococcus pyogenes* var. *aureus* Zopf, Die Spaltpilze, 3 Aufl., 1885, 56; *Micrococcus aureus* Zopf, *ibid.*, 57; *Micrococcus pyogenes* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 165; *Aurococcus aureus* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 554; *Micrococcus lactis varians* Conn, Esten and Stocking, Storrs Agr. Exp. Sta. Rept. for 1906, 121; *Staphylococcus pyogenes* Andrewes and Gordon, Rept. (35th) Med. Officer Local Govt. Board, London, 1907, 549; (*Tetracoccus*) *Micrococcus pyogenes aureus* Orla-Jensen, The Lactic Acid Bacteria, 1919, 81; *Staphylococcus pyogenes-aureus* Holland, Jour. Bact., *5*, 1920, 225.) From Greek, *pyon*, pus; M. L.,-*genes*, producing. From Latin, *aureus*, golden.

Spheres: 0.8 to 1.0 micron, occurring singly, in pairs, in short chains, and in irregular clumps. Non-motile. Gram-positive.

Gelatin stab: Saccate liquefaction with yellowish pellicle and yellow to orange sediment.

Agar colonies: Circular, smooth, yellowish to orange, glistening, butyrous, entire.

Agar slant: Abundant, opaque, smooth, flat, moist, yellowish to orange.

Broth: Turbid with yellowish ring and sediment, becoming clear.

Litmus milk: Acid; coagulated.

Potato: Abundant, orange, glistening.

Indole not formed.

Nitrites produced from nitrates.

Acid from glucose, lactose, sucrose, mannitol and glycerol, but not from raffinose, salicin or inulin.

Forms inactive or levorotary lactic acid (Orla-Jensen, *loc. cit.*).

Slight H_2S formation.

Starch not hydrolyzed.

Does not utilize $NH_4H_2PO_4$, as a source of nitrogen.

Ammonia produced from peptone.

Pathogenic. Individual strains vary in their ability to produce hemolysin, coagulase and other metabolic products.

Certain strains, under favorable conditions, produce not only exotoxins (hematoxin, dermatoxin, lethal toxin, etc.) but also a potent enterotoxin which is a significant cause of food poisoning (Dolman and Wilson, Jour. Immunology, *35*, 1938, 13).

Aerobic, facultative.

Optimum temperature 37°C.

Source: Isolated from pus in wounds.

Habitat: Skin and mucous membranes. The cause of boils, abscesses, furuncles suppuration in wounds, etc.

9b. **Micrococcus pyogenes** var. **albus** (Rosenbach) Schroeter. (*Staphylococcus pyogenes albus* Rosenbach, Mikroorganismen bei den Wundinfektionskrankheiten des Menschen, Wiesbaden, 1884, 2; *Staphylococcus albus* Rosenbach, *ibid.*, 27; *Micrococcus pyogenes* var. *albus* Schroeter, in Cohn, Kryptog. Flora v. Schlesien, *3*, 1, 1886, 147; *Micrococcus pyogenes* Migula, Syst. d. Bakt., *2*, 1900, 87; *Albococcus pyogenes* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 544; *Micrococcus albus* Buchanan, Veterinary Bacteriology 1911, 196; (*Tetracoccus*) *Micrococus pyogenes albus* Orla-Jensen, The Lactic Acid Bacteria, 1919, 81; *Staphylococcus pyogenes-albus* Holland, Jour. Bact., *5*, 1920, 225.) From Latin, *albus*, white.

Spheres: 0.6 to 0.8 micron, occurring singly, in pairs and in irregular groups. Non-motile. Gram-positive.

Gelatin stab: Saccate liquefaction with heavy white sediment.

Agar colonies: Circular, white, smooth, glistening, entire.

Ten per cent evaporated milk agar: Growth at 20°C frequently orange (Chapman, Jour. Bact., *45*, 1943, 405).

Agar slant: Abundant, white, smooth, glistening.

Broth: Turbid, with delicate pellicle and white sediment.

Litmus milk: Acid; coagulated. Little or no visible peptonization.

Potato: Thick, smooth, white, glistening.

Indole not formed.

Nitrites produced from nitrates.

Hydrogen sulfide is formed.

Acid formed from glucose, lactose, sucrose, glycerol and mannitol, but not from raffinose, salicin and inulin.

Forms inactive or levorotary lactic acid (Orla-Jensen, *loc. cit.*).

Starch not hydrolyzed.

Ammonia produced from peptone.

Does not utilize $NH_4H_2PO_4$ as a source of nitrogen.

Pathogenic. Production of toxins, coagulase and hemolysin as in *Micrococcus aureus*.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Originally isolated from pus.

Habitat: Skin and mucous membranes. Occurs in wounds, boils, abscesses, etc.

10. **Micrococcus citreus** Migula. (*Staphylococcus pyogenes citreus* Passet, Aetiologie der eiterigen phlegmone des Menschen, Berlin, 1885, 9; *Micrococcus pyogenes citreus* Schroeter, in Cohn, Kryptog. Flora v. Schlesien, *3*, 1, 1886, 147; Migula, Syst. d. Bakt., *2*, 1900, 147; *Staphylococcus citreus* Bergey et al., Manual, 1st ed., 1923, 55.) From Latin, *citreus*, of or relating to the citrus tree; M. L., lemon yellow.

Spheres: 0.9 micron, occurring singly. Gram-positive.

Gelatin colonies: Circular, pale yellow, granular, entire, liquefying in 6 days.

Gelatin stab: Lemon yellow surface growth sinking into the medium. Grayish-white growth in stab. Complete liquefaction in 43 days.

Agar colonies: Small, yellow, smooth, entire.

Agar slant: Broad, lemon yellow, glistening, elastic.

Broth: Turbid, with yellow sediment and pellicle.

Litmus milk: Acid, with slow coagulation.

Potato: Thin, grayish streak, becoming citron yellow.

Indole not formed.

Nitrites produced from nitrates.

Starch not hydrolyzed.

Acid from glucose, lactose, sucrose, raffinose, inulin, salicin, glycerol and mannitol.

Does not utilize $NH_4H_2PO_4$ as a source of nitrogen.

Ammonia produced from peptone.

Aerobic, facultative.

Pathogenic.

Optimum temperature 37°C.

Source: Originally isolated from pus.

Habitat: Skin and mucous membranes of vertebrates.

11. **Micrococcus aurantiacus** (Schroeter) Cohn. (*Bacteridium aurantiacum* Schroeter, Beitr. z. Biol., *1*, Heft 2, 1872, 126; Cohn, Beitr. z. Biol., *1*, Heft 2, 1872, 154; *Pediococcus aurantiacus* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1051; *Micrococcus aurantiacus-sorghi* Bruyning, Arch. Néer. Sci. Exact. et Nat., *1*, 1898, 297; *Streptococcus aurantiacus* Chester, Man. Determ. Bact., 1901, 69; *Aurococcus aurantiacus* Winslow and Winslow, Systematic Relationships of the Coccaceae, 1908, 186; *Sarcina aurantiaca* Holland, Jour. Bact., *5*, 1920, 225 (not *Sarcina aurantiaca* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 180); *Staphylococcus aurantiacus* Holland, *ibid.*) From Latin, *aurum*, gold; M. L., *aurantium*, the orange; M.L., *aurantiacus*, orange-colored.

Spheres: Slightly ellipsoidal, 1.3 to 1.5 microns, occurring singly, in short chains and in small clumps. Non-motile. Gram-positive.

Gelatin colonies: Circular to oval, smooth, glistening with yellow to orange center.

Gelatin stab: Yellow surface growth. No liquefaction.

Agar colonies: Circular, smooth, glistening, yellow to orange, entire.

Agar slant: Buff to scant orange-yellow, beaded growth, raised, glistening.

Broth: Turbid, with pellicle.

Litmus milk: Faintly acid, no coagulation.

Potato: Slimy, yellow growth. Pigment is insoluble in alcohol and ether.

Indole not produced.

Nitrites generally produced from nitrates.

Slight acidity from glucose, fructose, sucrose, lactose and mannitol. No acid from raffinose, salicin, inulin.

Starch not hydrolyzed.

Ammonia produced from peptone.

No growth in ammonium media.

May be pathogenic.

Optimum temperature 25°C.

Aerobic.

Source: First isolated from colonies that grew on boiled egg exposed to dust contamination.

Habitat: Usually isolated from infections but also found in milk, cheese and dust.

NOTE: *Albococcus epidermidis* (var. A) Kligler (Jour. Infect. Dis., *12*, 1913, 444) which was based on a white culture received from Kral under the name *Micrococcus aurantiacus* was apparently a white strain of this organism as it grew luxuriantly on ordinary agar.

12. **Micrococcus epidermidis** (Winslow and Winslow) Hucker. (*Staphylococcus epidermidis albus* Welch, Amer. Jour. of Med. Sci., Phila., N. S., *102*, 1891, 441; *Micrococcus epidermidis albus* Randolph, Jour. Amer. Med. Assoc., *31*, 1898, 706; *Albococcus epidermidis* Winslow and Winslow, Syst. Relationships Coccaceae, New York, 1908, 201; *Staphylococcus epidermidis* Evans, Jour. Inf. Dis., *15*, 1916, 449; Hucker, N. Y. Agr. Exp. Sta. Tech. Bull. 102, 1924, 21.) From Greek, *epidermis*, the outer skin.

Spheres: 0.5 to 0.6 micron, occurring singly, in pairs and in irregular groups. Non-motile. Gram-positive.

Gelatin stab: White surface growth with slow saccate liquefaction.

Agar colonies: Rather scant, white, translucent.

Broth: Turbid, with white ring and sediment.

Litmus milk: Acid.

Potato: Limited growth, white.

Indole not formed.

Nitrites are produced from nitrates.

Usually does not utilize $NH_4H_2PO_4$ as a source of nitrogen.

Acid formed from glucose, fructose, maltose, lactose and sucrose, but not from mannitol, raffinose, salicin or inulin.

Usually fails to hemolyze blood. No coagulase produced.

Parasitic rather than pathogenic.

Aerobic, facultative.

Optimumtemperature 37°C.

Source: Originally isolated from small stitch abscesses and other skin wounds.

Habitat: Skin and mucous membranes.

13. **Micrococcus roseus** Flügge. (Rosafarbiger Diplococcus, Bumm, Der Mikroorganismen der gonorrhoischen Schleimhauterkrankungen, 1 Aufl., 1885, 25; Flügge, Die Mikroorganismen, 2 Aufl., 1886, 183; *Neisseria rosea* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; *Diplococcus roseus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 12; *Merismopedia rosea* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 354; *Rhodococcus roseus* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 545.) From Latin, *roseus*, rose-colored.

Spheres: 1.0 to 1.5 microns, occurring singly and in pairs. Non-motile. Gram-variable.

Gelatin colonies: Rose surface growth usually with slow liquefaction.

Agar colonies: Circular, entire, rose-red surface colonies.

Agar slant: Thick, rose-red, smooth, glistening streak.

Broth: Slightly turbid with rose-colored sediment.

Litmus milk: Unchanged to alkaline, usually reddish sediment after 14 days.

Usually produce nitrites from nitrates.

Potato: Raised, rose-red, smooth, glistening.

Starch not hydrolyzed.

Acid from glycerol and mannitol.

Utilizes $NH_4H_2PO_4$ as a source of nitrogen.

Saprophytic.

Aerobic.

Optimum temperature 25°C.

Source: Dust contamination.

Habitat: Widespread, as it occurs in dust.

14. **Micrococcus cinnabareus** Flügge. (Flügge, Die Mikroorganismen, 2 Aufl., 1886, 174; *Rhodococcus cinnabareus* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 545.) From M. L., cinnabar-colored.

Spheres: 1.0 micron, occurring singly and in pairs. Non-motile. Gram-variable.

Gelatin colonies: Small, circular, bright red, becoming cinnabar red.

Gelatin stab: Thick, raised, rose to cinnabar red growth on surface. No liquefaction. White colonies along stab.

Agar slant: A carmine-red streak. Slow growth.

Broth: Turbid.

Litmus milk: Slightly alkaline to slightly acid.

Potato: Slowly developing vermillion red streak.

Small amount of acid from test sugars.

Indole not formed.

Does not utilize $NH_4H_2PO_4$ as a source of nitrogen.

Nitrites produced from nitrates.

Starch not hydrolyzed.

Saprophytic.

Aerobic.

Optimum temperature 25°C.

Source: Found as contamination of cultures.

Habitat: Usually found as a dust contamination.

15. **Micrococcus rubens** Migula. (*Micrococcus tetragenus ruber* Bujwid, in Schneider, Arb. bakt. Inst. Karlsruhe, *1*, Heft 2, 1894, 215; Migula, Syst. d. Bakt., *2*, 1900, 177; *Micrococcus ruber* and *Rhodococcus ruber* Holland, Jour. Bact., *6*, 1920, 224; *Micrococcus roseofulvus* Hucker, N. Y. S. Agr. Exp. Sta. Tech. Bull. 135, 1928, 27; not *Micrococcus roseofulvus* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 177 and 439; *Rhodococcus roseofulvus* Pribram, Klassifikation der Schizomyceten, 1933, 44). From Latin, *rubens*, ruddy.

The following description is taken from Migula (*loc. cit.*) and from Hucker (*loc. cit.*) supplemented from unpublished notes of the latter. Also see Breed (Jour. Bact., *45*, 1943, 455).

Spheres: 1.3 to 4.0 microns, average size 2.1 microns, occurring in fours and

in irregular masses, generally not singly or in pairs. Non-motile. Gram-negative to Gram-variable

Gelatin colonies: After several days, small, pink or flesh-colored, shiny, butyrous, 0.5 to several mm. in diameter. Smaller colonies have regular edges; larger colonies have lobate edges.

Gelatin streak: Thick, shiny, flesh-colored to carmine-red growth, generally spreading.

Gelatin stab: Scant, whitish growth along line of stab; surface growth flesh-red. No liquefaction after several weeks, but a slight softening of the medium underneath the growth.

Agar slant: Luxuriant, thick, spreading, slimy, flesh-colored growth.

Broth: Bright red, slimy sediment. No pellicle.

Milk: Generally acid curd followed by slight peptonization.

Nitrites produced from nitrates.

Acid from glucose, sucrose, mannitol and glycerol. No action on lactose or starch.

Pigment soluble in ether, benzol, carbon bisulfide, chloroform and alcohol. Not soluble in water (Schneider, *loc. cit.*).

Saprophytic.

Grows well at 26° to 37°C.

Aerobic.

Source: Original culture isolated by Bujwid in Bern, Switzerland and sent to Migula at Karlsruhe, Germany.

Habitat: Unknown.

16. **Micrococcus rhodochrous** (Zopf) Migula. (*Rhodococcus rhodochrous* Zopf, Berichte d. deutsch. bot. Gesellsch., *9*, 1891, 22; Migula, Syst. d. Bakt., *2*, 1900, 162.) From Greek, *rhodum*, rose; *chros*, color.

Spheres: 0.5 to 1.0 micron, occurring singly. Non-motile. Gram-variable.

Gelatin colonies: Small, circular, glistening, raised, entire, dark, reddish-brown.

Gelatin stab: Dark, carmine-red, dry surface growth. Slight growth in stab. No liquefaction.

Agar slant: Carmine-red streak, becoming brick-red in color.

Broth: Thick rose-red pellicle with red, flocculent sediment.

Litmus milk: Slightly alkaline.

Potato: Carmine-red streak.

Does not ferment glycerol and mannitol.

Aerobic.

Saprophytic.

Optimum temperature 25°C.

Habitat: Water.

17. **Micrococcus agilis** Ali-Cohen. (Ali-Cohen, Cent. f. Bakt., *6*, 1889, 36; *Planosarcina agilis* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 20; *Micrococcus agilis ruber* Peppler, Cent. f. Bakt., I Abt., *29*, 1901, 352; *Planococcus agilis* Chester, Man. Determ. Bact., 1901, 115; *Rhodococcus agilis* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 545; *Sarcina agilis* Enderlein, Sitzber. Gesell. Naturf. Freunde Berlin, 1930, 182; not *Sarcina agilis* Matzuschita, Zeit. f. Hyg., *35*, 1900, 496; not *Sarcina agilis* Saito, Jour. Coll. Sci. Imp. Univ. Tokyo, *23*, 1908, .) From Latin, *agilis*, agile.

Spheres, 1.0 micron, occurring singly, in pairs and in fours. Motile by means of one or two flagella. Gram-variable.

Gelatin colonies: Small, gray, becoming distinctly rose-colored.

Gelatin stab: Thin, whitish growth in stab. On surface thick, rose-red, glistening growth. Generally no liquefaction.

Agar slant: Glistening, dark rose-red, lobed, much variation in color.

Broth: Slightly turbid, with slight, rose-colored ring and pink sediment.

Litmus milk: Slightly acid, pink sediment.

Potato: Slow growth as small, rose-colored colonies.

Loeffler's blood serum: Pink, spread-

ing, shiny, abundant. Slow liquefaction.

Indole not formed.

Nitrites produced (trace).

Ammonia formed (trace).

Does not utilize $NH_4H_2PO_4$ as source of nitrogen.

Acid from glucose, sucrose, inulin, glycerol and mannitol. No acid from raffinose.

Aerobic.

Saprophytic.

Optimum temperature 25°C.

Source: Isolated from water.

Habitat: Water, sea water, on sea fish.

*18. **Micrococcus aerogenes** (Schottmüller) Bergey et al. (*Staphylococcus aerogenes* Schottmüller, Cent. f. Bakt., I Abt., Orig., *64*, 1912, 270; Bergey et al., Manual, 1st ed., 1923, 70; not *Micrococcus aerogenes* Miller, Deutsch. med. Wchnschr., *12*, 1886, 119.) From Greek, forming air or gas.

Description according to Prévot, Ann. Sci. Nat., Sér. Bot. et Zool., *15*, 1933, 212.

Spheres: 0.6 to 0.8 micron, occurring in clusters, sometimes in pairs or short chains. Gram-positive.

Gelatin: No liquefaction.

Deep agar colonies: Small, lenticular, nearly spherical, yellowish white. Some gas bubbles produced, not fetid.

Blood agar colonies: Very small, grayish. No true hemolysis, but a narrow clear zone is formed.

Serum agar: Colonies lenticular. Gas not fetid.

Neutral red serum agar: Colonies lenticular. Gas produced. Neutral red changed to greenish yellow.

Glucose broth with blood: Turbid. Gas produced. Hydrogen sulfide not produced. Slight hemolysis.

Glucose serum broth: Turbid. Gas produced.

Peptone water with serum: Gas. Indole produced.

Milk: Growth feeble. Neither acid nor coagulated.

Proteins not attacked.

Glucose and fructose attacked slightly by two out of three strains.

Does not plasmolyse readily.

Neutral red broth: Changed to yellowish green.

Nitrites not produced from nitrates.

Optimum pH 6.5 to 8.0.

Optimum temperature 37°C.

Pathogenic.

Strict anaerobe.

Distinctive character: Fermentation of glucose and gas production from peptones.

Source: Isolated (Schottmüller) from cases of puerperal fever. Three strains from infected tonsils studied by Prévot.

Habitat: Natural cavities, especially the tonsils and female genital organs.

19. **Micrococcus asaccharolyticus** (Distaso) *comb. nov.* (*Staphylococcus asaccharolyticus* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 445.) From Greek, not dissolving sugar.

Description according to Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 211.

Large spheres: 1.0 to 1.2 microns, occurring in very large clusters, also in pairs and short chains. Gram-positive.

Gelatin: At 37°C, growth resembles tufts of cotton which precipitate. No liquefaction.

Deep agar colonies: Very delicate, pin-point, transparent. A few bubbles of gas produced.

Broth: Turbid. Growth settles at the bottom of the tube as a sort of viscous zooglea. Unpleasant odor produced.

Peptone water: Turbid. Indole produced.

Milk: Feebly acidified, but not coagulated.

Egg white not attacked.

Carbohydrates not attacked.

Strict anaerobe.

* Anaerobic section revised by Dr. Ivan C. Hall, New York, N. Y.

Distinctive characters: Large size; unpleasant odor; production of indole; production of gas.

Source: Isolated from the large intestine of a man with intestinal intoxication.

Habitat: Intestine. Not common.

NOTE: Weinberg, Nativelle and Prévot (Les Microbes Anaérobies, 1937, 1023) regard *Micrococcus indolicus* Christiansen (Ac. Pat. Micr. Scand., *18*, 1934, 42) as a variety of this species giving it the name *Staphylococcus asaccharolyticus* var. *indolicus*. This variety differs from the species by forming opaque lens-shaped colonies and by a more abundant production of gas from peptone.

20. **Micrococcus niger** Hall. (Jour. Bact., *20*, 1930, 409.) From Latin, *niger*, black.

Small spheres: 0.6 micron in diameter, occurring in irregular masses, occasionally in pairs. Gram-positive.

Gelatin: After 5 days a dark sediment is produced which gradually gets more and more intensely black. No liquefaction.

Deep agar colonies: Slow growth. At first very tiny, colorless, irregularly globular, smooth, dense. Small bubbles of gas sometimes produced. After several days colonies become brown, then black. If exposed to air, colonies fade to a dull gray. Medium not discolored.

Blood agar slant: After 4 or 5 days, minute, black colonies, round, smooth, glistening, 0.5 mm. in diameter. Non-hemolytic.

Broth: After 4 or 5 days uniform turbidity and slight production of gas which contains H_2S. Black sediment.

Coagulated serum: Minute, brown colonies appear on the 8th day. No liquefaction.

Milk: No change.

Brain medium: Turbid after 4 or 5 days at 37°C. Uniform gas production about the 6th day. Discoloration of the medium not marked.

No acid from carbohydrates. Black sediment produced.

Non-pathogenic for guinea-pigs and rabbits.

Optimum temperature 37°C. No growth below 30°C.

Strict anaerobe.

Distinctive characters: Formation of a water-insoluble, black pigment. Growth slow, visible after 2 to 4 days.

Source: Isolated from urine of an aged woman.

Habitat: Unknown.

21. **Micrococcus grigoroffi** Prévot. (*Micrococcus* A, Grigoroff, Thèse de Geneve, 1905; Prévot, Ann. Sci. Nat., Sér. Bot. et Zool., *15*, 1933, 219.) Named for Grigoroff, who first isolated this organism.

Small spheres: Average size 0.7 micron, occurring singly or in irregular masses. Gram-positive.

Gelatin: Colonies appear in four days. No liquefaction.

Deep agar colonies: After three days, round, lenticular, yellowish.

Glucose broth: Turbid after 2 days with whitish sediment. Neither gas nor fetid odor produced. The medium is acidified.

Milk: Good growth. Acid. Coagulation.

Acid from glucose, maltose, lactose, fructose and sorbitol.

One strain slightly pathogenic.

Optimum temperature 37°C.

Strict anaerobe.

Distinctive characters: This is the only anaerobic coccus growing in irregular masses that coagulates milk. Lactose is fermented.

Source: Five strains isolated from the appendix by Grigoroff. One strain isolated from an appendix by Prévot.

Habitat: Human digestive tract. Not common.

22. **Micrococcus anaerobius** (Hamm) *comb. nov.* (Anaerobic staphylococcus, Jungano, Compt. rend. Soc. Biol. Paris, *59*, 1907, 707; *Staphylococcus anaerobius*

Hamm, Die puerperale Wundinfektion, Berlin, 1912; not *Staphylococcus anaerobius* Heurlin, Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen, Helsingfors, 1910, 120.) From Greek, living without air.

Description according to Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 209.

Small spheres: 0.5 to 0.6 micron, occurring in masses. Gram-positive.

Gelatin: No liquefaction.

Deep agar colonies: Lenticular, thick. No gas produced.

Broth: Turbid, later clearing. Sediment.

Glucose broth: Good growth. Neither acid nor gas produced.

Peptone water: No turbidity. No gas. Indole not produced.

Milk: Neither coagulated nor acidified.

Coagulated serum not attacked.

Egg white not attacked.

Carbohydrates not attacked by the strains of Jungano. Acid feebly produced from glucose and galactose by Prévot's strain.

Does not plasmolyse.

Temperature relations: Optimum 36° to 38°C. At 22°C growth slow, poor. No growth below 22°C. Killed in ten minutes at 80°C or in half an hour at 60°C.

Optimum pH 6.0 to 8.0.

Pathogenic for guinea-pigs and rabbits.

Strict anaerobe.

Distinctive characters: Neutral red broth remains unchanged. No gas produced.

Source: First isolated by Jungano from a case of cystitis. Found by Prévot in the pus from a suppurated tonsil.

Habitat: Urinary tract, urethra, intestine, buccal cavity and conjunctiva.

Appendix I*: The following genus is organized on a physiological basis. Because of this no attempt is made to fit it into the classification outline. A single species has been described.

Genus A. **Methanococcus** *Kluyver and van Niel.*

(Cent. f. Bakt., II Abt., *94*, 1936, 400.)

Spherical cells, occurring singly or in masses. Motility not observed. No endospores formed. Gram-variable. Chemo-heterotrophic, anaerobic, fermenting various organic compounds with the formation of methane. Saprophytes.

The type species is *Methanococcus mazei* Barker.

1. **Methanococcus mazei** Barker. (Pseudosarcina, Mazé, Compt. rend. Soc. Biol., Paris, *78*, 1915, 398; Barker, Arch. f. Mikrobiol., *7*, 1936, 430.) Named for Mazé, the French bacteriologist who first gave a clearly recognizable description of this type of methane organism.

Small spherical cells, occurring singly, in large, irregular masses, or in regular cysts of various sizes and forms. Nonmotile. Stains readily with erythrosine. Gram-variable.

Grows on calcium acetate enrichment media and ferments the acetate vigorously.

Grows slowly on agar containing 2 per cent clear mud extract.

Ferments acetic and butyric acids with production of methane in the presence of CO_2. Ethyl and butyl alcohols not attacked.

Does not utilize organic nitrogen.

Obligate anaerobe.

Grows best at 30° to 37°C.

Sources: Garden soil, black mud containing H_2S, feces of herbivorous animals.

Habitat: One of the most active methane-producing organisms found in nature.

* Appendixes I and II prepared by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, December, 1943.

Appendix II: The following genus is recognized by workers in the brewing industry. It includes species that present characters intermediate between *Micrococcus*, *Sarcina* and *Streptococcus*. Many students prefer to regard these as species of *Micrococcus* (Hucker, N. Y. State Exper. Sta., Tech. Bul. 102, 1924, 5), of *Sarcina* (Macé, Traité pratique d. Bact., 4th ed., 1901, 460) or of *Streptococcus* (Shimwell, Sect. 670 in Hind, Brewing Science and Practice, New York, 1940). Others (Mees, Thesis, Delft, 1934) would include in the genus, the species described as *Tetracoccus* by Orla-Jensen (The Lactic Acid Bacteria, Copenhagen, 1919, 76).

Genus B. Pediococcus *Balcke.*

(Wchnschr. f. Brauerei, *1*, 1884, 257.)

Cocci occurring singly, in pairs and tetrads. Non-motile. No endospores. Gram-positive. Facultative anaerobes under favorable conditions, especially in acid media. Nitrites not produced from nitrates. Produce acidification and more or less clouding of wort and beer. Saprophytes.

The type species is *Pediococcus cerevisiae* Balcke.

1. **Pediococcus cerevisiae** Balcke. (Ferment No. 7, Pasteur, Études sur la bière, Paris, 1876, 4; *Sarcina* Balcke, Wchnschr. f. Brauerei, *1*, 1884, 183; *ibid.*, *1*, 1884, 257; *Merismopedia cerevisiae* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 348; *Micrococcus cerevisiae* Migula, Syst. d. Bakt., *2*, 1900, 77; *Sarcina cerevisiae* Macé, Traité Pratique d. Bact., 4th ed., 1901, 460.) From Latin, *cerevisia*, beer.

Spheres: 1 to 1.3 microns, occurring singly, in pairs or tetrads. In acid media the latter prevail. Catalase negative. Non-motile. Gram-positive.

No growth in alkaline media.

Peptone, meat-extract gelatin: White becoming yellowish to yellowish brown. No liquefaction.

Wort gelatin with Ca-carbonate: White colonies, 2 to 3 mm; carbonate dissolved.

Meat extract gelatin stab: Growth along stab, white raised surface growth. No liquefaction.

Litmus milk: No growth.

Potato: Scanty growth.

Acid from glucose, fructose, maltose, sucrose.

Wort and beer: Slight to moderately turbid growth, strong development on bottom of the flask. Hop sensitive, but may develop in heavily hopped beers under special conditions.

Does not utilize urea.

Nitrites not produced from nitrates.

Facultative anaerobic.

Killed at 60°C. in 8 minutes. Optimum temperature: 25°C.

Source: Sarcina-sick beer.

Habitat: Wort, beer and beer yeast.

Additional species have been described from spoiled wort and beer which vary but slightly from the species first named and described by Balcke. These are listed below together with other species that have been placed in the genus.

Pediococcus acidilactici Lindner. (Lindner, Wchnschr. f. Brauerei, *3*, No. 23, 1887, see Cent. f. Bakt., *2*, 1887, 342; also see Die Sarcina-Organismen der Gährungsgewerbe, Lindner, Inaug. Diss., Berlin, 1888, 26, and Cent. f. Bakt., *4*, 1888, 429; *Micrococcus pseudocerevisiae* Migula, Syst. d. Bakt., *2*, 1900, 77; *Micrococcus acidi-lactici* Chester, Man. Determ. Bact., 1901, 88.) From spoiled mash.

Pediococcus albus Lindner. (Die Sarcina-Organismen der Gährungsgewerbe, Lindner, Inaug. Diss., Berlin, 1887, 39; see Cent. f. Bakt., *4*, 1888, 429; *Micrococcus pseudosarcina* Migula, Syst. d. Bakt., *2*, 1900, 92; *Micrococcus albus* Chester, Man. Determ. Bact., 1901, 97.) From spoiled beer.

Pediococcus damnosus Claussen.

(Compt. rend. Trav. Labor. de Carlsberg, *6*, 1906, 68; *Streptococcus damnosus* Shimwell and Kirkpatrick, Jour. Inst. Brewing, *45*, 1939, 137.) From clear, spoiled beer.

Pediococcus halophilus Mees. (Tetracoccus No. 1, Orla-Jensen, The Lactic Acid Bacteria, 1919, 77; Mees, Thesis, Delft, 1934, 94.) From anchovy pickle.

Pediococcus hennebergi Sollied. (Ztschr. Spiritusindus., *26*, 1903, 491.) From spoiled beer.

Pediococcus kochii Trevisan. (Mikrokokkus in Wundsecreten bei Menschen, Koch; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 28.)

Pediococcus pentosaceus Mees. (Tetracoccus No. 2, Orla-Jensen, The Lactic Acid Bacteria, 1919, 78; Mees, Thesis, Delft, 1934, 94.) From yeast.

Pediococcus perniciosus Claussen (*loc. cit.*). From clouded, spoiled beer.

Pediococcus sarcinaeformis Reichard. (Ztschr. f. d. ges. Brauwesen, *17*, 1894, 257.) From spoiled beer.

Pediococcus urinae equi Mees. (Pferdeurinsarcina, von Huth, Alg. Ztg. f. Bierber. u. Malzfabr., 185, 968 and 981, 1885; *ibid.*, 1886, 141; Mees, Thesis, Delft, 1934, 95.) From horse urine.

Pediococcus violaceus (Kützing) Trevisan. (*Merismopedia violacea* Kützing; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 28.)

Pedioplana haeckeli Wolff. (Cent. f. Bakt., II Abt., *18*, 1907, 9.) Motile. From rotting beets. Placed in a new genus *Pedioplana* Wolff (*loc. cit.*, 9).

Streptococcus damnosus var. *mucosus* Shimwell. (Shimwell, Sect. 670, Hind, Brewing Science and Practice, New York, 1940.) From ropy beer.

Appendix III*. The following species have been found in the literature and are listed here chiefly for their historical interest. Many are incompletely described, while many others are identical with previously described species. See Monographs by Winslow and Winslow, Systematic Relationships of the *Coccaceae*, 1908 and Hucker, N. Y. State Exper. Sta., Tech. Buls. Nos. 99–103. References are to Tech. Bul. 102.

Ascococcus cantabridgensis Hankin. (Quoted from Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 165.) Migula (Syst. d. Bakt., *2*, 1900, 195) reports he is unable to find further reference to this organism and we likewise are unable to trace it. From the human mouth.

Ascococcus gangrenosus Bevan. (Med. News, No. 1003, 1892, 375; Abst. in Cent. f. Bakt., *13*, 1893, 796.) From a gangrenous foot.

Ascococcus vibrans van Tieghem. (Bul. Soc. Bot. France, *27*, 1880, 150.) From water.

Aurococcus tropicus Chalmers and O'Farrell. (1913, quoted from Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 931.) Found in Ceylon in granulating ulcers of skin.

Coccus carduus Heurlin. (Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen. Helsingfors, 1910, 136.) Anaerobic. From genital canal.

Coccus caudatus Heurlin (*loc. cit.*, 84). From genital canal.

Coccus vaginalis Heurlin (*loc. cit.*, 79). From genital canal.

Galactococcus albus Guillebeau. (Landwirtsch. Jahrb. d. Schweiz, *4*, 1892, 27; Abst. in Cent. f. Bakt., *12*, 1892, 101.) From milk from an inflamed udder.

Galactococcus fulvus Guillebeau (*loc. cit.*). From milk from an inflamed udder.

Galactococcus versicolor Guillebeau (*loc. cit.*). From milk from an inflamed udder.

Gyrococcus flaccidifex Glaser and Chapman. (Science, *36*, 1912, 219.) Isolated from the gypsy moth, *Porthetria dispar*.

Jodococcus vaginatus Miller. (Miller,

* Prepared for Prof. G. J. Hucker by Mrs. Eleanore Heist Clise, New York State Experiment Station, Geneva, New York, March, 1943.

Mikroorganismen der Mundhöhle, 1889, 54; *Bacterium iogenum* Baumgartner, Ergebnisse d. ges. Zahnheilk., Heft 2, 1910, 729; Abst. in Cent. f. Bakt., I Abt., Ref., *48*, 1911, 621.) From the oral cavity.

Merismopedia aurantiaca Maggiora. (Giorn. Soc. Ital. d'Igiene, *11*, 1889, 354; Abst. in Cent. f. Bakt., *8*, 1890, 13.) From the normal skin of the human foot.

Micrococcus achrous Migula. (No. 16, Lembke, Arch. f. Hyg., *26*, 1896, 310; Migula, Syst. d. Bakt., *2*, 1900, 201.) From feces. Winslow and Winslow (Systematic Relationships of the Coccaceae, 1908, 224) state that this species is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus acidi lactici Marpmann. (Ergänzungsheft d. Cent. f. allg. Gesundheitspflege, *2*, 1886, 22.) Found in fresh milk.

Micrococcus acidovorax Müller-Thurgau and Osterwalder. (Cent. f. Bakt., II Abt., *36*, 1913, 236.) From wine. Hucker (*loc. cit.*, 6) considers this a synonym of *Micrococcus luteus* Cohn or *Micrococcus varians* Migula.

Micrococcus acne Holland. (Jour. Bact., *5*, 1920, 223; *Staphylococcus acne* Holland, *ibid.*, 225; see *Micrococcus cutis communis* Sabouraud.)

Micrococcus (*Staphylococcus*) *acridicida* Kufferath. (Ann. de Gembloux, *27*, 1921, 253.) Isolated from diseased locusts from Greece. Resembles *Micrococcus aureus* Zopf.

Micrococcus aerius Chester. (No. 49, Conn, Storrs Agr. Exp. Sta. 7th Ann. Rept., 1895, 81; Chester, Man. Determ. Bact., 1901, 104.) From dust. Hucker (*loc. cit.*, 12) states that this species appears to be identical with *Micrococcus aureus* Zopf.

Micrococcus aerogenes Miller. (Miller, Deutsche med. Wehnschr., *12*, 1886, 119; not *Micrococcus aerogenes* Bergey et al., Manual, 1st ed., 1923, 70.) From the alimentary canal.

Micrococcus agilis albus Catterina. (Cent. f. Bakt., I Abt., Orig., *34*, 1903, 108.) Found in septicemia of rabbits. Motile with one or two flagella.

Micrococcus albatus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 479.) From the intestine of a woodpecker (*Picus major*). Winslow and Winslow (Systematic Relationships of the Coccaceae, 1908, 199) state that this species appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (N. Y. Agr. Exper. Sta., Tech. Bull. 102, 19) regards it as a synonym of *Micrococcus freudenreichii* Guillebeau or *Micrococcus ureae* Cohn.

Micrococcus albescens Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 76.) From cheese. Winslow and Winslow (*loc. cit.*, 199) state that this species appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) regards it as a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus albidus Losski. (Losski, Inaug. Diss., Dorpat, 1893, 55; not *Micrococcus albidus* Henrici, see *Micrococcus subniveus* below; not *Micrococcus albidus* Roze, Compt. rend. Acad. Sci. Paris, *122*, 1896, 750.) From soil. Hucker (*loc. cit.*, 19) regards this species as a synonym of *Micrococcus freudenreichii* Guillebeau or *Micrococcus ureae* Cohn.

Micrococcus albocereus Migula. (*Staphylococcus cereus albus* Passet, Untersuch. ü. d. Aetiol. d. eiterigen Phlegmone d. Menschen, Berlin, 1885, 53, and Fortschr. d. Med., *3*, 1885; *Micrococcus cereus albus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 182; *Staphylococcus cereus* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; Migula, Syst. d. Bakt., *2*, 1900, 56; *Staphylococcus cereus-albus* Holland, Jour. Bact., *5*, 1920, 225.) From human pus, also from water. Winslow and Winslow (Systematic Relationships of the Coccaceae, 1908, 205) consider this a synonym of *Micrococcus*

candidus Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus albus Frankland and Frankland. (Phil. Trans. Roy. Soc., London, *178*, B, 1888, 264; not *Micrococcus albus* Matzuschita, Cent. f. Bakt., I Abt., *29*, 1901, 382; not *Micrococcus albus* Buchanan, Veterinary Bacteriology, 1911, 196; not *Micrococcus albus* Macé, Traité Pratique de Bact., 6th éd., 1912, 605.) From air. Resembles *Micrococcus candicans*.

Micrococcus albus II Maggiora. (Cent. f. Bakt., *8*, 1890, 13.) See *Micrococcus opalescens* De Toni and Trevisan. From the skin of the human foot.

Micrococcus amplus Migula. (Grauweisser Diplococcus, Bumm, Der Mikroorg. d. gonorrh. Schleimhauterkrank., 1 Aufl., 1885, 17; *Micrococcus albicans amplus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 183; *Neisseria albicans* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; *Diplococcus albicans amplus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 24; Migula, Syst. d. Bakt., *2*, 1900, 118; *Micrococcus albicans* Chester, Man. Determ. Bact., 1901, 80.) From vaginal secretions. Hucker (*loc. cit.*, 15) considers this species identical with *Micrococcus albus* Schroeter.

Micrococcus ampullaceus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 477.) From the intestine of a dove (*Columba oenas*). Hucker (*loc. cit.*, 19) considers this a synonym of *Micrococcus freudenreichii* Guillebeau or *Micrococcus ureae* Cohn.

Micrococcus annulatus Kern (*loc. cit.*, 490). From the stomach contents of the hedge sparrow (*Passer montanus*) and the intestine of the rock dove (*Columba livia*). Winslow and Winslow (Systematic Relationships of the Coccaceae, 1908, 216) consider this species a synonym of *Micrococcus flavus* Lehmann and Neumann.

Micrococcus aquatilis Bolton. (Zschr. f. Hyg., *1*, 1886, 94; not *Micrococcus aquatilis* Chester, see below.) From water. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus aquatilis Chester. (*Micrococcus aquatilis invisibilis* Vaughan, Amer. Jour. Med. Sci., *104*, 1892, 183; Chester, Man. Determ. Bact., 1901, 88.) From water. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus aquatilis albus. (Quoted from Toporoff, Protok. d. Kaiserl. kaukasisch Mediz. Gesellsch., 1892, No. 21; Abst. in Cent. f. Bakt., *13*, 1893, 487.) From water.

Micrococcus aquatilis flavus. (Quoted from Toporoff, *loc. cit.*) From water.

Micrococcus aqueus Migula. (No. 25, Lembke, Arch. f. Hyg., *26*, 1896, 317; Migula, Syst. d. Bakt., *2*, 1900, 204.) From feces. Winslow and Winslow (*loc. cit.*, 184) state that this species is apparently a synonym of *Micrococcus aureus* Zopf, while Hucker (*loc. cit.*, 15) regards this as a synonym of *Micrococcus albus* Schroeter.

Micrococcus arborescens lactis Conn. (Conn, Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 46; *Micrococcus lactis arborescens* Conn, Esten and Stocking, Storrs Agr. Exp. Sta. 18th Ann. Rept., 1907, 110.) From milk. Hucker (*loc. cit.*, 21) regards this as a synonym of *Micrococcus candidus* Cohn or *Micrococcus epidermidis* Hucker.

Micrococcus argenteus Migula. (No. 27, Lembke, Arch. f. Hyg., *26*, 1896, 317; Migula, Syst. d. Bakt., *2*, 1900, 206.) From feces. Winslow and Winslow (*loc. cit.*, 184) state that this species is apparently a synonym of *Micrococcus aureus* Zopf, while Hucker (*loc. cit.*, 10) considers it a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus ascoformans Johne. (*Zoogloea pulmonis equi* Bollinger, Arch. f. path. Anat., *49*, 1870, 583; *Discomyces equi* Rivolta, Giorn. di Anat. e Fisiolog.,

10, 1884; Johne, Ber. u. d. Veterin. im Königr. Sachsen, Jahr 1885, 47; *Ascococcus johnei* Cohn in letter to Johne, Deutsche Ztschr. f. Thiermed., *12*, 1886, 210; *Micrococcus botryogenus* Rabe, Deut. Ztschr. f. Thiermed., *12*, 1886, 137; *Botryomyces equi* Bollinger, Deut. Ztschr. f. Thiermed., *13*, 1887, 176; *Botryococcus ascoformans* Kitt, Cent. f. Bakt., *3*, 1888, 247; *Bollingera equi* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 26; *Staphylococcus ascoformans* Ford, Textb. of Bact., 1927, 424; *Staphylococcus aureus* var. *equi* Hauduroy et al., Dict. d. Bact. Path., 1937, 504.) Causes botryomycosis in horses. Lehmann and Neumann (Bakt. Diag., 7 Aufl., *2*, 1927, 291) consider this a form of *Micrococcus aureus* Zopf; while Hucker (*loc. cit.*, 15) regards this as a form of *Micrococcus albus* Schroeter.

Micrococcus ascoformis Fermi. (Arch. f. Hyg., *10*, 1890, 10.) Presumably intended for *Micrococcus ascoformans* Johne.

Micrococcus asper Migula. (Seibert, Inaug. Diss., Würzburg, 1894, 12; Migula, Syst. d. Bakt., *2*, 1900, 82.) From a hairbrush. Winslow and Winslow (*loc. cit.*, 205) consider this species to be a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus aurantiacus-sorghi Bruyning. (Arch. Néer. Sci. Exact. et Nat., *1*, 1898, 297; *Streptococcus aurantiacus* Chester, Man. Determ. Bact., 1901, 69.) From sorghum.

Micrococcus aureus Chester. (*Micrococcus cremoides aureus* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 349; Chester, Manual Determ. Bact., 1901, 99.) From dust. Regarded by Dyar as a varietal form of *Micrococcus cremoides* Zimmermann. Winslow and Winslow (*loc. cit.*, 184) consider this species a synonym of *Micrococcus aureus* Zopf.

Micrococcus aureus lactis Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 36.) From milk. This seems to be identical with *Micrococcus lactis aureus A*, Conn, Esten and Stocking, Storrs Agr. Exper. Sta. 18th Ann. Rept., 1907, 119. Hucker (*loc. cit.*, 9) regards this species as identical in part with *Micrococcus flavus* Lehmann and Neumann and with *Micrococcus conglomeratus* Migula.

Micrococcus (*Sarcina*) *baccatus* Migula. (No. 18, Lembke, Arch. f. Hyg., *26*, 1896, 311; Migula, Syst. d. Bakt., *2*, 1900, 202.) From feces. Winslow and Winslow (*loc. cit.*, 232) state that this is a yellow, gelatin-liquefying sarcina, apparently a synonym of *Sarcina flava* De Bary. Hucker (*loc. cit.*, 10) considers this a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus badius Lehmann and Neumann. (Bakt. Diag., 1 Aufl., *2*, 1896, 163.) Received from the Kral collection as *Sarcina lutea*. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Lehmann and Neumann.

Micrococcus baregensis purpureus Robine and Hauduroy. (Compt. rend. Soc. Biol., Paris, *98*, 1928, 25.) From hot sulfur springs at Barèges.

Micrococcus beigelii (Rabenhorst) Migula. (*Pleurococcus beigelii* Küchenmeister and Rabenhorst, Hedwigia, 1867, No. 4; *Sclerotium beigelianum* Hallier, 1868; *Zoogloea beigeliana* Eberth, 1873; *Hyalococcus beigelii* Schroeter, Kryptog.-Flora v. Schlesien, *3*, 1, 1886, 152; *Chlamydatomus beigelii* Trevisan, Rendiconti Reale Inst. Lombardo de Sci. e Lett., Ser. II, *12*, 1879, 22; Migula, Syst. d. Bakt., *2*, 1900, 193; *Trichosporum beigelii* Vuillemin, 1901.) From human hair.

Micrococcus beri-beri Pekelharing. (Pekelharing, Weekblad v. h. Ned. Tijdschr. v. Geneesk., No. 25; also Pekelharing and Winkler, Deut. med. Wchnschr., No. 39, 1887, 845; *Neisseria winkleri* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32.) Considered the cause of beri-beri by Pekelharing. Winslow and Winslow (*loc. cit.*, 184) state that this is apparently a synonym of *Micrococcus aureus* Zopf; while Hucker (*loc. cit.*, 11) considers

this a synonym of *Micrococcus citreus* Migula.

Micrococcus bicolor Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 485.) From the intestine of a dove (*Columba oenas*). Hucker (*loc. cit.*, 21) considers this a synonym of *Micrococcus candidus* Cohn or of *Micrococcus epidermidis* Hucker.

Micrococcus billrothii (Cohn) Migula. (*Ascococcus billrothii* Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 3, 1875, 151; Migula, Syst. d. Bakt., *2*, 1900, 195.) Found in putrefying meat infusion.

Micrococcus biskra Heydenreich. (Heydenreich, Ausgabe d. Haupt Med.-Verhalt., St. Petersburg, 1888; see Cent. f. Bakt., *5*, 1889, 163; *Staphylococcus biskrae* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; *Micrococcus heydenreichii* Chester, Man. Determ. Bact., 1901, 91.) Found in ulcers in an Oriental skin disease. Winslow and Winslow (*loc. cit.*, 184) state that this is apparently a synonym of *Micrococcus aureus* Zopf; while Hucker (*loc. cit.*, 11) considers it a synonym of *Micrococcus citreus* Migula.

Micrococcus boleti Passerini. (Erbar. crittogam. Italiano, II ser., No. 1199; quoted from Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 34.) Saprophytic on a fungus (*Boletus edulis*).

Micrococcus bombycis (Naegeli) Cohn. (*Panhistophyton ovatum* Lebert, Jahresber. ü. d. Wirksamkeit d. Vereins z. Beförd. d. Seidenbaues f. Brandenburg im Jahre 1856–57, 28; and Berliner Entomolog. Ztschr., 1858; *Nosema bombycis* Naegeli, Botan. Sect. d. 33 Versammlg. d. Naturf. u. Aerzte in Bonn, 1857, 160; and Botan. Zeitg., 1857, 760; *Microzyma bombycis* Béchamp, Compt. rend. Acad. Sci., Paris, *64*, 1867, 1045; Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 165; *Micrococcus ovatus* Winter, in Rabenhorst, Krypt. Flora v. Deutschl., Oesterr. u. d. Schweiz, 2 Aufl., *1*, 1884, 47; *Streptococcus bombycis* Zopf, Die Spaltpilze, 2 Aufl., 1884, 52.) Found in the blood and organs of diseased silkworms (*Bombyx mori*).

Micrococcus boreus Issatchenko. (Recherches sur les Microbes de l'Océán Glacial Arctique, Petrograd, 1914, 144.) From sea water.

Micrococcus bovinus Migula. (Micrococcus der Lungenseuche der Rinder, Poels and Nolen, Fortschr. d. Med., 1886, 217; Migula, Syst. d. Bakt., *2*, 1900, 67.) From the lungs of diseased cattle. Hucker (*loc. cit.*, 22) regards this a synonym of *Micrococcus candidus* Cohn or of *Micrococcus epidermidis* Hucker.

Micrococcus bovis Migula. (Hematococcus, Babes, Compt. rend. Acad. Sci., Paris, *107*, 1888, 692 and *110*, 1890, 800 and 975; also see Arch. f. path. Anat., *115*, 1889; *Neisseria babesi* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; *Haematococcus bovis* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 271; Migula, Syst. d. Bakt., *2*, 1900, 85.) From the blood and organs of cattle.

Micrococcus burchardti Trevisan. (Coccus bei keratitis phlyctaenulosa, Burchardt, Cent. f. Bakt., *1*, 1887, 392; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) Pathogenic. From the cornea of a rabbit.

Micrococcus butyri (v. Klecki) Migula. (*Diplococcus butyri* von Klecki, Cent. f. Bakt., *16*, 1894, 358; Migula, Syst. d. Bakt., *2*, 1900, 216.) From rancid butter. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus butyri fluorescens Teichert. (Inaug. Diss., Jena, 1904; Abst. in Cent. f. Bakt., II Abt., *13*, 1904, 561.) From milk. Exhibits a green fluorescence.

Micrococcus butyricus (von Klecki) Migula. (*Tetracoccus butyricus* von Klecki, Cent. f. Bakt., *15*, 1894, 360; Migula, Syst. d. Bakt., *2*, 1900, 216.) From rancid butter. Winslow and Winslow (*loc. cit.*, *220*) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus calco-aceticus Beijerinck. (Proc. Sect. Sci., Kon. Akad. v. Wetenschappen, *13*, 1911, 1066; Abst. in Cent. f. Bakt., II Abt., *31*, 1912, 290.) Occurs commonly in soils.

Micrococcus campeneus Orme. (Jour. Trop. Med. and Hyg., *11*, 1908, No. 10, May 15; Abst. in Cent. f. Bakt., I Abt., Ref., *43*, 1909, 299.)

Micrococcus candicans Flügge. (Die Mikroorganismen, 2 Aufl., 1886, 173; *Albococcus candicans* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 544; *Staphylococcus candicans* Holland, Jour. Bact., *5*, 1920, 225.) From air, water and milk. Hucker (*loc. cit.*, 22) regards this a synonym of *Micrococcus candidus* Cohn or of *Micrococcus epidermidis* Hucker. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 255.

Micrococcus canescens Migula. (Micrococcus No. 4, Adametz, Landwirtsch. Jahrb., *18*, 1889, 240; Migula, Syst. d. Bakt., *2*, 1900, 51; *Albococcus canescens* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 544; *Staphylococcus canescens* Holland, Jour. Bact., *5*, 1920, 225.) From Emmenthal cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus capillorum (Buhl) Trevisan. (*Zoogloea capillorum* Buhl, Ztschr. f. ration. Med., II Reihe, *14*, 18–, 356; *Palmella capillorum* Kühn, Abhandl. d. Naturf. Ges. zu Halle, *9*, Heft 1, 18–, 62; *Palmellina capillorum* Rabenhorst, Flor. Eur. Alg., 3, 1856 (?), 35; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) From the skin. Considered pathogenic.

Micrococcus capsaformans Jamieson and Edington. (Brit. Med. Jour., *1*, June 11, 1887, 1262; *Micrococcus capriformis* (sic), Abst. in Cent. f. Bakt., *2*, 1887, 223.) From the scales and blood of scarlet fever patients. Not pathogenic.

Micrococcus carbo Renault. (Compt. rend. Acad. Sci., Paris, *123*, 1896, 935.)

Micrococcus carneus Zimmermann. (Roter Coccus, Maschek. Bakt. Untersuch d. Leitmeritz. Trinkwassers, No. 5, 1887, 60; Zimmermann, Die Bakt. unserer Trink- u. Nutzwässer, Chemnitz, I Reihe, 1890, 78.) From water. Hucker (*loc. cit.*, 25 and 26) regards this species as identical with *Micrococcus roseus* Flügge or *Micrococcus cinnabareus* Flügge.

Micrococcus carnicolor Frankland and Frankland. (Phil. Trans. Roy. Soc. London, *178*, B, 1888, 263; not *Micrococcus carnicolor* Kern, see *Micrococcus subcarneus* below.) From air. Hucker (*loc. cit.*, 25) states that this species may be identical with *Micrococcus roseus* Flügge.

Micrococcus carniphilus Wilhelmy. (Arb. bakt. Inst. Karlsruhe, *3*, 1903, 10.) From a meat extract.

Micrococcus casei amari edamicus Raamot. (Inaug. Diss., Königsberg, 1906; Abst. in Cent. f. Bakt., II Abt., *18*, 1907, 348.) From pasteurized skim milk.

Micrococcus castellanii Chalmers and O'Farrell. (Ann. Trop. Med. and Parasitol., *7*, 1913, 528; *Rhodococcus castellanii* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 2102.) Found in the red variety of trichomycosis axillaris, a tropical disease.

Micrococcus cartharinensis Issatchenko. (Recherches sur les Microbes de l'Oceán Glacial Artique, Petrograd, 1914, 148.) From sea water.

Micrococcus cellaris (Schroeter) Migula. (*Leucocystis cellaris* Schroeter, Kryptog. Flora v. Schlesien, *3*, 1886, 152; Migula, Syst. d. Bakt., *2*, 1900, 195.) From a coating on the walls of damp cellars and mines.

Micrococcus centropunctatus Issatchenko. (Recherches sur les Microbes de l'Oceán Glacial Arctique, Petrograd, 1914, 146.) From sea water.

Micrococcus cerasinus Migula. (Micrococcus aus roter Milch, Keferstein; Cent. f. Bakt., I Abt., *21*, 1897, 177; *Micrococcus cerasinus lactis* Heim, Lehrb.

d. Bakt., 2 Aufl., 1898, 299; Migula, Syst. d. Bakt., *2*, 1900, 170; not *Micrococcus cerasinus* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 179; *Micrococcus kefersteinii* Chester, Man. Determ. Bact., 1901, 107.) From red milk. Hucker (*loc. cit.*, 26) regards this species as identical with *Micrococcus cinnabareus* Flügge.

Micrococcus cereus Migula. (*Staphylococcus cereus flavus* Passet, Untersuchungen über die Aetiologie der eiterigen Phlegmone des Menschen, 1885, 53; *Micrococcus cereus flavus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 182; *Staphylococcus passeti* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; Migula, Syst. d. Bakt., *2*, 1900, 126; *Staphylococcus cereus-flavus* Holland, Jour. Bact., *5*, 1920, 225.) From pus. Winslow and Winslow (*loc. cit.*, 220) consider this species identical with *Micrococcus luteus* Migula. For a description of this organism, see Bergey et al., Manual, 5th ed., 1939, 241.

Micrococcus cereus aureus Dyar. (Ann. N. Y. Acad. Sci., *8*, 1895, 347.) Obtained as *Staphylococcus cereus aureus* from Kral's laboratory; also found in air.

Micrococcus cerinus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 84.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus chersonesia Corbet. (Quart. Jour. Rubber Research Inst., Malaya, *2*, 1930, 150.) From the latex of the rubber tree (*Hevea brasiliensis*). For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 258.

Micrococcus chinicus Emmerling and Abderhalden. (Cent. f. Bakt., II Abt., *10*, 1902, 337.) Putrefying meat.

Micrococcus chlorinus Cohn. (Grüngelber Coccus, Maschek, Jahresber. d. Kom.- Oberrealschule zu Leitmeritz, 1887, 66; Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 155.) From water and dust. Hucker (*loc. cit.*, 10) considers this a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus chromidrogenus citreus Trommsdorff. (Münch. Med. Wochnschr., 1904, No. 29, 1286; Abst. in Cent. f. Bakt., I Abt., Ref., *37*, 1905, 60.) Isolated from a case of chromidrosis of the axilla.

Micrococcus chromidrogenus ruber Trommsdorff (*loc. cit.*). Isolated from a case of chromidrosis of the axilla.

Micrococcus chromoflavus Huss. (Cent. f. Bakt., II Abt., *19*, 1907, 520.) From cheese

Micrococcus chryseus Frankland and Frankland. (Phil. Trans. Roy. Soc. London, 178, B, 1888, 268.) From dust. Winslow and Winslow (*loc. cit.*, 184) state that this species is apparently a synonym of *Micrococcus aureus* Zopf.

Micrococcus cinnabarinus Zimmermann. (Die Bakt. unserer Trink- u. Nutzwässer, Chemnitz, I Reihe, 1890, 76.) From water. Hucker (*loc. cit.*, 26) regards this species as identical with *Micrococcus cinnabareus* Flügge.

Micrococcus cirrhiformis Migula. (Ranken Coccus, Maschek, Jahresber. d. Kom.- Oberrealschule in Leitmeritz, 1887, 66; Migula, Syst. d. Bakt., *2*, 1900, 53.) From water. Hucker (*loc. cit.*, 22) considers this a synonym of *Micrococcus candidus* Cohn or of *Micrococcus epidermidis* Hucker.

Micrococcus citreus I and *II*, Maggiora. (Giorn. Soc. Ital. d'Igiene, *11*, 1889, 354; Abst. in Cent. f. Bakt., *8*, 1890, 13; not *Micrococcus citreus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 36; not *Micrococcus citreus* Migula, Syst. d. Bakt., *2*, 1900, 147; not *Micrococcus citreus* Winslow and Winslow, Systematic Relationships of the Coccaceae, 1908, 218.) From the normal skin of the foot.

Micrococcus citreus granulatus Freund. (Inaug. Diss., Erlangen, 1893, 27; Abst. in Cent. f. Bakt., *16*, 1894, 641; *Micrococcus granulatus* Bazarewski, Cent. f. Bakt., II Abt., *15*, 1905, 7; not *Micrococcus granulatus* Weiss, Arb. bakt. Inst.

Karlsruhe, *2*, Heft 3, 1902, 197.) From the oral cavity. Hucker (*loc. cit.*, 9) regards this as a synonym of *Micrococcus flavus* Trevisan.

Micrococcus citreus lactis Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 40.) From milk. Hucker (*loc. cit.*, 10) considers this a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus citreus rigensis Bazarewski. (Cent. f. Bakt., II Abt., *15*, 1905, 5.) From dust.

Micrococcus citrinus Migula. (*Diplococcus citreus liquefaciens* Unna and Tommasoli, Monats. f. prakt. Dermatologie, *9*, 1889, 56; Migula, Syst. d. Bakt., *2*, 1900, 150; *Micrococcus tommasoli* Chester, Man. Determ. Bact., 1901, 101; *Micrococcus citreus liquefaciens* Winslow and Winslow, Systematic Relationships of the Coccaceae, 1908, 216.) From human skin in a case of eczema. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus claviformis von Besser. (Beitr. z. path. Anat. u. z. allgem. Path., *6*, 1889, 340; see Cent. f. Bakt., *7*, 1890, 152.) Found once in nasal secretions.

Micrococcus coccineus Migula. (Micrococcus No. VI, Adametz, Landwirtsch. Jahrb., *18*, 1889, 242; Migula, Syst. d. Bakt., *2*, 1900, 174.) From Emmenthal cheese. Hucker (*loc. cit.*, 26) regards this species identical with *Micrococcus cinnabareus* Flügge.

Micrococcus coli brevis Lehmann. (Lehmann, Inaug. Diss., München, 1903; Abst. in Cent. f. Bakt., I Abt., Ref., *36*, 1905, 688.) From feces of infants.

Micrococcus communis lactis Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 48.) From milk. Hucker (*loc. cit.*, 19) considers this a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus commensalis (Turró) Migula. (*Diplococcus commensalis* Turró, Cent. f. Bakt., *16*, 1894, 1; Migula, Syst. d. Bakt., *2*, 1900, 125.) From sputum. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus commutatus De Toni and Trevisan. (*Micrococcus albus I* or *Micrococcus albus fluidificans* Maggiora, Giorn. Soc. Ital. d'Igiene, *11*, 1889, 350; De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1079.)

Micrococcus concentricus Zimmermann. (Die Bakt. unserer Trink- u. Nutzwässer, Chemnitz, I Reihe, 1890, 86.) From water. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus confluens Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 494.) From the stomach and intestine of the starling (*Sturnus vulgaris*) and the finch (*Fringella carduelis*). Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus conjunctivae Migula. (*Micrococcus liquefaciens conjunctivae* Gombert, Recherches expérimentales sur les microbes des conjunctives, Montpellier and Paris, 1889; Migula, Syst. d. Bakt., *2*, 1900, 115.) From normal human conjunctiva. Hucker (*loc. cit.*, 15) considers this a synonym of *Micrococcus albus* Schroeter.

Micrococcus conjunctividis Migula. (*Micrococcus flavus conjunctivae* Gombert, Recherches expérimentales sur les microbes des conjunctives, Montpellier and Paris, 1889; Migula, Syst. d. Bakt., *2*, 1900, 141.) From normal human conjunctiva. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan; while Hucker (*loc. cit.*, 11) regards it as a synonym of *Micrococcus citreus* Migula.

Micrococcus conoideus Migula. (*Staphylococcus salivarius pyogenes* Biondi, Ztschr. f. Hyg., *2*, 1887, 227; *Staphylococcus sialopyus* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889,

32; *Micrococcus salivarius pyogenes* Freire, Mémoire sur la bactériologie, pathogénie, traitement et prophylaxie de la fievre jaune. Rio de Janiero, 1898; Abst. in Cent. f. Bakt., I Abt., *26*, 1899, 741; *Staphylococcus pyogenes salivarius*, quoted from Goadby, Trans. of Odontolog. Society, June, 1899, see Abst. in Cent. f. Bakt., I Abt., Ref., *31*, 1902, 493; Migula, Syst. d. Bakt., *2*, 1900, 102.) From saliva. Hucker (*loc. cit.*, 12 and 15) regards this as a synonym of *Micrococcus aureus* Zopf or of *Micrococcus albus* Schroeter.

Micrococcus corallinus Cantani. (Cantani, Cent. f. Bakt., I Abt., *23*, 1898, 311; *Rhodococcus coralinus* (sic) Levine and Soppeland, Iowa State Coll. Engineering Exp. Sta. Bul. 77, 1926, 22.) From dust. Hucker (*loc. cit.*, 25) considers this a synonym of *Micrococcus roseus* Flügge. Levine and Soppeland (*loc. cit.*) regard this as a synonym of *Rhodococcus fulvus* Winslow and Rogers. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 253.

Micrococcus coralloides Zimmermann. (Die Bakt. unserer Trink- u. Nutzwässer, Chemnitz, II Reihe, 1894, 72.) From water. Winslow and Winslow (*loc. cit.*, 199) state that this species appears to be a synonym of *Micrococcus albus* Zopf; while Hucker (*loc. cit.*, 17) considers it a synonym of *Micrococcus caseolyticus* Evans.

Micrococcus corrugatus Migula. (*Merismopedia mesentericus corrugatus* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 355; Migula, Syst. d. Bakt., *2*, 1900, 161.) From dust. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus coryzae (Hajek) Migula. (*Diplococcus coryzae* Hajek, Berliner klin. Wochnschr., No. 33, 1888; Migula, Syst. d. Bakt., *2*, 1900, 63.) From secretions in acute catarrh. Winslow and Winslow (*loc. cit.*, 205) consider this a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus cremoides Zimmermann. (Die Bakt. unserer Trink- u. Nutzwässer, Chemnitz, I Reihe, 1890, 74.) From water. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan; while Hucker (*loc. cit.*, 10) considers it a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus cremoides albus Dyar. (Ann. N. Y. Acad. Sci., *8*, 1895, 350). From dust. Regarded by Dyar as a white form of *Micrococcus cremoides* Zimmermann.

Micrococcus cremorisviscosi (Hammer and Cordes) Bergey et al. (*Staphylococcus cremoris-viscosi* Hammer and Cordes, Jour. Dairy Sci., *3*, 1920, 291; Bergey et al., Manual, 3rd ed., 1930, 86.) From ropy milk. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 254.

Micrococcus crepusculum (Ehrenberg) Cohn. (*Monas crepusculum* Ehrenberg, Abhandl. d. Berliner Akad., 1830, 74 and 1832, 57; Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 160.) De Toni and Trevisan (in Saccardo, Sylloge Fungorum, *8*, 1889, 1082) list the following as synonyms of this species; *Protococcus nebulosus* Kützing, Linneae, *8*, 1833, 365; *Cryptococcus nebulosus* Kützing, Phycol. gener., 1845, 147; *Cryptococcus natans* Kützing, Spec. Alg., 1849, 146.

Micrococcus cretaceus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 65.) From cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus cristatus Glage. (Ztschr. f. Fleisch- u. Milch-hygiene, *10*, 1900, 145.) From the surface of wurst and similar meat products.

Micrococcus cruciformis Freire. (Compt. rend. Acad. Sci., Paris, *128*, 1899, 1047.) From the stamens and pistils of *Hibiscus*.

Micrococcus cumulatus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 497; not *Micrococcus cumulatus* Chester,

see *Micrococcus tenuissimus* Migula.) From the stomach and intestine of the yellow-hammer (*Emberiza citrinella*) and of the finch (*Fringella carduelis*). Hucker (*loc. cit.*, 25) regards this as a synonym of *Micrococcus roseus* Flügge.

Micrococcus cupularis Migula. (No. 29, Lembke, Arch. f. Hyg., *29*, 1897, 331; Migula, Syst. d. Bakt., *2*, 1900, 211.) From feces. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus cupuliformis Migula. (No. 19, Lembke, Arch. f. Hyg., *29*, 1897, 325; Migula, Syst. d. Bakt., *2*, 1900, 213.) From feces. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus curtissi Chorine. (Chorine, Internat. Corn Borer Invest. Chicago, *2*, 1929, 48.) From diseased larvae of the corn borer (*Pyrausta nubilalis*). Also virulent to larvae of the flour moth (*Ephestia kühniella*) and of the bee moth (*Galleria mellonella*).

Micrococcus cutis communis Sabouraud. (Sabouraud, Ann. d. dermatol. et syphil., 1896, Heft 3; Abst. in Cent. f. Bakt., I Abt., *20*, 1896, 249; *Staphylococcus cutis communis* Sabouraud, Practique Dermatologique, *1*, 1903, 714.) From human skin especially in alopecia areata, certain types of eczema and acne. May be the same as *Micrococcus epidermidis* Hucker.

Micrococcus cyaneus (Schroeter) Cohn. (*Bacteridium cyaneum* Schroeter, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 122 and 126; Cohn, *ibid.*, 156; *Nigrococcus cyaneus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 932.) From dust and water.

Micrococcus cyanogenus Pammel and Combs. (Proc. Iowa Acad. Sci., *3*, 1895, 136; see Abst. in Cent. f. Bakt., II Abt., *2*, 1896, 764.) From milk.

Micrococcus cyclops Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 69.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus cystiopoeus Müller-Thurgau. (Cent. f. Bakt., II Abt., *20*, 1908 464.) From wine.

Micrococcus cytophagus Merker. (Cent. f. Bakt., II Abt., *31*, 1912, 589.) Found on the leaves of *Elodea*. Utilizes cellulose. Stanier (Bact. Rev., *6*, 1942 150) thinks that these micrococci were microcysts of *Sporocytophaga spp.*

Micrococcus dantecii Chester. (Coccus du rouge de morue, Le Dantec, Ann. Past. Inst., *5*, 1891, 662; Chester, Man. Determ. Bact., 1901, 106.) From red salted codfish. Hucker (*loc. cit.*, 25) considers this a synonym of *Micrococcus roseus* Flügge.

Micrococcus decalvens (Thin) Schroeter. (*Bacterium decalvens* Thin, Monats. f. prakt. Dermatol., No. 28, 1885; Schroeter in Cohn, Kryptog.-Flora v. Schlesien, *3*, 1, 1886, 149.) From hair follicles in alopecia areata.

Micrococcus decipiens Trevisan. (Bactérie de l'air, Cornil and Babes, Les Bactéries, 1885, 124; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 34.) From dust.

Micrococcus (*Streptococcus* ?) *decolor* Migula. (No. 22, Lembke, Arch. f. Hyg., *26*, 1896, 311; Migula, Syst. d. Bakt., *2*, 1900, 203.) From feces. Hucker (*loc. cit.*, 17) considers this a synonym of *Micrococcus caseolyticus* Evans.

Micrococcus deformans Crowe. (Brit. Med. Jour., Nov. 27, 1920, 815; Abst. in Cent. f. Bakt., I Abt., Ref., *73*, 1922, 84.) From cases of arthritis. A form of *Micrococcus pyogenes albus* according to Lehmann and Neumann (Bakt. Diag., 7 Aufl., *2*, 1927, 293).

Micrococcus delacourianus Roze. (Compt. rend. Acad. Sci., Paris, *123*, 1896, 613 and 1323.) From dry rotting potatoes.

Micrococcus dendroporthos Ludwig. (Cent. f. Bakt., *10*, 1891, 10.) From the bark of poplar trees (*Populus sp.*).

Micrococcus denitrificans Beijerinck. (Cent. f. Bakt., II Abt., *25*, 1910, 53.) From Rochelle salts (sodium potassium tartrate).

Micrococcus dermatogenes Fuhrmann. (Cent. f. Bakt., II Abt., *17*, 1906, 618.) From bottled beer.

Micrococcus diffluens Schroeter. (In Cohn, Kryptog.-Flora v. Schlesien, *3*, 1, 1886, 144.) From dust, feces, etc.

Micrococcus dimorphus Bucherer. (Planta, Arch. f. wissen. Bot., 1934, 98.) A dimorphic bacterium. He reports it as much like *Micrococcus melitensis* Bruce and *Bacterium fraenkelii* Hashimoto.

Micrococcus diphtericus (sic) Cohn. (*Micrococcus*, Oertel, Deutsch. Arch. f. klin. Med., *8*, 1871; Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 162; *Streptococcus diphtheriticus* Zopf, Die Spaltpilze, 3 Aufl., 1885, 53.) From throats and nasal passages of diphtheria patients.

Micrococcus dissimilis Dyar. (See Sattler, Cent. f. Bakt., *5*, 1889, 70; Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 353; *Micrococcus trachomatis conjunctivae* Sattler in Kral, Die gegenwartigen Bestand der Kral'schen Sammlung von Mikroorganismen, 1900, 19.) From trachoma infections. Hucker (*loc. cit.*, 17) considers this a synonym of *Micrococcus caseolyticus* Evans.

Micrococcus djokjakartensis Zettnow. (Cent. f. Bakt., I Abt., Orig., *75*, 1915, 376.) From a sugar factory in Java.

Micrococcus doyeni De Toni and Trevisan. (*Micrococcus urinae albus olearius* Doyen, Jour. d. connaiss. médic., No. 14, 1889, 108; De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1076.) From urine. Hucker (*loc. cit.*, 16) states that this species is apparently identical with *Micrococcus albus* Schroeter.

Micrococcus drimophylus Baumgartner. (Baumgartner, Ergebnisse d. ges. Zahnheilk., Heft 2, 1910, 729; Abst. in Cent. f. Bakt., I Abt., Ref., *48*, 1911, 622.) From the mouth cavity.

Micrococcus eatonii Corbet. (Quart. Jour. Rubber Research Inst. Malaya, *2*, 1930, 145.) From the latex of the rubber tree (*Hevea brasiliensis*). For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 244.

Micrococcus eburneus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 85.) From Camembert cheese. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus ephestiae Mattes. (Sitzungsber. d. Gesellsch. z. Beförd. d. gesamt. Naturwissensch. zu Marburg, *62*, 1927, 406.) From the Mediterranean flour moth (*Ephestia kuehniella*).

Micrococcus epimetheus Corbet (*loc. cit.*, 148). From the latex of the rubber tree (*Hevea brasiliensis*). For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 256.

Micrococcus esterificans Beck. (Arb. kaiserl. Gesundheitsamte, *29*, Heft 2, 1905; Abst. in Cent. f. Bakt., II Abt., *19*, 1907, 594.) Has a characteristic fruity aroma. From butter.

Micrococcus exanthematicus Lewascheff. (Deutsch. med. Wochnschr., No. 13 and 34, 1892; Abst. in Cent. f. Bakt., *12*, 1892, 635.) From blood in cases of typhus fever. Motile. Grows anaerobically.

Micrococcus excavatus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 486.) From the stomach contents of a coot (*Fulica atra*) and a woodpecker (*Picus major*). Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus exiguus Kern (*loc. cit.*, 470). From the stomach contents of the chaffinch (*Fringella coelebs*). Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) considers it a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus expositionis Chester. (No.

34, Conn, Storrs Agr. Exp. Sta. 7th Ann. Rept., 1895, 77; Chester, Man. Determ. Bact., 1901, 92.) From air. Winslow and Winslow (*loc. cit.* 216) consider this a synonym of *Micrococcus flavus* Trevisan; while Hucker (*loc. cit.*, 10) regards it as a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus expressus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 195.) From a carrot infusion. Produces slime. Hucker (*loc. cit.*, 7) considers this species a synonym of *Micrococcus luteus* Cohn or of *Micrococcus varians* Migula.

Micrococcus faviformis Migula. (Milchweisser Diplococcus, Bumm, Mikroorg. d. gonorrh. Schleimbautkr., II Ausg., 1887, 18; *Micrococcus lacteus faviformis* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 182; *Neisseria lactea* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; Migula, Syst. d. Bakt., *2*, 1900, 117.) From vaginal and other body secretions. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus feddei Herter. (Micrococcus XVI, Choukevitch, Ann. Inst. Past., *25*, 1911, 354; Botan. Jahresber., *39*, II Abt., Heft 4, 1914, 755; Abst. in Cent. f. Bakt., II Abt., *51*, 1920, 367.) From the large intestine of a horse. Resembles *Micrococcus roscidur* Matzuschita.

Micrococcus fervitosus Adametz and Wichmann (Bakt. d. Trink- u. Nutzwässer, Mitt. Oest. Versuchstat. f. Brauerei u. Mälzerei, Wien, Heft 1, 1888.) From water. Winslow and Winslow (*loc. cit.*, 205) consider this a synonym of *Gaffkya tetragena* Trevisan.

Micrococcus fickii Trevisan. (*Coccus albus non liquefaciens* (*Coccus candicans*) Fick, Ueber Microorg. in Conjunctivalsack, Wiesbaden, 1887; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) From conjunctiva.

Micrococcus finlayensis Sternberg. (Rept. on Etiology and Prevention of Yellow Fever, Washington, 1891, 219.) Obtained by Finlay in cultures from the liver and spleen of a yellow-fever cadaver. Hucker (*loc. cit.*, 11) considers this a synonym of *Micrococcus citreus* Migula.

Micrococcus flaccidifex danai Brown. (Amer. Museum Novit., No. 251, 1927, 5.) Causative agent of wilt disease of monarch butterfly larvae (*Danais archippus*). Considered a sub-species of *Gyrococcus flaccidifex* Glaser and Chapman (Science, *36*, 1912, 219).

Micrococcus flagellatus Klotz. (Jour. Med. Research, *11* (N.S.*6*), 1904, 493.) Found in an epizootic among rabbits and white rats. Supposedly flagellated.

Micrococcus flavens Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 80.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus flavescens Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 79.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 246.

Micrococcus flavidus Henrici. (*loc. cit.*, 81; not *Micrococcus flavidus* Roze, Compt. rend. Acad. Sci., Paris, *122*, 1896, 750.) From Swiss and Limburger cheeses. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus flavovirens Migula. (*Staphylococcus viridis flavescens* Guttmann, Arch. f. path. Anat., *107*, 1887, 261; *Staphylococcus viridi-flavescens* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33; Migula, Syst. d. Bakt., *2*, 1900, 124; *Micrococcus viridis* Chester, Man. Determ. Bact., 1901, 95; *Micrococcus viridis-flavescens* Winslow and Winslow, Systematic Relationships of the Coccaceae, 1906, 221.) Winslow and Winslow (*ibid.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus flavus non liquefaciens

Amsler. (Amsler, Korrespondenbl. f. Schweizer Aerzte, 1900, No. 9; Abst. in Cent. f. Bakt., I Abt., *29*, 1901, 450.) From thermal springs.

Micrococcus fluorescens Maggiora. (Giorn. Soc. Ital. d'Igiene, *11*, 1889, 352; Abst. in Cent. f. Bakt., *8*, 1890, 13.) From the skin of the foot.

Micrococcus foetidus Flügge. (Die Mikroorganismen, 2 Aufl., 1886, 172; not *Micrococcus foetidus* Veillon, Compt. rend. Soc. Biol. Paris, 1893, 867; see *Streptococcus foetidus* Prévot.) From carious teeth.

Micrococcus foetidus Klamann. (Allgem. med. Centralzeitung, 1887, 1344.) Isolated from the posterior nares of man. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus fragilis (Dyar) Migula. (*Merismopedia fragilis* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 351; Migula, Syst. d. Bakt., *2*, 1900, 186.) From dust. Hucker (*loc. cit.*, 25) states that this species may be identical with *Micrococcus roseus* Flügge.

Micrococcus franklandiorum Trevisan. (*Micrococcus candicans* Frankland and Frankland, Phil. Trans. Roy. Soc. London, *178*, B, 1888, 270; not *Micrococcus candicans* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 173; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 34.) From dust.

Micrococcus fulvus Weiss. (Arb. a. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 206; not *Micrococcus fulvus* Cohn, Beitr. z. biol. d. Pflanz., *1*, Heft 3, 1875, 181.) From a bean infusion.

Micrococcus fuscus Adametz. (Brauner Coccus, Maschek, Jahresb. d. Kommunal-Oberrealsch. zu Leitmeritz, No. 6, 1867, 60; Adametz, Bakt. d. Nutz- u. Trinkwässer, Vienna, 1888; *Micrococcus fuscus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 932.) Hucker (*loc. cit.*, 10) states that this species is probably identical with *Micrococcus conglomeratus* Migula.

Micrococcus galbanatus Zimmermann. (Bakt. unserer Trink- u. Nutzwässer, Chemnitz, II Reihe, 1894, 68.) From water. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus gallicidus Burrill. (Amer. Nat., *17*, 1883, 320.) From blood of fowls infected with chicken cholera.

Micrococcus gelatinogenus Bräutigam. (Pharmaceutische Centralhalle, *32*, 1891, 427.) From digitalis infusions. See *Micrococcus gummosus* Happ.

Micrococcus gelatinosus Warrington. (The Lancet, 1, 1888, No. 25; Abst. in Cent. f. Bakt., *4*, 1888, 394.) Curdles milk.

Micrococcus gelatinosus Issatchenko. (Recherches sur les Microbes de l'Océan Glacial Arctique, Petrograd, 1914, 232; not *Micrococcus gelatinosus* Warrington, The Lancet, 1, 1888, No. 25.) From sea water.

Micrococcus giganteus lactis Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 46.) From milk.

Micrococcus gigas Frankland and Frankland. (Philos. Trans. Roy. Soc., London, *178*, B, 1888, 268.) From dust. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus gilvus Losski. (Inaug. Diss., Dorpat, 1893, 60.) Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus gingivae Migula. (*Micrococcus gingivae pyogenes* Miller, Die Mikroorganismen d. Mundhöhle, Leipzig, 1889, 216; Migula, Syst. d. Bakt., *2*, 1900, 68.) From alveolar pyorrhoea, also from the mouth of a healthy man.

Micrococcus gingreardi Renault. (Compt. rend. Acad. Sci., Paris, *120*, 1895, 217.)

Micrococcus glandulosus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 201.) From an asparagus infusion. Hucker

(*loc. cit.*, 19) regards this species as identical with *Micrococcus freudenreichii* Guillebeau or with *Micrococcus ureae* Cohn.

Micrococcus globosus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 469.) From the stomach contents of a coot (*Fulica atra*). Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus granulatus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 197.) From a malt infusion.

Micrococcus granulosus Kern (*loc. cit.*, 483). From the stomach contents of the yellow-hammer (*Emberiza citrinella*) and the starling (*Sturnus vulgaris*). Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus griseus (Warming) Winter. (*Bacterium griseum* Warming, Videnskabelige Meddelelser fra den naturhist. Forening i Kjöbenhavn, 1875, 398; Winter, in Rabenhorst, Kryptog.-Flora v. Deutschl., Oesterr. u. d. Schweiz, 2 Aufl., *1*, 1884, 47.)

Micrococcus grossus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 71.) From Camembert cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus gummosus Happ. (Happ, Inaug. Diss., Basel, 1893, 31; not *Micrococcus gummosus* Weiss, Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 189.) From snakeroot and digitalis infusions. Presumably *Leuconostoc mesenteroides* Van Tieghem.

Micrococcus haematodes Zopf. (Microbes de la sueur rouge, Babes, Biol. Centralbl., *2*, 1882, No. 8; Zopf, Die Spaltpilze, 3 Aufl., 1885, 60.) The cause of red perspiration. Hucker (*loc. cit.*, 25) states that this may be a synonym of *Micrococcus roseus* Flügge.

Micrococcus haemorrhagicus (Klein) Migula. (*Staphylococcus haemorrhagicus* Klein, Cent. f. Bakt., I Abt., *22*, 1897, 81; Migula, Syst. d. Bakt., *2*, 1900, 88.) Associated with an erythema of the skin resembling anthrax. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus halensis Lehmann and Neumann. (*Micrococcus acidi paralactici liquefaciens halensis* Kozai, Ztschr. f. Hyg., *31*, 1899, 374; Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 210; *Micrococcus acidi paralactici liquefaciens* Thiele, Ztschr. f. Hyg., *46*, 1904, 394.) From milk. Hucker (*loc. cit.*, 17) considers this a synonym of *Micrococcus caseolyticus* Evans.

Micrococcus halophilus Bergey et al. (Culture No. 19, Baranik-Pikowsky, Cent. f. Bakt., II Abt., *70*, 1927, 373; Bergey et al., Manual, 3rd ed., 1930, 89.) From sea water. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 258.

Micrococcus hauseri (Rosenthal) Migula. (*Diplococcus hauseri* Rosenthal, Inaug. Diss., Berlin, 1893, 26; Migula, *loc. cit.*, 80.) From the oral cavity. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently identical with *Micrococcus candicans* Flügge.

Micrococcus helvolus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 77.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 220) consider this to be identical with *Micrococcus luteus* Cohn.

Micrococcus hibiscus Nakahama. (Jour. Agr. Chem. Soc. Japan, *16*, 1940, 345, Eng. Abs., Bull. Agr. Chem. Soc., *16*, 1940, 51.) Isolated from retting kenaf (*Hibiscus*).

Micrococcus humidus Migula. (Micrococcus No. 2, Adametz, Landwirtsch. Jahrb., *18*, 1889, 239; Migula, Syst. d. Bakt., *2*, 1900, 50.) From Emmenthal cheese. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently identical with *Micrococcus candicans* Flügge.

Micrococcus hydrothermicus Cronquist. (Monatsh. f. prakt. Derm., *36*, 1903.) Optimum temperature 41°C.

Micrococcus hymenophagus Renault. (Compt. rend. Acad. Sci., Paris, *120*, 1895, 217.)

Micrococcus imperatoris Roze. (Compt. rend. Acad. Sci., Paris, *122*, 1896, 545.) Isolated from potatoes. Probably from dust.

Micrococcus inconspicuus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 64.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently identical with *Micrococcus candicans* Flügge.

Micrococcus indolicus Christiansen. (Ac. Path. Micr. Scand., *18*, 1934, 42; *Staphylococcus asaccharolyticus* var. *indolicus* Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, 1937, 1023.) Strict anaerobe. For description see Bergey et al., Manual, 5th ed., 1939, 266.

Micrococcus influenzae Migula. (Mikroorganismus II, Fischel, Ztschr. f. Heilkunde, *12*, 1891; Abst. in Cent. f. Bakt., *9*, 1891, 611; Migula, Syst. d. Bakt., *2*, 1900, 90.) From the blood of an influenza patient. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be identical with *Micrococcus albus* Schroeter.

Micrococcus insectorum Burrill. (Burrill, Amer. Nat., *17*, 1883, 319; *Streptococcus insectorum* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1061; *Bacillus insectorum* Smith, 28th Biennial Rept. Kan. State Bd. Agri., 1933, 54.) From the cecal organs of the chinch bug (*Blissus leucopterus*).

Micrococcus intermedius Stark and Scheib. (Jour. Dairy Sci., *19*, 1936, 210.) From butter.

Micrococcus intertriginis Meyer. (N.Y. Med. Jour., *70*, 1900, 873; Abst. in Cent. f. Bakt., I Abt., *30*, 1901, 434.) From a case of erythema intertrigo.

Micrococcus iris Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 67.) From Limburger cheese. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently identical with *Micrococcus candicans* Flügge.

Micrococcus irregularis Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 184.) From an infusion of beans and carrots.

Micrococcus jongii Chester. (*Staphylococcus pyogenes bovis* de Jong, Cent. f. Bakt., I Abt., *25*, 1899, 64; *Staphylococcus bovis* de Jong, *ibid.*, 67; Chester, Man. Determ. Bact., 1901, 95.) Associated with suppurative processes in cattle. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus lactericeus Freund. (Inaug. Diss., Erlangen, 1893, 21; Abst. in Cent. f. Bakt., *16*, 1894, 640.) From the human mouth. Hucker (*loc. cit.*, 21) regards this as a synonym of *Micrococcus candidus* Cohn or of *Micrococcus epidermidis* Hucker.

Micrococcus lacteus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 74.) From cheese. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) considers it a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus lactis Chester. (No. 44, Conn, Storrs Agr. Exp. Sta., 7th Ann. Rept., 1895, 79; Chester, Man. Determ. Bact., 1901, 90.) From milk. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus lactis II (Hueppe) Scholl. (Quoted from Löhnis, Cent. f. Bakt., II Abt., *18*, 1907, 141.) From milk.

Micrococcus lactis acidi Krueger. (Cent. f. Bakt., *7*, 1890, 494.) From milk.

Micrococcus lactis albus Conn, Esten and Stocking. (Storrs Agr. Exp. Sta. 18th Ann. Rept., 1907, 120.) From milk. Hucker (*loc. cit.*, 19) considers this a synonym of *Micrococcus freudenreichii*

Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus lactis amari von Freudenreich. (Bittere Milch *Micrococcus*, Conn, Cent. f. Bakt., *9*, 1891, 653; von Freudenreich, Cent. f. Bakt., II Abt., *13*, 1904, 407.) From the udder and bitter cream.

Micrococcus lactis aureus Conn, Esten and Stocking (*loc. cit.*, 112). From milk, butter, cheese, stable dust. Hucker (*loc. cit.*, 7 and 12) regards this as a synonym of *Micrococcus luteus* Cohn, of *Micrococcus varians* Migula or of *Micrococcus aureus* Zopf.

Micrococcus lactis citreus Conn, Esten and Stocking (*loc. cit.*, 102). From milk. Hucker (*loc. cit.*, 7) considers this species identical with *Micrococcus luteus* Cohn or with *Micrococcus varians* Migula.

Micrococcus lactis citronus Conn, Esten and Stocking (*loc. cit.*, 117). From slime on Camembert cheese. Hucker (*loc. cit.*, 12) regards this as a synonym of *Micrococcus aureus* Zopf.

Micrococcus lactis flavus Conn, Esten and Stocking (*loc. cit.*, 109). May be identical with *Micrococcus aurantiacus* Cohn. From milk. Hucker (*loc. cit.*, 7 and 12) states that this may be a synonym of *Micrococcus luteus* Cohn, of *Micrococcus varians* Migula or of *Micrococcus aureus* Zopf.

Micrococcus lactis fluorescens Conn, Esten and Stocking (*loc. cit.*, 120). From stable dust. Exhibits a green fluorescence. Hucker (*loc. cit.*, 18) states that this species is very similar to *Micrococcus caseolyticus* Evans.

Micrococcus lactis gigas Conn, Esten and Stocking (*loc. cit.*, 116). From milk. Hucker (*loc. cit.*, 22) states that this species is probably identical with *Micrococcus candidus* Cohn or *Micrococcus epidermidis* Hucker.

Micrococcus lactis giganteus Conn, Esten and Stocking (*loc. cit.*, 122). From milk.

Micrococcus lactis minutissimus Conn, Esten and Stocking (*loc. cit.*, 119). From milk. Hucker (*loc. cit.*, 10) considers this a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus lactis rosaceus Conn, Esten and Stocking (*loc. cit.*, 109). From milk. Hucker (*loc. cit.*, 26) states that this is probably identical with *Micrococcus roseus* Flügge.

Micrococcus lactis rugosus Conn, Esten and Stocking (*loc. cit.*, 122). From milk.

Micrococcus lactis varians Conn, Esten and Stocking (*loc. cit.*, 121). Commonly found in milk. May be identical with *Micrococcus aureus* Zopf. Hucker (*loc. cit.*, 15) states that this may be identical in part with *Micrococcus albus* Schroeter.

Micrococcus lardarius Krassilschtschik. (Memoires Soc. Zool. de France, *9*, 1896, 513; Compt. rend. Acad. Sci., Paris, *123*, 1896, 428.) From diseased silkworms. Differs from *Streptococcus bombycis*. Hucker (*loc. cit.*, 22) states that this is probably identical with either *Micrococcus candidus* Cohn or *Micrococcus epidermidis* Hucker.

Micrococcus lembkei Migula. (No. 21, Lembke, Arch. f. Hyg., *29*, 1897, 327; Migula, Syst. d. Bakt., *2*, 1900, 212.) From feces. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn, while Hucker (*loc. cit.*, 11) regards it as probably identical with *Micrococcus citreus* Schroeter.

Micrococcus lentus Migula. (No. 22, Lembke, *loc. cit.*, 328; Migula, *loc. cit.*, 209.) From feces. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) regards it as probably identical with *Micrococcus freudenreichii* Guillebeau or *Micrococcus ureae* Cohn.

Micrococcus licheniformis Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 482.) From the intestine of the yellowhammer (*Emberiza citrinella*). Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus lignithum Renault.

(Compt. rend. Acad. Sci., Paris, *126*, 1898, 1828.) A fossil form from lignite.

Micrococcus lipolyticus Horowitz-Wlassowa. (Ztschr. f. Untersuch. d. Lebensmittel, *62*, 1931, 602.) A fat splitting micrococcus from salted fish.

Micrococcus lipolyticus Stark and Scheib. (Jour. Dairy Sci., *19*, 1936, 210; not *Micrococcus lipolyticus* Horowitz-Wlassowa, *loc. cit.*) From butter.

Micrococcus liquefaciens Migula. (*Micrococcus ureae liquefaciens* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 169; *Streptococcus aëthebius* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 31; *Staphylococcus ureae liquefaciens* Lundström, Festschr. d. path. anat. Inst. z. Andenken a.d. 250 jährige Bestehen d. finnländ. Univ. z. Helsingfors, 1890; abst. in Cent. f. Bakt., *9*, 1891, 672; Migula, Syst. d. Bakt., *2*, 1900, 106; *Micrococcus aethebius* Chester, Man. Determ. Bact., 1901, 77; *Urococcus liquefaciens flueggei* Miquel and Cambier, Traité de Bact., 1902, 627; *Micrococcus liquefaciens flueggei* Miquel in Lafar, Handb. d. tech. Mykol., *3*, 1904–06, 75; *Albococcus ureae* Kligler, Jour. Inf. Dis., *12*, 1913, 442; not *Micrococcus liquefaciens* Bergey et al., Manual, 1st ed., 1923, 67.) From urine. Hucker (*loc. cit.*, 18 and 19) states that this species may be identical with *Micrococcus caseolyticus* Evans, *Micrococcus freudenreichii* Guillebeau or *Micrococcus ureae* Cohn.

Micrococcus liquefaciens acidi I and *II*, Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 48.) From milk. Hucker (*loc. cit.*, 18) regards this species as very similar to *Micrococcus caseolyticus* Evans.

Micrococcus liquidus Migula. (No. 21, Lembke, Arch. f. Hyg., *26*, 1896, 313; Migula, Syst. d. Bakt., *2*, 1900, 208.) From feces. Hucker (*loc. cit.*, 15) states that this species appears identical with *Micrococcus albus* Schroeter.

Micrococcus lobatus Migula. (Siebert, Inaug. Diss., Würzburg, 1894, No. 3, 10; Migula, Syst. d. Bakt., *2*, 1900, 139.) From the human scalp. Winslow and Winslow (*loc. cit.*, 184) state that this is apparently a synonym of *Micrococcus aureus* Zopf.

Micrococcus loewenbergii Trevisan. (Micrococcus de l'ozène, Löwenberg, Congrès des otologistes, 1884 and Union médicale, 1884; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) From secretions in ozena.

Micrococcus luridus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft, 4, 1897, 480.) From the intestine of the chaffinch (*Fringilla coelebs*). Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus luteolus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 82; not *Micrococcus luteolus* Irwin and Harrison, Le Lait, *8*, 1928, 881.) From cheese. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan. For a description of Irwin and Harrison's organism, see Bergey et al., Manual, 5th ed., 1939, 249.)

Micrococcus luteus var. *larvae* Hauduroy et al. (*Micrococcus luteus-liquefaciens* var. *larvae* Toumanoff, Bull. Soc. Centr. de Méd. Vétér., *80*, 1927, 367; Hauduroy et al., Dict. d. Bact. Path., 1937, 277.) From foulbrood of bees. Pathogenic.

Micrococcus lutosus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 489.) From the stomach contents of the chaffinch (*Fringilla coelebs*). Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus lysodeikticus Fleming. (Proc. Roy. Soc. London, Ser. B, *93*, 1922, 306.) Non-pathogenic.

Micrococcus lyssae (Rivolta) Trevisan. (*Cocco-bacterium lyssae* Rivolta, 1886; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) Spore-bearer.

Micrococcus madidus Migula. (No. 19, Lembke, Arch. f. Hyg., *26*, 1896, 311; Migula, Syst. d. Bakt., *2*, 1900, 207.) From feces. Winslow and Winslow (*loc. cit.*, 184) state that this is apparently a synonym of *Micrococcus aureus* Migula;

while Hucker (*loc. cit.*, 15) regards it as identical with *Micrococcus albus* Schroeter.

Micrococcus magnus (Miller) Trevisan. (*Jodococcus magnus* Miller, Deutsche med. Wochnschr., No. 30, 1888; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33; not *Micrococcus magnus* Chester, Man. Determ. Bact., 1901, 85 (*Diplococcus magnus* Rosenthal, Cent. f. Bakt., *25*, 1899, 1); not *Micrococcus magnus* Stark and Scheib, Jour. Dairy Sci., *19*, 1936, 210.)

Micrococcus major De Toni and Trevisan. (*Micrococcus urinae major* Doyen, Jour. d. connaiss. médic., No. 14, 1889, 108; De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1076.) From urine.

Micrococcus major Eckstein. (Ztschr. f. Forst- u. Jagdwesen, *26*, 1894, 18; not *Micrococcus major* DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1076.) Isolated from the larvae of the nun moth (*Lymantria monacha*) and *Hyponomeuta sp.*

Micrococcus manfredii Trevisan. (Micrococcus der progressiven Lymphome im Tierörper, Manfredi, Fortschr. d. Med., 1886, 713; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33; *Streptococcus manfredii* DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1056; *Micrococcus canus* Migula, Syst. d. Bakt., *2*, 1900, 63.) From sputum. Winslow and Winslow (*loc. cit.*, 206) regard this as a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus malolacticus Seifert. (Ztschr. f. d. landwirtsch. Versuchswesen in Oesterreich, 1903, 567; Abst. in Cent. f. Bakt., II Abt., *10*, 1903, 664.) From wine. Hucker (*loc. cit.*, 7) considers this a synonym of *Micrococcus luteus* Cohn or of *Micrococcus varians* Migula.

Micrococcus mammitis Hutchens. (Hutchens in Besson, Pract. Bact. Microbiol. and Serum Therapy, Trans. of 5th ed., 1913, 615; not *Streptococcus mammitis bovis* Hutchens, *ibid.*, 613.) From gangrenous mammitis of milking ewes. This is le microcoque de l'araignée or de la mammite gangréneuse, Nocard, Ann. Inst. Past., *1*, 1887, 417.

Micrococcus marginatus Wilhelmy. (Arb. bakt. Inst. Karlsruhe, *3*, 1903, 11.) From meat extract.

Micrococcus marinus Issatchenko. (Recherches sur les Microbes de l'Océan Glacial Arctique, Petrograd, 1914, 147.) From sea water.

Micrococcus mastitidis Holland. (Jour. Bact., *5*, 1920, 224.) *Nomen nudum.*

Micrococcus mastobius Trevisan. (Micrococque de la mammite gangréneuse des brebis laitières, Nocard, Ann. Inst. Past., *1*, 1887, 417; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33; *Micrococcus gangr. ovium*, quoted from Freire, Rio de Janeiro, 1898; Abst. in Cent. f. Bakt., I Abt., *26*, 1899, 841; *Micrococcus ovis* Migula, Syst. d. Bakt., *2*, 1900, 90; *Micrococcus mastitis* Chester, Man. Determ. Bact., 1901, 76; *Micrococcus mastidis gangraenosae ovis* Pfeiler, Ztschr. f. Infektionskr., parasit. Krankh. u. Hyg. d. Haustiere, *4*, 1908, 132.) Said to be the cause of gangrenous mastitis in sheep. This species appears to be *Micrococcus pyogenes* Migula.

Micrococcus melanocyclus Merker. (Cent. f. Bakt., II Abt., *41*, 1911, 589.) See *Actinomyces melanocyclus* Krainsky.

Micrococcus melanoglossophorus Spegazzini. (Fung. Arg. Pug., *4*, 18--, 316.) From the epithelium of the tongue.

Micrococcus meldensis Roger. (Ber. An. de Soc. d'Agric. de Meaux, 1898.)

Micrococcus melleus grandinis Harrison. (Bot. Gazette, *26*, 1898, 211.)

Micrococcus memelensis Leichmann. (Coccus, Leichmann, Cent. f. Bakt., II Abt., *2*, 1896, 780; Leichmann, in Koch, Jahresber., *12*, 1901, 254; *Micrococcus acidi laevolactici* Weigmann, in Lafar, Handb. d. techn. Mykol., *2*, 1905, 62.) From milk.

Micrococcus minimus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902,

188; not *Micrococcus minimus* Bergey et al., Manual, 1st ed., 1923, 69.) From a bean infusion. Hucker (*loc. cit.*, 7) considers this a synonym of either *Micrococcus luteus* Cohn or *Micrococcus varians* Migula.

Micrococcus minutissimus Issatchenko. (Recherches sur les Microbes de l'Océan Glacial Artique, Petrograd, 1914, 146.) From sea water.

Micrococcus mirificus (Rabenhorst) Trevisan. (*Palmella mirifica* Rabenhorst, Hedwigia, 1867, 115, and Flor. Europ. Algar., *3*, 1856, 35; Trevisan, Rendic. R. Ist. Lombardo, *12*, 1879.)

Micrococcus mollis (Dyar) Migula. (*Merismopedia mollis* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 352; Migula, Syst. d. Bakt., *2*, 1900, 161; *Aurococcus mollis* Winslow and Rogers, Science, *21*, 1905, 669; *Staphylococcus mollis* Holland, Jour. Bact., *5*, 1920, 225.) From air. A cause of boils in the tropics, according to Castellani and Chalmers (Man. Trop. Med., 3rd ed., 1919, 931). Hucker (*loc. cit.*, 12) states that this species is apparently identical with *Micrococcus aureus* Zopf.

Micrococcus (*Diplococcus*) *morrhuae* Klebahn. (Mitteil. Inst. Allgm. Botan. Hamburg, *4*, 1919, 11-69; Abst. in Cent. f. Bakt., II Abt., *52*, 1921, 123.) Halophilic. Associated with spoilage of salted fish.

Micrococcus mucilagineus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 191.) From bean infusions. Hucker (*loc. cit.*, 11) states that this is probably a synonym of *Micrococcus citreus* Migula.

Micrococcus mucilaginosus Migula. (Micrococcus der schleimigen Milch, Ratz, Arch. f. Tierheilkunde, *12*, Heft 1 and 2, 1890; Migula, Syst. d. Bakt., *2*, 1900, 119; not *Micrococcus mucilaginosus* Weiss, Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 205.) From slimy milk. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 18) considers it a synonym in part of *Micrococcus caseolyticus* Evans.

Micrococcus mucofaciens Thöni and Thaysen. (Cent. f. Bakt., II Abt., *36*, 1913, 359; not *Micrococcus mucofaciens* Pribram, Klassifikation der Schizomyceten, 1933, 42.) From milk. Hucker (*loc. cit.*, 9) considers this a synonym of *Micrococcus flavus* Trevisan. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 245.

Micrococcus myceticus Castellani. (Proc. Soc. Exp. Biol. and Med., *25*, 1928, 535–536.) From gummy lesions.

Micrococcus mycodermatus Holland. (Jour. Bact., *5*, 1920, 224.)

Micrococcus nacreaceus Migula. (Perlmutterglänzender Diplococcus, Tataroff, Inaug. Diss., Dorpat, 1891, 70; Migula, Syst. d. Bakt., *2*, 1900, 62.) Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus neoformans Doyen. (Doyen, Le *Micrococcus neoformans* et les néoplasmes, Paris, 1903.) From cancerous tissue. Shown by Andrewes and Gordon (35th Ann. Rept. Local Govt. Board, London, 1905–06, 553) to be identical with *Micrococcus epidermidis albus* Welch.

Micrococcus neurotomae Paillot. (Compt. rend. Acad. Sci., Paris, *178*, 1924, 246.) Gram-negative. From the larvae of *Neurotoma nemoralis*.

Micrococcus neuvillei Trevisan. (Micrococcus G, Malapert-Neuville, 1887; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 34.) From mineral water.

Micrococcus nigrescens Castellani. (Brit. Jour. of Dermatology, *23*, 1911, 341; *Nigrococcus nigrescens* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 2103.) Produces a black pigment. Found in the black variety of trichomycosis axillaris, a tropical disease.

Micrococcus nigrofaciens Northrup. (Mich. Agr. Exp. Sta. Tech. Bull. No. 18, 1914, 12; also in Cent. f. Bakt., II Abt.,

41, 1914, 326.) From diseased larvae of the June beetle (*Lachnosterna sp.*) and other insects.

Micrococcus nitidus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 476.) From the stomach and intestine of birds. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) regards it as a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus nitrificans Bergey et al. (Micrococcus 6, Rubentschick, Cent. f. Bakt., II Abt., *72*, 1927, 125; Bergey et al., Manual, 3rd ed., 1930, 88; not *Micrococcus nitrificans* van Tieghem, Traité de Botanique, Paris, 1883.) From sewage filter beds. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 257.

Micrococcus nivalis Chester. (No. 47, Conn, Storrs Agr. Exp. Sta. 7th Ann. Rept., 1895, 80; Chester, Man. Determ. Bact., 1901, 90.) From dust. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus niveus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 66.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus nonfermentans Steinhaus. (Jour. Bact., *42*, 1941, 779.) From the alimentary tract of the lyreman cicada (*Tibicen linnei*) and of an unidentified damsel fly (*Coenagrionidae*).

Micrococcus nubilis Migula. (Coccus B, Foutin, Bakt. Untersuch. von Hagel, Wratsch, No. 49 and 50, 1889; see Cent. f. Bakt., *7*, 1890, 373; Migula, Syst. d. Bakt., *2*, 1900, 60; *Micrococcus beta* Chester, Man. Determ. Bact., 1901, 87.) Isolated from hail. Winslow and Winslow (*loc. cit.*, 205) consider this to be a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus nuclei Roze. (Compt. rend. Acad. Sci., Paris, *122*, 1896, 544.) From potatoes.

Micrococcus obscoenus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 473.) From the stomach contents of a crow (*Corvus corone*). Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) considers it a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus ochraceus Rosenthal. (Inaug. Diss., Erlangen, 1893, 22; Abst. in Cent. f. Bakt., *16*, 1894, 1024; not *Micrococcus ochraceus* Hansgirg, Oestr. Bot. Ztschr., 1885, No. 4.) From the oral cavity. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Migula. For a description of this species see Bergey et al., Manual, 5th ed., 1939, 242.

Micrococcus ochroleucus Prove. (Prove, Beitr. z. Biol. d. Pflanz., *4*, Heft 3, 1887, 409; *Streptococcus ochroleucus* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 31; *Planococcus ochroleucus* Migula, Syst. d. Bakt., *2*, 1900, 272.) From urine. Motile.

Micrococcus odoratus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 73.) From cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus odorus Henrici (*loc. cit.*, 72). From cheese. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus olearius DeToni and Trevisan. (*Micrococcus urinae flavus olearius* Doyen, Jour. d. connaiss. Médic., No. 14, 1889, 108; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1077.) From urine. Hucker (*loc. cit.*, 12) considers this species a synonym of *Micrococcus aureus* Zopf.

Micrococcus olens Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 87.)

From Swiss cheese. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus opalescens DeToni and Trevisan. (*Micrococcus albus II*, Maggiora, Giorn. Soc. Ital. d'Igiene, *11*, 1889, 351; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1078.)

Micrococcus orbicularis Chester. (*Micrococcus orbicularis flavus* Ravenel, Mem. Nat. Acad. Sci., *8*, 1896, 8; Chester, Man. Determ. Bact., 1901, 101.) From soil. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan; while Hucker (*loc. cit.*, 10) regards it as a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus orbiculatus Wright. (Mem. Nat. Acad. Sci., *7*, 1895, 432.) From Schuylkill River water. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus ovalis Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 500; not *Micrococcus ovalis* Escherich, Die Darmbakterien des Säuglings, Stuttgart, 1886, 90.) From the stomach contents of the rock dove (*Columba livia*). Hucker (*loc. cit.*, 9) regards this as a synonym of *Micrococcus flavus* Trevisan.

Micrococcus pallens Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 61.) From cheese. Winslow and Winslow (*loc. cit.*, 205) consider this a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus pallidus Henrici (*loc. cit.*, 62). From cheese. Hucker (*loc. cit.*, 7) regards this species as identical with either *Micrococcus luteus* Cohn or *Micrococcus varians* Migula.

Micrococcus pannosus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 466.) From the stomach contents of the rock dove (*Columba livia*) and the intestine of another dove (*Columba oenas*). Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus paraffinae Söhngen. (Cent. f. Bakt., II Abt., *37*, 1913, 595.) From garden earth.

Micrococcus parotitidis Korentschewsky. (Cent. f. Bakt., I Abt., Orig., *44*, 1907, 402.) Isolated from cases of parotitis epidemica.

Micrococcus parvus (Miller) Trevisan. (*Jodococcus parvus* Miller, Deutsche med. Wchnschr., No. 30, 1888; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.)

Micrococcus parvus Migula. (No. 14, Lembke, Arch. f. Hyg., *26*, 1896, 309; Migula, Syst. d. Bakt., *2*, 1900, 200.) From feces. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus pasteuri Trevisan. (Microbe pyogene de l'eau de Seine, Pasteur, 1877; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 34; not *Micrococcus pasteuri* Sternberg, Trans. Pathol. Soc. of Philadelphia, *12*, 1885, 162.) From water.

Micrococcus pellucidus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 468; not *Micrococcus pellucidus* Roze, Compt. rend. Acad. Sci., Paris, *122*, 1896, 1012.) From the intestine of a sparrow (*Passer montanus*). Hucker (*loc. cit.*, 23) regards this as a synonym of *Micrococcus candidus* Cohn or of *Micrococcus epidermidis* Hucker.

Micrococcus pemphigi Migula. (Diplococcus des Pemphigus acutus, Demme, Verhandl. d. Kongr. f. innere Med., Wiesbaden, 1886, 336; *Diplococcus pemphigi acuti* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 173; Migula, Syst. d. Bakt., *2*, 1900, V and 191; *Micrococcus demmei* Chester, Man. Determ. Bact., 1901, 74.) Isolated from bullae in a case of pemphigus acutus.

Micrococcus pemphigicontagiosi Castellani and Chalmers. (*Micrococcus pemphigi contagiosa* Clegg and Wherry, Jour. Inf. Dis., *3*, 1906, 171; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 931.) From bullae in a case of pem-

phigus contagiosa. This may be a synonym of *Micrococcus pemphigineonatorum*, see below.

Micrococcus pemphigineonatorum Castellani and Chalmers. (*Micrococcus pemphigi neonatorum* Almquist, Ztschr. f. Hyg., *10*, 1891, 253; *Staphylococcus pemphigi neonatorum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 173; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 931.) Found in bullae in a case of pemphigus neonatorum. This may be *Micrococcus mollis*, according to Castellani and Chalmers (*loc. cit.*). Falls (Jour. Inf. Dis., *20*, 1917, 97) identifies this and the previous organism as *Micrococcus pyogenes* var. *aureus* Zopf.

Micrococcus percitreus Bergey et al. (Manual, 1st ed., 1923, 63.) From air and water. Hucker (*loc. cit.*, 10) considers this a synonym of *Micrococcus conglomeratus* Migula. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 248.

Micrococcus perflavus Bergey et al. (Manual, 1st ed., 1923, 62.) From air and water. Hucker (*loc. cit.*, 12) regards this as a synonym of *Micrococcus aureus* Zopf. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 247.

Micrococcus persicus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 499.) From the intestine of a dove (*Columba oenas*). Hucker (*loc. cit.*, 25) states that this may be identical with *Micrococcus roseus* Flügge.

Micrococcus petechialis Trevisan. (Micrococco del dermotifo, Bareggi, 1886; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.)

Micrococcus petilus Trevisan. (Micrococcus der Pyaemie bei Kaninchen, Koch, Über d. Aetiolog. d. Wundinfectionskr., Leipzig, 1878; *Micrococcus pyaemiae cuniculorum* Schroeter, in Cohn, Kryptogam. Flora v. Schlesien, *3*, 1, 1886, 148; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33; *Micrococcus cuniculorum* Migula, Syst. d. Bakt., *2*, 1900, 192.) From rabbits.

Micrococcus petrolei Renault. (Compt. rend. Acad. Sci., Paris, *124*, 1897, 1315.) A fossil form from oil bearing rocks.

Micrococcus pieridis Burrill. (Quoted from Chittenden, U. S. Dept. Agr., Farmers' Bull. No. 1461, 1926, 6.) From larvae of the cabbage butterfly (*Pieris rapae*).

Micrococcus pikowskyi Bergey et al. (Culture No. 22, Baranik-Pikowsky, Cent. f. Bakt., II Abt., *70*, 1927, 373; Bergey et al., Manual, 3rd ed., 1930, 78.) From sea water. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 242.

Micrococcus piliformis Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 194.) From a bean infusion. Hucker (*loc. cit.*, 7) considers this a synonym of *Micrococcus luteus* Cohn or of *Micrococcus varians* Migula.

Micrococcus piltonensis Gray and Thornton. (Cent. f. Bakt., II Abt., *73*, 1928, 81.) From manure and soil. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 259.

Micrococcus pituitoparus (Hohl) Buchanan and Hammer. (*Karphococcus* (*Carphococcus*) *pituitoparus* Hohl, Jahrb. d. Schweiz, *22*, 1906, 439; *Diplococcus viscosus* Sato, Cent. f. Bakt., II Abt., *19*, 1907, 27; Buchanan and Hammer, Iowa Agr. Exp. Sta. Res. Bull. 22, 1915, 285.) From slimy milk and from straw. Hucker (*loc. cit.*, 23) states that this species is probably identical with *Micrococcus candidus* Cohn or with *Micrococcus epidermidis* Hucker. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 243.

Micrococcus plumosus Eisenberg. (Bräutigam, Inaug. Diss., Leipzig, 1886, 18; Federiger Micrococcus, Adametz, Mitteil. d. Oesterr. Versuchssta. f. Brauerei u. Mälzerei, Wien, Heft 1, 1888; Eisenberg, Bakt. Diag., 3 Aufl., 1891, 56.) From feces of cattle and from water. Winslow and Winslow (*loc. cit.*,

220) consider this a synonym of *Micrococcus luteus* Cohn; while Hucker (*loc. cit.*, 22 and 23) regards it as probably identical with *Micrococcus candidus* Cohn or *Micrococcus epidermidis* Hucker.

Micrococcus polypus Migula. (Syst. d. Bakt., *2*, 1900, 79.) From air. Hucker (*loc. cit.*, 23) states that this species is probably identical with *Micrococcus candidus* Cohn or *Micrococcus epidermidis* Hucker.

Micrococcus populi Delacroix. (Bul. Mens. Off. Renseig. Agr., Paris, *5*, 1906, 1349 and Ann. Inst. Nat. Agron., 2 Ser., *5*, 1906, 353.) Parasitic on poplar trees (*Populus spp.*).

Micrococcus porcellorum Trevisan. (Micrococcus bei Hepatitis enzootica porcellorum, Nonewitsch, Cent. f. Bakt., *3*, 1888, 233; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) From an infected liver.

Micrococcus progrediens Schroeter. (Micrococcus der progressiven Abscessbildung bei Kaninchen, Koch, Über d. Aetiolog. d. Wundinfectionskrankheiten, Leipzig, 1878; Schroeter, in Cohn, Kryptogam.-Flora v. Schlesien, *3*, 1, 1886, 148; *Micrococcus haematosaprus* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) From the blood of diseased rabbits.

Micrococcus psalteri Buemann. (Cent. f. Bakt., I Abt., Orig., *71*, 1913, 308.) From the third stomach of cattle.

Micrococcus pseudocyaneus Schroeter. (Kryptogam.- Flora v. Schlesien, *3*, 1, 1886, 145.) A synonym of *Micrococcus cyaneus* Cohn according to Migula, Syst. d. Bakt., *2*, 1900, 188.

Micrococcus pseudoinfluenzae Migula. (Microörganismus I, Fischel, Ztschr. f. Heilkunde, *12*, 1891; See Cent. f. Bakt., *9*, 1891, 611; Migula, Syst. d. Bakt., *2*, 1900, 86.) From the blood of an influenza patient. Hucker (*loc. cit.*, 23) considers this a synonym of *Micrococcus candidus* Cohn or of *Micrococcus epidermidis* Hucker.

Micrococcus pulcher Glage. (Ztschr. f. Fleisch- u. Milchhyg., *10*, 1900, 146; not *Micrococcus pulcher* Weiss, Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 182.) From coating on surface of wurst and similar meat products.

Micrococcus pultiformis Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 474.) From stomach contents of the yellow-hammer (*Emberiza citrinella*) and starling (*Sturnus vulgaris*) and from the intestine of the woodpecker (*Picus major*). Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) regards it as probably identical with *Micrococcus freudenreichii* Guillebeau or with *Micrococcus ureae* Cohn.

Micrococcus punctatus Migula. (No. 18, Lembke, Arch. f. Hyg., *29*, 1897, 325; Migula, Syst. d. Bakt., *2*, 1900, 213.) From feces. Winslow and Winslow (*loc. cit.*, 199) state that this species appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus purpurifaciens Lehmann and Neumann. (Micrococcus, Dudtschenko, Cent. f. Bakt., II Abt., *42*, 1915, 529; Lehmann and Neumann, Bakt. Diag., 6 Aufl., *2*, 1920, 755.) From ice. Produces a purple pigment in alkaline gelatin media.

Micrococcus pustulatus Henneberg. (Cent. f. Bakt., II Abt., *55*, 1922, 251.) From the human intestine.

Micrococcus putridus Tilanus. (Münch. med. Wchnschr., *34*, 1887, 310.) From gelatin, agar, etc., containing iodiform.

Micrococcus pygmaeus Henneberg (*loc. cit.*, 252). From the human intestine.

Micrococcus pyocyaneus Francisco. (Revista Valenciana de Ciencias Médicas, 1914, 2; Abst. in Cent. f. Bakt., I Abt., Ref., *63*, 1915, 44; not *Micrococcus pyocyaneus* Gessard, Thesis, Paris, 1882.) From an acne pustule.

Micrococcus pyosepticus (Héricourt and Richet) Solowjew. (*Staphylococcus pyosepticus* Héricourt and Richet, Compt.

rend. Acad. Sci., Paris, *107*, 1888, 691; Solowjew, Abst. in Cent. f. Bakt., I Abt., *18*, 1895, 60.) From an abscess in a dog and from dust. Regarded as identical with *Micrococcus albus* Schroeter.

Micrococcus quadrigeminus Klebs. (*Staphylococcus quadrigeminus* Vanselow and Czaplewski, Cent. f. Bakt., I Abt., *25*, 1899, 143; see Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 174.) Closely related to *Micrococcus albus* Schroeter.

Micrococcus quaternus Migula. (Siebert, Inaug. Diss., Würzburg, No. I, 1894, 7; Migula, Syst. d. Bakt., *2*, 1900, 92.) Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus radiatus Flügge. (Die Mikroorganismen, 2 Aufl., 1886, 176; *Streptococcus radiatus* Crookshank, Man. of Bact., 3rd ed., 1890, 256; not *Micrococcus radiatus* Kern, see below.) From dust and water. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 18) considers it a synonym of *Micrococcus caseolyticus* Evans.

Micrococcus radiatus Kern. (Kern, Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 471; *Micrococcus radiosus* Migula, Syst. d. Bakt., *2*, 1900, 114.) From the stomach contents of the starling (*Sturnus vulgaris*). Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus reessii Rosenthal. (Inaug. Diss., Berlin, 1893, 19; Abst. in Cent. f. Bakt., *16*, 1894, 1024.) From the oral cavity. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus regularis Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 183.) From bean infusions. Hucker (*loc. cit.*, 7) considers this a synonym of *Micrococcus luteus* Cohn or *Micrococcus varians* Migula.

Micrococcus resinaceus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 487.) From the stomach contents of the starling (*Sturnus vulgaris*) and from the intestine of a sparrow (*Passer montanus*). Winslow and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus rhenanus Migula. (Neuer Mikrococcus aus Rheinwasser, Burri, Arch. f. Hyg., *19*, 1893, 34; Migula, Syst. d. Bakt., *2*, 1900, 109; *Micrococcus rheni* Chester, Man. Determ. Bact., 1901, 82; *Albococcus rhenanus* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 544.) From Rhine River water. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 18) considers it a synonym of *Micrococcus caseolyticus* Evans.

Micrococcus ridleyi Corbet. (Quart. Jour. Rubber Research Inst., Malaya, *2*, 1930, 146.) From the latex of the rubber tree (*Hevea brasiliensis*). For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 244.

Micrococcus rosaceus Frankland and Frankland. (Trans. Roy. Society, London, *178*, B, 188, 269; *Rhodococcus rosaceus* Holland, Jour. Bact., *5*, 1920, 225.) From air. Hucker (*loc. cit.*, 25) states that this species may be identical with *Micrococcus roseus* Flügge. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 252.

Micrococcus rosaceus lactis Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 34; *Micrococcus lactis rosaceus* Conn, Esten and Stocking, Storrs Agr. Exp. Sta. Rept. for 1906, 108.) From milk.

Micrococcus roscidus Migula. (Micrococcus No. I, Adametz, Landwirtsch. Jahrb., *18*, 1889, 238; Migula, Syst. d. Bakt., *2*, 1900, 68.) From Emmenthal cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Microccccus candicans* Flügge.

Micrococcus roseo-persicinus Migula.

(Rote Kokken von Van Ermengem, Schneider, Arb. bakt. Inst. Karlsruhe, *1*, Heft 2, 1894, 216; Migula, Syst. d. Bakt., *2*, 1900, 184.)

Micrococcus rosettaceus Zimmermann. (Bakt. unserer Trink- u. Nutzwässer, Chemnitz, I Reihe, 1890, 72.) From water. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus roseus Maggiora. (Giorn. Soc. Ital. d'Igiene, *11*, 1889, 356; not *Micrococcus roseus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 183; not *Micrococcus roseus* Gruber, Cent. f. Bakt., II Abt., *22*, 1909, 408.)

Micrococcus rubellus Migula. (Syst. d. Bakt., *2*, 1900, 169.) Source not given. Hucker (*loc. cit.*, 27) regards this as identical with *Micrococcus cinnabareus* Flügge.

Micrococcus rubescens Migula. (No. 20, Lembke, Arch. f. Hyg., *26*, 1896, 312; Migula, Syst. d. Bakt., *2*, 1900, 208; not *Micrococcus rubescens* Chester, see *Micrococcus subroseus* below.) From feces. Hucker (*loc. cit.*, 27) regards this species as identical with *Micrococcus cinnabareus* Flügge.

Micrococcus rubidus lactis Conn. (Conn, Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 34; *Micrococcus lactis rubidus* Conn, Esten and Stocking, Storrs Agr. Exp. Sta. 18th Ann. Rept., 1907, 117.) From milk. Resembles *Micrococcus cinnabareus* Flügge. Hucker (*loc. cit.*, 25) thinks this species may be identical with *Micrococcus roseus* Flügge.

Micrococcus rubigenosus Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 492.) From the stomach contents of a dove (*Columba oenas*). Hucker (*loc. cit.*, 25) states that this species may be identical with *Micrococcus roseus* Flügge.

Micrococcus rubiginosus Passer. and Beltr. (Fung. Sicil., 18—, no. 35; quoted from DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1082.)

Micrococcus rugatus Migula. (*Micrococcus endocarditidis rugatus* Weichselbaum, Beitr. z. path. Anat. u. z. allgm. Pathol., *4*, 1889, 164; Migula, Syst. d. Bakt., *2*, 1900, 190; *Micrococcus endocarditis* Chester, Man. Determ. Bact., 1901, 74.) From ulcerative endocarditis. Winslow and Winslow (*loc. cit.*, 205) consider this a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan; while Hucker (*loc. cit.*, 15) regards it as a synonym of *Micrococcus albus* Schroeter.

Micrococcus rugosus Chester. (No. 2, Conn, Storrs Agr. Exp. Sta. 6th Ann. Rept., 1894, 50; Chester, Man. Determ. Bact., 1901, 101.) From milk and ripened cream. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan.

Micrococcus ruminantium Henneberg. (Cent. f. Bakt., II Abt., *55*, 1922, 252.) From the human intestine.

Micrococcus rushmorei Brown. (Amer. Museum Novit., No. 251, 1927, 4.) Isolated from a fly (*Lucilia sericata*) which was infected with *Bacillus lutzae*.

Micrococcus saccatus Migula. (*Micrococcus albus liquefaciens* von Besser, Beitr. z. path. Anat., *6*, 1889, 46; *Micrococcus liquefaciens albus*, see Cent. f. Bakt., *7*, 1890, 152; Migula, Syst. d. Bakt., *2*, 1900, 117; *Micrococcus liquefaciens* Chester, Man. Determ. Bact., 1901, 78; not *Micrococcus liquefaciens* Holland, Jour. Bact., *5*, 1920, 224; *Micrococcus alvi* Chester, *loc. cit.*, 81.) From the nasal mucous membrane. Winslow and Winslow (*loc. cit.*, 199) state that this is apparently a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) regards it as probably identical with *Micrococcus freudenreichii* Guillebeau or with *Micrococcus ureae* Cohn. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 254.

Micrococcus salivalis septicus, quoted from Wigura, see Cent. f. Bakt., I Abt., *17*, 1895, 899. From the human skin.

Micrococcus sarcinoides Migula. (Syst. d. Bakt., *2*, 1900, 168.) Hucker

(*loc. cit.*, 27) considers this identical with *Micrococcus cinnabareus* Flügge.

Micrococcus scariosus Migula. (Siebert, Inaug. Diss., Würzburg, No. II, 1894, 9; Migula, Syst. d. Bakt., *2*, 1900, 91.) From a hairbrush. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus scarlatinosus Trevisan. (Trevisan, Batteri italiani, 1879, 19; *Streptococcus rubiginosus* Edington, Brit. Med. Jour., *1*, 1887, 1265; *Perroncitoa scarlatinosa* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 29.) From a scarlet fever patient.

Micrococcus scarlatinus Migula. (Syst. d. Bakt., *2*, 1900, 173.) From feces.

Micrococcus selenicus Brenner. (Jahrb. f. wissensch. Botan., *57*, 1916, 85; Abst. in Cent. f. Bakt., II Abt., *48*, 1918, 431.) From mud.

Micrococcus sensibilis Zettnow. (Cent. f. Bakt., I Abt., Orig., *77*, 1915, 216.) From dust. Hucker (*loc. cit.*, 19) considers this a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 248.

Micrococcus septicus (Klebs) Cohn. (*Microsporon septicum* Klebs, Die Ursachen der infectiösen Wundkrankheiten, 1871; and Zur path. Anat. d. Schusswunden, 1872; Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 164.) From pus.

Micrococcus serophilus Costa. (Compt. rend. Soc. Biol., Paris, *83*, 1920, 931.) From acute articular rheumatism.

Micrococcus serratus Migula. (No. 15, Lembke, Arch. f. Hyg., *26*, 1896, 309; Migula, Syst. d. Bakt., *2*, 1900, 200.) From feces. Winslow and Winslow (*loc. cit.*, 205) regard this as a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus sialosepticus Trevisan. (*Coccus salivarius septicus* Biondi, Ztschr. f. Hyg., *2*, 1887, 195; *Coccus septicus* Biondi, *ibid.*, 220; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33; *Micrococcus salivarius* Migula, Syst. d. Bakt., *2*, 1900, 65; *Micrococcus salivarius-septicus* Chester, Man. Determ. Bact., 1901, 87.) From human saliva. Winslow and Winslow (*loc. cit.*, 205) consider this a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus siccus Migula. (Micrococcus No. V, Adametz, Landwirtsch. Jahrb., *18*, 1889, 241; Migula, Syst. d. Bakt., *2*, 1900, 124.) From Emmenthal cheese. Winslow and Winslow (*loc. cit.*, 185) state that this is probably a synonym of *Micrococcus aurantiacus* Cohn; while Hucker (*loc. cit.*, 7) considers it a synonym of *Micrococcus luteus* Cohn or of *Micrococcus varians* Migula.

Micrococcus similis Dyar. (Ann. N. Y. Acad. Sci., *8*, 1895, 347.) From dust. Winslow and Winslow (*loc. cit.*, 205) regard this as a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus simplex Wright. (Mem. Nat. Acad. Sci., *7*, 1895, 432.) From Schuylkill River water. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus simulans DeToni and Trevisan. (*Micrococcus citreus II*, Maggiora, Giorn. Soc. Ital. d'Igiene, *11*, 1889, 354; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1079.)

Micrococcus sordidus Schroeter. (Schroeter in Cohn, Kryptogam.-Flora v. Schlesien, *3*, 1, 1886, 145.) Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus sphaeroides Gray and Thornton. (Cent. f. Bakt., II Abt., *73*, 1928, 74.) From manure and soil. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 259.

Micrococcus staphylophagus Serbinov.

(La Defense des Plantes, Leningrad, *2*, 1926, 556; see Rev. Appl. Mycol., *5*, 1926, 650.) Considered pathogenic on grapevines.

Micrococcus stellatus (Lustig) Frankland and Frankland. (Stern-Coccus, Maschek, Jahresber. d. Kom.- Oberrealschule, Leitmeritz, No. 10, 1887, 62; *Coccus stellatus* Lustig, Diag. d. Bakt. d. Wassers, 2 Aufl., 1893, 40; Frankland and Frankland, Micro-organisms in Water, 1894, 503.) From water. Winsolw and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus strobiliformis Migula. (No. 23, Lembke, Arch. f. Hyg., *26*, 1896, 315; Migula, Syst. d. Bakt., *2*, 1900, 203.) From feces. Winslow and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus subcandicans Lavanchy. (Univ. Genève, Inst. bot. Prof. Chodat, Sér. 8, Fasc. 12, 1914, 68; Abst. in Cent. f. Bakt., II Abt., *47*, 1917, 611.) From water of Lake Geneva.

Micrococcus subcanus Migula. (No. 17, Lembke, Arch. f. Hyg., *26*, 1896, 311; Migula, Syst. d. Bakt., *2*, 1900, 202.) From feces. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus subcarneus Migula. (*Micrococcus carnicolor* Kern, Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 495; not *Micrococcus carnicolor* Frankland and Frankland, Micro-organisms in water, 1894, 503; Migula, Syst. d. Bakt., *2*, 1900, 181.) From the intestines of doves (*Columba livia* and *Columba oenas*). Hucker (*loc. cit.*, 26) states that this may be identical with *Micrococcus roseus* Flügge.

Micrococcus subcitreus Migula. (Citronengelber Micrococcus, Keck, Ueber das Verhalten der Bakterien im Grundwasser, Dorpat Dissertation, 1890, 60; Migula, Syst. d. Bakt., *2*, 1900, 147.) From air and water. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 249.

Micrococcus subcretaceus Migula. (Kreideweisserverflüssigender *Micrococcus*, Keck, Inaug. Diss., Dorpat, 1890, 64; Migula, Syst. d. Bakt., *2*, 1900, 107.) Winslow and Winslow (*loc. cit.*, 199) state that this species appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus subflavescens Bergey et al. (Manual, 1st ed., 1923, 61.) From dust and water. Hucker (*loc. cit.*, 9) considers this a synonym of *Micrococcus flavus* Trevisan. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 246.

Micrococcus subflavidus Migula. (*Micrococcus tetragenus subflavus* v. Besser, Beitr. z. allgm. Path. u. path. Anat., *6*, 1889, 347; Migula, Syst. d. Bakt., *2*, 1900, 190; *Micrococcus subflavus* Chester, Man. Determ. Bact., 1901, 96; not *Micrococcus subflavus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 159.) From normal nasal mucus. Winslow and Winslow (*loc. cit.*, 184) state that this is apparently a synonym of *Micrococcus aureus* Zopf; while Hucker (*loc. cit.*, 7 and 21) considers it probably identical with *Micrococcus luteus* Cohn, *Micrococcus varians* Migula, or *Gaffkya tetragena* Trevisan.

Micrococcus subflavus Flügge. (Gelbweisser Diplococcus, Bumm, Die Mikroorg. d. gonorrh. Schleimhauterkr., 1 Aufl., 1885 and 2 Aufl., 1887, 20; Flügge, Die Mikroorganismen, 2 Aufl., 1886, 159; *Neisseria subflava* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; *Diplococcus subflavus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 307; not *Micrococcus subflavus* Chester, Man. Determ. Bact., 1901, 96.) From gonorrheal pus. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 248.

Micrococcus subfuscus Matzuschita (Cent. f. Bakt., I Abt., *29*, 1901, 383.)

From dust. Similar to *Micrococcus fuscus* Adametz.

Micrococcus subgilvus Migula. (*Micrococcus gilvus* Henrici, Arb. a bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 78; not *Micrococcus gilvus* Losski, Inaug. Diss., Dorpat, 1893, 60; Migula, Syst. d. Bakt., *2*, 1900, 132.) From cheese. Winslow and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus subgranulatus Migula. (*Micrococcus citreus granulatus* Freund, Inaug. Diss., Erlangen, 1893, 27; Migula, Syst. d. Bakt., *2*, 1900, 148; *Micrococcus granulatus* v. Bagarewski, Cent. f. Bakt., II Abt., *15*, 1905, 7.) From the oral cavity. Winslow and Winslow (*loc. cit.*, 216) consider this a synonym of *Micrococcus flavus* Trevisan. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 249.

Micrococcus subgriseus Migula. (Grauer Coccus, Maschek, Jahresb. d. Kom.- Oberrealschule, Leitmeritz, No. 8, 1887, 61; Migula, Syst. d. Bakt., *2*, 1900, 94.) From water. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) regards it as a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus sublacteus Migula. (No. 27, Lembke, Arch. f. Hyg., *29*, 1897, 329; Migula, Syst. d. Bakt., *2*, 1900, 210.) From feces. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 19) regards it as a synonym of *Micrococcus freudenreichii* Guillebeau or of *Micrococcus ureae* Cohn.

Micrococcus sublilacinus Migula. (No. 26, Lembke, Arch. f. Hyg., *26*, 1896, 317; Migula, Syst. d. Bakt., *2*, 1900, 205.) From feces. Hucker (*loc. cit.*, 15) considers this a synonym of *Micrococcus albus* Schroeter.

Micrococcus subluteus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 198.) From vegetable infusions.

Micrococcus subniveus Migula. (*Micrococcus albidus* Henrici, Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 75; not *Micrococcus albidus* Losski, Inaug. Diss., Dorpat, 1893, 55; Migula, Syst. d. Bakt., *2*, 1900, 105.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus subochraceus Migula. (No. 30, Lembke, Arch. f. Hyg., *29*, 1897, 332; Migula, Syst. d. Bakt., *2*, 1900, 215.) From feces. Winslow and Winslow (*loc. cit.*, 216) regard this as a synonym of *Micrococcus flavus* Trevisan.

Micrococcus subroseus Migula. (*Micrococcus roseus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 408; Migula, Syst. d. Bakt., *2*, 1900, 176; *Micrococcus rubescens* Chester, Man. Determ. Bact., 1901, 105.) From the sputum of an influenza patient. Hucker (*loc. cit.*, 26) states that this may be identical with *Micrococcus roseus* Flügge.

Micrococcus subterraneus Hansgirg. (Hansgirg, Oest. Bot. Zeitschr., 1888, No. 7–8, 8; *Staphylococcus subterraneus* DeToni and Trevisan in Saccardo, Sylloge Fungorum, *8*, 1889, 1075.) From damp walls of wine cellars in Bohemia.

Micrococcus subtilis Migula. (Diplococcus, Kirchner, Ztschr. f. Hyg., *9*, 1890, 528; Migula, Syst. d. Bakt., *2*, 1900, 192.) Found in the sputum and blood of influenza patients.

Micrococcus succulentus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 63.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus sulphureus Zimmermann. (Bakt. unserer Trink- u. Nutzwässer, Chemnitz, I Reihe, 1890, 84.) From water. Winslow and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus suis Burrill. (*Bacillus*

suis Detmers, Rept. U. S. Dept. Agric. for 1878; Burrill, Amer. Nat., *17*, 1883, 320.) From blood of hogs sick with swine plague or hog cholera.

Micrococcus syphiliticus Migula. (Coccen, Disse, Deutsche med. Wchnschr., *13*, 1887, 888; Migula, Syst. d. Bakt., *2*, 1900, 218.) This may be synonymous with *Micrococcus candicans* Flügge.

Micrococcus tardigradus Trevisan. (*Micrococcus flavus tardigradus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 175; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 34; *Micrococcus sulfureus β-tardigradus* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 163; *Micrococcus sulfureus* var. *tardigradus* Löhnis and Pillai, Cent. f. Bakt., II Abt., *19*, 1907, 92.) From air; also found in water. Winslow and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus tardior Migula. (*Diplococcus flavus liquefaciens tardus* Unna and Tommasoli, Monatshefte f. prakt. Dermatol., *9*, 1889, 56; Migula, Syst. d. Bakt., *2*, 1900, V and 141; *Micrococcus epidermis* Chester, Man. Determ. Bact., 1901, 97; *Diplococcus flavus-liquefaciens* Chester, *ibid.*) From eczema. Winslow and Winslow (*loc. cit.*, 216) regard this as a synonym of *Micrococcus flavus* Trevisan; while Hucker (*loc. cit.*, 11) regards it as a synonym of *Micrococcus citreus* Migula.

Micrococcus tardissimus (Trevisan) Migula. (Milchweisser Micrococcus, Bumm, Mikroorg. d. gonorrh. Schleimhauterkr., 1 Aufl., 1885; *Diplococcus albicans tardissimus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 183; *Neisseria tardissima* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; *Micrococcus albicans tardissimus* Sternberg, Man. of Bact., 1893, 882; Migula, Syst. d. Bakt., *2*, 1900, 49.) Found in vaginal secretions. Winslow and Winslow (*loc. cit.*, 205) regard this as a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan; while Hucker (*loc. cit.*, 7) considers it a synonym of *Micrococcus luteus* Cohn or *Micrococcus varians* Migula.

Micrococcus tardus Migula. (*Diplococcus albicans tardus* Unna and Tommasoli, Monatshefte f. prakt. Dermatol., *9*, No. 2, 1889, 49; *Micrococcus albicans tardus* Sternberg, Man. of Bact., 1893, 882; Migula, Syst. d. Bakt., *2*, 1900, 50; *Micrococcus eczemae* Chester, Man. Determ. Bact., 1901, 86). From eczema. Winslow and Winslow (*loc. cit.*, 216 and 224) regard this as a synonym of *Micrococcus flavus* Trevisan or of *Micrococcus candicans* Flügge.

Micrococcus tenacatis Chester. (No. 43, Conn, Storrs Agr. Exp. Sta. 7th Ann. Rept., 1895, 78; Chester, Man. Determ. Bact., 1901, 88.) From milk from Uruguay. Winslow and Winslow (*loc. cit.*, 220) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus tener Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 200.) From a vegetable infusion.

Micrococcus tenuissimus Migula. (*Micrococcus cumulatus tenuis* v. Besser, Beitr. z. path. Anat., *6*, 1889, 347; Migula, Syst. d. Bakt., *2*, 1900, 55; *Micrococcus cumulatus* Chester, Man. Determ. Bact., 1901, 87.) Frequently found in human nasal mucus. Winslow and Winslow (*loc. cit.*, 205) regard this as a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus tetragenus aureus Boutron. (Thèse, Paris, 1893; Abst. in Cent. f. Bakt., *16*, 1894, 971.) Hucker (*loc. cit.*, 21) regards this as a synonym of *Gaffkya tetragena* Trevisan.

Micrococcus tetragenus concentricus Schenk. (Allg. Wien. med. Zeitung, 1892, 81 and 92; Abst. in Cent. f. Bakt., *13*, 1893, 720.) From feces. Motile.

Micrococcus tetragenus-pallidus Chester. (*Micrococcus tetragenus pallidus*, Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 354; Chester, Man. Determ. Bact., 1901, 93.) From dust. Probably a variety of *Micrococcus versatilis* Chester, see below.

Micrococcus tetragenus-vividus Chester. (*Micrococcus tetragenus vividus* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 354; Chester, Man. Determ. Bact., 1901, 102.) From dust. Probably a variety of *Micrococcus versatilis* Chester, see below.

Micrococcus tetras Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 60; *Pediococcus tetras* Pribram, Klassifikation der Schizomyceten, 1933, 46.) From cheese. Winslow and Winslow (*loc. cit.*, 224) state that this species is apparently the same as *Micrococcus candicans* Flügge.

Micrococcus thermophilus Hansgirg. (Oestr. Bot. Ztschr., No. 3, 1888, 5.) From hot springs.

Micrococcus toxicatus Burrill. (Amer. Nat., *17*, 1883, 319.) From poison ivy and other plants in the genus *Rhus*.

Micrococcus trachomatis Migula. (Trachomococcus, Sattler, in Zehender, Klin. Monatsbl., 1881; Trachomococcus, Michel, Arch. f. Augenheilk., *16*, 1886; *Neisseria micheli* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; see Baumgarten, Lehrb. d. path. Mykol., *1*, 1890, 421; Migula, Syst. d. Bakt., *2*, 1900, 67.) Winslow and Winslow (*loc. cit.*, 205) consider this to be a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus tributyrus Stark and Scheib. (Jour. Dairy Sci., *19*, 1936, 210.) From butter.

Micrococcus tritici Prillieux. (Maladies des plantes agricoles, *1*, 1895, 7; not *Micrococcus tritici* Köck, Monatshefte f. Landwirtschaft, 1909, 247, quoted from Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 653.) Considered pathogenic on wheat.

Micrococcus tuberculosus Migula. (No. 23, Lembke, Arch. f. Hyg., *29*, 1897, 325; Migula, Syst. d. Bakt., *2*, 1900, 214.) From feces. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus typhoideus Migula. (Coccus A, Foutin, Bakt. Untersuch. v. Hagel, Wratsch, 1889, No. 49 and 50; see Cent. f. Bakt., *7*, 1890, 373; Migula, Syst. d. Bakt., *2* 1900, 94; *Micrococcus alpha* Chester, Man. Determ. Bact., 1901, 93.) From hail. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 25) states that it may be identical with *Micrococcus roseus* Flügge.

Micrococcus ulceris de Luca. (Gazzetta degli Ospitali, 1886; Abst. in Cent. f. Bakt., *1*, 1887, 333; *Micrococcus ulceris mollis* de Luca, *ibid.*) From the secretion of a venereal ulcer.

Micrococcus ulmi Brussoff. (Cent. f. Bakt., II Abt., *63*, 1925, 261.) Isolated from diseased elm trees.

Micrococcus umbilicatus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 186.) From a bean infusion. Hucker (*loc. cit.*, 12) considers this a synonym of *Micrococcus aureus* Zopf.

Micrococcus ureae Migula. (Torule ammoniacale, Pasteur, Ann. de Chim. et de Phys., 3 sér., *64*, 1862, 52; van Tieghem, Comp. rend. Acad. Sci., Paris, *58*, 1864, 210; *Torula ureae* Lea, Jour. of Physiol., *11*, 1890, 226; Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 17.) From urine. May not be the same as *Micrococcus ureae* Cohn.

Micrococcus urinalbus De Toni and Trevisan. (*Micrococcus albus urinae* Doyen, Jour. d. connaiss. médic., No. 14, 1889, 108; De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1076.) From urine. Hucker (*loc. cit.*, 15) considers this a synonym of *Micrococcus albus* Schroeter.

Micrococcus uruguae Chester. (No. 40, Conn, Storrs Agr. Exp. Sta. 7th Ann. Rept., 1895, 78; Chester, Man. Determ. Bact., 1901, 100.) From milk from Uruguay. Winslow and Winslow (*loc. cit.*, 216) regard this as a synonym of

Micrococcus flavus Trevisan; while Hucker (*loc. cit.*, 10) regards it as a synonym of *Micrococcus conglomeratus* Migula.

Micrococcus utriculosus Migula. (No. 20, Lembke, Arch. f. Hyg., *29*, 1897, 327; Migula, Syst. d. Bakt., *2*, 1900, 199.) From feces. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus varians lactis Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 37.) From milk, cream, dust. According to Weigmann (In Lafar, Handb. d. techn. Mykologie, *2*, 1905, 13) this is identical with *Staphylococcus mastitis albus*. Hucker (*loc. cit.*, 11) regards it as a synonym of *Micrococcus citreus* Migula.

Micrococcus variococcus Müller-Thurgau and Osterwalder. (Cent. f. Bakt., II Abt., *36*, 1913, 236.) From wine.

Micrococcus versatilis Chester. (*Micrococcus tetragenus febris flavae* Finlay; *Micrococcus tetragenus versatilis* Sternberg, Report on etiology and prevention of yellow fever, Washington, 1891, 164; Chester, Man. Determ. Bact., 1901, 102.) Isolated from the excrement of mosquitoes which had sucked the blood of yellow fever patients; and from dust. Winslow and Winslow (*loc. cit.*, 216) regard this as a synonym of *Micrococcus flavus* Trevisan.

Micrococcus versicolor Flügge. (Die Mikroorganismen, 2 Aufl., 1886, 177.) From dust. Winslow and Winslow (*loc. cit.*, 220) consider this a synonym of *Micrococcus luteus* Cohn.

Micrococcus vesicae Heim. (Lehrb. d. Bakt., 2 Aufl., 1898, 297.) From acid urine. Winslow and Winslow (*loc. cit.*, 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Micrococcus vesicans Harman. (Jour. Path. and Bact., *9*, 1904, 1.) Considered the cause of veld sore, a disease of Africa and tropical Australia.

Micrococcus vesicosus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 203.) From a vegetable infusion. Hucker (*loc. cit.*, 8) considers this species identical with either *Micrococcus luteus* Cohn or *Micrococcus varians* Migula.

Micrococcus vesiculiferus Migula. (No. 28, Lembke, Arch. f. Hyg., *29*, 1897, 330; Migula, Syst. d. Bakt., *2*, 1900, 211.) From feces. Winslow and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus vincenzii Chester. (*Micrococcus tetragenus citreus* Vincenzi, La Riforma Med., 1897, 758; Chester, Man. Determ. Bact., 1901, 103.) From the submaxillary lymphatic gland of a child. Winslow and Winslow (*loc. cit.*, 220) regard this as a synonym of *Micrococcus luteus* Cohn.

Micrococcus vini Migula. (*Micrococcus saprogenes vini I*, Kramer, Bakt. in Beziehungen z. Landwirtsch. u. d. landwirtsch-techn. Gewerben, II Teil, 1892, 139; Migula, Syst. d. Bakt., *2*, 1900, 118.) From wine. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter; while Hucker (*loc. cit.*, 8) considers it identical with *Micrococcus luteus* Cohn or *Micrococcus varians* Migula.

Micrococcus viniperda Schroeter. (Schroeter in Cohn, Kryptog.-Flora v. Schlesien, *3*, 1, 1886, 144.) From dust, feces, etc.

Micrococcus viscosus Bergey et al. (*Micrococcus lactis viscosus B*, Conn, Esten and Stocking, Storrs Agr. Exp. Sta. Rept. for 1906, 109; Bergey et al., Manual, 1st ed., 1923, 68.) From pasteurized milk. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 256. See *Micrococcus lactis viscosus* Sternberg.

Micrococcus viscosus lactis Conn. (Storrs Agr. Exp. Sta. 12th Ann. Rept., 1900, 44.) From milk.

Micrococcus viticulosus Flügge. (Die Mikroorganismen, 2 Aufl., 1886, 178.) From dust and water. Winslow and Winslow (*loc. cit.*, 205) consider this to

be a synonym of *Micrococcus candidus* Cohn or of *Gaffkya tetragena* Trevisan.

Micrococcus vulgaris Eckstein. (Ztschr. f. Forst- u. Jagdwesen, *26*, 1894, 17; Abst. in Cent. f. Bakt., I Abt., *18*, 1895, 292; not *Micrococcus vulgaris* Weiss, Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 193.) From insects.

Micrococcus xanthogenicus (Freire) Trevisan. (*Cryptococcus xanthogenicus* Freire, Recherches sur la cause de la fièvre jaune, Rio de Janeiro, 1884; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.) Isolated from yellow fever and supposed by Freire to be the cause of the disease. Winslow and Winslow (*loc. cit.*, 199) state that this appears to be a synonym of *Micrococcus albus* Schroeter.

Micrococcus xenopus Schrire and Greenfield. (Trans. Royal Soc. So. Africa, *17*, 1930, 309.) From an abscess in a toad (*Xenopus sp.*). For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 243.

Micrococcus xerophilus Glage. (Ztschr. f. Fleisch- u. Milchhygiene, *10*, 1900, 145.) From coating on surface of dry wurst and similar meat products.

Micrococcus zeae Serbinov. (La Defense des Plantes, *2*, 1926, 546.) From flour, grain and seedlings of corn. Was thought to be a cause of pellagra in South Russia.

Micrococcus zonatus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 68.) From cheese. Winslow and Winslow (loc. cit., 224) state that this is apparently a synonym of *Micrococcus candicans* Flügge.

Planococcus casei Migula. (Micrococcus No. III, Adametz, Landwirtsch. Jahrb., *18*, 1889, 240; Migula, Syst. d. Bakt., *2*, 1900, 270.) From Emmenthal cheese.

Planococcus loeffleri Migula. (Löffler, Cent. f. Bakt., *7*, 1890, 637; Migula, Syst. d. Bakt., *2*, 1900, 273.) From colony on an old gelatin plate.

Planococcus luteus (Adametz) Migula. (*Diplococcus luteus* Adametz, Mitteil. d. oesterr. Vers. Station f. Brauerei u. Mälzerei in Wien, Heft I, 1888, 39; *Neisseria lutea* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32; Migula, Syst. d. Bakt., *2*, 1900, 274.) Hucker (*loc. cit.*, 9) considers this species a synonym of *Micrococcus flavus* Trevisan.

Rhodococcus fulvus Winslow and Rogers. (Jour. Inf. Dis., *8*, 1906, 545; not *Micrococcus fulvus* Cohn, Beitr. z. Biol. d. Pflanzen, *1*, Heft 3, 1875, 181.) From soil, air and water.

Staphylococcus albicans Stigell. (Cent. f. Bakt., I Abt., Orig., *45*, 1908, 489.) Probably intended for *Micrococcus albicans amplus* Flügge.

Staphylococcus albus liquefaciens Sternberg. (White liquefying staphylococcus, Escherich, Die Darmbakterien des Säuglings, Stuttgart, 1886, 88; Sternberg, Manual of Bact., 1893, 607.) Found occasionally in the feces of healthy infants.

Staphylococcus albus non liquefaciens Hlava. (Sborník lékařský, II, Prague, 1887, 12 pp.; see Cent. f. Bakt., *2*, 1887, 688.) Probably a synonym of *Micrococcus albocereus* Migula.

Staphylococcus anaerobius Heurlin. (Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen, Helsingfors, 1910, 120.) See Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, Paris, 1937, 1027; probably not the same as *Staphylococcus anaerobius* Hamm, Die puerperale Wundinfektion, Berlin, 1912. Incompletely described. From genital tract.

Staphylococcus anaerobius major Heurlin (*loc. cit.*, 120). From genital tract.

Staphylococcus anaerobius minor Heurlin (*loc. cit.*, 120). From genital tract.

Staphylococcus aureus sarciniformis Rosenhauch. (Klin. Monatsbl. f. Augenheilkunde, Jahrg., *8*, 1909, 257; Abst. in Cent. f. Bakt., I Abt., Ref., *45*, 1910, 787.)

Staphylococcus bovis Ford. (*Staphylococcus pyogenes bovis* Lucet, Ann. Inst.

Past., 7, 1893, 327; Ford, Textb. of Bact., 1927, 424.) Found in suppurative lesions of cattle.

Staphylococcus candidus Warrington. (Lancet, *1*, 1888.)

Staphylococcus flavocyaneus Knaysi. (Jour. Bact., *43*, 1942, 368.) Found as a contaminant in dissociation studies.

Staphylococcus flavus non pyogenes Fränkel and Sänger. (Arch. f. path. Anat., *108*, 1887, 286; Abst. in Cent. f. Bakt., *3*, 1888, 281.) Found in endocarditis ulcerosa.

Staphylococcus griseus Tavel. (Quoted from Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 173.) From pus.

Staphylococcus griseus radiatus Viti. (Atti d. R. Accad. d. Fisiocritici di Siena, Ser. IV., 2, 1891, Abst. in Cent. f. Bakt., *11*, 1892, 672.) From cases of endocarditis.

Staphylococcus habanensis Gibler. (Quoted from Fernandez, Cronica médico quirúrgica de la Habana, 1891, No. 30; Abst. in Cent. f. Bakt., *11*, 1892, 472.) Isolated from the human eye.

Staphylococcus insectorum Krassilstschik. (Quoted from Paillot, Les maladies du ver à soie grasserie et dysenteries, 1928, 171.) From the intestinal tract of the silkworm (*Bombyx mori*).

Staphylococcus lactis acidi McDonnell. (Inaug. Diss., Kiel, 1899; Abst. in Cent. f. Bakt., II Abt., *6*, 1900, 120.)

Staphylococcus leloirii Trevisan. (Microbe des périfolliculites conglomérées, Leloir, Soc. anatomique, May, 1884; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 33.)

Staphylococcus liquefaciens aurantiacus Distaso. (Cent. f. Bakt., I Abt., Orig., *59*, 1911, 102.) From feces.

Staphylococcus muscae Glaser. (Amer. Jour. Hyg., *4*, 1924, 411.) Causes a fatal infection in house flies (*Musca domestica*). For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 264.

Staphylococcus non pyogenes Savor. (Beitr. z. Geburtshilfe u. Gynäkol. v. Hegar, *2*, Heft 1, 1898; Abst. in Cent. f. Bakt., I Abt., *26*, 1899, 642.) From urino-genital tract.

Staphylococcus pharyngis Bergey et al. (Manual, 1st ed., 1923, 56.) Found in the human nasopharynx in acute catarrhal inflammation. For a description of this species, see Bergey et al., Manual, 5th ed., 1939, 265.

Staphylococcus putrificus Schottmüller. (Leitfaden f. d. Klinisch- Bakt. Kultur-Methoden, Berlin, Wien, 1923. Quoted from Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, Paris, 1927, 1027.)

Staphylococcus pyogenes liquefaciens albus Hlava. (Sborník lékařský, II, Prague, 1887, 12 pp.; Abst. in Cent. f. Bakt., *2*, 1887, 688.) From small pox pustules.

Staphylococcus pyogenes tenuis Scheibe. (Inaug. Diss., München, 1889; see Cent. f. Bakt., *6*, 1889, 186.) From middle ear infections.

Staphylococcus roseus Tavel. (Quoted from Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 177.) Evidently identical with *Micrococcus roseus* Lehmann and Neumann or *Micrococcus roseo-fulvus* Lehmann and Neumann.

Staphylococcus salivarius Andrewes and Gordon. (35th Ann. Rept. Local Govt. Board London, 1905–06, 558.) From saliva. Probably *Micrococcus candidus* Cohn.

Staphylococcus ureae candidus Lundström. (Festschr. d. path.-anat. Inst. z. Andenken a. d. 250 jährige Bestehen d. finnländ. Univ. Helsingfors, 1890; abst. in Cent. f. Bakt., *9*, 1891, 672.) From urine. Probably *Micrococcus ureae* Cohn.

Staphylococcus ureae non pyogenes Barlow. (Arch. f. Dermat. u. Syph., 1893; Abst. in Cent. f. Bakt., *14*, 1893, 456.) From cases of cystitis.

Urococcus dowdeswelli Miquel. (Ann. de Micrographie, *5*, 1893, 209.) Ferments urea.

Urococcus van tieghemi Miquel (*loc. cit.*, 161). Ferments urea.

Genus II. **Gaffkya** *Trevisan.**

(Trevisan, Atti d. Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 106; *Tetracoccus* Klecki, Cent. f. Bakt., *15*, 1894, 360; not *Tetracoccus* Orla-Jensen, The Lactic Acid Bacteria, Mém. Acad. Sci. Danemark, Sec. Sci., 8 sér, *5*, 1919, 154; *Tetradiplococcus* Bartoszewicz and Schwarzwasser, Cent. f. Bakt., II Abt., *21*, 1908, 614.) Named for Prof. Georg Gaffky, 1850–1918, Berlin.

Occur in the animal body and in special media as tetrads, while in ordinary culture media they occur in pairs and irregular masses. Aerobic to anaerobic. Gram-positive. Parasitic organisms.

The type species is *Gaffkya tetragena* (Gaffky) Trevisan.

Key to the species of genus **Gaffkya.**

I. Facultative aerobe.

1. *Gaffkya tetragena.*

II. Strict anaerobe.

2. *Gaffkya anaerobia.*

1. **Gaffkya tetragena** (Gaffky) Trevisan. (*Micrococcus tetragenus* Gaffky, Arch. f. Chirurg., *28*, Heft 3, 1883, 500; Trevisan, Atti d. Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 106; *Micrococcus tetragenus septicus* Boutron, Thesis, Paris, 1893; Abst. in Cent. f. Bakt., *16*, 1894, 971; *Micrococcus tetragenus albus* Boutron, *ibid.*; *Merista septica* Hueppe, Principles of Bacteriology (Eng. trans.), 1899, 170; *Sarcina septica* Hueppe, *ibid.*; *Sarcina tetragena* Migula, Syst. d. Bakt., *2*, 1900, 225; *Merista tetragena* Vuillemin, Ann. Mycologie, Berlin, *11*, 1913, 525; *Staphylococcus tetragenus* Holland, Jour. Bact., *5*, 1920, 224; *Tetracoccus septicus* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 18; *Pediococcus tetragenus* Pribram, Klassifikation der Schizomyceten, 1933, 46.) From Greek, *tetra* (*tetara*), four; M. L. *genes*, producing.

Spheres: 0.6 to 0.8 micron in size, with pseudocapsule (in body fluids) surrounding four of the elements showing typical tetrads. Gram-positive.

Gelatin colonies: Small, 1 to 2 mm. in diameter, white convex.

Gelatin stab: Thick, white surface growth. No liquefaction.

Agar colonies: Circular, white, smooth, glistening, entire. Reimann (Jour. Bact., *31*, 1936, 385) has described eleven colony form variants for this species.

Agar slant: White, moist, glistening.

Broth: Clear, with gray viscous sediment.

Litmus milk: Slightly acid.

Potato: White, viscid.

Indole not formed.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Ammonium salts not utilized.

Acid from glucose, lactose and glycerol.

No H_2S formed.

Aerobic, facultative.

Pathogenic for mice and guinea pigs; rabbits less susceptible.

Optimum temperature 37°C.

Source: Isolated from sputum in tuberculosis; also from air and skin.

Habitat: Mucous membrane of respiratory tract.

---

* Revised by Prof. G. J. Hucker, N. Y. State Experiment Station, Geneva, New York March, 1943.

2. **Gaffkya anaerobia** (Choukévitch) Prévot. (*Tetracoccus anaerobius* Choukévitch, Ann. Inst. Past., *25*, 1911, 349; *Micrococcus tetragenes anaerobius* Hamm, Die puerperale Wundinfektion, Berlin, 1912; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 203.) From Greek, *an*, without; *aer*, air; *bios*, life.

Spheres: About 1.0 to 1.5 microns, occurring in tetrads, sometimes in groups of eight. Gram-positive.

Gelatin: No liquefaction.

Deep agar colonies: After 24 to 48 hours, small, grayish, 2 to 3 mm. in diameter. Abundant production of gas which breaks up the agar.

Broth: Poor growth. Slight sediment.

Milk: Unchanged.

Coagulated proteins not digested.

Optimum temperature 37°C. No growth at 22°C.

Non-pathogenic for guinea-pigs or rabbits.

Strict anaerobe.

Distinctive characters: Prefers acid media.

Source: Isolated from the female genital tract; isolated from the large intestine of a horse.

Habitat: Probably widely distributed in natural cavities of man and animals.

Appendix: The following species have been placed in the genus *Gaffkya* or in the genus *Tetracoccus*.

Gaffkya archeri Trevisan. (A black micrococcus, Archer, Quart. Jour. Microscop. Sci., 1874, 321; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 27.)

Gaffkya grandis DeToni and Trevisan. (Microcoque des reins et des ulcéres syphilitiques de la peau, Babes, in Cornil and Babes, Les Bactér., 2nd ed., 1886, 782; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1042.)

Gaffkya mendozae DeToni and Trevisan. (*Micrococcus tetragenus* and *Micrococcus tetragenus mobilis ventriculi* Mendoza, Cent. f. Bakt., *6*, 1889, 567; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1043; *Planococcus tetragenus* Migula, Syst. d. Bakt., *2*, 1900, 269; *Micrococcus mendozae* Chester, Man. Determ. Bact., 1901, 84; *Sarcina tetragena* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 545; *Planomerista ventriculi* Vuillemin, Ann. Mycolog., Berlin, *11*, 1913, 525.) Motile. Isolated from the contents of the stomach. Hucker (N. Y. State Exp. Sta. Tech. Bull. No. 102, 1924, 21) regards this as a synonym of *Gaffkya tetragena* Trevisan.

Gaffkya tardissima (Altana) Bergey et al. (*Tetragenus tardissimus* Altana, Cent. f. Bakt., I Abt., Orig., *48*, 1909, 42; Bergey et al., Manual, 2nd ed., 1925, 59.) From a natural infection of guinea pigs. See Manual, 5th ed., 1939, 269 for a description of this species.

Gaffkya verneti Corbet. (Organism No. 21, Denier and Vernet, La Caoutchouc, *17*, 1920, 10491; Corbet, Quart. Jour. Rubber Research Inst., Malaya, *2*, 1930, 143.) From the latex of the Para rubber tree (*Hevea brasiliensis*). For a description of this species, see Manual, 5th ed., 1939, 269.

Tetracoccus carneus halophilus Horowitz-Wlassowa. (Cent. f. Bakt., II Abt., *85*, 1932, 16.) Isolated from salted intestines (Wiener skins).

Tetracoccus casei Orla-Jensen. (The Lactic Acid Bacteria, 1919, 80.) From cheese. Probably identical with *Micrococcus freudenreichii* Guillebeau.

Tetracoccus mastitidis Orla-Jensen (*loc. cit.*, 81). From milk of a woman with mastitis. Orla-Jensen thinks this is identical with the staphylococcus that causes mastitis in cows, i.e., *Micrococcus pyogenes* var. *aureus* Zopf.

Tetracoccus mycodermatus Orla-Jensen (*loc. cit.*, 81). From Camembert cheese.

Genus III. **Sarcina** *Goodsir.**

(Goodsir, Edinborough Med. and Surg. Jour., 1842, 430; *Lactosarcina* Beijerinck, Arch. néerl. d. sci. exact., Ser. 2, *13*, 1908, 359; *Urosarcina* Miquel, Ann. Microg., *1*, 1888, 517; *Planosarcina* Migula, Arb. Bakt. Inst. Karlsruhe, *1*, 1894, 236; *Pseudosarcina* Löhnis, Handb. d. landwirtsch. Bakt., 1910, 449 (Pseudo-sarcina, Mazé, Compt. rend. Acad. Sci. Paris, *137*, 1903, 887); *Sporosarcina* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 340; *Paulosarcina* Enderlein, Sitzber. Gesell. Naturf., Berlin, 1917, 319; *Phacelium* Enderlein, *ibid.*, 319; *Zymosarcina* Smit, Die Gärungssarcinen. Pflanzenforschung, Heft 14, 1930, 26; *Butyrisarcina* Kluyver and Van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 400; *Methanosarcina* Kluyver and Van Niel, *ibid.*) From Latin *sarcina*, packet, bundle.

Division occurs, under favorable conditions, in three planes, producing regular packets. Usually Gram-positive. Growth on agar abundant, usually with formation of yellow or orange pigment. Glucose broth slightly acid, lactose broth generally neutral. Gelatin frequently liquefied. Nitrites may or may not be produced from nitrates. Saprophytes and facultative parasites.

The type species is *Sarcina ventriculi* Goodsir.

Key to the species of genus Sarcina.

I. Microaerophilic to anaerobic.
  A. No growth without sugars. Do not produce methane. Sub-genus *Zymosarcina* Smit (Die Gärungssarcinen. Pflanzenforschung, Heft 14, 1930, 26).
    1. Cellulose reaction positive. Slow coagulation in litmus milk.
      1. *Sarcina ventriculi.*
    2. Cellulose reaction negative. Litmus milk not coagulated.
      2. *Sarcina maxima.*
  B. Does not utilize sugars. Produces methane. Sub-genus *Methanosarcina* Kluyver and van Niel (Cent. f. Bakt., II Abt., *94*, 1936, 400).
      3. *Sarcina methanica.*

II. Aerobic.
  A. No endospores present. Sub-genus *Sarcinococcus subgen. nov.*
    1. Not halophilic.
      a. Non-motile.
        b. Yellow pigment produced. Nitrites not produced from nitrates.
          c. Milk alkaline; coagulated.
            4. *Sarcina lutea.*
          cc. Milk alkaline; not coagulated.
            5. *Sarcina flava.*
        bb. Orange pigment produced. Nitrites produced from nitrates.
            6. *Sarcina aurantiaca.*
      aa. Motile.
            7. *Sarcina citrea.*
    2. Halophilic red chromogen.
            8. *Sarcina littoralis.*
  B. Endospores present. Motile. Sub-genus *Sporosarcina* Orla-Jensen (Cent. f. Bakt., II Abt., *22*, 1909, 340).
            9. *Sarcina ureae.*

*** Revised by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, March, 1943.**

1. **Sarcina ventriculi** Goodsir. (Goodsir, Edinborough Med. and Surg. Jour., *57*, 1842, 430; *Merismopedia goodsirii* Husemann, De anim. et végét., 18—, 13; *Merismopedia ventriculi* Robin, Histoire des végét. parasites, 1853, 331; Anaerobic sarcina, Beijerinck, Proc. of Section of Sciences, Kon. Akad. v. Wetensch., Amsterdam, *7*, 1905, 580; *Zymosarcina ventriculi* Smit, Die Gärungssarcinen. Pflanzenforschung, Jena, Heft 14, 1930, 26; *Sarcina beijerincki* Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 205.) From Latin, *ventriculus*, the stomach.

Description taken in part from Smit (*loc. cit.*).

Large spheres: 3.5 to 4.0 microns, occurring in packets of 8, 16, 32 or more elements. Non-motile. Gram-positive. Cellulose reaction positive.

Growth occurs only in sugar media, containing peptones.

Gelatin: No liquefaction.

Deep glucose agar colonies: Multi-lenticular, surrounded by a cloudy zone. Abundant gas.

Glucose agar slant: Round, whitish colonies, several millimeters in diameter.

Glucose broth: Abundant, flaky growth. Abundant gas. Acid. No turbidity.

Plain peptone water: No growth.

Sugar peptone water: Abundant growth. Gas. Indole not formed.

Milk: Slow growth. Acid and coagulation.

Coagulated proteins not attacked.

Acid and gas from glucose, fructose, sucrose, maltose, lactose and galactose. No acid from xylose, arabinose, raffinose, mannitol, dulcitol, salicin, starch, glycerin and inulin.

Neutral red broth changed to fluorescent yellow.

Utilizes peptones, wort and yeast water as sources of nitrogen. Cannot utilize amino acids or inorganic nitrogen.

Principal products of metabolism are carbon dioxide and ethyl alcohol.

Nitrites not produced from nitrates.

Non-pathogenic.

Optimum pH 1.5 to 5.0. Limits of pH 0.9 to 9.8.

Temperature relations: Optimum 30°C. Maximum 45°C. Minimum 10°C. Killed in ten minutes at 65°C.

Microaerophilic to anaerobic.

Source: Isolated from a diseased stomach.

Habitat: Garden soil, dust, sand, mud; the stomach.

2. **Sarcina maxima** Lindner. (Lindner, Die Sarcina-Organismen der Gärungsgewerbe. Inaug. Diss., Berlin, 1888, 54; Also abstract in Cent. f. Bakt., *4*, 1888, 427; *Zymosarcina maxima* Smit, Die Gärungssarcinen. Pflanzenforschung, Heft 14, 1930, 22; *Butyrisarcina maxima* Kluyver and van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 400.) From Latin *maxima*, largest.

Description from Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, 1937, 1030 and from Smit, *loc. cit.*

Large spheres: 4.0 to 4.5 microns, occurring in regular packets of 8, 16, 32 or more elements. Non-motile. Gram-positive.

Growth occurs only in sugar media, containing peptones.

Gelatin: No liquefaction.

Deep glucose agar colonies: Multi-lenticular. Abundant gas produced.

Glucose agar slant: Round, whitish colonies.

Glucose broth: Abundant growth, flaky, gaseous, marked acidification. Disagreeable butyric odor. No turbidity.

Sugar peptone water: Abundant growth, flaky, gaseous, followed by acidification.

Milk: Not coagulated.

Coagulated proteins not attacked.

Cellulose reaction negative.

Acid and gas from glucose, fructose, galactose, maltose, sucrose and lactose.

Neutral red broth changed to fluorescent yellow.

Utilizes peptones, yeast water or broth as source of nitrogen. Cannot utilize amino acids or inorganic nitrogen.

Principal products of metabolism are carbon dioxide, butyric and acetic acids.

Non-pathogenic.

Limits of pH 1.0 to 9.5.

Temperature relations: Optimum 30°C. Maximum 40°C. Minimum 15°C. Killed in twenty minutes at 55°C.

Microaerophilic to anaerobic.

Source: Isolated from fermenting malt mash.

Habitat: Acidified flour pastes, wheat bran; seldom in soils. Also intestinal contents of guinea pigs (Crecelius and Rettger, Jour. Bact., *46*, 1943, 10).

3. **Sarcina methanica** (Smit) Weinberg et al. (Methaansarcine, Söhngen, Inaug. Diss., Delft, 1906, 104; *Zymosarcina methanica* Smit, Die Gärungssarcinen. Pflanzenforschung, Heft 14, 1930, 25; *Methanosarcina methanica* Kluyver and Van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 400; Barker, Arch. f. Mikrobiol., *7*, 1936, 420; Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, 1937, 1032.) From M. L. *methanum*, methane; M. L. *methanicus*, related to methane.

Description from Weinberg, Nativelle and Prévot (*loc. cit.*) and Smit (*loc. cit.*).

Spheres: 2.0 to 2.5 microns, occurring in packets of 8 or more cocci. Non-motile. Gram-variable.

Growth in solutions of calcium acetate and possibly butyrate and inorganic ammonium salts. Carbon dioxide is needed for growth.

In acetate-agar (with addition of some H_2S and $NaHCO_3$): Colonies of 50 to 100 microns are formed, showing gas formation.

Cultural characters as yet unknown.

Peptones not attacked.

Cellulose reaction negative.

Utilizes ammonium salts as source of nitrogen. No organic nitrogen compounds utilized.

Carbohydrates not fermented. Ethyl alcohol is not fermented.

Principal products from the metabolism of calcium acetate and butyrate are methane, carbon dioxide and calcium carbonate.

Non-pathogenic.

Optimum temperature 35° to 37°C.

Strict anaerobe. Killed by a short contact with the air.

Distinctive characters: Utilizes ammonium salts and acyclic acids producing methane and carbonic acid.

Source: Sediment in methane fermentation (Weinberg et al.). Isolated from mud (Smit).

Habitat: Swamp waters and mud; fermenting sewage sludge.

4. **Sarcina lutea** Schroeter. (Kryptog. Flora v. Schlesien, *3*, 1, 1886, 154; also see Klein, Microorganisms and Disease, 1885, 43; Eisenberg, Bakt. Diag., 1 Aufl., Taf. 2, 1886; Flügge, Die Mikroorganismen, 2 Aufl., 1886, 179; Frankland and Frankland, Phil. Trans. London, *178*, B, 1888, 265.) From Latin *luteus*, yellow.

Spheres: 1.0 to 1.5 microns, showing packets in all media. Gram-positive.

Gelatin colonies: Circular up to 5 mm. in diameter, sulfur-yellow, sinking into the medium.

Gelatin stab: Slow infundibuliform liquefaction.

Agar colonies: Yellow, coarsely granular, circular, raised, moist, glistening, entire margin.

Agar slant: Sulfur to chrome yellow, smooth, soft.

Broth: Clear with abundant yellow sediment.

Litmus milk: Coagulated, becoming alkaline.

Potato: Sulfur to chrome yellow, raised; sometimes limited growth.

Slight indole formation.

Nitrites generally produced from nitrates.

No acid from glucose, lactose or sucrose.

Hydrogen sulfide is formed.

Aerobic.

Optimum temperature 25°C.

Habitat: Air, soil and water, skin surfaces.

5. **Sarcina flava** De Bary. (Vorlesungen über Bakterien, 1887, 151; *Sarcina liquefaciens* Frankland and Frankland, Philos. Trans. Roy. Soc. London, *178*, B, 1888, 267.) From Latin, *flavus*, yellow.

Spheres: 1.0 to 2.0 microns, occurring in packets of 16 to 32 cells. Gram-positive.

Gelatin colonies: Small, circular, yellowish.

Gelatin stab: Slowly liquefied.

Agar slant: Yellow streak.

Broth: Slowly becoming turbid with whitish, later yellowish sediment.

Litmus milk: Alkaline, not coagulated.

Potato: Yellow streak.

Indole not produced.

Nitrites not produced from nitrates.

Aerobic.

Optimum temperature 30° to 35°C.

Habitat: Air, water, soil.

6. **Sarcina aurantiaca** Flügge. (Die Mikroorganismen, 1886, 180; For description see Frankland and Frankland, Phil. Trans. Roy. Soc. London, *178*, *B*, 1888, 266; *Paulosarcina aurantiaca* Enderlein, Sitzungsber. Ges. Naturf. Freunde, Berlin, 1917, 319.) From M. L., *aurantiacus*, orange-colored.

Spheres developing packets in all media. Gram-positive.

Gelatin colonies: Small, circular, dark yellow, entire margin, sinking into the medium.

Gelatin stab: Infundibuliform liquefaction.

Agar slant: Slightly raised, orange yellow to orange red, soft, smooth.

Broth: Flocculent turbidity, with abundant sediment.

Litmus milk: Coagulation and digestion.

Potato: Raised, yellow-orange, glistening to dull, granular.

Slight indole formation.

Nitrites not produced from nitrates.

No H_2S produced.

Aerobic.

Optimum temperature 30°C.

Habitat: Air and water.

7. **Sarcina citrea** (Migula) Bergey et al. (*Micrococcus agilis citreus* Menge, Cent. f. Bakt., *12*, 1892, 52; *Planococcus citreus* Migula, Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 236; *Micrococcus agilis-citreus* Chester, Man. of Bact., 1901, 115; Bergey et al., Manual, 1st ed., 1923, 74.) From M. L. *citreus*, lemon-yellow.

Spheres: 0.6 to 0.8 micron, occurring singly, in pairs and in packets. Motile, possessing a single flagellum. Gram-positive.

Gelatin colonies: Small, circular, yellowish, entire, becoming citron-yellow to orange.

Gelatin stab: No liquefaction.

Agar colonies: Small, yellow, convex, entire, smooth, glistening.

Agar slant: Abundant, yellow, plumose, glistening, taking on an orange color with age.

Broth: Turbid.

Potato: Abundant, yellow growth.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic.

Optimum temperature 25°C.

Habitat: Air.

8. **Sarcina littoralis** Poulsen. (Poulsen, Vidensk. Meddel. naturh. Foren. i Copenhagen, 1879–80, 231–254; *Sarcina morrhuae* Farlow, U. S. Fish Commission Report for 1878, 1880, 974; Micrococcus a, Høye, Bergens Museums Aarbog., No. 7, 2 Hefte, 1901, 39; *Micrococcus litoralis* Kellerman, Cent. f. Bakt., II Abt., *42*, 1915, 399.) From Latin, *litus* (*littus*) *-toris*, the sea shore; *-alis*, relating to.

The relationships of the following to each other and to *Sarcina littoralis* are not clear:

Erythroconis litoralis Oersted. (Naturh. Tidsskrift, *3*, 1840–41, 555; *Merismopedia litoralis* Rabenhorst, Flora Europ. Algarum, *2*, 1864–65, 57; *Sarcina littoralis* Winter in Rabenhorst, Kryptogamen-Flora, *1*, I Abt., 1884, 50; *Pediococcus litoralis* Trevisan, I generi e le specie delle Batteriacee, Milano, 1889, 28; *Lampropedia littoralis* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1049.)

Coniothecium bertherandi Mégnin. (Revue Mycologique, *6*, 1884, 197.) Saccardo and Berlese (Atti. del R. Instituto Veneto, Ser. VI, Vol. 3) consider *C. bertherandi* to be identical with *Sarcina littoralis*, while Zopf (Die Spaltpilze, 2 Aufl., 1884, 73; 3 Aufl., 1885, 102) considers *C. bertherandi* a stage of *Beggiatoa roseo-persicina*.

Description taken from Lochhead (Can. Jour. Res., *10*, 1934, 280).

Spheres: 1.2 to 1.6 microns occurring singly, in pairs, in fours, in short chains, and in packets, the arrangement varying with medium, temperature, salt concentration and age of culture. Non-motile. Gram stain variable, with rather more positive than negative cells.

No growth in ordinary media.

Salt gelatin: Growth slow, with no liquefaction.

Starch media (20 per cent salt): Colonies usually 1 to 3 mm, round, entire, convex, with a waxy appearance, brick red with a pale border, color appearing gradually.

Starch media slants (20 per cent salt): Filiform, slightly raised, entire edge. Coral red in color. Slight decrease in shade as cultures age.

Liquid media: No growth.

Potato: In 20 per cent salt, scanty growth. Slight chalky pink development near the top.

Indole not formed.

Nitrates reduced to nitrites.

Diastatic action negative.

Aerobic, obligate.

Halophilic, obligate, 16–32 per cent salt. Optimum 20–24 per cent.

Optimum temperature 37°C.

Source: Isolated from seashore mud near Copenhagen.

Habitat: Sea water brine, or sea salt. Isolated from salted hides and salted fish.

The following is believed by Kellerman (*loc. cit.*) to be a variety of *Sarcina littoralis*:

Diplococcus gadidarum Beckwith. (Beckwith, Cent. f. Bakt., I Abt., Orig., *60*, 1911, 351; *Micrococcus litoralis gadidarum* Kellerman, Cent. f. Bakt., II Abt., *42*, 1915, 400; *Pediococcus gadidarum* Pribram, Klassification der Schizomyceten, 1933, 46.) From reddened salted codfish.

9. **Sarcina ureae** (Beijerinck) Löhnis. (*Planosarcina ureae* Beijerinck, Cent. f. Bakt., II Abt., 7, 1901, 52; Löhnis, Landwirtsch. bakteriol. Prakticum, 1911, 138; *Sporosarcina ureae* Kluyver and van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 401.) From Greek, *urum*, urine; M. L., *urea*, urea.

Probable synonym: *Sarcina psychrocarterica* (Rubentschick) Bergey et al. (*Urosarcina psychrocarterica* Rubentschick, Cent. f. Bakt., II Abt., *64*, 1925, 168; *ibid.*, *66*, 1926, 161; *ibid.*, *67*, 1926, 167; *ibid.*, *68*, 1926, 327; Bergey et al., Manual, 3rd ed., 1930, 95.)

Spheres: 0.7 to 1.2 microns, occurring singly, in pairs and in packets. Atypical endospores present. Motile, possessing long peritrichous flagella. Gram-positive.

Gelatin colonies: Small, circular, flat, tough, yellowish.

Converts urea into ammonium carbonate.

Aerobic.

Optimum temperature 20°C. Resists heating to 80°C for 10 minutes.

Source: Isolated from urine.

Appendix: The following names appear in the literature, and are listed here chiefly for their historical interest.

Many are inadequately described, and probably many are synonyms.

Micrococcus aurantiacus Pagliani, Maggiora and Fratini. (Pagliani et al., 1887; *Pediococcus aurantiacus* Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 28; *Merismopedia aurantiaca* Maggioria, Giorn. Soc. ital. d'Igiene, *11*, 1889, 355; *Pediococcus maggiorae* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1051.) From skin of the human foot.

Planosarcina samesii Migula. (Eine bewegliche Sarcine, Sames, Cent. f. Bakt., II Abt., *4*, 1898, 664; Migula, Syst. d. Bakt., *2*, 1900, V and 278; *Sarcina agilis* Matzuschita, Zeit. f. Hyg., *35*, 1900, 496.) From liquid manure. Probably identical with *Sarcina ureae* Löhnis.

Sarcina acidificans Migula. (Sarcina No. VIII, Adametz, Landwirtsch. Jahrb., *18*, 1889, 243; Migula, Syst. d. Bakt., *2*, 1900, 258.) From cheese. Winslow and Winslow (The Systematic Relationships of the Coccaceae, 1908, 235) regard this species as a variant of *Sarcina lutea* Schroeter.

Sarcina agilis Saito. (Jour. Coll. Science Imp. Univ. Tokyo, *23*, 1908, 68; abst. in Cent. f. Bakt., II Abt., *24*, 1909, 228.) From dust.

Sarcina alba Zimmermann. (Weisse Sarcina, Maschek, Bakt. Untersuch. d. Leitmeritzer Trinkwässer, 1887, 64; Zimmermann, Die Bakterien unserer Trink- u. Nutzwässer, Chemnitz, I Reihe, 1890, 90.) From water. Zimmermann reported the presence of spores; subsequent workers failed to observe spores, even when working with original cultures.

Sarcina alba var. *incana* Appel. (Ber. d. landw. Inst. Königsberg, Heft 5, 1900, 89; quoted from Löhnis, Cent. f. Bakt., II Abt., *18*, 1907, 146.) Frequently found in milk. Closely related to Adametz's Sarcinae Nos. VII, VIII and IX.

Sarcina albida Gruber. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 3, 1895, 256.) From the stomach contents of a man with stomach cancer.

Sarcina alutacea Gruber (*loc. cit.*, 221). From leaven.

Sarcina aurea Macé. (Traité Pratique de Bact., 2nd ed., 1892, 371; not *Sarcina aurea* Henrici, see below.) From lung exudate. Possesses active oscillary motility, but no flagella.

Sarcina aurea Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 91; *Sarcina aurescens* Gruber, *ibid.*, Heft 3, 1895, 263.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 233) regard this species as a variant of *Sarcina flava* De Bary which has acquired certain fermentative powers.

Sarcina aurescens var. *mucosa* Jaiser; quoted from Pribram, Klassifikation der Schizomyceten, 1933, 44.

Sarcina bicolor Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 505.) From the stomach of a woodpecker (*Picus major*). Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina butyrica Migula. (Sarcina No. XI, Adametz, Landwirtsch. Jahrb., *18*, 1889, 244; Migula, Syst. d. Bakt., *2*, 1900, 240.) From cheese. Winslow and Winslow (*loc. cit.*, 233) regard this as a variant of *Sarcina flava* De Bary which has acquired certain fermentative powers.

Sarcina candida Lindner. (Die Sarcina-Organismen der Gährungsgewerbe, Inaug. Diss., Berlin, 1888, 43; Abst. in Cent. f. Bakt., *4*, 1888, 427.) From water reservoir of a brewery and from air in the vicinity of the brewery.

Sarcina canescens Stubenrath. (Stubenrath, in Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 143.) Stubenrath considered this a subspecies or variety of his *Sarcina equi* from which it differed only by its constant gray color on all culture media. Winslow and Winslow (*loc. cit.*, 232) regard this as identical with *Sarcina flava* De Bary.

Sarcina carnea Gruber. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 3, 1895, 278.) From leaven.

Sarcina casei Migula. (Sarcina No. VII, Adametz, Landwirtsch. Jahrb., *18*,

1889, 242; Migula, Syst. d. Bakt., *2*, 1900, 239.) From cheese. Winslow and Winslow (*loc. cit.*, 233) regard this species as a variant of *Sarcina flava* De Bary which has acquired certain fermentative powers.

Sarcina caseolytica Stark and Scheib. (Jour. Dairy Sci., *19*, 1936, 212.) From butter.

Sarcina cervina Stubenrath. (Stubenrath, in Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 146.) From the stomach in a case of carcinoma.

Sarcina citrea Winslow and Winslow. (The Systematic Relationships of the Coccacceae, 1908, 234; not *Sarcina citrea* Bergey et al., Manual, 1st ed., 1923, 74.) This is the name given by Winslow and Winslow to their Type 2, the nitrate-reducing group of *Sarcina*.

Sarcina citrina Gruber. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 3, 1895, 269.) From leaven. Winslow and Winslow (*loc. cit.*, 235) regard this species as identical with *Sarcina lutea* Schroeter.

Sarcina conjunctivae Bergey et al. (*Sarcina citrea conjunctivae* Verderame, Cent. f. Bakt., I Abt., Orig., *59*, 1911, 384; Bergey et al., Manual, 1st ed., 1923, 71.) From the conjunctiva. Gram-negative.

Sarcina devorans Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 502.) From stomach contents of a sparrow (*Passer montanus*).

Sarcina equi Stubenrath. (Stubenrath, in Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 143.) Found frequently in the urine of horses. Very similar to *Sarcina lutea* according to Stubenrath, who names three subspecies or varieties: *Sarcina livido-lutescens*, *S. canescens* and *S. variabilis*. Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina erythromyxa (Overbeck) Král. (*Micrococcus erythromyxa* Overbeck, Nova Acta der Leop.-Carol, *55*, No. 7, 1891; Král, Verzeichnis der abzugebenden Bak.) For a description of this species, see Zimmermann, Die Bakterien unserer Trink- und Nutzwässer, Chemnitz, II, 1894, 70. From water. Produces a red pigment.

Sarcina fimentaria Lehmann and Neumann. (Eine bewegliche Sarcine, Sames, Cent. f. Bakt., II Abt., *4*, 1898, 664; Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 146; *Planosarcina samesii* Migula, Syst. d. Bakt., *2*, 1900, V and 278; *Sarcina samesii* Matzuschita, Bakt. Diag., Jena, 1902, 300.) From liquid manure. Exhibits active motility with many long flagella. Pribram (Klassifikation der Schizomyceten, 1933, 45) regards this organism as identical with *Sarcina ureae* and *Sarcina mobilis*.

Sarcina flavescens Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 91.) From Swiss cheese. Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina fulva Stubenrath. (Das Genus Sarcina, München, 1897; see Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 143.) Isolated many times from stomach contents and once from preputial smegma. Similar to *Sarcina pulmonum*.

Sarcina fusca Gruber. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 3, 1895, 282.) From flour.

Sarcina fuscescens De Bary. (Vorlesungen über Bakterien, 2 Aufl., 1887, 181 and Botan. Centralb., 1887, 34. Reduced to a synonym of *Sarcina ventriculi* Goodsir by Migula, Syst. d. Bakt., *2*, 1900, 259.) From the contents of the stomach.

Sarcina gasoformans Gruber. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 3, 1895, 270.) From leaven. Young cultures produce considerable gas.

Sarcina gigantea Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 508.) From stomach contents of the starling (*Sturnus vulgaris*). The diameter of a cell is 2.05 to 2.1 microns. Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina gigantea Petter. (Proc. Kon.

Akad. Wet. Amsterdam, *34*, 1931, 1417; Thesis, Utrecht, 1932; Compt. rend. Acad. Sci., Paris, *196*, 1933, 300.) From salted herring. Halophilic.

Sarcina hamaguchiae Saito. (Cent. f. Bakt., II Abt., *17*, 1906, 155.) From soy bean mash.

Sarcina incana Gruber (*loc. cit.*, 248). From leaven.

Sarcina incarnata Gruber. (*Loc. cit.*, 279; *Rhodococcus incarnatus* Winslow and Rogers, Jour. Inf. Dis., *3*, 1906, 545.) From leaven. Produces pink pigment.

Sarcina intermedia Gruber (*Loc. cit.*, 277). From leaven. Winslow and Winslow (*loc. cit.*, 235) regard this species as identical with *Sarcina lutea* Schroeter.

Sarcina intestinalis Zopf. (Die Spaltpilze, 3 Aufl., 1885, 55.) From the intestines of poultry.

Sarcina lactea Gruber. (*Loc. cit.*, 254; not *Sarcina lactea* Bergey et al., Manual, 1st ed., 1923, 73.) From leaven.

Sarcina lactis Chester. (No. 45, Conn, Storrs Agr. Exp. Sta. Rept., 1894, 79; Chester, Man. Determ. Bact., 1901, 111.) From fermented milk (matzoon). Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina lactis acidi Conn, Esten and Stocking. (Storrs Agr. Exp. Sta. Ann. Rept., 1907, 125.) From milk.

Sarcina lactis albus Conn, Esten and Stocking (*loc. cit.*, 124). From milk.

Sarcina lactis aurantiaca Conn, Esten and Stocking (*loc. cit.*, 125). From milk.

Sarcina lactis lutea Conn, Esten and Stocking (*loc. cit.*, 124). From milk.

Sarcina lembkei Migula. (No. 24, Lembke, Arch. f. Hyg., *26*, 1896, 316; Migula, Syst. d. Bakt., *2*, 1900, 241.) From the intestine. Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina liquefaciens Frankland and Frankland. (Phil. Trans. Royal Soc. London, *178*, B, 1888, 267.) From dust. Also found in cheese by Henrici (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 95). Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina livida Gruber (*loc. cit.*, 297). From leaven. Winslow and Winslow (*loc. cit.*, 235) regard this species as identical with *Sarcina lutea* Schroeter.

Sarcina livido-lutescens Stubenrath. (Stubenrath, in Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 143; *Sarcina lutescens* Chester, Man. Determ. Bact., 1901, 112.) From stools in a case of enteritis. Stubenrath regards this as a subspecies or variety of his *Sarcina equi*.

Sarcina loewenbergii Macé. (Une sarcine pathogène, Loewenberg, Ann. Inst. Past., *13*, 1899, 358; Macé, Traité Pratique de Bact., 4th ed., 1901, 464.) From the nasal cavity in a case of ozena. Probably a strongly slime-forming variety of *Sarcina tetragena*, according to Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 206. Also see Galli-Valerio, Cent. f. Bakt., I Abt., Orig., *47*, 1908, 177, for discussion.

Sarcina luteola Gruber (*loc. cit.*, 265). From leaven. Winslow and Winslow (*loc. cit.*, 235) regard this species as identical with *Sarcina lutea* Schroeter.

Sarcina marginata Gruber (*loc. cit.*, 268). From leaven. Winslow and Winslow (*loc. cit.*, 235) regard this as identical with *Sarcina lutea* Schroeter.

Sarcina meliflava Gruber (*loc. cit.*, 272). From flour. Winslow and Winslow (*loc. cit.*, 235) consider this identical with *Sarcina lutea* Schroeter.

Sarcina minuta De Bary. (Vorlesungen über Bakterien, 1 Aufl., 1885; Eng. trans., 2nd ed., 1887, 117 and 185.)

Sarcina mirabilis Kern. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1897, 506.) From intestine of the yellow-hammer (*Emberiza citrinella*) and a dove (*Columba oenas*). Winslow and Winslow (*loc. cit.*, 232) consider this species identical with *Sarcina flava* De Bary.

Sarcina mobilis Maurea. (Cent. f. Bakt., *11*, 1892, 228; *Planosarcina mobilis* Migula, Arb. bakt. Inst. Karlsruhe, *1*, 1894, 236; *Micrococcus mobilis* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 353.) From old ascitic fluid. Motile, each cell with two short flagella.

Sarcina mucosa Sauerbeck. (Cent. f. Bakt., I Abt., Orig., *50*, 1909, 289.) From pulmonary sputum. Probably a slime-forming variety of *Sarcina tetragena*, according to Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 206.

Sarcina nivea Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 88.) From cheese.

Sarcina olens Henrici (*loc. cit.*, 94). From Camembert cheese. Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina orangea Cahanesco. (Ann. Inst. Past., *15*, 1901, 856.) From vagina of a dog.

Sarcina paludosa Schroeter. (Schroeter, in Cohn, Kryptog. Flora v. Schlesien, *3*, I, 1886, 153.) From the waste water of a sugar factory. Not cultivated.

Sarcina persicina Gruber (*loc. cit.*, 281). From leaven.

Sarcina pseudogonorrhoeae Lehmann and Neumann. (Eine neue Sarcina, Nagano, Cent. f. Bakt., I Abt., Orig., *32*, 1902, 327; Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 212; *Sarcina naganoi* Macé, Traité Pratique de Bact., 6th ed., *1*, 1912, 631.) From pus.

Sarcina pulchra Henrici (*loc. cit.*, 89). From cheese.

Sarcina pulmonum Hauser. (Lungensarcine, Virchow, Arch. f. path. Anat., *9*, 1856, 557; Hauser, Deutsch. Arch. f. klin. Medizin, *42*, 1887, 127; *Sarcina virchowii* Trevisan, Atti dell' Accad. Fisio-Medico-Statistica di Milano, Ser. IV, *3*, 1885, 119.) From the sputum of a patient with phthisis. Motile (Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 141). Hauser says this sarcina forms endogenous spores which may be demonstrated by Neisser's method of staining, and which have great resistance to heat. When cultivated in urine, it causes ammoniacal fermentation of the urea. Regarded by Jan Smit (personal communication, 1939) as identical with *Sarcina ureae*.

Sarcina radiata Kern (*loc. cit.*, 53). From stomach and intestines of the rock dove (*Columba livia*) and a sparrow (*Passer montanus*). Winslow and Winslow (*loc. cit.*, 232) regard this as identical with *Sarcina flava* De Bary.

Sarcina rosacea Migula. (*Sarcina rosea* (Schroeter) Lindner, Inaug. Diss., Berlin, 1888, 45; Migula, Syst. d. Bakt., *2*, 1900, 263.) Found frequently in dust and water. Lindner believed his culture to be *Sarcina rosea* Schroeter.

Sarcina rubra Migula. (Eine rothe Sarcine, Menge, Cent. f. Bakt., *6*, 1889, 596; Migula, Syst. d. Bakt., *2*, 1900, 261.) From red milk.

Sarcina schaudinni (Wolff) Pribram. (*Planosarcina schaudinni* Wolff, Cent. f. Bakt., II Abt., *18*, 1907, 9; Pribram, Klassifikation der Schizomyceten, 1933, 45.) From rotten places on potatoes. A motile coccus with long flagella.

Sarcina solani Reinke and Berthold. (Die Zersetzung der Kartoffel durch Pilze, Berlin, 1879; see O. Appel in Lafar, Handbuch der Technischen Mykologie, *2*, 1905–08, 350.) Found in wet rotting of potatoes.

Sarcina striata Gruber (*loc. cit.*, 271). From flour. Winslow and Winslow (*loc. cit.*, 235) regard this species as identical with *Sarcina lutea* Schroeter.

Sarcina subflava Ravenel. (Memoirs Nat. Acad. Sci., *8*, 1896, 10.) From soil.

Sarcina sulfurea Henrici (*loc. cit.*, 90). From cheese. Winslow and Winslow (*loc. cit.*, 235) consider this species identical with *Sarcina lutea* Schroeter.

Sarcina superba Henrici (*loc. cit.*, 93). From cheese. Winslow and Winslow (*loc. cit.*, 232) regard this species as identical with *Sarcina flava* De Bary.

Sarcina symbiotica Pribram. (Eine gelbe Sarcina, Gropenfiesser, Cent. f.

Bakt., II Abt., *61*, 1925, 495; Pribram, Klassifikation der Schizomyceten, 1933, 45.) Lives symbiotically with cockroaches.

Sarcina thermodurica Wainess and Parfitt. (Jour. Bact., *40*, 1940, 157.) From milking machines and other dairy farm utensils. Resists pasteurization temperatures.

Sarcina thermophila Bargagli-Petrucci. (Nuov. Giorn. Bot. Ital., *20*, 1913; Abst. in Cent. f. Bakt., II Abt., *43*, 1915, 294.) From the borax-yielding waters of Tuscany. Grows at temperatures up to 75°C.

Sarcina urinae Welcker. (*Sarcina renis* Hepworth, Microscop. Jour., *5*, 1857, 1; Welcker, in Henle and Pfeffer, Ztschr. f. rat. Med., 3 Ser., *5*, 1859, 199; *Merismopedia urinae* Rabenhorst, Flor. europ. algarum, *2*, 1865, 59.) Observed in the bladder. See below, *Sarcina welckeri*.

Sarcina variabilis Stubenrath. (Stubenrath, in Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 143.) From gastric contents. May be considered a subspecies of *Sarcina equi* Stubenrath. Winslow and Winslow (*loc. cit.*, 232) regard this as identical with *Sarcina flava* De Bary.

Sarcina variegata Pansini. (Arch. f. path. Anat., *122*, 1890, 459.) Found in sputum from cases of influenza.

Sarcina velutina Gruber (*loc. cit.*, 275). From leaven. Winslow and Winslow (*loc. cit.*, 235) consider this species identical with *Sarcina lutea* Schroeter.

Sarcina vermicularis Gruber (*loc. cit.*, 253). From wheat flour.

Sarcina vermiformis Gruber (*loc. cit.*, 266). From leaven. Winslow and Winslow (*loc. cit.*, 235) consider this species identical with *Sarcina lutea* Schroeter.

Sarcina viridis flavescens Rosenthal. (Inaug. Diss., Erlangen, 1893; Abst. in Cent. f. Bakt., *16*, 1894, 1024.) From the oral cavity.

Sarcina welckeri Rossmann. (Rossman, Ueber Urinsarcina, Flora, *40*, 1857, 641; *Merismopedia welckeri* Rabenhorst, Flora europaea, Alg. II, 1865, 58.) From the urinary bladder.

Urosarcina dimorpha Beijerinck. (Cent. f. Bakt., II Abt., *7*, 1901, 53.) Reported to form spores. Non-motile. From garden earth.

FAMILY VI. NEISSERIACEAE PRÉVOT.*

(Ann. Sci. Nat., Sér. Bot., *15*, 1933, 119.)

Cells spherical, in pairs or in masses. Non-motile. Gram-negative. Pigment formation rare. The family contains aerobic and anaerobic species. Some grow poorly or not at all without mammalian body fluids. Optimum temperature 37°C. All known species are parasitic.

Key to the genera of family **Neisseriaceae.**

I. Occurring in pairs, with adjacent sides usually flattened. Aerobes, facultative anaerobes and anaerobes. Approximately 1 micron in diameter.
Genus I. *Neisseria*, p. 295.

II. Occurring in masses, rarely in pairs. Anaerobes. Less than .5 micron in diameter.
Genus II. *Veillonella*, p. 302.

Genus I. Neisseria *Trevisan.*

(Trevisan, Atti della Accademia Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 105; *Gonococcus* Lindau (?), Just's Bot. Jahresber., I Abt., Orig., *26*, 1898, 100.) Named for Dr. Albert Neisser who discovered the organism causing gonorrhoea in 1879.

Paired, Gram-negative cocci with adjacent sides flattened. Four of the eleven species produce yellow pigment. Aerobic and anaerobic species occur. Growth on standard media may be poor. Biochemical activities are limited. Few carbohydrates are utilized. Indole is not produced. Nitrates are not reduced. Catalase is produced abundantly. Parasites of mammals so far as known.

The type species is *Neisseria gonorrhoeae* Trevisan.

Key to the species of genus **Neisseria.**

I. Aerobes, facultative anaerobes.
  A. Grow best on special culture media or on plain agar containing blood, blood serum or similar enrichment fluids, especially with added glucose. Grow best at 35° to 37°C; no growth below 25° or above 40°C. Not chromogenic.
    1. Acid from glucose, not from maltose. Growth anaerobically.
    1. *Neisseria gonorrhoeae.*
    2. Acid from glucose and maltose. No growth anaerobically.
    2. *Neisseria meningitidis.*
  B. Grow well on ordinary culture media. Grow well at 22°C.
    1. Non-chromogenic.
      a. Moist colonies on agar. No action on glucose, sucrose or mannitol.
      3. *Neisseria catarrhalis.*
      aa. Dry crumbly colonies on agar. Acid from glucose and sucrose; but not from mannitol.
      4. *Neisseria sicca.*

---

* Revised by Prof. E. G. D. Murray, McGill University, Montreal, P.Q., Canada in consultation with Dr. Sara E. Branham, United States Public Health Service, Washington, D. C., June, 1938; further revision, August, 1943. Descriptions of anaerobic species reviewed by Dr. Ivan C. Hall, New York City, January, 1944.

2. Chromogenesis best seen on Löffler's serum.
    a. Acid from fructose.
        b. Acid from sucrose.
            5. *Neisseria perflava.*
        bb. No acid from sucrose.
            6. *Neisseria flava.*
    aa. No acid from fructose.
        b. Acid from glucose.
            7. *Neisseria subflava.*
        bb. No acid from glucose.
            8. *Neisseria flavescens.*

II. Anaerobes.
  A. Gas produced from peptone broth.
            9. *Neisseria discoides.*
  B. No gas produced.
    1. Odor of rancid butter.
            10. *Neisseria reniformis.*
    2. No rancid odor.
            11. *Neisseria orbiculata.*

1. **Neisseria gonorrhoeae** Trevisan. (Micrococcus der Gonorrhoe, Neisser, Vorl. Mitteil., Cent. f. Medicinische Wissenschaft, *17*, 1879, 497; Trevisan, Atti della Accademia Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 105.) From Greek, *gonorrhoea*, flux of semen; M.L. genitive of gonorrhoea.

Synonyms: Gonococcus, Diplococcus der Gonorrhoe, Bumm, Der Mikroorganismen der gonorrhoischen Schleimhauterkrankung, Weisbaden, 1885, 16; *Merismopedia gonorrhoeae* Zopf, Die Spaltpilze, 1885, 54; *Micrococcus gonorrhoeae* Flügge, Die Mikroorganismen, 1886, 156; *Micrococcus gonococcus* Schroeter, in Cohn, Kryptog. Flora v. Schlesien, *3*, I, 1886, 147; *Diplococcus gonorrhoeae* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 150; *Micrococcus gonorrhoeae* Lehmann and Neumann, *ibid.*, 4 Aufl., *2*, 1907, 212.

Spheres: 0.6 to 1.0 micron, occurring singly and in pairs, the sides flattened where they are in contact. Gram-negative.

Grows only on media with the addition of body fluids (blood, ascites, etc.), or other specially prepared media.

Colonies are small, transparent, eventually (2 to 4 days) developing a lobate margin, grayish-white with a pearly opalescence by transmitted light. Larger colonies on special media.

Acid from glucose. No acid from maltose, fructose, sucrose and mannitol.

Optimum temperature 37°C. No growth below 25° or above 40°C.

Aerobic to facultative anaerobic. Many strains develop more readily with increased CO_2 tension.

Common name: Gonococcus.

Source: Originally found in purulent venereal discharges. Also found in blood, conjunctiva, joints and cerebrospinal fluid.

Habitat: The cause of gonorrhoea and other infections of man. Not found in other animals.

2. **Neisseria meningitidis** (Albrecht and Ghon) Holland. (*Diplokokkus intracellularis meningitidis* Weichselbaum, Fortschr. d. Med., *5*, 1887, 583; *Neisseria weichselbaumii* Trevisan, I generi e le specie delle Batteriacee, 1889, 32; not *Diplococcus intracellularis* Jaeger, Ztschr. f. Hyg., *19*, 1895, 353; not *Tetracoccus intracellularis* Jaeger, *ibid.*, 368; not *Streptococcus intracellularis* Lehmann

and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 132; *Micrococcus intracellularis* Migula, Syst. d Bakt., *2*, 1900, 189; *Micrococcus meningococcus cerebrospinalis* Albrecht and Ghon, Wiener klin. Wochnschr., *14*, 1901, 988; not *Streptococcus weichselbaumii* Chester, Man. Determ. Bact., 1901, 64; not *Meningococcus intracellularis* Jaeger, Cent. f. Bakt., I Abt., Orig., *33*, 1903, 23; *Micrococcus meningitidis* Albrecht and Ghon, Cent. f. Bakt., I Abt., Orig., *33*, 1903, 498; *Diplococcus intracellularis* Weichselbaum, Cent. f. Bakt., I Abt., Orig., *33*, 1903, 511; *Micrococcus intracellularis meningitidis* de Bettencourt and França, Ztschr. f. Hyg., *46*, 1904, 464; *Diplococcus meningitidis*, *ibid.*, 495; Holland, Jour. Bact., *5*, 1920, 224; *Neisseria intracellularis-meningitidis* Holland, *ibid.*, 224; *Neisseria intracellularis* Holland, *ibid.*, 224; see also Elser and Huntoon, Jour. Med. Res., *20* (N. S. *15*), 1909, 371 and Murray, Med. Res. Council, London, Special Report Series No. 124, 1929 for detailed studies of the group.) From Greek, *meninx*, *meninges*, a membrane, a membrane covering the brain; M. L. genitive of *meningitis*, an inflammation of the meninges.

The binomial, *Neisseria intracellularis*, used in previous editions of the Manual has proved confusing because the names *Micrococcus intracellularis*, *Diplococcus intracellularis* and *Streptococcus intracellularis*, have been used loosely for unrelated organisms. *Neisseria weichselbaumii* has been so rarely and loosely used that any attempt to introduce it now is inadvisable despite rights of priority. The equally available name, *Neisseria meningitidis*, has therefore been adopted to avoid further confusion. It has the obvious advantage of association with the common name, meningococcus, which has been so frequently used in the literature.

In 1898, Councilman, Mallory and Wright (Epidemic Cerebrospinal Meningitis and its Relation to Other Forms of Meningitis, Boston, 1898) definitely established the Gram-negative coccus as the cause of epidemic meningitis and clarified the confusion created because Jaeger regarded the coccus that he isolated (see *Diplococcus crassus* von Lingelsheim) as identical with *Neisseria meningitidis.*

Spheres: 0.6 to 0.8 micron in diameter, occasionally larger, occurring singly, in pairs with adjacent sides flattened, or occasionally in tetrads. Gram-negative.

Good growth is obtained on media containing blood, blood serum and other enrichment fluids with added glucose. Best growth on special media.

Blood agar plates are generally employed to isolate the organism. The colonies are small, slightly convex, transparent, glistening. Colonies large on special media.

Older cultures may show growth on neutral agar or glucose agar, properly prepared. Frequent transplantation is necessary to keep the organism alive in recently isolated strains; older strains survive for one month or longer at 37°C and for years on special media.

Acid from glucose and maltose. No acid from fructose, sucrose and mannitol.

Nitrites not produced from nitrates (Branham).

Optimum temperature 37°C. No growth at 22° or at 40°C.

Aerobic, no growth anaerobically.

Common name: Meningococcus.

Source: Originally found in cerebrospinal fluid. Also found in nasopharynx, blood, conjunctiva, pus from joints, petechiae in skin, etc.

Habitat: Nasopharynx of man, not found in other animals. Cause of epidemic cerebrospinal fever (meningitis).

Four main varieties or types of *Neisseria meningitidis* have been differentiated by Gordon and Murray (Jour. Roy. Army Med. Corps, *25* (*2*), 1915, 423) and by others on the basis of agglutination reactions with immune serums.

3. **Neisseria catarrhalis** (Frosch and Kolle) Holland. (*Micrococcus catarrhalis* Frosch and Kolle, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 154; *Diplococcus pharyngis communis* von Lingelsheim, Klin. Jahrb., *15*, 1906, 408; Holland, Jour. Bact., *5*, 1920, 224.) From Greek, *catarrh*, a running down.

Spheres: 0.6 to 0.8 micron in diameter, occurring singly or in pairs with adjacent sides flattened, occasionally in fours. Gram-negative.

Agar colonies: Small, circular, grayish white to dirty white, with erose margins.

Broth: Turbid, often with slight pellicle.

No acid from any of the carbohydrates.

Optimum temperature 37°C. Grows well at 22°C.

Aerobic, facultative.

Source: Nasopharynx, saliva and respiratory tract.

Habitat: Human mucous membrane of the respiratory tract. Often associated with other organisms in inflammations of the mucous membrane.

Note: Topley and Wilson (Prin. of Bact., 1931, 349) state that *Neisseria pharyngis cinerea* (*Micrococcus pharyngis cinereus* von Lingelsheim, Klin. Jahrb., *15*, 1906, 373) resembles *Neisseria catarrhalis* so closely that it should probably be regarded as a variety of this species.

4. **Neisseria sicca** (von Lingelsheim) Bergey et al. (*Diplococcus pharyngis siccus* von Lingelsheim, Klin. Jahrb., *15*, 1906, 409; *Diplococcus siccus* von Lingelsheim, Ztschr. f. Hyg., *59*, 1908, 476; *Micrococcus pharyngis siccus* Kutscher, in Kolle and Wassermann, Handb. d. Path. Mikroorganismen, 2 Aufl., *4*, 1912, 603; *Micrococcus pharyngis-siccus* Holland, Jour. of Bact., *5*, 1920, 224; *Neisseria pharyngis-sicci* (sic) Holland, *ibid.*; Bergey et al., Manual, 1st ed., 1923, 43.) From Latin, *sicca*, dry.

Spheres: 0.6 to 0.8 micron in diameter, occurring singly and in pairs with adjacent sides flattened. Gram-negative.

Blood agar colonies: Grayish, somewhat dry, crumbling when an effort is made to remove them.

Ascitic agar colonies: Small, very firm and adherent to medium, becoming corrugated on the surface.

The organisms precipitate spontaneously when suspended in normal salt solution.

Acid from glucose, fructose, maltose and sucrose. No acid from mannitol.

Optimum temperature 37°C. Grows at 22°C.

Aerobic, facultative.

Source: Nasopharynx, saliva and sputum.

Habitat: Mucous membrane of the respiratory tract of man.

5. **Neisseria perflava** Bergey et al. (Chromogenic group I, Elser and Huntoon, Jour. Med. Res., *20* (N. S. *15*), 1909, 415; Bergey et al., Manual, 1st ed., 1923, 43.) From Latin *per*, very and *flavus*, yellow.

Spheres: 0.6 to 0.8 micron, occurring singly and in pairs with adjacent sides flattened. Gram-negative.

Glucose agar colonies: Small, circular, slightly raised, greenish-gray by reflected light, and greenish-yellow and semi-opaque by transmitted light. The surface is smooth, glistening. The growth is adherent to the medium. Chromogenesis best seen on Löffler's blood serum medium.

Ascitic agar colonies: Like those on glucose agar.

Acid from glucose, maltose, fructose, sucrose and mannitol.

Optimum temperature 37°C. Grows at 22°C.

Aerobic, facultative.

Source: Nasopharynx, saliva and sputum.

Habitat: Mucous membrane of respiratory tract of man.

6. **Neisseria flava** Bergey et al. (*Diplococcus pharyngis flavus I* and possibly

Diplococcus pharyngis flavus II, von Lingelsheim, Klin. Jahrb., *15*, 1906, 409; *Diplococcus flavus I* and possibly *Diplococcus flavus II*, v. Lingelsheim, Zeitschr. f. Hyg., *59*, 1908, 476; *Micrococcus pharyngis flavus I* and possibly *Micrococcus pharyngis flavus II*, Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 259; Chromogenic group II, Elser and Huntoon, Jour. Med. Res., *20* (N. S. *15*), 1909, 415; Bergey et al., Manual, 1st ed., 1923, 43.) From Latin *flavus*, yellow.

Spheres: 0.5 to 0.8 micron, occurring singly and in pairs with adjacent sides flattened. Gram-negative.

Glucose agar colonies: Small, circular, slightly raised, greenish-gray by reflected light and greenish-yellow by transmitted light. . Growth not adherent to medium. Surface colony is smooth with numerous, rather coarse crumbs in center. Margin entire, or rarely slightly irregular. Chromogenesis best seen on Löffler's blood serum medium.

Ascitic agar colonies: Like those on glucose agar.

Acid from glucose, fructose and maltose. No acid from sucrose or mannitol.

Optimum temperature 37°C. Grows at 22°C.

Source: Nasopharynx, cerebro-spinal fluid in cases of meningitis (very rare).

Habitat: Mucous membrane of respiratory tract.

7. **Neisseria subflava** Bergey et al. (Chromogenic group III, Elser and Huntoon, Jour. Med. Research, *20* (N.S. *15*), 1909, 415; Bergey et al., Manual, 1st ed., 1923, 44.) From Latin *sub*, less and *flavus*, yellow.

Spheres: 0.6 to 0.8 micron, occurring singly and in pairs with adjacent sides flattened. Gram-negative.

Glucose agar colonies: Small, slightly raised, pale greenish-yellow, especially on primary culture.

Acid from glucose and maltose. No acid from fructose, sucrose or mannitol.

Agglutinates in normal rabbit serum.

Optimum temperature 37°C. Little or no growth at 22°C.

Aerobic, facultative.

Easily confused with *Neisseria meningitidis*.

Source: Nasopharynx.

Habitat: Mucous membrane of the respiratory tract of man.

8. **Neisseria flavescens** Branham. (U. S. Public Health Service, Pub. Health Repts., *45*, 1930, 845.) From Latin *flavescens*, becoming yellow.

Biscuit-shaped cocci occurring in flattened pairs. Giant forms common. Gram-negative.

Glucose agar: Poor growth.

Blood agar: Good growth, colonies less moist than those of the meningococcus. Golden yellow pigment. Greenish-yellow on Löffler's blood serum medium.

Semisolid agar: Good growth.

No acid from any of the carbohydrates.

Optimum temperature 37°C.

Aerobic, facultative.

Serologically homogeneous group.

Source: Cerebro-spinal fluid in cases of meningitis.

Habitat: Probably mucous membrane of respiratory tract of man.

Note: Wilson and Smith (Jour. Path. and Bact., *31*, 1928, 597) do not regard differences in sugar fermentations, chromogenesis, appearance of colonies, etc. sufficiently constant to warrant the separation of the species *Neisseria catarrhalis*, *N. flava*, *N. cinerea*, *N. mucosa* and *N. sicca*. They recommend that all be grouped under a single species known as *Neisseria pharyngis* (*Diplococcus pharyngis*).

9. **Neisseria discoides** Prévot. (Ann. Sci. Nat., Sér. Bot., *15*, 1933, 106.) From Greek, *discoeides*, discus shaped; Latin adj., disk-shaped.

Spheres: 0.6 to 0.7 micron, occurring in pairs or tetrads. Gram-negative.

Gelatin: No liquefaction.

Deep agar colonies: Lenticular, up to 1 mm in diameter. Grows in a narrow disk about 1 cm below the surface. Gas produced.

Broth: Turbid. Fine granular precipitate. Slight rancid odor and inflammable, explosive gas produced.

Peptone water: Gas produced.

Indole not formed.

No action on milk.

Coagulated proteins not digested.

Carbohydrates not attacked.

Hydrogen sulfide not produced.

Neutral red glucose broth: Becomes pink, but no further change.

Optimum pH 7.0 to 8.0.

Temperature relations: Optimum 37°C. No growth at 28°C. Killed in half an hour at 60°C.

Non-pathogenic.

Strict anaerobe.

Distinctive characters: Colonies grow in narrow zone 1 cm below the surface of an agar stab; gas produced from peptones.

Source: Isolated from bronchial mucus, respiratory system; dental and tonsillary focal infections.

Habitat: Buccal cavity (human) and probably also in other warm-blooded animals.

10. **Neisseria reniformis** (Cottet) Prévot. (*Diplococcus reniformis* Cottet, Compt. rend. Soc. Biol., *52*, 1900, 421; *Micrococcus reniformis* Oliver and Wherry, Jour. Inf. Dis., *28*, 1921, 341; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 102.) From Latin, *ren* (*renes*), kidney; *-formis*, form, i.e. kidney-shaped.

Spheres: 0.8 to 1.0 micron, bean-shaped, occurring in pairs. Gram-negative.

Gelatin: No liquefaction.

Deep agar colonies: Appear in 24 to 48 hours; at first punctiform, then lenticular; small, 0.3 to 0.5 mm. No gas produced.

Agar slant: Minute, bluish-white, dewdrop colonies.

Broth: Turbid in 24 hours; flocculent precipitate rapidly formed, clearing the medium. No gas produced, but a rancid odor is present.

Peptone water: Very meagre growth. Traces of indole.

Milk: Unchanged.

Coagulated proteins not digested.

Slight amount of acid from glucose by one strain only.

Optimum pH 7.0. Limits of pH 6.0 to 8.0.

Temperature relations: Optimum 37°C. No growth at 22°C. Killed in half an hour at 60°C. or in an hour at 56°C.

Pathogenic.

Strict anaerobe.

Distinctive character: Odor of rancid butter.

Source: Isolated in several cases from suppurations of the urino-genital system.

Habitat: Presumably in bodies of warm-blooded animals.

11. **Neisseria orbiculata** Prévot. (*Diplococcus orbiculus* Tissier, Ann. Inst. Past., *22*, 1908, 204; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 109.) From Latin, *orbiculatus*, having the form of an orb or sphere.

Spheres: 1.5 to 2.0 microns, occurring in pairs. Gram-negative.

Gelatin: No growth at 22°C.

Deep agar colonies: After 36 to 48 hours, large, lenticular, very regular, whitish, almost transparent. Gas not produced.

Broth: Turbid. Sediment.

Milk: No coagulation.

Egg white not attacked.

Proteoses attacked without formation of indole.

Acid from glucose. Acid produced feebly from lactose. No acid from sucrose.

Temperature relations: Optimum 37°C. No growth at 22°C. Killed at 60°C.

Non-pathogenic.

Strict anaerobe.

Distinctive characters: Large size; no gas production.

Source: Isolated from feces of young children.

Habitat: Intestinal canal. Not common.

Appendix I: Additional species have been placed in this genus as given below. Some are undoubtedly identical with previously described species, while some may belong in other genera.

Diplococcus crassus von Lingelsheim. (*Diplococcus intracellularis* Jaeger, Ztsch. f. Hyg., *19*, 1893, 353; *Tetracoccus intracellularis*, *ibid.*, 318; von Lingelsheim, Ztschr. f. Hyg., *59*, 1908, 467; *Micrococcus crassus* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 259.) Commonly found in nasopharyngeal secretions, also in the cerebrospinal fluid of suspected cases of meningitis. Also known as Jaeger's coccus or as Jaegersher Modifikation der Meningococcus.

Diplococcus mucosus von Lingelsheim. (von Lingelsheim, Klin. Jahrb., *15*, 1906, 373, and Ztschr. f. Hyg., *59*, 1908, 457; *Neisseria mucosa* Murray, in Manual, 5th ed., 1939, 283; not *Streptococcus mucosus* Howard and Perkins, Jour. Med. Res., *6*, (N.S. *1*), 1901, 174; not *Pneumococcus mucosus* Park and Williams, Jour. Exp. Med., *7*, 1905, 411.) From nasal secretions. This Gram-negative coccus is said to show similarity to the meningococcus and to be like the diplococcus found by Weichselbaum and Ghon (Weiner Klin. Wchnschr., No. 24, 1905) in nasal secretions of a healthy person. Clearly it is different from the Gram-positive, mucoid type of pneumococcus which is described by Binaghi (Cent. f. Bakt., I Abt., *22*, 1897, 273), Howard and Perkins (Jour. Med. Res., *6*, 1901, 174), Park and Williams (Jour. Exp. Med., *7*, 1905, 411) and others.

Micrococcus pharyngis cinereus von Lingelsheim. (Klin. Jahrb., *15*, 1906, 373; *Micrococcus cinereus* v. Lingelsheim, Ztschr. f. Hyg., *59*, 1908, 456; *Neisseria cinerea* Murray, in Manual, 5th ed., 1939, 283.) From mucous membrane of nose and throat.

Neisseria arthritica (Costa) Hauduroy et al. (*Micrococcus arthritica* Costa, Comp. rend. Soc. Biol., Paris, *85*, 1920, 933; Hauduroy, Ehringer, Urbain, Guillot and Magrou, Dictionnaire des Bactéries Pathogènes, Paris, 1937, 296.) Isolated from a case of human arthritis.

Neisseria ediglоni (sic) Trevisan. (*Diplococcus scarlatinae sanguinis* Jamieson and Edington, Brit. Med. Jour., *1*, 1887, 1265; Trevisan, I generi e le specie delle Batteriacee, 1889, 32.) From a scarlet fever patient.

Neisseria fulva De Bord. (Jour. Bact., *38*, 1939, 119; Iowa State Coll. Jour. Sci., *16*, 1942, 471.) From conjunctivitis and vaginitis.

Neisseria gibbonsi Hauduroy et al. (Gram-negative coccus, Gibbons, Jour. Inf. Dis., *45*, 1929, 289; Hauduroy et al., Dict. d. Bact. Path., 1937, 300.) Isolated from skin abscesses in rabbits and guinea pigs.

Neisseria gigantea De Bord. (Jour. Bact., *38*, 1939, 119; Iowa State Coll. Jour. Sci., *16*, 1942, 472.) From a normal vagina.

Neisseria luciliarum Brown. (Amer. Mus. Novit., No. 251, 1927, 3.) A motile, Gram-negative diplococcus that probably should be placed in the genus *Micrococcus*. From a dead fly, *Lucilia sericata* killed by *Bacillus lutzae*.

Neisseria pseudocatarrhalis Huntoon. (Jour. Bact., *27*, 1934, 108.) Like *Neisseria catarrhalis*, shows no action on carbohydrates but is culturally more like *Neisseria meningitidis* and forms homogeneous suspensions in a salt solution. From nasopharynx.

Neisseria rebellis Trevisan. (Micrococcus in Trachoma folliculare, Kucharksky, 1887; Trevisan, I generi e le specie delle Batteriacee, Milan, 1889, 32.) From trachoma.

Neisseria venezuelensis Hauduroy et al. (Riguez, Gaceta Med. de Caracas,

June 30, 1935; Pedro del Corral, Rev. de Med. y Cir. de la Clinica Macacay, April, 1935; Hauduroy et al., Dict. d. Bact. Path., 1937, 308.) Found in localized epidemics of cerebrospinal meningitis in Venezuela.

Genus II. **Veillonella** *Prévot.**

(Ann. Sci. Nat., Sér. Bot., *15*, 1933, 118.) Named for A. Veillon, the French bacteriologist, who isolated the type species.

Small, Gram-negative cocci averaging 0.3 micron. Occur in masses, rarely in pairs or short chains. Cells undifferentiated. United by an interstitial substance of ectoplasmic nature. The known species are anaerobic. Good growth on standard culture media. Biochemical activity pronounced. Harmless parasites in mouth and intestine of man and animals.

The type species is *Veillonella parvula* (Veillon and Zuber) Prévot.

Key to the species of genus **Veillonella.**

I. Acid and gas from glucose. Weakly hemolytic.
 1. *Veillonella parvula.*

II. Carbohydrates not attacked. Gas produced from peptone broth. Non-hemolytic.
 2. *Veillonella gazogenes.*

1. **Veillonella parvula** (Veillon and Zuber) Prévot. (*Staphylococcus parvulus* Veillon and Zuber, Arch. méd. Exp., 1898, 542; *Micrococcus parvulus* Bergey et al., Manual, 3rd ed., 1930, 92; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 119.) From Latin, *parvulus*, very small.

Description from Prévot (*loc. cit.*).

Very small spheres: 0.2 to 0.4 micron, occurring in masses, occasionally in very short chains. Gram-negative.

Gelatin: No liquefaction.

Semisolid agar (Veillon) colonies: At first punctiform, becoming lenticular, reaching a diameter of 2 mm. Gas bubbles.

Blood agar colonies: Usually surrounded by a clear halo; weakly hemolytic.

Agar slant: Transparent, bluish, minute colonies.

Peptone broth: Turbid with fine sediment.

Glucose broth: Turbid. Faintly fetid odor. Gas produced contains CO_2, H_2 and H_2S.

Broth serum: Very abundant, rapid growth.

Milk: No acid. Not coagulated. Some strains produce gas.

Small amount of indole formed.

Nitrites produced from nitrates.

Acid and gas from glucose. Slight amount of acid from fructose, galactose and sucrose. Some strains feebly attack mannitol, maltose and inulin.

Coagulated protein not attacked.

Ammonia not produced.

Hydrogen sulfide produced.

Optimum pH 6.5 to 8.0.

Temperature relations: Optimum 37°C. Grows feebly at 22°C. Killed in one hour at 55°C.

Strict anaerobe.

Distinctive characters: Fermentation of polypeptids to produce hydrogen, carbon dioxide, hydrogen sulfide and indole; fermentation of sugars; hemolysis of blood; production of nitrites from nitrates.

Source: Isolated by Veillon and Zuber from appendices, buccal cavities and lungs. Of the 13 strains studied by Prévot, 3 were isolated from pulmonary gangrene, one from an appendix, one

---

*** Revised by Prof. E. G. D. Murray, McGill University, Montreal, P. Q., Canada, June, 1938. Descriptions reviewed by Dr. Ivan C. Hall, New York City, January, 1944.**

from alveolar pyorrhea, 5 from amniotic fluid, 2 from abscesses and pulmonary congestion and one from the buccal cavity of a normal rabbit. Found in suppurative lesions or pus. It may occasionally be pathogenic and invade the tissues, causing suppurations, alone or in association with other pyogenic organisms.

Habitat: Normally a harmless parasite found in natural cavities of man and animals, especially the mouth and digestive tract.

1a. *Veillonella parvula* var. *minima* Prévot. (*Staphylococcus minimus* Gioelli, Boll. R. Accad. Med. di Genova, 1907; Abst. in Cent. f. Bakt., I Abt., Ref., *42*, 1908–09, 595; *Micrococcus minimus* Bergey et al., Manual, 1st ed., 1923, 69; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 125.) From Latin, *minimus*, smallest.

Differs from *Veillonella parvula* only in its slightly smaller size (0.2 to 0.3 micron). Growth only at 37°C. No growth on gelatin. Growth on the wall of the culture tube in fine flakes, not clouding the medium, and no plasmolysis in a 5 per cent salt solution.

Source: Isolated from a periuterine abscess.

1b. *Veillonella parvula* var. *branhamii* Prévot. (Anaerobic micrococcus, Branham, Jour. Inf. Dis., *41*, 1927, 203; *ibid.*, *42*, 1928, 230; *Micrococcus branhamii* Bergey et al., Manual, 3rd ed., 1930, 92; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 126.) Named for Dr. Sara E. Branham, of the National Institute of Health, Washington, D. C.

Serologically distinct from *Veillonella parvula*. One strain liquefied gelatin slowly.

Source: Isolated from nasal washings in two cases of influenza.

1c. *Veillonella parvula* var. *thomsonii* Prévot. (Anaerobic diplococcus, Thomson, Jour. Trop. Med. and Hyg., *26*, 1923, 227 and Ann. Pickett-Thomson Res. Lab., *1*, 1924–25, 105 and 164; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 126; *Micrococcus thomsoni* Hauduroy et al., Dict. d. Bact. Path., 1937, 283.) Named for Dr. David Thomson of London, England.

Differs but slightly from *Veillonella parvula* in that it requires some accessory factor of growth found in serum or similar body fluids, testicular agar and the like.

Source: Found in the throat in measles and scarlet fever.

2. **Veillonella gazogenes** (Hall and Howitt) Murray. (*Micrococcus gazogenes alcalescens anaerobius* Lewkowicz, Arch. Méd. Exp., *13*, 1901, 633; *Micrococcus gazogenes* Hall and Howitt, Jour. Inf. Dis., *37*, 1925, 112; not *Micrococcus gazogenes* Choukévitch, Ann. Inst. Pasteur, *25*, 1911, 356; *Veillonella alcalescens* Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 127; *Micrococcus alcalescens* Hauduroy et al., Dict. d. Bact. Path., 1937, 274; Murray, in Manual, 5th ed., 1939, 287.) From Latin, the gas-producing *Veillonella*.

The species name *gazogenes* as given by Hall and Howitt is well established in the literature for this organism. It is valid under the rules when the organism is placed in a new genus (*Veillonella*) in spite of the earlier use of *Micrococcus gazogenes* by Choukévitch for a different organism.

Spheres: 0.3 to 0.7 micron, average 0.4 micron, occurring in irregular masses, rarely in pairs, short chains or singly. Gram-negative.

Gelatin: No liquefaction.

Deep agar colonies: At first punctiform, becoming lenticular. Gas bubbles appear after 16 to 18 hours.

Blood agar plate: Minute colonies. Non-hemolytic. Several strains show greenish colonies.

Peptone broth: Gas produced. Broth becomes slightly alkaline.

Indole not formed.

Milk: Gas, but no acid. No coagulation.

Ammonia and hydrogen produced in small amounts.

Egg-white and coagulated serum not attacked.

Hydrogen sulfide not produced.

Carbohydrates not attacked.

Nitrites not produced from nitrates.

Slowly plasmolysed in 5 per cent NaCl solution.

Optimum pH 6.0 to 8.0. Will grow in broth of pH 5.5.

Temperature relations: Optimum 37°C. Some strains grow at 22°C. Killed at 56°C in one hour, or at 65°C in a half hour, or at 80°C in 10 minutes.

Non-pathogenic (Lewkowicz's strains). Two strains (Prévot) pathogenic for rabbits.

Strict anaerobe.

Distinctive characters: Differs from *Veillonella parvula* in that it does not ferment sugars, does not produce H_2S nor indole, is not hemolytic, does not produce nitrites from nitrates, and does not develop fetid odors.

Source: Isolated (Lewkowicz) from mouth of a healthy infant. Twenty-four strains (Hall and Howitt) from human saliva. Fifteen strains (Prévot) one from alveolar pyorrhea, one from pulmonary gangrene, 5 from tonsils, one from appendix, 2 from measles, 3 from scarlet fever, and 2 from normal guinea pigs and rabbits.

Habitat: Prevalent in saliva of man and animals.

2a. *Veillonella gazogenes* var. *gingivalis* Murray. (Kleiner Micrococcus, Ozaki, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 83; *Micrococcus gingivalis* Bergey et al., Manual, 1st ed., 1923, 69; *Veillonella alcalescens* var. *gingivalis* Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 133; Murray in Manual, 5th ed., 1939, 288.) From Latin, pertaining to the gums.

Differs from *Veillonella gazogenes* by its ability to grow at 22°C, and by the fact that glucose favors its growth although this carbohydrate is not fermented.

Source: Oral cavity and (Prévot) two strains from the intestine.

2b. *Veillonella gazogenes* var. *minutissima* Murray. (*Micrococcus minutissimus* Oliver and Wherry, Jour. Inf. Dis., *28*, 1921, 342; *Veillonella alcalescens* var. *minutissima* Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 134; Murray, in Manual, 5th ed., 1939, 288.) From Latin, very tiny.

Differs from *Veillonella gazogenes* only in that the usual carbohydrates favor growth and that the gas formed is not absorbed by sodium hydroxide and is not inflammable.

Non-pathogenic for rabbits, guinea pigs or white mice (Oliver and Wherry).

Source: Two strains isolated from a mixed infection in aphthous ulcers of the gingival and buccal mucosa of a case of postpoliomyelitic paralysis.

2c. *Veillonella gazogenes* var. *syzygios* Murray. (*Syzygiococcus scarlatinae* Herzberg, Cent. f. Bakt., I Abt., Ref., *90*, 1928, 575; *Micrococcus syzygios scarlatinae* Herzberg, Cent. f. Bakt., I Abt., Orig., *111*, 1929, 373; *Micrococcus syzygios* Bergey et al., Manual, 3rd ed., 1930, 92; *Veillonella alcalescens* var. *syzygios* Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 134; Murray, in Manual, 5th ed., 1939, 288.) From Latin, yoked.

Differs from *Veillonella gazogenes* only by its ability to grow under an atmospheric pressure of 4 cm mercury, with the formation of H_2S in small amounts by some strains, and the production of nitrites from nitrates.

Source: Found by Herzberg in 30 per cent of normal mouths and in 100 per cent of saliva from scarlet fever patients.

FAMILY VII. LACTOBACTERIACEAE ORLA-JENSEN.

(Orla-Jensen, Jour. Bact., *6*, 1921, 271; *Streptobacteriaceae* Bergey, Breed and Murray, Preprint, Manual, 5th ed., 1938, 71.)

Long or short rods, or cocci which divide like rods in one plane only, producing chains, but never tetrads or packets. Non-motile except for certain cultures of streptococci. Gram-positive. Pigment production is rare; a few species form a yellow, orange, red or rusty brown pigment. Surface growth on all media is poor or absent. Some species are strictly anaerobic. Carbohydrates are essential for good development; they are fermented to lactic acid, sometimes with volatile acids, alcohol and CO_2 as by-products (except for the non-fermenting *Diplococcus magnus*). Gelatin is very rarely liquefied. Nitrate is not reduced to nitrite. Found regularly in the mouth and intestinal tract of man and other animals, dairy products, fermenting vegetable juices. A few are highly pathogenic.

Key to the tribes of family **Lactobacteriaceae.**

I. Cocci occurring singly, in pairs and in chains.
Tribe I. *Streptococceae*, p. 305.

II. Rods occurring singly, in pairs and in chains. Individual cells may be very long or even filamentous.
Tribe II. *Lactobacilleae*, p. 349.

TRIBE I. STREPTOCOCCEAE TREVISAN.

(I generi e le specie delle Batteriacee, 1889, 29.)

Cells spherical or elongate, dividing in one plane only, usually occurring in pairs or chains. A few species are strict anaerobes; none grow abundantly on solid media. Carbohydrates and polyalcohols are changed either by homofermentation to lactic acid or by heterofermentation to lactic and acetic acids, alcohol and carbon dioxide. Some pathogenic species grow poorly without blood serum or other enrichment fluids. Catalase negative.

Key to the genera of tribe **Streptococceae.**

I. Parasites, growing poorly on artificial media. Cells usually in pairs, often elongated. Anaerobic species rarely in tetrads or small clumps.
Genus I. *Diplococcus*, p. 305.

II. Parasites and saprophytes. Normally forming short or long chains. Ferment glucose to lactic acid with practically no other acids or CO_2.
Genus II. *Streptococcus*, p. 312.

III. Saprophytes. Form chains of cocci to short rods in plant juices and milk. Ferment glucose with the production of CO_2, lactic acid, acetic acid and ethyl alcohol. Mannitol is formed from fructose.
Genus III. *Leuconostoc*, p. 346.

Genus I. **Diplococcus** *Weichselbaum.**

(Weichselbaum, Wiener med. Jahrb., *82*, 1886, 483; *Hyalococcus* Schroeter, in Cohn, Kryptogamen Flora v. Schlesien, 1886, 152; *Pseudodiplococcus* Bonome, Cent. f. Bakt.,

* Revised by Prof. E. G. D. Murray, McGill University, Montreal, Canada, September, 1938; anaerobic section adapted from papers by Dr. A. R. Prévot, Institut Pasteur, Paris, France, 1938; further revision by Lt. Col. Elliott S. Robinson, M.C., Washington, D. C., January, 1944.

2, 1888, 321; ? *Pneumococcus* Schmidlechner, Ztschr. f. Geburtshilfe u. Gynäkol., *56*, 1905, 291; not *Pneumococcus* Arloing, Compt. rend. Acad. Sci., Paris, *109*, 1889, 430; *Mogallia* Enderlein, Sitzb. Gesell. Naturf. Freunde, Berlin, 1917, 309.) From Greek *diploos*, double; *kokkos*, a grain or berry; M. L., a sphere.

Cells usually in pairs, sometimes in chains or more rarely in tetrads or small clumps. Young cells Gram-positive. Parasites sometimes growing poorly or not at all on artificial media. Fermentative powers usually high, most strains forming acid from glucose, lactose, sucrose and inulin. The aerobic species are bile soluble while the anaerobic species are not bile soluble.

The relationships of the strictly anaerobic diplococci placed in this genus by Prévot (Ann. Sci. Nat., Sér. Bot., *15*, 1933, 140) to pneumococci are not yet entirely clear. The anaerobic species are included here in the hope that this arrangement will stimulate research.

The type species is *Diplococcus pneumoniae* Weichselbaum.

Key to the species of genus **Diplococcus.**

I. Aerobic, facultative. Bile soluble.
    1. *Diplococcus pneumoniae.*
II. Strictly anaerobic. Not bile soluble.
  A. Greater than 1 micron in diameter.
    1. Carbohydrates not attacked.
      2. *Diplococcus magnus.*
  B. Not greater than 1 micron in diameter.
    1. Acid from glucose and lactose.
      a. Capsulated. Pathogenic.
        3. *Diplococcus paleopneumoniae.*
      aa. Not capsulated. Non-pathogenic.
        4. *Diplococcus plagarum-belli.*
    2. Acid from glucose, not from lactose.
      a. Grows on ordinary culture media. Non-pathogenic.
        5. *Diplococcus constellatus.*
      aa. No growth on ordinary culture media. Pathogenic.
        6. *Diplococcus morbillorum.*

1. **Diplococcus pneumoniae** Weichselbaum. (Microbe septicémique du salive, Pasteur, Chamberland and Roux, Compt. rend. Acad. Sci., Paris, *92*, 1881, 159; Micrococcus of rabbit septicemia, Sternberg, National Board of Health Bull., Washington, *2*, 1881, 781; Coccus lancéolé, Talamon, Communication à la Société anatom. de Paris, *58*, 1883, 475; *Micrococcus pyogenes tenuis* Rosenbach, Mikroorganismen bei den Wundinfektionskrankheiten des Menschen, 1884, 30 (see Neumann, Cent. f. Bakt., 7, 1890, 177); *Micrococcus pasteuri* Sternberg, Trans. Pathol. Soc. of Philadelphia, *12*, 1885, 162 (not *Micrococcus pasteuri* Trevisan, I generi e le specie delle Batteriacee, 1889, 34); Weichselbaum, Wiener med. Jahrb., *82*, 1886, 485; Pneumoniemikrococcus or Pneumococcus, Fränkel, Ztschr. f. klin. Medizin, *10*, 1886, 402; *Bacillus septicus sputigenus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 262; *Bacillus salivarius septicus* Biondi, Ztschr. f. Past., *2*, 1888, 442; *Streptococcus lanceolatus* Gamaléia, *ibid.*, 443; *Klebsiella salivaris* Trevisan, I generi e le specie

delle Batteriacee, 1889, 26; *Micrococcus rosenbachii* Trevisan, *ibid.*, 33; *Micrococcus pyogenes-tenuis* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1031; *Micrococcus pneumoniae crouposae* Sternberg, Cent. f. Bakt., *12*, 1892, 53; *Diplococcus lanceolatus capsulatus* Kruse and Pansini, Ztschr. f. Hyg., *11*, 1892, 335; *Diplococcus lanceolatus* incorrectly ascribed to Fränkel by Binaghi, Cent. f. Bakt., I Abt., *22*, 1897, 278; *Micrococcus tenuis* Migula, Syst. d. Bakt., *2*, 1900, 193; *Bacterium pneumoniae* Migula, *ibid.*, 347; *Bacterium salivarium* Migula, *ibid.*, 379; *Streptococcus pneumoniae* Chester, Man. Determ. Bact., 1901, 63; *Micrococcus lanceolatus* Longcope, Jour. Med. Res., *7* (N.S. *2*), 1902, 220; *Pneumococcus lanceolatus* Schmidlechner, Ztschr. f. Geburtshilfe u. Gynäkologie, *56*, 1905, 291; *Pneumococcus pneumoniae* Fried, Jour. Exp. Med., *57*, 1933, 111.) From Greek *pneumonia*, inflammation of the lungs.

Monas pulmonale Klebs (Arch. f. exper. Path. u. Pharmakol., *4*, 1875, 472) is inadequately described by Klebs and ought not to be regarded as identical with Weichselbaum's organism.

Common name: Pneumococcus.

The organisms occur as oval or spherical forms typically in pairs, occasionally singly or in short chains, 0.5 to 1.25 microns. The distal ends of each pair of organisms tend to be pointed or lancet-shaped. Encapsulated. Non-motile. Young cells, Gram-positive.

Gelatin stab: Filiform or beaded growth. No liquefaction.

Infusion agar colonies: Small, transparent, grayish, with entire margin. Elevation high convex, glistening, mucoid to watery.

On blood agar, the colonies are elevated at the center with concentric elevations and depressions. Hemolysis usually slight but often marked in anaerobic culture; methemaglobin formation with green zone around colony.

Beef heart infusion broth: Uniform turbidity with variable amount of sediment.

Addition of glucose, serum, whole blood or ascitic fluid enhances growth.

Meat extract media: Growth irregular, usually poor if any.

Inulin serum water: Usually acid with coagulation.

Litmus milk: Usually acid with coagulation.

Potato: No growth.

Whole bile or 10 per cent solutions of sodium taurocholate or sodium glycocholate added to actively growing broth cultures will dissolve the organisms. It is customary to use from 0.1 to 0.5 ml of bile for each 0.5 ml of culture.

Aerobic, facultative.

Optimum temperature 37°C. Usually no growth at 18° to 22°C.

Optimum initial pH 7.8.

Source: Sputum, blood and exudates in pneumonia; cerebrospinal fluid in meningitis; mastoiditis; otitis media; peritonitis; empyema; pericarditis; endocarditis; arthritis; saliva and secretions of respiratory tract in normal persons. Commonest cause of lobar pneumonia.

Habitat: The respiratory tract of man and animals.

At present, thirty-one types of *Diplococcus pneumoniae* are recognized on the basis of serological reactions, chiefly the Neufeld "Quellung" phenomenon as induced by type-specific immune rabbit serums. Following the description of Pneumococcus 1 by Neufeld and Händel (Arb. a. d. k. Gesundheitsamte, *34*, 1910, 293), Dochez and Gillespie (Jour. Amer. Med. Assoc., *61*, 1913, 727) divided the species into Types 1, 2, 3 and a heterogenous group 4; Cooper, Edwards and Rosenstein (Jour. Exp. Med., *49*, 1929, 461) separated Types 4 to 13 from the strains previously designated as group 4, and later Cooper, Rosenstein, Walter and Peizer (Jour. Exp. Med., *55*, 1932, 531)

continued the classification to Type 32. Due to marked cross-reactions, it was subsequently decided that Type 6 was identical with Type 26, and that Types 15 and 30 were identical. This resulted in the deletion of the Cooper Types 26 and 30, thus leaving thirty of the original thirty-two types. Type 33 (Wilder) has been described by Walter, Blount, Beattie and Cotler (Jour. Inf. Dis., *66*, 1940, 181) as a distinct type; sufficient recognition has been accorded to justify the acceptance of this type, thereby making a total of thirty-one types of the species. In a still more recent publication, Walter, Guevin, Beattie, Cotler and Bucca (Jour. Immunol., *41*, 1941, 279) recommend the addition of nine new types and eight subtypes. These, together with new strains reported by Kauffmann, March and Schmith (Jour. Immunol., *39*, 1940, 397), if eventually recognized, would make a total of fifty-five types. Eddy still more recently, taking into account all known types, raises the number of recognized types to seventy five (U. S. Public Health Repts., *59*, 1944, 449–468).

NOTE 1. *Streptococcus mucosus* Howard and Perkins. (Howard and Perkins, Jour. Med. Res., *6* (N.S. *1*), 1901, 174; *Diplococcus capsulatus* incorrectly attributed to Fränkel by Binaghi, Cent. f. Bakt., I Abt., *22*, 1897, 273; *Streptococcus mucosus* Schottmüller, Münch. med. Wchnschr., *50*, 1903, 909; *Streptococcus lanceolatus* var. *mucosus* Park and Williams, *Diplococcus lanceolatus* var. *mucosus* Park and Williams, *Diplococcus mucosus* Park and Williams, *Pneumococcus mucosus* Park and Williams, Jour. Exp. Med., *7*, 1905, 411; *Streptococcus mucosus capsulatus* Buerger, Cent. f. Bakt., I Abt., *41*, 1906, 314.) This organism is no longer recognized as a separate species. Dochez and Gillespie (Jour. Amer. Med. Assoc., *61*, 1913, 727), Wirth (Cent. f. Bakt., I Abt., Orig., *102*, 1928, 40) and others have established the identity of strains of this group as *Diplococcus pneumoniae*, Type 3.

Buerger (Cent. f. Bakt., I Abt., Orig., *41*, 1906, 314) lists the following capsulated closely related streptococci: *Streptococcus involutus* Kurth, Arb. a. d. k. Gesundheitsamte, *8*, 1893, 449 (*Diplococcus involutus* Winslow and Winslow, The Systematic Relationships of the Coccaceae, New York, 1908, 131); *Streptococcus aggregatus* Seitz, Cent. f. Bakt., I Abt., *20*, 1896, 854; *Streptococcus capsulatus* Binaghi, Cent. f. Bakt., I Abt., *22*, 1897, 273; Streptocoque auréole, Le Roy des Barres and Weinberg, Arch. de Méd. expér. et d'anat. pathol., *2*, 1899, 399; *Leuconostoc hominis* Hlava, Cent. f. Bakt., I Abt., Orig., *32*, 1902, 263.

NOTE 2. Pneumococci, regardless of serological type, manifest three chief culture phases (or stages): Mucoid, Smooth, and Rough. The Mucoid (M) form corresponds to that previously designated as Smooth (S) and represents the typical phase of the species; Smooth (S) supercedes the earlier term Rough (R); and the present Rough (R) form is a relatively newly-described variant. The most frequently observed dissociative trend is M → S → R. Serological types are recognizable only in the Mucoid form due to the presence of type-specific polysaccharides in the capsular material; both Smooth and Rough forms are devoid of capsular material, but possess species-specific antigens common to all members of the species. Smooth and Rough forms are non-pathogenic, possess distinctive growth characteristics, and require special technic for accurate observations. The cultural characteristics given are those of the mucoid and smooth phases only, e. g., see growth in broth.

*† **Diplococcus magnus** Prévot. (*Diplococcus magnus anaerobius* Tissier and

* Anaerobic section reviewed by Dr. Ivan C. Hall, New York, N. Y.

† These anaerobic diplococci and streptococci, many of which are putrefactive

Martelly, Ann. Inst. Past., *16*, 1902, 885; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 140.) From Latin *magnus*, large.

Large spheres: 1.5 to 1.8 microns, usually in pairs, sometimes occurring singly, in small clumps or very short chains. Gram-positive.

Gelatin: Growth slow, scanty. No liquefaction.

Deep agar colonies: After 24 hours at 37°C, lenticular, whitish, granular; margin finely cut. No gas produced.

Broth: Turbid, clearing in 4 or 5 days resulting in a viscous mass similar to the zoogloea which *Clostridium bifermentans* forms.

Peptone water: Slight turbidity. Indole not formed.

Milk: Unchanged.

Fibrin not digested.

Sterilized urine: Turbid in 3 to 4 days. The urea is attacked forming $(NH_4)_2CO_3$.

Proteoses: Digested and disintegrated forming $(NH_4)_2CO_3$ with the liberation of NH_3.

Carbohydrates not attacked.

Optimum pH 7.0. Limits of pH 5.5 to 8.5.

Temperature relations: Optimum 37°C. Grows from 18° to 37°C. Killed in five minutes on boiling or in half an hour at 60°C.

Non-pathogenic.

Strict anaerobe.

Distinctive characters: Large size; very marked alkalinizing power.

Source: Isolated by Tissier and Martelly (*loc. cit.*) from putrefying butcher's meat. Isolated by Prévot (*loc. cit.*) from a case of acute appendicitis.

Habitat: Human digestive tract. Very common on butcher's meat in the process of putrefaction. Probably occurs in household dust.

3. **Diplococcus paleopneumoniae** Prévot. (An anaerobic pseudopneumococcus, Rist, Thèse de Paris, 1898; Der Fränkelsche Diplococcus, Bolognesi, Cent. f. Bakt., I Abt., Orig., *43*, 1907, 113; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 143.) From Greek *paleus*, old and *pneumonia*, inflammation of the lungs.

Spheres: About 0.7 to 1.0 micron, occurring in pairs, rarely occurring singly or in very short chains. Capsulated. Gram-positive.

Gelatin: No liquefaction.

Deep agar colonies: Probably lenticular.

Agar slant colonies: Round, raised, transparent, dew-drop.

Broth: Opalescent turbidity which settles as a rather abundant, powdery, flocculent precipitate. No gas produced.

Glucose or lactose broth: Rapid, abundant growth.

Peptone water (2 per cent): Very slow development. After 4 or 5 days at 37°C growth very poor.

Milk: Good growth. Partial coagulation.

Blood agar: Very rapid, abundant growth.

Acid from glucose and lactose.

Temperature relations: Optimum 37°C. No growth at 20°C nor at 42°C. Killed at 55°C.

Pathogenic.

Strict anaerobe.

Distinctive characters: Resembles

---

and gas-forming, seem to us so different from the fermentative microaerophilic diplococci, streptococci, leuconostocs and lactobacilli that we beleive they should be placed in genera and in a family separate from *Lactobacteriaceae*. Prévot in a discussion (Ann. Inst. Past., *67*, 1941, 87) that has just reached us (Oct., 1945) recognizes this difference in physiology. He would solve the difficulty by returning the fermentative diplococci and streptococci to the family *Coccaceae* because of resemblances in morphology which do not seem to us to be fundamental—The editors.

Diplococcus pneumoniae but is a strict anaerobe; highly pathogenic.

Source: Isolated by Rist (*loc. cit.*) from an osseous abscess; by Bolognesi (*loc. cit.*) from lesions of pleuropneumonia.

Habitat: Buccal-pharyngeal cavity of man and rodents.

4. **Diplococcus plagarum-belli** Prévot. (Diplococcus from septic wounds, Adamson, Jour. Path. and Bact., *22*, 1919, 393; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 157.) From Latin *plaga*, wound; *bellum*, war.

Spheres: 0.6 to 1.0 micron, occurring in pairs of unequal size or in short chains. Gram-positive.

Gelatin: No liquefaction.

Deep agar colonies: Appear after 24 to 48 hours, gradually increasing in size to 2 mm in diameter; lenticular, regular, almost transparent. Gas not produced, even in glucose agar.

Broth: Growth precipitates in 5 or 6 days. No gas produced.

Indole not formed.

Milk: Strongly acidified and coagulated in 2 to 3 days.

Serum not digested.

Acid but not gas from glucose, maltose, lactose and sucrose. No acid from mannitol.

Temperature relations: Optimum 37°C. Not always killed in half an hour at 80°C.

Non-pathogenic.

Strict anaerobe.

Source: Sixteen strains isolated from fifty-one cases of septic war wounds.

Habitat: Common in septic wounds.

5. **Diplococcus constellatus** Prévot. (Compt. rend. Soc. Biol. Paris, *91*, 1924, 426.) From Latin *constellatus*, studded with stars.

Description in part from Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 158.

Spheres: 0.5 to 0.6 micron, occurring in pairs and tetrads, rarely in very short chains, never in clusters. Gram-positive.

Gelatin: Good growth. No liquefaction.

Deep agar colonies: At first very small, lenticular, biconvex, thick, opaque, yellowish, 0.5 to 1.5 mm in diameter. Each colony surrounded by many small satellite colonies visible microscopically.

Broth: Growth slow, poor. After 48 hours a slight homogenous turbidity which quickly clears, leaving a slight powdery sediment. Neither gas nor odor produced.

Glucose broth: Growth rapid, abundant.

Proteins not attacked.

Blood broth: Good growth. No hemolysis.

Milk: Poor growth. No change.

Peptone water: Good growth. Not acidified. Indole not formed.

Neutral red broth unchanged.

Acid but not gas from glucose, arabinose. Slightly acid from glycerol. No acid from lactose, inulin, mannitol or dulcitol.

Optimum pH 6.0 to 8.0.

Optimum temperature 37°C. Feeble growth at 22°C. Not thermo-resistant.

Strict anaerobe.

Distinctive character: The microscopic appearance of agar colonies each of which is surrounded by a constellation of satellites.

Source: Isolated from a case of chronic, cryptic tonsillitis. Later isolated from pus in acute appendicitis.

Habitat: Digestive tract, especially the lymphoid tissues, as tonsils and appendix.

6. **Diplococcus morbillorum** Prévot. (Diplococci from cases of measles, Tunnicliff, Jour. Amer. Med. Assoc., *68*, 1917, 1028; *Diplococcus rubeolae* Tunnicliff, Jour. Inf. Dis., *52*, 1933, 39; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 148; original name withdrawn by Tunnicliff,

Jour. Inf. Dis., *58*, 1936, 1.) From Latin *morbus*, disease; M. L. *morbilli*, measles.

Spheres: 0.6 to 0.8 micron, occurring in short chains, rarely in small masses. Gram-positive.

This organism does not develop on ordinary culture media. The addition of fresh serum or ascitic fluid is necessary.

Gelatin: No liquefaction.

Serum agar colonies: Very small, punctiform, appearing after 5 to 22 days. No gas produced.

Glucose agar containing ascitic fluid and blood: Colonies are slightly larger and appear more rapidly; greenish.

Blood agar colonies: Surrounded by a greenish halo. May be large and moist. Gas not produced.

Broth: Very poor growth.

Hemolysed blood broth: Growth flocculent, leaving the liquid clear.

Milk: Unchanged by most strains. Acidified and coagulated by four strains.

Indole not formed.

Bile: Not soluble in bile.

Acid from glucose, sucrose and maltose.

Temperature relations: Optimum 37°C. Killed in 45 minutes at 57°C. Withstands −2°C for two weeks.

Strict anaerobe. Most strains become microaerophilic with transfers.

Distinctive characters: Greenish colonies on blood media; poor growth on ordinary media.

Source: Isolated from the throat and blood in measles.

Habitat: Nose, throat, eyes, ears, mucous secretions and blood from cases of measles.

Genus II. **Streptococcus** *Rosenbach.**

(Rosenbach, Mikroorganismen bei Wundinfektionskrankheiten des Menschen, 1884, 22; *Arthrostreptokokkus* Hueppe, Wiesbaden, 1886, 144; *Sphaerococcus* Marpmann, Ergänzungshefte z. Cent. f. allg. Gesundheitspflege, *2*, 1889, 121; *Perroncitoa, Babesia, Schuetzia* Trevisan, I generi e le specie delle Batteriacee, 1889, 29; *Lactococcus* Beijerinck, Arch. neérl. d. sci. exactes, Sér. 2, *7*, 1901, 213; *Hypnococcus* Bettencourt et al., Cent. f. Bakt., I Abt., Orig., *35*, 1904, 55; *Myxococcus* Gonnermann, Oester. u. Ungar. Ztschr. f. Zuckerind. u. Landwirtsch., *36*, 1907, 883; not *Myxococcus* Thaxter, Bot. Gaz., *17*, 1892, 404; *Melococcus* Amiradzibi, Med. Zurn., *4*, 1907, 309; *Diplostreptococcus* v. Lingelsheim, in Kolle and Wassermann, Handb. d. path. Mikroorg., 2 Aufl., *4*, 1912, 494; ? *Brachybacterium* Troili-Petersson, Cent. f. Bakt., II Abt., *11*, 1903, 138; *Pseudostreptus* Enderlein, Sitzb. Gesell. Naturf. Freunde, Berlin, 1917, 309; *Planostreptococcus* Meyer, Die Zelle der Bakterien, Jena, 1912, 4; *Streptus* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1930, 104; *Peptostreptococcus* Kluyver and Van Niel, Cent. f. Bakt., II Abt., *94*, 1936, 391.) From Greek *streptus*, flexible or pliant; Greek *kokkos*, a grain or berry; M. L., a sphere.

Cells spherical or ovoid, rarely elongated into rods, occurring in pairs, or short or long chains, never in packets or zoogloeal masses. Capsules are not regularly formed, but become conspicuous with some species under certain conditions. Gram-positive, some species decolorizing readily. A few cultures produce a rusty red growth in deep agar stab, or a yellow or orange pigment in starch broth. Growth on artificial media is slight. Agar colonies are small. Surface colonies are translucent. Colonies may be effuse, convex or mucoid. Some species are aided by the addition of native proteins. Mostly facultative anaerobes, with little surface growth in stab cultures. A few are strict anaerobes. Some of the latter attack proteins with production of gas and foul odors. Carbohydrate fermentation by all others is homofermentative, with dextrorotatory lactic acid as the dominant product, while volatile acids, other volatile products and CO_2 are either absent or produced in very small amounts. Inulin is rarely attacked. Nitrate is not reduced to nitrite. Not soluble in bile. Common wherever organic matter containing sugars is accumulated. Regularly in the mouth and intestine of man and other animals, dairy products, fermenting plant juices. Some species are highly pathogenic.

The type species is *Streptococcus pyogenes* Rosenbach.

NOTE: The classification of streptococci is beset with many difficulties and it seems advisable for the present to accept only such described species about which there is reasonable agreement. With present knowledge, many species which have been separated can justifiably be considered as identical with older species and have been treated as such here. The descriptions of certain other species do not permit their exact identification now and they have been classed as invalid names with no present significance. It is admitted there are grounds for belief that more than one species may be included in certain of the species described here, but the onus of proof lies with the investigators interested in them. It is hoped that the simplification introduced will prove useful as a starting point for the more exact differentiation and description of the species of *Streptococcus*. The general arrangement used is in

---

* Revised by Prof. E. G. D. Murray, McGill University, Montreal, Canada, in consultation with Prof. G. J. Hucker, New York State Experiment Station, Geneva, New York and Prof. J. M. Sherman, Cornell University, Ithaca, New York, June, 1938; further revision by Prof. J. M. Sherman, February, 1944.

harmony with the suggestions made by Hucker (Proc. 2nd Internat. Cong. for Microbiology, London, 1936, 127) and Sherman (Bact. Reviews, *1*, 1937, 3).

Serological reactions are included as far as possible in the descriptions but the true significance of these methods is not known and on that account they are not stressed in the primary classification.

Throughout the history of this genus motile streptococci have been reported occasionally (e.g., *Streptococcus herbarum* Schieblich, Cent. f. Bakt., I Abt., Orig., *124*, 1932, 269; Koblmüller, Cent. f. Bakt., I Abt., Orig., *133*, 1934, 310; Stölting, Über die Streptokokken des normal reifenden Tilsiter Käses. Inaug. Diss., Kiel, 1935, 51; Pownall, Brit. Jour. Exp. Path., *16*, 1935, 155) but it is not known whether these constitute definite species or whether (Levenson, Ann. Inst. Past., *60*, 1938, 99) motile individuals occasionally appear in ordinarily non-motile species.

The anaerobic streptococci have not been sufficiently studied to be sure whether they should be included in the genus *Streptococcus* or given separate generic rank. Their metabolic processes seem reason for the latter view. The descriptions given are taken from Prévot (Ann. Sci. Nat., Sér. Bot., *15*, 1933, 23).

The material is arranged accordingly in three categories: A key and complete descriptions have been prepared for clearly defined species, species of uncertain taxonomic relationships have been placed in Appendix I with their necessarily incomplete descriptions, while even less valid and unidentifiable species are merely listed in Appendix II.

Key to the species of genus Streptococcus.

I. Facultative anaerobic species.
  A. *Pyogenic group.* No growth at 10°C. No growth at 45° C. Generally beta hemolytic. Generally do not curdle litmus milk and reduce litmus slowly if at all. Mannitol and glycerol generally not fermented. Not tolerant of 0.1 per cent methylene blue, 6.5 per cent NaCl and pH 9.6. Produce ammonia from peptone.
    1. Sodium hippurate not hydrolyzed.
      a. Lactose fermented.
        b. Sorbitol not fermented but trehalose fermented. Lancefield Group A.
          1. *Streptococcus pyogenes.*
        bb. Sorbitol fermented and trehalose not fermented. Lancefield Group C.
          2. *Streptococcus zooepidemicus.*
      aa. Lactose may or may not be fermented. Lancefield Group C.
        b. Trehalose not fermented.
          3. *Streptococcus equi.*
        bb. Trehalose fermented.
          4. *Streptococcus equisimilis.*
    2. Sodium hippurate hydrolyzed. Lancefield Group B.
          5. *Streptococcus agalactiae.*
  B. *Viridans group.* No growth at 10°C. Growth at 45°C (few exceptions in *Streptococcus mitis*). Reduce litmus after curdling litmus milk; sorbitol and glycerol generally not fermented; mannitol rarely. Not tolerant of 0.1 per cent methylene blue, 6.5 per cent NaCl or pH 9.6. Not beta

hemolytic (though they may be under anaerobic conditions) but show varying degrees of greening of blood. Do not produce ammonia from peptone (few exceptions in *Streptococcus mitis*).

1. Lactose is fermented.
   a. Do not grow at 50°C. Greening or indifferent in blood agar. Raffinose, inulin, salicin and dextrin generally fermented. Esculin generally attacked. Growth with 2 per cent NaCl.
      b. Do not survive 60°C for 30 minutes. Starch not hydrolyzed. Not tolerant of bile.
         c. Mucoid colonies produced on sucrose and raffinose media.
            6. *Streptococcus salivarius*.
         cc. Colonies not mucoid on sucrose or raffinose media. Inulin not fermented.
            7. *Streptococcus mitis*.
      bb. Survives 60°C for 30 minutes. Starch is hydrolyzed except by variety *inulinaceus*. Tolerant of bile.
            8. *Streptococcus bovis* (and varieties).
   aa. Grows at 50°C. No action on blood. Esculin not attacked. Raffinose, inulin, salicin and dextrin not fermented. No growth in 2 per cent NaCl.
            9. *Streptococcus thermophilus*.
2. Lactose not fermented. Tolerant of bile.
            10. *Streptococcus equinus*.

C. *Lactic group*. Growth at 10°C. No growth at 45°C. Reduce litmus prior to curdling of litmus milk. Sorbitol and glycerol not fermented. Not beta hemolytic. Tolerate 0.1 per cent methylene blue, but do not tolerate 6.5 per cent NaCl or pH 9.6.
   1. Maltose and dextrin fermented. Ammonia produced from peptone. Growth at 40°C. Group N of Shattock and Mattick.
            11. *Streptococcus lactis*.
   2. Maltose and usually dextrin not fermented. Ammonia not produced from peptone. No growth at 40°C.
            12. *Streptococcus cremoris*.

D. *Enterococcus group*. Growth at 10°C. Growth at 45°C. Usually reduce litmus prior to curdling litmus milk. Sorbitol, glycerol and mannitol generally fermented. May or may not be beta hemolytic. Tolerate 0.1 per cent methylene blue, 6.5 per cent NaCl and pH 9.6. Ammonia produced from peptone. Lancefield Group D.
   1. Not beta hemolytic.
      a. Gelatin not liquefied.
            13. *Streptococcus faecalis*.
      aa. Gelatin liquefied.
            14. *Streptococcus liquefaciens*.
   2. Beta hemolytic.
      a. Mannitol and sorbitol fermented.
            15. *Streptococcus zymogenes*.
      aa. Mannitol and sorbitol not fermented.
            16. *Streptococcus durans*.

II. Anaerobic species.
   A. Strict anaerobes.
      1. Gas and fetid odor produced.
         a. No general turbidity in broth.

b. Acid from maltose.

17. *Streptococcus anaerobius.*

bb. No acid from maltose.

18. *Streptococcus foetidus.*

aa. Turbidity in broth.

b. No gas in Veillon's semisolid agar. No gas in peptone water.

19. *Streptococcus putridus.*

bb. Abundant gas in semisolid agar. Gas in peptone water.

20. *Streptococcus lanceolatus.*

2. No gas and no fetid odor produced.

a. Milk not coagulated.

21. *Streptococcus micros.*

aa. Milk coagulated.

b. Viscous sediment in broth. Semisolid agar colonies blacken with age.

22. *Streptococcus parvulus.*

bb. No viscous sediment in broth. Semisolid agar colonies do not blacken with age.

23. *Streptococcus intermedius*

B. Microaerophilic.

1. Strictly anaerobic on isolation, later microaerophilic.

24. *Streptococcus evolutus.*

1. **Streptococcus pyogenes** Rosenbach. (Fehleisen, Ueber Erysipel, Deut. Zeit. f. Chir., *16*, 1882, 391; Erysipelkokken, Fehleisen, Die Aetiologie des Erysipels, Berlin, 1883; Rosenbach, Mikroorganismen bei Wundinfektionskrankheiten des Menschens, 1884, 22; *Streptococcus erysipelatos* (sic) Rosenbach, *ibid.*, 22; *Micrococcus erysipelatis* Zopf, Die Spaltpilze, 2 Aufl., 1884, 86; *Streptococcus erysipelatis* Zopf, Die Spaltpilze, 3 Aufl., 1885, 51; *Streptococcus erysipelatosus* Klebs, Die Allg. Path., Jena, 1887, 318; *Micrococcus scarlatinae* and *Streptococcus scarlatinae* Klein, Report of the Medical Officer of the Local Government Board for 1885–1886, No. 8, 1887, 85; *Streptococcus conglomeratus* Kurth, Arb. d. k. Gesundheitsamte, 7, 1891, 389; *Streptococcus longus* von Lingelsheim, Ztschr. f. Hyg., *10*, 1891, 331 and *12*, 1891, 3C8; *Streptococcus puerperalis* Arloing, Septicémie puerperale, Paris, 1892 (Jordan, Brit. Med. Jour, 1912, 1); *Staphylococcus erysipelatos* Hesse, Ztschr. f. Hyg., *34*, 1900, 347; *Streptococcus longus pathogenes* seu *erysipelatos* Schottmüller, Münch. med. Wchnschr., *50*, 1903, 909; *Streptococcus longus hemolyticus* Sachs, Ztschr. f. Hyg., *63*, 1909, 466; *Streptococcus longissimus* Thalmann, Cent. f. Bakt., I Abt., Orig., *56*, 1910, 248; *Streptococcus hemolyticus* Rolly, Cent. f. Bakt., I Abt., Orig., *61*, 1911, 87; *Streptococcus epidemicus* Davis, Jour. Am. Med. Assoc., *58*, 1912, 1852; Jour. Inf. Dis., *15*, 1914, 378; *ibid.*, *19*, 1916, 236; *Streptococcus hemolysans* Blake, Jour. Med. Res., *36* (N.S. *31*), 1917, 116; *Streptococcus pyogenes haemolyticus* Weisenbach, Compt. rend. Soc. Biol. Paris, *81*, 1918, 819; *Streptus scarlatinae* Enderlein, Sitzber. Geseil. Naturf. Freunde Berlin, 1930, 104; *Streptococcus pyogenes* var. *scarlatinae* Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 520.) From Greek *pyon*, pus; *-genes*, producing.

Spherical or ovoid cells: 0.6 to 1 micron in diameter in cultures; usually spherical in blood and inflammatory exudates; occurring in chains or pairs. Capsules are variable, sometimes well developed and can be induced. Gram-positive.

Gelatin stab: Growth slight; minute opaque colonies, little surface growth. No liquefaction.

Nutrient agar: Small colonies, translucent, convex, entire, slightly granular; colonies are variable; confluent growth a thin transparent film; tendency for

colonies to remain discrete. Growth increased by addition of blood or native proteins. Pairs or short chains in surface growth and longer chains in condensation fluid of slants.

Broth: Flocculent sediment of tangled, chains, supernatant broth often clear except in very young cultures. No pellicle.

Potato: Very slight or no visible growth.

Litmus milk: Acid, seldom curdled, and litmus reduced slowly or not at all.

Acid from glucose, maltose, lactose, sucrose, salicin and trehalose. No acid from inulin, raffinose, arabinose, glycerol, mannitol, sorbitol or dulcitol.

No hydrolysis of sodium hippurate, starch or esculin.

Ammonia is produced from peptone.

Temperature relations: Optimum temperature around 37°C. No growth at 10°C or 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Tolerates 2 per cent NaCl but not 4 per cent and 6.5 per cent. Final pH in glucose broth 4.8 to 6.0; no growth at pH 9.6. Methylene blue 0.01 per cent and 0.1 per cent not tolerated and not reduced. Inhibited by bile but not soluble.

Action on blood: Superficial and deep colonies cause hemolysis in blood agar, usually with a wide zone surrounding the colony, which may have a well-defined margin circumscribed by a zone of concentrated hemoglobin; the margin of the zone is ill-defined with some strains. Conditions defined by Brown (Rockefeller Inst. Med. Res., Monograph 9, 1919, 14) known as beta hemolysis. Soluble antigenic hemolysin of more than one kind produced in fluid cultures; influenced by constitution of medium and presence of serum; one is oxygen-sensitive and another is oxygen-stable. Special precautions necessary for its demonstration (F. Smith, Jour. Bact., *34*, 1937, 585, 603).

Toxin: An erythrogenic toxin is produced; commonly associated with scarlet fever. Relatively thermostable.

Fibrinolysin: Dissolves human fibrin but not fibrin of rabbit or ox blood. Markedly thermostable.

Serology: Constitutes Group A of Lancefield (C substance; polysaccharide) (Jour. Exp. Med., *57*, 1933, 571). Types within the species are distinguishable (M substance; protein); 23 identified by Griffith (Jour. Hyg., *34*, 1934, 542). Antigen common to the group (P substance; nucleo-protein) also present in other Gram-positive cocci.

Facultative anaerobe. Occasionally in primary culture from lesions, pus, etc. grows only in anaerobic culture.

Source: Human mouth, throat and respiratory tract; inflammatory exudates, blood stream and lesions in human disease of very varied character. Occasionally in milk and udder of cows. Dust in sick rooms, hospital wards and other contaminated sites.

Habitat: In human infections of many varied types. Occasionally in udder infections of cattle and perhaps other animal sources.

2. **Streptococcus zooepidemicus** Frost and Engelbrecht. (Animal pyogenes, Type A of Edwards, Jour. Bact., *27*, 1934, 527; Frost and Engelbrecht, A Revision of the Genus *Streptococcus*, privately published, 1936, 3 pp. and The Streptococci, 1940, 25; *Streptococcus pyogenes animalis* Seelemann, Deutsche tierarzt. Wchnschr., *50*, 1942, 8 and 48.) From M. L., derived to mean animal *epidemicus*.

Morphology and general cultural characters resemble *Streptococcus pyogenes*. Mucoid colonies are common. Capsules are constantly demonstrable and prominent. Gram-positive.

Gelatin stab: No liquefaction.

Litmus milk: May be curdled, litmus not reduced or slowly after curdling.

Acid from glucose, lactose and sorbitol. Acid may be produced from maltose, sucrose and salicin. No acid

from arabinose, trehalose, raffinose, inulin, glycerol or mannitol.

Does not hydrolyze sodium hippurate, but starch and esculin may be split.

Ammonia is produced from peptone.

Temperature relations: No growth at 10°C or at 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Tolerates 2 per cent NaCl but not 4 per cent and 6.5 per cent. Final pH in glucose broth 4.5 to 5.2. No growth at pH 9.6. Methylene blue 0.01 per cent and 0.1 per cent not tolerated and not reduced.

Action on blood: Beta hemolysis.

Serology: Group C of Lancefield (*loc. cit.*). Cross precipitation with *Streptococcus equi*.

Facultative anaerobe.

Source: Blood stream, inflammatory exudates and lesions of diseased animals. Not known from man.

Habitat: Disease process of domestic and laboratory animals. (Horse: endometritis, foetus. Hog: septicemia. Cow: septicemia, metritis, foetus. Fowls: slipped tendon. Guinea pig: lymphadenitis. Rabbit: septicemia. Fox: pneumonia.)

3. **Streptococcus equi** Sand and Jensen. (*Bacillus adenitis equi* Baruchello, Soc. Veter. de Venetie, Undine, 1886; Giornale di anatomia fisiologica et patologia degli animali domestici, Pisa, Sept., 1887; Sand and Jensen, Deuts. Ztschr. f. Tiermed., *13*, 1888, 436, dated December 27, 1887, Veterinary Congress, Copenhagen, 1887; sometimes incorrectly credited to Schütz, Arch. f. wissens. u. prakt. Tierheilkunde, *14*, 1888, 172; *Streptococcus cappelletti* Chester, Manual Determ. Bact., 1901, 57; *Streptococcus coryzae contagiosae equorum* Schütz, in Eisenberg, Bakt. Diag., 3 Aufl., 1891, 270; *Streptococcus schütz*, Bongert, in Kolle and Wassermann, Handb. d. path. Mikroorg., 2 Aufl., *6*, 1913, 208.) From Latin *equus*, horse.

Possible synonyms: *Streptococcus peritonitidis equi* Hamburger, Cent. f. Bakt., I Abt., *19*, 1896, 882 (*Streptococcus peritonitidis* Migula, Syst. d. Bakt., *2*, 1900, 21); *Streptococcus pyogenes equi* Hutyra, in Lehmann and Neumann, Bakt. Diag., 7 Aufl., 1927, 221.

Note: Rivolta (Dei parassiti vegetali come introduzione allo studio delle malattie parassitarie e delle alterazione dell' alimento degli animali domestici. Turin, 1873, 161) described chains of cocci in *adenitis scrophula equorum, morbus glandulosus*.

Holth, reported by C. O. Jensen (Handb. d. Serumtherapie u. Serum diagnostik in d. Veterinar-med. (Klimmer-Wolff-Eisner), *2*, 1911, 223), and Adsersen (Cent. f. Bakt., I Abt., Orig., *76*, 1915, 111) studied the fermentation reactions of Sand and Jensen's organism. Review of early literature given by Brocq-Rousseau, Forgeot and Urbain (Le streptocoque gourmeux. Revue de Pathologie Comparée et d'Hygiene Générale, Paris, 1925).

Ovoid or spherical cells: 0.6 to 1 micron in diameter, sometimes in pus the long axis of the cells are transverse to the chain, and sometimes in the axis of the chain resembling streptobacilli; bacillary forms are not rare; occur in pairs, short or long chains; very long chains common in broth cultures. Capsules often marked in blood of infected mouse and when grown in serum. Gram-positive.

Gelatin stab: Growth uncertain. No liquefaction.

Nutrient agar: Primary aerobic cultures from pus occasionally fail; growth is poor; small, convex, transparent colonies. Confluent growth is thin, grayish-white or yellowish and more abundant in the condensation water. Growth is increased particularly by horse protein.

Broth: Poor growth even in infusion broth; growth increased by serum (Evans, Jour. Bact., *32*, 1936, 541).

Litmus milk: No change. Not curdled and litmus not reduced.

Acid from glucose, maltose, sucrose and salicin. No acid from arabinose, lactose, trehalose, raffinose, inulin, glycerol, mannitol or sorbitol.

No hydrolysis of sodium hippurate.

Temperature relations: Optimum temperature 37°C. Growth slow at 20°C. No growth at 10°C or 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Does not tolerate 6.5 per cent NaCl; final pH in glucose broth 4.8 to 5.5. Methylene blue is not tolerated 0.01 per cent to 0.1 per cent. Inhibited by bile but not soluble.

Action on blood: On blood-agar, colonies are small and watery, dry out rapidly leaving flat glistening colony. Well-defined wide clear zone of hemolysis (beta hemolysis). Growth in serum broth gives a hemolysin active on horse corpuscles, less so on those of sheep and guinea pig.

Toxin: Subcutaneous injection causes necrosis, other evidence of toxin production is defective.

Fibrinolysin: Usually does not lyse human fibrin; some strains reported to do so.

Serology: A member of Lancefield's Group C (Jour. Exp. Med., *57*, 1933, 571); cross precipitation with Species No. 2 (animal pyogenes) of Edwards (Jour. Bact., *27*, 1934, 527). Cultures have been poor antigens for production of agglutinating serum and results have been unsatisfactory. Immunized rabbit serum may protect mice from infection, to which mice are very susceptible.

Pathogenicity high for white mice, low or no virulence for rabbits and guinea pigs.

Facultative anaerobe; growth in primary culture often better in depth of medium.

Source: Pus from lesions and mucous membrane of upper respiratory tract of horses. Evidence of occurrence in man is unconvincing.

Habitat: Found only in strangles in horses.

4. **Streptococcus equisimilis** Frost and Engelbrecht. (Human C, Ogura, Jour. Jap. Soc. Vet. Sci., *8*, 1929, 174; Edwards, Jour. Bact., *23*, 1932, 259; *ibid.*, *25*, 1933, 527; Sherman, Bact. Reviews, *1*, 1937, 35; Frost and Engelbrecht, A Revision of the Genus *Streptococcus*, privately published, 1936, 3 pp. and The Streptococci, 1940, 45.) From M. L., derived to mean similar to *equi*.

This species is apt to be confused with *Streptococcus equi* Sand and Jensen, but it is not as fastidious in its growth requirements and shows greater tolerance of methylene blue, lyses human fibrin and ferments glycerol and trehalose. It may or may not ferment lactose.

It is also apt to be confused with *Streptococcus pyogenes* Rosenbach except for its greater tolerance of methylene blue, glycerol fermentation and especially Lancefield's serological grouping (Jour. Exp. Med., *57*, 1933, 371).

Spheres: Gram-positive.

Gelatin: Not liquefied.

Litmus milk: Acid, may be curdled; litmus not reduced before curdling.

Acid from glucose, maltose, sucrose, trehalose and glycerol; may or may not form acid from lactose and salicin. No acid from arabinose, raffinose, inulin, mannitol or sorbitol.

No hydrolysis of sodium hippurate but may hydrolyze starch and esculin.

Ammonia is produced from peptone.

Temperature relations: No growth at 10°C and 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Does not tolerate 6.5 per cent NaCl. Final pH in glucose broth 5.4 to 4.6; no growth at pH 9.6. Methylene blue 0.1 per cent not tolerated, but Edwards (Kentucky Agr. Exp. Station Bull. 356, 1935; confirmed by Davis and Guzdar, Jour. Path. and Bact., *43*, 1936, 197) finds resistance to 0.000025 molar methylene blue in infusion-casein digest broth. Rarely grows on 40 per cent bile-blood agar.

Action on blood: Beta hemolysis.

Fibrinolysin: Dissolves human fibrin.

Serology: Lancefield (*loc. cit*) Group C.

Facultative anaerobe.

Source: Human nose and throat, vagina and skin; erysipelas and puerperal fever. Uncommon in domestic animals and usu-

ally associated with other streptococci (Edwards, *loc. cit*).

Habitat: Human upper respiratory tract and vagina.

Streptococcus dysgalactiae Diernhofer (Milchw. Forsch., *13*, 1932, 368), Group II Minett (Proc. 12th Internat. Vet. Cong., *2*, 1934, 511) and *Streptococcus pseudoagalactiae* Plastridge and Hartsell (Jour. Inf. Dis., *61*, 1931, 114) appear to be identical (Little, personal communication). Physiologically these organisms are like Human C types (*Streptococcus equisimilis* Frost and Engelbrecht) except that they are not hemolytic.

5. **Streptococcus agalactiae** Lehmann and Neumann. (Streptococcus de la mammite, Nocard and Mollereau, Ann. Inst. Past., *1*, 1887, 109; *Streptococcus nocardi* Trevisan, I generi e le specie delle Batteriacee, 1889, 36 (this name rightly has priority and is valid but has remained unused and it would seem unwise to adopt it in place of a name familiar by usage); *Streptococcus mastitis sporadicae* Guillebeau and *Streptococcus mastitis contagiosae* Guillebeau, Landw. Jahrb. d. Schweiz, *4*, 1892, 27; abst. in Cent. f. Bakt., *12*, 1892, 101; *Streptococcus agalactiae contagiosae* Kitt, Bakterienkunde, Wien, 1893, 322; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 126; *Streptococcus mastitidis* Migula, Syst. d. Bakt., *2*, 1900, 19.) From Greek, want of milk.

According to Hucker and Harrison (N. Y. Agr. Exp. Sta. Tech. Bul. 246, 1937, 9), *Streptococcus agalactiae* Lehmann and Neumann is identical with Group I of Minett, Stableforth and Edwards (Jour. Comp. Path. and Ther., *46*, 1933, 131) and Group A of Plastridge, Anderson, Brigham and Spaulding (Conn. (Storrs) Agr. Exp. Sta. Bul. 195, 1934).

Description largely taken from Hansen, N. Y. Agr. Exp. Sta. Tech. Bul. 232, 1935.

Spherical or ovoid cells: 0.4 to 1.2 microns in diameter, occurring in chains of seldom less than four cells and frequently very long; the longer axis of the cells may be in the axis of the chain or may be transverse to it. Chains may appear to be composed of paired cocci. Capsules(?). Gram-positive.

Gelatin stab: Gray, filiform growth. No liquefaction.

Nutrient agar: Small gray colonies.

Broth: Growth is variable in character; most frequently a sticky, flaky deposit which may adhere to the side of the tube but the supernatant fluid is clear; long chains are formed.

Starch broth: May produce yellow to orange sediment.

Litmus milk: Acid followed by curdling. Litmus reduced subsequent to curdling and proceeds from the bottom upwards. Little or no proteolysis.

Indole not formed.

Acid from glucose, maltose, galactose, fructose, lactose, sucrose, mannose, dextrin and trehalose and at times from salicin. No acid from arabinose, raffinose, inulin, xylose, mannitol, sorbitol or amygdalin. Slight amount of acid from glycerol.

Sodium hippurate is hydrolyzed. No hydrolysis of starch and esculin.

Nitrites not produced from nitrates.

Ammonia is produced from peptone.

Temperature relations: Optimum temperature 37°C. Range of growth tolerance between 15°C and 40°C. No growth at 10°C or 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Tolerates 2 per cent NaCl, variable tolerance of 4 per cent NaCl and does not tolerate 6.5 per cent NaCl. Final pH in glucose broth 4.2 to 4.6; no growth at pH 9.6. Methylene blue 0.01 per cent and 0.1 per cent not tolerated and not reduced.

Not soluble in bile and is not inhibited by 10 per cent and usually not by 40 per cent bile.

Action on blood: Variable; between ⅓ and ½ of the strains produce a narrow clear zone of hemolysis; certain strains described as producing greening. The hemolytic strains produce an oxygen-stable, filterable hemolysin.

Toxin: No evidence of an erythrogenic toxin.

Fibrinolysin: Does not dissolve human fibrin.

Serology: Group B of Lancefield (Jour. Exp. Med., *47*, 1933, 571). Three antigenic types have been separated which appear to be associated with the carbohydrate and not the protein fraction.

Facultative anaerobe.

Source: Isolated from milk and tissues from udders infected with mastitis. Occasionally reported from human sources (Lancefield, Jour. Exp. Med., *57*, 1933, 571; Hare, Jour. Path. Bact., *41*, 1935, 499).

Habitat: Udder of cattle with mastitis.

6. **Streptococcus salivarius** Andrewes and Horder. (Lancet, *2*, 1906, 712; *Streptococcus cardio-arthritidis* Small, Amer. Jour. Med. Sci., *173*, 1927, 103.) From Latin *salivarius*, slimy, clammy; M. L., related to saliva.

Description based on studies by Safford, Sherman and Hodge, Jour. Bact., *33*, 1937, 263 and Sherman, Niven and Smiley, Jour. Bact., *45*, 1943, 249.

Spherical or ellipsoidal cells, 0.6 to 0.8 micron in diameter, usually in short chains. Long axis of cell lies in axis of chain. Cells are relatively large in liquid media, especially milk. Gram-positive.

Gelatin stab: Filiform growth. No liquefaction.

Plain nutrient agar: Colonies white, small, not more than 0.5 mm in diameter. Notwithstanding rather vigorous growth on artificial culture media, cultures die out readily.

Nutrient agar containing 5 per cent sucrose or raffinose produces a large, clear, soft, mucoid colony about the diameter of those produced by coliform bacteria and yeasts. This is quite distinctive as no other known species of streptococcus (except occasional strains of *Streptococcus bovis*) produce colonies of this type on sucrose or raffinose agar. The polysaccharide produced is a soluble levan, some strains producing in addition a smaller amount of insoluble dextran (the polysaccharide in the *Streptococcus bovis* colonies is a dextran).

Action on blood agar: Indifferent (gamma hemolysis of Brown, Rockefeller Inst. Med. Res., Monograph 9, 1919, 8). No soluble toxin and no hemolysin has been demonstrated

Broth: Variable. Loose, flocculent deposit with clear supernatant fluid and long chains, or uniform or granular turbidity with small deposit and short chains. No pellicle.

Litmus milk: Acidified and curdled promptly by all lactose-fermenting strains. Completely reduced but only after curdling. No digestion.

Potato: Slight growth. Difficult to detect.

Acid from glucose, maltose, sucrose, raffinose, inulin and salicin. No acid from glycerol, mannitol, sorbitol, arabinose or xylose. Trehalose and lactose usually fermented.

No hydrolysis of sodium hippurate and arginine. Splits esculin. Starch is not hydrolyzed.

Ammonia is not produced from peptone.

Chemical tolerance: Tolerates 2 per cent but not 4 per cent NaCl. Final pH in glucose broth between 4.4 and 4.0. No growth at pH 9.6. Methylene blue 0.01 per cent and 0.1 per cent not tolerated. Not soluble in bile but inhibited by 30 per cent bile in blood agar.

Catalase not produced.

Temperature relations: Optimum growth 37° to 43°C. Growth at 45°C. No growth at 47°C. No growth at 10°C. Does not survive 60°C for 30 minutes.

Facultative anaerobe.

Serology: No group antigen has been demonstrated. Contains several serological types.

Source: Saliva and sputum in various pulmonary infections, apical abscesses of teeth, carious lesions of teeth, intestinal tract.

Habitat: Human mouth, throat and nasopharynx.

7. **Streptococcus mitis** Andrewes and Horder. (Lancet, *2*, 1906, 712.) From Latin *mitis*, mild.

Synonyms: *Streptococcus mitior* seu *viridans* Schottmüller, Münch. med. Wchnschr., *50*, 1903, 849 (these names refer to a group of species and they are therefore confused in meaning in medical literature. See Winslow and Winslow, The Systematic Relationships of the Coccaceae. New York, 1908, and Safford, Sherman and Hodge, Jour. Bact., *33*, 1937, 263). The name *Streptococcus mitis* was first proposed by Fränkel (Münch. med. Wchnschr., *52*, 1904, 548 and 1868). Because others have used this name with varied meanings (*Streptococcus mitis* seu *viridans* von Lingelsheim, in Kolle and Wassermann, Handb. d. path. Mikroorg., 2 Aufl., *4*, 1912, 453; *Streptococcus mitis* Holman, Jour. Med. Res., *34*, 1916, 377), the more definite emendation of Andrewes and Horder has been used as the basis of the description given here. The relationships of these organisms has been discussed by Brown, Rockefeller Inst. Med. Res., Monograph No. 9, 1919, 86.

Description based on studies by Safford, Sherman and Hodge (*loc. cit.*) and Sherman, Niven and Smiley, Jour. Bact., *45*, 1943, 249.

Spherical or ellipsoidal cells, 0.6 to 0.8 micron in diameter. Long axis of cell lies in axis of chain. Cells not especially large in liquid media including milk. No capsules. Gram-positive.

Gelatin stab: Filiform growth. No liquefaction.

Nutrient agar: Growth increased when serum or blood is added. Confluent growth, gray and abundant.

Action on blood agar: The colonies are surrounded by a characteristic greening (alpha hemolysis of Brown, Rockefeller Inst. Med. Res., Monograph 9, 1919, 8). This is weak with some strains and is variable under anaerobic conditions. No soluble toxin and no hemolysin has been demonstrated.

Broth: Variable. Loose, flocculent deposit with clear supernatant fluid and long chains, or granular turbidity with small deposit and short chains. No pellicle.

Litmus milk: Usually acidified and curdled promptly; litmus is completely reduced but only after curdling; no digestion.

Potato: Slight growth which is difficult to detect.

Acid from glucose, maltose, lactose, sucrose and usually salicin. Variable fermentation of raffinose. No acid from inulin, mannitol, sorbitol, glycerol, arabinose or xylose. Trehalose rarely fermented.

No hydrolysis of sodium hippurate and usually no hydrolysis of arginine. Action on esculin usually negative.

Usually ammonia is not produced from peptone.

Chemical tolerance: Tolerates 2 per cent but not 4 per cent NaCl. Final pH in glucose broth 5.8 to 4.2, ave. 4.5. No growth at pH 9.6. Methylene blue 0.01 per cent and 0.1 per cent not tolerated. Not soluble in bile but inhibited by 30 per cent bile in blood agar.

Catalase not produced.

Temperature relations: Optimum growth 37° to 40°C. Many strains do not grow at 45°C. No growth at 10°C. Does not survive 60°C for 30 minutes.

Facultative anaerobe.

Serology: No group antigen has been demonstrated. Contains several serological types.

Source: Saliva and sputum in various pulmonary infections, pus from upper respiratory tract and sinuses, blood and various organs in sub-acute endocarditis.

Habitat: Human mouth, throat and nasopharynx.

8. **Streptococcus bovis** Orla-Jensen *emend.* Sherman. (Orla-Jensen, The Lactic Acid Bacteria, 1919, 137; Sherman, Bacteriological Reviews, *1*, 1937, 57.) From Latin *bos*, cow.

The majority of the strains of *Strepto-*

coccus inulinaceus may be considered as identical with *Streptococcus bovis* as described here. The so-called Bargen streptococcus (Bargen, Jour. Amer. Med. Assn., *83*, 1924, 332; Arch. Int. Med., *45*, 1930, 559) is also considered to be *Streptococcus bovis*.

Spheres: Occurring in pairs and chains. Capsulated in milk. Gram-positive.

Gelatin stab: No liquefaction.

Litmus milk: Acid, curdled in 3 to 5 days, followed by reduction of the litmus.

Acid from glucose, fructose, mannose, galactose, maltose, lactose, sucrose, raffinose and salicin; sometimes from mannitol, sorbitol, inulin, arabinose and trehalose. Not from glycerol.

Starch is hydrolyzed by typical strains but not by variety *inulinaceus*. Esculin is hydrolyzed but not sodium hippurate.

Nitrites not produced from nitrates.

Ammonia not produced from 4 per cent peptone.

Temperature relations: Optimum temperature 35°C. When freshly isolated, maximum 45°C. No growth at 22°C or below. Survives 60°C for 30 minutes, but not 65°C.

Chemical tolerance: 2 per cent NaCl growth, 4 per cent NaCl no growth, 6.5 per cent NaCl no growth. Final pH in glucose broth 4.5 to 4.0. No growth at pH 9.6. May tolerate 0.01 per cent methylene blue but not 0.1 per cent. Tolerant of bile and not soluble.

Action on blood: Not hemolytic; the changes exhibited vary from greening (alpha) to no observable change (gamma).

Soluble hemolysin: Absent.

Toxin: Absent.

Serology: Some cross reaction with Lancefield Group D (Sherman, Jour. Bact., *35*, 1938, 81).

Facultative anaerobe.

Distinctive characters: Greening or no change in blood; a higher maximum temperature of growth than *Streptococcus salivarius* and distinctly higher thermal resistance (60°C for 30 minutes); hydrolysis of starch and usually ferments arabinose and sometimes mannitol.

Source: Saliva, feces and intestinal contents of cattle; milk of cows; sometimes abundantly present in human feces (Bargen's coccus) in health and disease. The variety *inulinaceus* is sometimes abundant in the bovine throat.

Habitat: Bovine mouth and alimentary tract where it is the predominating streptococcus.

9. **Streptococcus thermophilus** Orla-Jensen. (Maelkeri-Bacteriologi, 1916, 37; The Lactic Acid Bacteria, 1919, 136.) From Greek *thermus*, heat; *philus*, loving.

Spheres: 0.7 to 0.9 micron, with pointed ends, occurring singly and in short chains. Gram-positive.

Gelatin stab: No liquefaction.

Nutrient agar: Small, pin-point, gray, circular colonies. In streak cultures growth is scanty, beaded and gray. Fastidious in nutritive requirements needing appropriate carbohydrates added to peptone-infusion media (especially lactose and sucrose). Viability on laboratory media low.

Broth: Fine granular sediment; usually in very long chains, especially at 45°C.

Litmus milk: Acid, curdled, followed by partial reduction of the litmus.

Acid from glucose, fructose, lactose, and sucrose; seldom ferments raffinose and arabinose. No acid from maltose, dextrin, inulin, glycerol, mannitol, sorbitol or salicin.

No hydrolysis of sodium hippurate or esculin. Starch may be hydrolyzed on a favorable medium.

Ammonia not formed from 4 per cent peptone.

Temperature relations: Optimum 40° to 50°C. Minimum 20°C. No growth at 53°C. Survives 60° and 65°C for 30 minutes. Thermal death point 72° to 74°C.

Chemical tolerance: Extremely sensitive to salt, no growth with 2 per cent, 4 per cent and 6.5 per cent NaCl. Final pH in glucose broth 4.5 to 4.0. No growth

at pH 9.6. Not tolerant of 0.01 per cent and 0.1 per cent methylene blue.

No action on blood.

Serology: No cross reaction with Lancefield Group D (Sherman, Jour. Bact., *35*, 1938, 81).

Facultative anaerobe.

Distinctive characters: High growth temperature (50°C) and heat resistance (60° to 65°C). Inability to ferment maltose and salicin. Inhibited by 2 per cent NaCl. Nutritive requirements in medium.

Source: Milk and milk products. Used as a starter in making Swiss cheese.

10. **Streptococcus equinus** Andrewes and Horder. (Lancet, *2*, 1906, 712.) From Latin *equinus*, of horses.

Spheres: Occurring in short chains; the chains are longer in broth than in milk and some cultures give extremely long chains in broth. Gram-positive.

Gelatin stab: Little or no growth at 20°C. Not liquefied.

Litmus milk: No visible change, grows poorly (with 2 per cent added glucose there is little reduction of litmus).

Acid from glucose, fructose, galactose, maltose and usually from sucrose and salicin; raffinose and inulin are seldom fermented; arabinose, xylose, lactose, mannitol and glycerol are not fermented. The salicin-negative strains correspond to *Streptococcus ignavus* Holman, Jour. Med. Res., *34*, (N. S. *29*), 1916, 377.

Starch is not hydrolyzed under ordinary conditions of test (poured plate); it may be hydrolyzed by streak cultures on a very favorable medium. Sodium hippurate is not split. Esculin is hydrolyzed slowly, failure in three days, becomes positive in seven.

Ammonia not produced from 4 per cent peptone.

Temperature relations: Minimum 21°C. Growth at 45°C, seldom at 47°C, and no growth at 48°C. Sometimes survives 60°C for 30 minutes.

Chemical tolerance: Growth in 2 per cent NaCl but not in 4 per cent and 6.5 per cent. Final pH in glucose broth 4.5 to 4.0; no growth at pH 9.6. Some strains tolerate 0.01 per cent but none tolerate 0.1 per cent methylene blue.

Action on blood: Greening (alpha on horse blood) varying to weak but definite. No hemolysis.

Serology unknown, but no cross reaction with Lancefield Group D (Sherman, Jour. Bact., *35*, 1938, 81).

Facultative anaerobe.

Distinctive characters: Minimum temperature of growth (20°C) and high maximum temperature of growth (47°C); poor growth in milk, even with added glucose; failure to ferment lactose.

Sources: Human and bovine feces; human mouth, urine and inflammatory exudates (pathogenicity not established). Andrewes and Horder (*loc. cit.*) failed to find it in feces of fox and stoat.

Habitat: Predominating organism in the intestine of horses.

11. **Streptococcus lactis** (Lister) Löhnis. (*Bacterium lactis* Lister, Quart. Jour. Micro. Sci., *13*, 1873, 380; *18*, 1878, 177; Löhnis, Cent. f. Bakt., II Abt., *22*, 1909, 553.) From Latin *lac*, milk.

The following organisms are generally regarded as identical with *Streptococcus lactis* Löhnis. See Breed, in Jordan and Falk, The Newer Knowledge of Bacteriology and Immunology, Chicago, 1928, 383.

Streptococcus acidi lactici Grotenfelt, Fortschr. d. Med., *7*, 1889, 121; *Micrococcus acidi paralactici* Nencki and Sieber, Monatschr. f. Chem., *10*, 1889, 532; Bacillus No. 19, Adametz, Landw. Jahrb., *18*, 1889, 227; Eine bestimmte Bacterienart, Günther and Thierfelder, Arch. f. Hyg., *25*, 1895, 164; *Bacillus acidi lactici* Esten, Storrs Agric. Exper. Sta. Conn., Ann. Rep. for 1896, 1897, 44 (not Milchsäurebacterium, Hueppe, Mitt. d. kais. Gesundheitsamte, *2*, 1884, 340, which is *Bacillus acidi lactici* Zopf, Die Spaltpilze, 3 Aufl., 1885, 87); *Bacterium güntheri* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 197; *Bacterium*

lactis acidi Leichmann, Cent. f. Bakt., II Abt., *2*, 1896, 777 (not *Bacterium lactis acidi* Marpmann, Ergänzungshefte Cent. f. allgem. Gesundheitspflege, *2*, 1886, 117); Der ovaler Coccus, Freudenreich, Cent. f. Bakt., II Abt., *1*, 1896, 168; *Bacillus lacticus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 356; *Bacterium lacticus* Chester, Del. Agr. Exp. Sta., 9th Ann. Rept., 1897, 88; *Bacillus acidi paralactici* Kozai, Ztschr. f. Hyg., *31*, 1899, 372; *Streptococcus paralacticus* Migula, Syst. d. Bakt., *2*, 1900, 18; *Bacterium lacticum* Migula, Syst. d. Bakt., *2*, 1900, 405; *Bacterium truncatum* Migula, Syst. d. Bakt., *2*, 1900, 407 (Bacillus No. 19 of Adametz; *Bacterium punctatum* Chester, Man. Determ. Bact., 1901, 147; not *Bacterium truncatum* Chester, *ibid.*, 157; not *Bacterium truncatum* Chester, *ibid.*, 195); *Streptococcus grotenfeltii* Chester, Manual Determ. Bact., 1901, 67; *Lactococcus lactis* Beijerinck, Arch. Neérl. d. Sci. Exact. et Nat., Sér. II, *7*, 1901, 213; *Streptococcus lacticus* Kruse, Cent. f. Bakt., I Abt., Orig., *34*, 1903, 737; *Streptococcus güntheri* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 242; *Bacillus lactis acidi* Sewerin, Cent. f. Bakt., II Abt., *22*, 1908, 8 (not *Bacillus lactis acidi* Marpmann, *loc. cit.*, 120, nor Leichmann, *loc. cit.*, 778); *Bacterium leichmanni* Wolff, Cent. f. Bakt., II Abt., *24*, 1909, 57.

Spheres: Many cells elongated in direction of chain; 0.5 to 1 micron; mostly pairs and short chains, with some cultures long chains. Gram-positive.

Gelatin stab: Filiform to beaded growth. No liquefaction.

Nutrient agar colonies: Small, round or oval, gray, entire, slightly raised. Streak culture tends to remain as definite colonies throughout, confluent in parts.

Glucose broth: Turbidity and later sediment.

Potato: No visible growth.

Litmus milk: Acid; complete reduction of litmus before curdling. Young cultures entirely reduced with narrow red band at top which widens with ageing. No digestion and no gas produced, but whey may be expressed.

Acid from glucose, maltose and lactose; variable in arabinose, xylose, maltose, sucrose, mannitol and salicin. No acid from raffinose, inulin, glycerol or sorbitol. Occasional strains have been noted which fail to ferment lactose (Yawger and Sherman, Jour. Dairy Sci., *20*, 1937, 83) and others which do ferment raffinose (Orla-Jensen and Hansen, Cent. f. Bakt., II Abt., *86*, 1932, 6).

Starch not hydrolyzed. Sodium hippurate may be hydrolyzed and esculin is split.

Ammonia is produced from 4 per cent peptone.

Temperature relations: No growth at 45°C. Some strains survive 60°C for 30 minutes.

Chemical tolerance: Growth with 2 per cent and 4 per cent NaCl but not with 6.5 per cent. Final pH in broth 4.5 to 4.0. No growth at pH 9.6 but grows at pH 9.2. Tolerates both 0.01 per cent, 0.1 per cent and 0.3 per cent methylene blue. Bile neither lyses nor inhibits growth.

Action on blood: No hemolysis; may show greening or no action.

Serology: Sherman, Smiley and Niven (Jour. Dairy Sci., *23*, 1940, 529) have produced a species-specific group serum for this species. Shattock and Mattick (Jour. Hyg., *43*, 1943, 173) have designated this group as Group N. The above authors are in agreement in feeling that their studies indicate a close serological relationship between *Streptococcus lactis* and *Streptococcus cremoris*. Toxin not known.

Facultative anaerobe.

Distinctive characters: Growth at 10°C or below and at 40°C but not at 45°C; rapid complete reduction of litmus before curdling milk; growth in presence of 4 per cent but not 6.5 per cent NaCl; ammonia produced from peptone; no growth at pH 9.6 but grows at pH 9.2.

Source: Isolated from milk by Lister (*loc. cit.*). Milk and milk products.

Habitat: Not in the udder of cows. Plants may be natural habitat (Stark and Sherman, Jour. Bact., *30*, 1935, 639).

NOTE: The following may be regarded as varieties of *Streptococcus lactis:* (1) *Streptococcus lactis* var. *maltigenes* Hammer and Cordes, Iowa Agr. Exp. Sta. Res. Bull. 68, 1921; (2) *Streptococcus lactis* var. *anoxyphilus* Hammer and Baker, Iowa Agr. Exp. Sta. Res. Bull. 99, 1926; (3) *Streptococcus lactis* var. *tardus* Hammer and Baker, *ibid.* Also (4) *Streptococcus amylolactis*, (5) *Streptococcus raffinolactis* and (6) *Streptococcus saccharolactis* Orla-Jensen and Hansen, Cent. f. Bakt., II Abt., *86*, 1932, 6.

12. **Streptococcus cremoris** Orla-Jensen. (The Lactic Acid Bacteria, 1919, 132.) From Latin *cremor*, thick juice; M. L., cream.

Synonyms: ? *Streptococcus hollandicus* Wiegmann, in Kramer, Die Bakteriologie in ihren Beziehungen zur Landwirtschaft und den Landw. Technischen Gewerben, Wien, 1890; *Streptococcus lactis B*, Ayers, Johnson and Mudge, Jour. Inf. Dis., *34*, 1934, 29.

Spheres: 0.6 to 0.7 micron (often larger than *Streptococcus lactis*); forming long chains, especially in milk, some cultures in pairs. Gram-positive.

Gelatin stab: No liquefaction.

Litmus milk: Acid; complete reduction of litmus before curdling with red line at top broadening with age; clot separates with no digestion of casein; milk becomes slimy.

Acid from glucose and lactose; may ferment maltose, salicin and rarely sucrose, raffinose and mannitol. Arabinose, xylose, sorbitol, inulin and glycerol are not fermented.

No hydrolysis of starch and sodium hippurate but sometimes esculin.

Ammonia not produced from 4 per cent peptone.

Temperature relations: Optimum below 30°C. Minimum 10°C. Maximum 37°C. May survive 60°C for 30 minutes. Thermal death point 65°C to 70°C.

Chemical tolerance: Grows with 2 per cent but not with 4 per cent and 6.5 per cent NaCl. Final pH in glucose broth 4.6 to 4.0. No growth at pH 9.6 and 9.2. Tolerates 0.01 per cent and sometimes 0.1 and seldom 0.3 per cent methylene blue.

Action on blood: No hemolysis.

Facultative anaerobe.

Distinctive characters: Inability to grow at 40°C; reduction of litmus before curdling milk; no growth in the presence of 4 per cent NaCl and at pH 9.2; does not grow well on artificial media.

Source: Raw milk and milk products; commercial starters in butter and cheese factories. Not known from human and animal sources.

The following may be regarded as varieties of *Streptococcus cremoris:* (1) *Streptococcus lactis* var. *hollandicus* Buchanan and Hammer, Iowa Agr. Exp. Sta. Res. Bull. 22, 1915; (2) *Streptococcus mannitocremoris* Orla-Jensen and Hansen, Cent. f. Bakt., II Abt., *86*, 1932, 6.

13. **Streptococcus faecalis** Andrewes and Horder. (*Micrococcus ovalis* Escherich, Die Darmbakterien, Stuttgart, 1886, 89; Entérocoque, Thiercelin, Compt. rend. Soc. Biol., Paris, *54*, 1902, 1082; *Enterococcus proteiformis* Thiercelin and Jouhaud, Compt. rend. Soc. Biol., Paris, *55*, 1903, 686; Andrewes and Horder, Lancet, *2*, 1906, 708; *Streptococcus faecium* and *Streptococcus glycerinaceus* Orla-Jensen, The Lactic Acid Bacteria, 1919, 139 and 140; *Diplococcus enterococcus* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 18; *Streptococcus ovalis* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 209 and 230; *Streptococcus proteiformis* Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 520.) From Latin *faex*, dregs, residue; M. L., feces, excrement; M. L. *faecalis*, fecal.

Escherich reclassified his *Micrococcus*

ovalis (*loc. cit.*) as a streptococcus in Jahrb. f. Kinderheilk., *49*, 1899, 161.

According to Gorini (Le Lait, *6*, 1936, 81) his term *Gastrococcus* is a synonym of *Enterococcus* Thiercelin (*loc. cit.*), *Micrococcus ovalis* Escherich (*loc. cit.*) and *Streptococcus faecalis* Andrewes and Horder (*loc. cit.*).

Spheres, ovals, of variable size (often large), usually occurring in pairs and sometimes short chains in fluid media. Gram-positive.

Gelatin stab: Filiform growth. No liquefaction.

Nutrient agar: Small, round, raised, milky colonies. Streak culture fairly abundant and confluent.

Broth: Turbid, clearing later with abundant sediment.

Potato: No visible growth.

Litmus milk: Acid, usually reduction of litmus before curdling; no digestion of clot.

Acid from glucose, maltose, lactose, salicin and almost always mannitol; may or may not ferment arabinose, sucrose, raffinose, glycerol, sorbitol. Inulin is seldom fermented.

Starch not hydrolyzed; sodium hippurate may be and esculin is hydrolyzed.

Ammonia is produced from 4 per cent peptone.

Temperature relations: Optimum 37°C. May grow at 5°C and below. Grows at 10°C and 45°C, seldom grows at 50°C. Survives 62.8°C for 30 minutes.

Chemical tolerance: Tolerates 2 per cent, 4 per cent and 6.5 per cent NaCl. Final pH in glucose broth 4.4 to 4.0. Grows at pH 9.6. Tolerates 0.01 per cent and 0.1 per cent methylene blue. Bile does not lyse or inhibit growth.

Action on blood: Usually greening; sometimes no change.

Toxin unknown.

Serology: Lancefield's Group D (Sherman, Jour. Bact., *35*, 1938, 81).

Facultative anaerobe.

Distinctive characters: Growth at 10°C and 45°C; survives 60°C for 30 minutes; reduction of litmus before curdling milk; growth at pH 9.6, in the presence of 6.5 per cent NaCl, and 0.1 per cent methylene blue; not hemolytic and does not liquefy gelatin.

Source: Human feces and intestinal contents; inflammatory exudates; blood stream in subacute endocarditis; European foul-brood of bees; milk and milk products, especially cheese; garden plants.

Habitat: Human intestine, milk and milk products.

14. **Streptococcus liquefaciens** Sternberg *emend.* Orla-Jensen. (Sternberg, Manual of Bacteriology, 1893, 613; Orla-Jensen, The Lactic Acid Bacteria, 1919, 142). From Latin *liquefaciens*, liquefying.

Synonyms: *Micrococcus casei amari* Freudenreich, Landw. Jahrb. d. Schweiz, *8*, 1894, 136; *Streptococcus apis* Maassen, Arb. Biol. Abt. f. Land- u. Forstwirtsch. a.d.k. Gesundheitsamte, *6*, 1908, 53 (as shown by Hucker, N. Y. Agr. Exp. Sta. Tech. Bull. 143, 1928, 40 and 190, 1932, 17); *Bacillus güntheri* Cowan, British Bee-Keepers Guide Book, 20th ed., London, 1911, 171; *Streptococcus coli gracilis* Escherich, Die Darmbakterien des Säuglings und ihre Beziehungen zur Physiologie der Verdauung, 1886, 77 (*Streptococcus gracilis* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 118).

As explained by Hucker (N. Y. Agr. Exp. Sta. Tech. Bull. 144, 1928, 6), some of the acid proteolytic cocci first described by Gorini in 1902 (*loc. cit.*) are gelatin-liquefying streptococci identical with *Streptococcus liquefaciens*. Also see Long and Hammer, Iowa Agr. Exp. Sta. Res. Bull. 206, 1936, 219. The following names have been used for these streptococci: Bactéries productrices d'acide et de présure, Gorini, Rev. gén. du Lait, *1*, 1902, 173; *Micrococcus casei liquefaciens* Orla-Jensen, Cent. f. Bakt., II Abt., *13*, 1904, 430; *Micrococcus casei acido-proteolyticus I* (liquefies gelatin) and *Micro-*

coccus casei acido-proteolyticus II (does not liquefy gelatin) Gorini, Rev. gén. du Lait, *8*, 1910, 337 (*Micrococcus casei proteolyticus I* and *II* Gorini, Rend. Accad. Lincei, Ser. 5, *19*, 1910, II Sem., 150); *Coccus acido-proteolyticus casei I* and *Coccus acido-proteolyticus casei II* Gorini, Rev. gén. du Lait, *9*, 1912, 97. The terms *Mammococcus* and *Caseococcus* have also been used for these cocci by Gorini, Le Lait, *6*, 1926, 81; *Mammococcus acidoproteolyticus* Gorini, Act. P. Accad. Sci. Nov. Lync., Vatican City, *88*, I Sess., 1934, 42.

Spheres: Usually in pairs, sometimes short chains. Gram-positive.

Gelatin stab: Liquefaction and profuse growth; liquefaction fails in occasional variants but these are nevertheless Lancefield group D and have the other characters of the species. (See Sherman, Stark and Mauer, Jour. Bact., *33*, 1937, 492.)

Litmus milk: Acid; curdled and peptonized; the litmus is reduced completely before acidulation and curdling; caseolysis fails in variants not liquefying gelatin (Sherman, Stark and Mauer, *loc. cit.*, 486). Gives milk bitter taste.

Acid from glucose, maltose, sucrose, lactose, trehalose, mannitol, sorbitol, salicin and glycerol (rare failure from sucrose and glycerol); variable fermentation of arabinose and raffinose. Inulin not fermented.

Starch not hydrolyzed, sodium hippurate may be and esculin is hydrolyzed.

Ammonia is produced from 4 per cent peptone.

Temperature relations: Growth at 10°C and 45°C, occasional growth at 50°C. Survives 60°C and 62.8°C for 30 minutes.

Chemical tolerance: Tolerates 2, 4 and 6.5 per cent NaCl; final pH in glucose broth 4.5 to 4.0; growth at pH 9.6; tolerates 0.01 per cent and 0.1 per cent methylene blue. Bile tolerant.

Action on blood: No change or greening (alpha). Human fibrin not lysed.

Serology: Lancefield Group D (Sherman, Jour. Bact., *35*, 1938, 81).

Facultative anaerobe.

Distinctive characters: Growth at 10°C and 45°C; resistance to 60°C; growth in presence of 6.5 per cent NaCl, 0.1 per cent methylene blue and at pH 9.6. Ammonia produced from peptone. Strong reduction of litmus before acidulation of milk, which is afterwards curdled and peptonized; gelatin is liquefied; marked proteolysis. Low final pH in glucose broth. Fermentation of glycerol and mannitol.

Source: Originally isolated by Sternberg from a cadaver. Dairy and other food products. Foul brood of bees. Plants, feces, human vagina, blood in subacute endocarditis.

Habitat: Human and animal intestine.

15. **Streptococcus zymogenes** (MacCallum and Hastings) Holland. (*Micrococcus zymogenes* MacCallum and Hastings, Jour. Exp. Med., *4*, 1899, 521; Holland, Jour. Bact., *5*, 1920, 226; *Staphylococcus zymogenes* Ford, Textb. of Bact., 1927, 425.) From Greek *zyme*, ferment and *-genes*, producing.

This species shows the same characteristics as *Streptococcus liquefaciens* except as given below. The two species have sometimes been regarded as identical (Bergey et al., Manual, 3rd ed., 1930, 59).

Gelatin stab: May or may not liquefy gelatin. Otherwise as in *Streptococcus liquefaciens*.

Action on blood: Beta hemolytic.

Source: Originally isolated from an acute case of endocarditis.

Habitat: Human and animal intestine.

16. **Streptococcus durans** Sherman and Wing. (*Streptococcus hemothermophilus* Sherman and Wing, Jour. Dairy Sci., *18*, 1935, 657; original name withdrawn by Sherman and Wing, Jour. Dairy Sci., *20*, 1937, 165.) From Latin *durans*, resisting.

Spheres: Occurring in pairs and short chains, more rarely in long chains. Gram-positive.

Gelatin stab: No liquefaction.

Litmus milk: Acid; curdled, followed by reduction of litmus.

Acid from glucose, maltose, lactose, and usually salicin and trehalose. Raffinose, inulin, sorbitol, arabinose, glycerol not fermented and mannitol and sucrose rarely fermented.

Starch not hydrolyzed. Sodium hippurate and esculin are hydrolyzed.

Ammonia is produced from 4 per cent peptone.

Temperature relations: Growth at 10°C. Maximum 50°C. Survives heating for 30 minutes at 62.8°C and usually 65.6°C.

Chemical tolerance: Growth with 2 per cent, 4 per cent and 6.5 per cent NaCl. Final pH in glucose broth 4.5 to 4.0. Growth at pH 9.6. Tolerates 0.01 per cent and 0.1 per cent methylene blue.

Action on blood: Active hemolysis of beta type (horse, human and rabbit blood); persistent after 5 years culture on media without blood.

Toxin unknown. Non-pathogenic for mice, rabbits and guinea pigs.

Serology: Lancefield's Group D (Sherman, Jour. Bact., *35*, 1938, 81).

Facultative anaerobe.

Distinctive characters: Growth at 10°C and 45°C; beta hemolysis; failure to ferment sucrose and mannitol; resistance to 60°C for 30 minutes; tolerance of 0.1 per cent methylene blue and 6.5 per cent NaCl.

Source: Forty strains were isolated from spray process milk powder.

Habitat: Human intestine; milk and milk products.

*17. **Streptococcus anaerobius** Krönig *emend.* Natvig. (Krönig, Zent. f. Gyn., 1895; Natvig, Arch. f. Gyn., 1905, 76.) From Greek *an*, without; *aër*, air; *bios*, life; M. L., anaerobic.

Heurlin (Bakt. Unters. d. Keimgehaltses im Genitalkanale d. fiebernden Wöchnerinnen. Helsingfors, 1910, 122–127) recognizes the following varieties of *Streptococcus anaerobius*: *S. anaerobius vulgaris*, *S. anaerobius* typ. *vulgaris*, *S. anaerobius gonoides*, *S. anaerobius* (Wegelius No. 28), *S. anaerobius micros* (Lewkowicz), and *S. anaerobius carduus*.

Description according to Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 180.

Spheres: Average size 0.8 micron, occurring in chains. Non-motile. Gram-positive.

Gelatin: No liquefaction.

Semi-solid agar (Veillon): After 48 hours colonies 1 to 2 mm in diameter, very regular, lenticular. Gas produced. Agar slightly acidified.

Martin broth: Rapid growth. No turbidity. Sediment in 24 hours. Medium slightly acidified. Feeble production of gas. Slight fetid odor.

Martin glucose broth: Very abundant growth. Gas fetid, inflammable, no H_2S. Very marked acidification.

Peptone water: Abundant flocculent growth. Gas produced at expense of peptone. Medium not acidified. Neither indole nor H_2S produced.

Meat and liver broth: Very abundant growth. Much gas produced which contains CO_2 and H_2.

Milk: No acid. No coagulation.

Cooked protein (egg white, meat, liver, fibrin and serum) not attacked. Fresh fibrin and fresh organs partially disintegrated with blackening, abundant gas, very fetid odor due in part to H_2S.

Serum broth: Abundant gas and fetid odor.

Neutral red broth: Changed to fluorescent yellow.

Acid from glucose, fructose, galactose, sucrose and maltose. Mannitol and arabinose sometimes fermented.

Optimum pH 6.0 to 8.0.

Temperature relations: Optimum 36° to 38°C. Grows at 26°C, but not below 22°C. Survives 5 minutes at 60°C or two minutes at 80°C. Killed in ten minutes at 80°C.

Pathogenic.

Strict anaerobe.

Distinctive characters: Very peptolytic; gas produced in peptone water with destruction of the peptone. Differs from

* See footnotes, p. 308. Reviewed by Dr. Ivan C. Hall.

Streptococcus foetidus by being morphologically like a typical streptococcus. Differs from *Streptococcus putridus* by its physiology, bread crumb-like growth, and the production of gas in all media.

Source: Isolated in cases of putrefactive gangrene; war wounds; uterus, lochia and blood in puerperal infections; appendicitis; pleurisy; and amniotic fluid.

Habitat: Mouth and intestines. Cavities of man and animals, especially the vagina. Can invade all tissues.

18. **Streptococcus foetidus** (Veillon) Prévot. (*Micrococcus foetidus* Veillon, Compt. rend. Soc. Biol. Paris, *45*, 1893, 867; not *Streptococcus foetidus* Migula, Syst. d. Bakt., *2*, 1900, 38; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 189.) From Latin *foetidus* (better *fetidus*), stinking.

Large spheres: 0.8 to 1.0 micron, occurring normally in short chains, also in tetrads, double or zig-zag chains. Non-motile. Gram-positive.

Gelatin: No liquefaction.

Semi-solid agar (Veillon): Slow growth. At first punctiform; small colonies ¼ to ½ mm in diameter, growing 1 to 2 cm below the surface, regular, thick, lenticular, opaque. Gas bubbles produced.

Blood agar: Small brownish hemopeptic zone around the colonies. No true hemolysis.

Martin broth: Poor growth. No turbidity. Flakes form on wall of tube, but rapidly settle to the bottom. Little or no gas. Very faint fetid odor.

Martin glucose broth: Good growth. No turbidity. Gas fetid, inflammable.

Meat and liver broth: Rapid, abundant growth. Abundant gas. Strong fetid odor.

Milk: No acid. No coagulation.

Peptone water: Gas production feeble. Indole not formed.

Neutral red broth changed to fluorescent yellow.

Fresh organs become green, then blacken. Much gas produced containing H_2S, later the organs are gradually disintegrated; partial bioproteolysis and H_2S fermentation.

Cooked protein not attacked.

Acid and gas from glucose, fructose, galactose and sucrose. No acid from lactose, maltose, arabinose, glycerol, mannitol, dulcitol or starch.

Temperature relations: Optimum 36° to 38°C. Feeble growth at 26°C. No growth below 22°C. Killed in one hour at 60°C or in ten minutes at 80°C.

Optimum pH 6.5 to 8.0.

Pathogenic for guinea pigs and mice.

Strict anaerobe.

Common in fetid suppurations and autogenous gangrenous processes.

Source: First isolated from a fatal case of Ludwig's angina. Perinephritic phlegmon; the fetid pus from Bartholin's gland; gangrene of the lung; appendicitis.

Habitat: Mouth, intestine and vagina of man and animals.

18a. *Streptococcus foetidus* var. *buccalis* Prévot. (Einen Micrococcus der Mundhöhle, Ozaki, Cent. f. Bakt., I Abt., Orig., *76*, 1915, 118; *Micrococcus buccalis* Bergey et al., Manual, 1st ed., 1923, 69; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 193.) From mouth.

19. **Streptococcus putridus** Schottmüller *emend.* Prévot. (Schottmüller, Mitteil. a. d. Grenzgeb. d. Med. Chirurg., *21*, 1910, 450; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 170, 184.) From Latin *putridus*, rotten, decayed.

Synonym: *Streptococcus putrificus* Schottmüller, Münch. med. Wochnschr., *68*, 1921, 662.

Spheres: Average size 0.8 micron, occurring in chains. Gram-positive.

Gelatin: No liquefaction.

Semi-solid agar (Veillon): More or less lenticular; colonies 1 to 2 mm in diameter. No gas produced.

Blood agar: A blackish-brown hemopeptic zone is produced around the colonies, with fetid gas (H_2S). Colonies become brownish, sometimes blackish.

Martin broth: In 6 to 8 hours uniform

turbidity which does not precipitate completely. No gas. Little odor.

Martin glucose broth: Rapid abundant growth. Uniform turbidity. Sediment. No gas. Slight fetid odor. Black pigment in the sediment.

Meat and liver broth: Very abundant growth, very marked putrid odor. Incomplete sedimentation.

Peptone water: Sparse growth. Neither gas, odor, H_2S nor indole.

Milk: No acid. No coagulation.

Cooked protein not attacked.

Deep blood agar: Agar is broken by the gas (H_2S).

Fresh blood broth: Abundant gas which contains a large amount of H_2S. Blood blackens rapidly, has typical putrid odor.

Fresh fibrin broth: The fibrin is broken up and partially digested.

Neutral red changed to fluorescent yellow.

Lead media blackened.

Acid from glucose, fructose and maltose. Acid sometimes produced from sucrose, mannitol and galactose.

Optimum pH 7.0 to 8.5.

Temperature relations: Optimum 36° to 38°C. Growth feeble at 28°C. No growth below 22°C. Killed in ten minutes at 80°C.

Pathogenic when grown in media with fresh tissue and body fluids.

Strict anaerobe.

Distinctive characters: Putrescence but absence of gas in ordinary media; presence of gas and H_2S in media with fresh tissue or body fluids.

Source: Normal and fetid lochia, blood in puerperal fever, gangrenous appendicitis, gangrene of the lung, in gas gangrene, gangrenous metastases; war wounds; osteomyelitis; and from amniotic fluid. Found in sea water by Montel and Mousseron (Paris Médical, 1929).

Habitat: Human mouth and intestine and especially the vagina.

20. Streptococcus lanceolatus Prévot. (*Coccus lanceolatus anaerobius* Tissier, Compt. rend. Soc. Biol. Paris, *94*, 1926, 447; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 173 and 193; not *Streptococcus lanceolatus pasteuri* nor *Streptococcus lanceolatus* Gamaleïa, Ann. Inst. Past., *2*, 1888, 440; not *Streptococcus lanceolatus* Saito, Arch. f. Hyg., *75*, 1912, 121.) Although Prévot's name is invalid, it is used until further comparative studies have been made. From Latin *lanceolatus*, having a little lance, pointed.

Large ovoid cells: 1.2 to 1.4 microns with pointed ends, occurring in short chains in culture and in pairs in exudates. Non-motile. Gram-positive.

Gelatin: No liquefaction.

Deep agar colonies: Very large, lenticular. Abundant gas produced which breaks up the medium.

Peptone broth: Uniform turbidity. Granular, glairy sediment.

Peptone water: Good growth. Gas produced.

Milk: No change.

Protein not attacked.

Hydrolyzed albumen reduced to CO_2, $(NH_4)_2CO_3$ and NH_3.

Acid from sucrose, glucose and starch. No acid from lactose. (Butyric, valerianic and acetic acid are produced, in the proportions 2:1:trace, from glucose and sucrose.)

Non-pathogenic for laboratory animals.

Optimum temperature 37°C.

Strict anaerobe.

Distinctive characters: Proteolytic and saccharolytic; produces ammonia from hydrolyzed proteins; butyric, valerianic and acetic acid produced from hexoses. No H_2S produced.

Source: From human feces in a case of diarrhoea.

Habitat: Putrefying materials.

21. Streptococcus micros Prévot. (*Streptococcus anaerobius micros* Lewkowicz, Arch. Méd. Exp., *13*, 1901, 645; Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 193; also see Weiss and Mercado, Jour. Inf. Dis., *62*, 1938, 181.) From Greek *micrus*, small (old spelling, *micros*).

Very small spheres: 0.2 to 0.4 micron, occurring in long chains or in pairs. Non-motile. Gram-positive.

Gelatin: Poor growth. No liquefaction.

Semi-solid agar (Veillon): Slow growth; colonies at first punctiform, becoming lenticular and later forming processes into the medium. Average size 0.5 to 1.0 mm in diameter, some reach 2 to 3 mm growing 2 or 3 cm below the surface.

Blood agar: No hemolysis. No hemopeptolysis.

Martin broth: Slight particulate turbidity which slowly settles.

Meat and liver broth: Rapid growth. Abundant sediment.

Peptone water: Powdery sediment. Medium not acidified. No indole formed.

Neutral red broth: Changed to fluorescent yellow.

Milk: Grows with difficulty. No acid. No coagulation.

Acid produced rapidly from glucose, fructose, galactose, sucrose and maltose. No acid from lactose, arabinose, glycerol, mannitol, inulin and starch.

Protein not attacked.

Optimum pH about 7.0.

Optimum temperature 36° to 38°C. No growth at 22°C. Killed in a quarter of an hour at 60°C.

Non-pathogenic for mice.

No toxin and no hemolysin.

Strict anaerobe.

Distinctive characters: Neither gas nor fetid odor produced. Small size.

Source: Gangrene of the lung; lochia and uterus in puerperal sepsis; appendicitis.

Habitat: Mouth and intestine of man and animals.

22. **Streptococcus parvulus** Weinberg, Nativelle and Prévot. (*Streptococcus parvulus non liquefaciens* Repaci, Compt. rend. Soc. Biol., Paris, *68*, 1910, 528; Weinberg, Nativelle and Prévot, Les Microbes Anaérobies, 1937, 1011; not *Streptococcus parvulus* Levinthal, Cent. f. Bakt., I Abt., Orig., *106*, 1928, 195.) From Latin *parvulus*, very small, minute.

Small spheres: Average size 0.3 to 0.4 micron, occurring in short chains, sometimes in pairs. Non-motile. Gram-positive.

Gelatin: At 37°C slow growth, culture at bottom of the tube; no gas. No liquefaction.

Deep glucose agar colonies: After 48 hours very tiny, lenticular, whitish. Old colonies become blackened. No gas produced.

Broth: Rapid turbidity. Sediment forms in 5 or 6 days as a whitish, mucous mass which clears the fluid. No gas. Faint disagreeable odor.

Indole not formed.

Milk: Coagulation in 24 hours.

Egg white not attacked.

Feebly attacks glucose and lactose. Does not attack sucrose, galactose and dextrin.

Optimum temperature 37°C. No growth at room temperature. Will grow at 41°C.

Strict anaerobe.

Distinctive characters: Differs from *Streptococcus micros* by its black colonies, coagulation of milk and its feeble saccharolytic power. Differs from *Streptococcus intermedius* by its black colonies, the smallness of its elements, feeble saccharolytic power and the viscous sediment in broth.

Source: Respiratory tract.

Habitat: Unknown.

Veillon and Repaci identified this organism as *Streptococcus micros*, but Weinberg, Nativelle and Prévot consider it as a distinct species, although rare.

23. **Streptococcus intermedius** Prévot. (Ann. Inst. Past., *39*, 1925, 439.) From Latin *intermedius*, intermediate.

Description taken in part from Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 197.

Spheres: 0.5 to 0.7 micron, very long chains in culture. Non-motile. Gram-positive.

Gelatin: Poor growth. No liquefaction.

Semi-solid agar (Veillon): After 24 hours colonies 1 to 2 mm in diameter, regular, lenticular; sometimes with complex processes.

Blood agar: No change or slight greening.

Martin broth: Rapid growth. Uniform turbidity which slowly settles.

Martin glucose broth: Abundant growth. Abundant sediment. Medium strongly acidified.

Peptone water: Particulate sediment.

Milk: Very acid. Coagulated in 24 hours, without retraction of clot and not peptonized.

Serum broth (1:2): Rapid growth. Coagulation by acidification.

Proteins not attacked.

Neutral red broth: Changed to fluorescent yellow.

Acid from glucose, fructose, galactose, maltose and lactose. Acid from sucrose by some strains. The acid produced is lactic acid. No acid from arabinose, glycerol, mannitol, dulcitol, inulin or starch.

Optimum pH 6.0 to 8.5.

Temperature relations: Optimum 36° to 38°C. Poor growth at 26°C. No growth below 22°C. Killed in half an-hour at 70°C or in ten minutes at 80°C.

Pathogenic for guinea pigs and mice, causing small abscesses; sometimes kills in 48 hours.

No toxin and no hemolysin.

Strict anaerobe.

Distinctive characters: Strongly acidifies media. Coagulates milk.

Source: Lochia and uterus in puerperal sepsis; gangrene of the lung; pleurisy; bronchiectasis; appendicitis.

Habitat: Human respiratory and digestive tracts and vagina.

24. Streptococcus evolutus Prévot. (*Streptococcus Sch.*, Gräf and Wittneben, Cent. f. Bakt., I Abt., Orig., *39*, 1925, 443; *Streptococcus Schwarzenbeck*, Ford, Textb. of Bact., 1927, 455; also see Weiss and Mercado, Jour. Inf. Dis., *62*, 1938, 181.) From Latin *evolutus*, unrolled.

Description taken in part from Prévot, Ann. Sci. Nat., Sér. Bot., *15*, 1933, 199.

Spheres: 0.7 to 1.0 micron, average 0.7 micron, occurring in pairs or in short and long chains. Pleomorphic. Often appear as short ovoid rods with rounded ends. Gram-positive.

Gelatin: Liquefaction.

Deep agar colonies: Lenticular or rosettes. Growth occurs about 1 cm beneath the surface; after a transfer the second generation may show a ring of growth in the middle of this sterile zone. This is the characteristic alternate zones appearance. Colonies usually become brownish with age.

Glucose broth: Abundant growth, resembling bread crumbs. Medium strongly acidified (pH 5). A small quantity of lactic acid produced.

Peptone broth: Rapid growth. No general turbidity. Precipitating flocculent growth on the wall of the tube.

Blood agar: No change, sometimes greening.

Peptone water: Flocculent growth. No turbidity. Indole not formed.

Litmus milk: Acid. Curdled in 24 hours, clot retracts and fragments. Slight peptonization with some strains.

Strongly acid in glucose, fructose, galactose, sucrose, lactose and maltose. Arabinose sometimes fermented.

Egg white not attacked.

Pathogenicity: Most strains not pathogenic, some produce slight local swelling subcutaneously with little pus in guinea pigs and mice.

Optimum pH 6.0 to 8.5.

Optimum temperature 36° to 38°C. No growth below 22°C.

Strict anaerobe at first, becoming facultative with subsequent transfers.

Viability short aerobically and several months anaerobically.

Distinctive characters: Growth in al-

ternate zones in agar. Strict anaerobe at first, later microaerophilic.

Source: Skin abscess; appendicitis.

Habitat: Respiratory tract, mouth, vagina.

Appendix I: Descriptions of poorly defined species, the taxonomic relationships of which are not clear.

1. **Streptococcus sp.** Long and Bliss. (Minute beta hemolytic streptococcus, Long and Bliss, Jour. Exp. Med., *60*, 1934, 619; Long, Bliss and Walcott, *ibid.*, 633.)

Minute cocci, half to two-thirds the size of *Streptococcus pyogenes*; occurring singly, in pairs, short chains and in small and large masses. Gram-positive, but may decolorize readily.

Blood agar: Very minute colonies 18 to 30 microns, surrounded by a marked area of hemolysis (beta), easily visible before the colony is seen by naked eye, 4 to 10 times the diameter of the colony. Under the microscope colonies are finely granular, may appear wrinkled and crenated. Colonies become visible after 48 to 96 hours incubation and relative area of hemolysis is 3 to 4 times diameter of colony.

Gelatin: Not liquefied.

Glucose broth: Growth diffuse, abundant.

Litmus milk: Not curdled; litmus not reduced.

Acid from glucose, maltose and sucrose; may or may not attack lactose, trehalose and salicin. No acid from arabinose, raffinose, inulin, glycerol, mannitol or sorbitol.

Does not hydrolyze sodium hippurate and starch. Esculin is hydrolyzed.

Ammonia is produced from peptone.

Temperature relations: No growth at 10°C, very rarely growth at 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Does not tolerate 6.5 per cent NaCl. Final pH in glucose broth 5.4 to 4.6; no growth at pH 9.6. Methylene blue 0.1 per cent not tolerated. No growth on 40 per cent bile-blood agar.

Action on blood: Hemolysis marked before colony is visible. May not produce soluble hemolysin by ordinary methods but does so abundantly by appropriate methods.

Fibrinolysin: No solution of human fibrin.

Serology: Constitutes Group F of Lancefield and Hare (Jour. Exp. Med., *61*, 1935, 335). Four serological types within the group (Bliss, Jour. Bact., *33*, 1937, 625).

Aerobe, facultative anaerobe.

Source: Human throat in health and disease, accessory sinuses, abscesses, vagina, skin and feces.

Habitat: Human upper respiratory tract.

2. **Streptococcus sp.** Long and Bliss. (Group II, Long and Bliss, Jour. Exp. Med., *60*, 1934, 633; Group G, Lancefield and Hare, Jour. Exp. Med., *61*, 1935, 346; Bliss, Jour. Bact., *33*, 1937, 625.)

Probably identical with *Streptococcus anginosus* Andrewes and Horder (Lancet, *2*, 1906, 712) but probably other serological types are included in this group (Sherman, Bacteriological Reviews, *1*, 1937, 40).

Spheres: Gram-positive.

Gelatin: Not liquefied.

Litmus milk: Acid, may be curdled, not reduced.

Acid from glucose, maltose, sucrose, trehalose and salicin; usually acid from lactose, and may or may not from raffinose and glycerol. No acid from arabinose, inulin, mannitol or sorbitol.

Sodium hippurate usually not hydrolyzed. May hydrolyze starch and esculin.

Ammonia is produced from peptone.

Temperature relations: No growth at 10°C and usually not at 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Does not tolerate 6.5 per cent NaCl. Final pH in glucose broth 6.0 to 4.6; no growth at pH 9.6. Methylene blue 0.1 per cent not tol-

erated. May grow on 40 per cent bile-blood agar, growth in 10 per cent bile.

Action on blood: Hemolytic (beta) with a wider zone than minute beta hemolytic streptococcus. Soluble hemolysin formed.

Fibrinolysis: May dissolve human fibrin, certain strains strongly, others weakly.

Serology: Constitutes Lancefield's and Hare's Group G. Bliss (*loc. cit.*) has shown serological Types I and II within the group. May include serological Type 16 of Griffith (Jour. Hyg., *34*, 1934, 542). Those resembling *Streptococcus anginosus* seem to form a homogeneous type; others seem unrelated to it.

Aerobic, facultative anaerobe.

Source: Human nose, throat, vagina, skin and feces in health. In human disease in puerperal fever with staphylococcus. Throat of normal domestic animals and in animal infections probably as secondary invaders.

Habitat: Human upper respiratory tract and vagina. Possibly throat of domestic animals.

3. **Streptococcus sp.** Brown, Frost and Shaw. (Jour. Inf. Dis., *38*, 1926, 381; Lancefield, Jour. Exp. Med., *57*, 1933, 571.)

Belongs to Lancefield Group E.

Gelatin: Not liquefied.

Litmus milk: Not curdled and not reduced.

Acid from glucose, lactose, trehalose and sorbitol; may form acid from sucrose, glycerol, mannitol and salicin. No acid from arabinose, raffinose or inulin.

No hydrolysis of sodium hippurate; may hydrolyze starch and esculin.

Ammonia is produced from peptone.

Temperature relations: No growth at 10°C and 45°C. Does not survive 60°C for 30 minutes.

Chemical tolerance: Does not tolerate 6.5 per cent NaCl. Final pH in glucose broth 4.8 to 4.2; no growth at pH 9.6. Methylene blue 0.1 per cent not tolerated and not reduced. No growth on 40 per cent bile-blood agar, nor on 10 per cent bile.

Action on blood: Very hemolytic; strains reported by Plastridge and Hartsell (Jour. Inf. Dis., *61*, 1937, 110) weakly hemolytic. Streptolysin produced and outstandingly acid stable (Todd, Jour. Path. and Bact., *39*, 1934, 299).

Fibrinolysin: No solution of human fibrin.

Serology: Lancefield Group E, some cross reaction with Group C.

Aerobe, facultative anaerobe.

Source: Certified milk; bovine udder.

Habitat: Probably in udder and dairy products.

4. **Streptococcus sp.** Hare. (Group H, Hare, Jour. Path. and Bact., *41*, 1935, 499.)

Spheres: Gram-positive.

Blood agar: Small colonies, 0.7 to 0.9 mm, smooth surface, greenish color tending to blacken, hard, almost gritty and adherent to the medium. Hemolysis seldom complete except on Brown's horse blood agar. On boiled blood agar definite greening and so different from Groups E, F and K.

Litmus milk: Not curdled and not reduced.

Acid from glucose, maltose, sucrose, raffinose and salicin; acid may be formed from lactose and trehalose. No acid from arabinose, inulin, glycerol, mannitol or sorbitol.

No hydrolysis of sodium hippurate and starch, but may hydrolyze esculin.

Ammonia may or may not be produced from peptone.

Temperature relations: No growth at 10°C. Growth at 45°C. May survive 60°C for 30 minutes.

Chemical tolerance: Does not tolerate 6.5 per cent NaCl. Final pH in glucose broth 5.0 to 4.5; no growth at pH 9.6. Methylene blue 0.1 per cent not tolerated. No growth on 40 per cent bile-blood agar.

Action on blood: Hemolysis incomplete

and some greening. No soluble hemolysin.

Fibrinolysin: No solution of human fibrin.

Serology: Group H.

Aerobe, facultative anaerobe.

Source: Human throat and feces.

Habitat: Human throat.

5. **Streptococcus sp.** Hare. (Group K, Hare, Jour. Path. and Bact., *41*, 1935, 499.)

Spheres: Gram-positive.

Blood agar: Colonies 0.8 to 1.3 mm, moist and transparent, with crenated edges. Incomplete hemolysis and no alpha-prime appearance.

Acid from glucose, lactose and salicin; may form acid from trehalose (doubtful). No acid from mannitol or sorbitol.

Does not hydrolyze sodium hippurate.

Chemical tolerance: Final pH in glucose broth 5.1 to 5.4. Does not grow on 10 per cent and 40 per cent bile-blood agar.

Action on blood: Incomplete hemolysis; does not produce soluble hemolysin. Doubtful if truly hemolytic streptococcus.

Fibrinolysin: Does not dissolve human fibrin.

Serology: Group K.

Aerobe, facultative anaerobe.

Source: Human throat.

Habitat: Human throat. No indication of relation to disease.

6. **Streptococcus acidominimus** Ayers and Mudge. (Ayers and Mudge, Jour. Inf. Dis., *31*, 1922, 40; *33*, 1923, 155.) From M. L., derived to mean a minimum amount of acid.

Description taken from Smith and Sherman, Jour. Inf. Dis., *65*, 1939, 301.

Spheres: Generally occur in short chains. Gram-positive.

Gelatin stab: Filiform, beaded growth. No liquefaction.

Plain nutrient agar: Small round white colonies.

Acid from glucose, lactose and sucrose. May form acid from maltose, trehalose, and mannitol. Sorbitol and salicin usually are not fermented. No acid from arabinose, xylose, raffinose, inulin and glycerol.

Sodium hippurate is hydrolyzed but not starch.

Carbon dioxide is produced from a 4 per cent peptone-infusion broth.

Litmus milk: Little or no visible change.

Ammonia is not produced from peptone.

Temperature relations: No growth at 10°C. A few cultures grow at 45°C. Do not survive 60°C for 30 minutes.

Chemical tolerance: No growth in .01 per cent methylene blue. Growth in 2 per cent but not in 6.5 per cent NaCl. Final pH in glucose broth 6.5 to 5.6. No growth at pH 9.6.

Action on blood: No hemolysis, slight greening (alpha).

Serology: Negative reaction with serums representing Lancefield groups A, B, C, D, E, F and G.

Facultative anaerobe.

Distinctive character: Small amount of acidity developed in fermentation tests.

Source: Originally 12 cultures were isolated from freshly drawn milk. Also found in bovine vagina, occasionally in the udder, and on the skin of calves.

Habitat: Known to occur abundantly in the bovine vagina.

The relationship between *Streptococcus uberis* Diernhofer and other similar streptococci is not yet entirely clear. Smith and Sherman (Jour. Inf. Dis., *65*, 1939, 301–305) at one time thought that *Streptococcus uberis* and *Streptococcus acidominimus* might be identical. Others have regarded *Streptococcus uberis* as identical with Group III, Minett (Proc. 12th Internat. Vet. Cong., *2*, 1934, 511).

Brown (Proc. 3rd Internat. Cong. for Microbiol., 1940, 173) describes a new species, *Streptococcus lentus* (not *Strep-*

tococcus lentus Lehmann, Deutsch. Arch. f. klin. Med., *150*, 1926, 144) which belongs to serological group E. He states that a few strains that produced the alpha appearance in blood agar corresponded culturally with *Streptococcus uberis*.

Later Sherman (personal communication) had an opportunity to determine the serological group of several cultures of *Streptococcus uberis* carefully identified by R. B. Little and found them to belong to Group D. While their characters were not exactly the same as the conventional *Streptococcus faecalis*, he feels that these cultures of *Streptococcus uberis* were only a variant type of *Streptococcus faecalis*.

Appendix II.* The following species of streptococci are listed chiefly because of their historical interest. In many cases the original cultures are lost and their exact taxonomic relationships have not been determined.

Bacterium acetylcholini Habs. (Cent. f. Bakt., II Abt., *97*, 1937, 194.) From ensilage. Regarded as a stable type of *Enterococcus*.

Diplococcus bombycis Paillot. (Annales des Épiphyties, *8*, 1922, 131.) From the silkworm (*Bombyx mori*).

Diplococcus liparis Paillot. (Annales des Épiphyties, *8*, 1922, 122.) From larvae of the gypsy moth (*Porthetria (Lymantria) dispar*).

Diplococcus lymantriae Paillot. (Compt. rend. Acad. Sci., Paris, *164*, 1917, 526.) From larvae of the gypsy moth (*Porthetria (Lymantria) dispar*).

Diplococcus melolonthae Paillot. (Compt. rend. Soc. Biol., Paris, *69*, 1917, 57; Annales des Épiphyties, *8*, 1922, 118.) From diseased larvae of cockchafers (*Melolontha melolontha*).

Diplococcus pieris Paillot. (Annales des Épiphytes, *8*, 1922, 128.) From diseased caterpillars of the cabbage butterfly (*Pieris brassicae*).

Diplococcus scarlatinae sanguinis Jamieson and Edington. (Brit. Med. Jour., *1*, 1887, 1265.) From the desquamation and blood of scarlet fever patients.

Enterococcus citreus Stutzer and Wsorow. (Cent. f. Bakt., II Abt., *71*, 1927, 117.) From normal pupae of a moth (*Euxoa segetum*).

Lactococcus agglutinans Plevako and Bakushinskaia. (Microbiology (Russian), *4*, 1935, 523; abst. in Cent. f. Bakt., II Abt., *94*, 1936, 64.) Agglutinates baker's yeast.

Streptobacillus malae Goadby. (Jour. State Med. London, *30*, 1922, 417; *Streptococcus malae* Thomson and Thomson, Ann. Pickett-Thomson Res. Lab., *5*, 1929, 22.) From the mouth. An aberrant streptococcus.

Streptococcus abortus-equi Hauduroy et al. (*Streptococcus abortus equi* Ostertag, Monatsh. f. Tierheilk., *12*, 1900, 384; Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 508.) From aborting mares.

Streptococcus acidi-lactici Chester. (*Sphaerococcus acidi lactici* Marpmann, Ergänzungshefte d. allegemeine Gesundheitspflege, *2*, 1886, 121; not *Streptococcus acidi lactici* Grotenfeldt, Fortschr. d. Med., *7*, 1889, 124; *Micrococcus lacticus* Migula, Syst. d. Bakt., *2*, 1900, 66; Chester, Man. Determ. Bact., 1901, 65.) From fresh milk.

Streptococcus aerobius Heurlin. (Bakt. Untersuch. d. Keimgehaltes im Genitalkanale der fiebernden Wöchnerinnen, Helsingfors, 1910, 60.) From the genital canal.

Streptococcus aerogenes Wirth. (Cent. f. Bakt., I Abt., Orig., *99*, 1926, 290.) From human blood. An aerobic species which produced gas in deep glucose agar.

Streptococcus aerophilus Trevisan. (I generi e le specie delle Batteriacee, Milan, 1889, 31; not *Streptococcus aerophilus* Heurlin, Bakt. Untersuch. d. Keimgehaltes im Genitalkanale der fiebernden Wöchnerinnen, Helsingfors, 1910, 62.) From air.

* Prepared by Miss Eleanore Heist, July, 1938; revised by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, February, 1944.

Streptococcus alactosus Smith and Brown. (Jour. Med. Res., *31*, 1915, 455; Rockefeller Inst. for Med. Res., Monograph 9, 1919; *Streptococcus haemolyticus II*, Holman, Jour. Med. Res., *34*, 1916, 377.) From human tonsillitis; peritoneal pus. See Manual, 5th ed., 1939, 352 for description of this species.

Streptococcus albicans Migula. (Schminkeweisser Streptococcus, Tataroff, Inaug. Diss., Dorpat, 1891, 69; Migula, Syst. d. Bakt., *2*, 1900, 22.) From water.

Streptococcus albidus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 53.) From Cantal cheese.

Streptococcus albus Sternberg. (Weisser Streptococcus, Maschek, Bakt. Untersuch. d. Leitmeritzer Trinkwasser, Jahresber. d. Oberrealschule zu Leitmeritz, 1887; Sternberg, Man. of Bact., 1893, 610; *Micrococcus albus* Macé, Traité pratique de Bact., 6th ed., 1912, 605.) From water.

Streptococcus allantoicus Barker. (Jour. Bact., *40*, 1943, 251.) From black mud, San Francisco Bay.

Streptococcus alvearis (Preuss) Trevisan. (*Cryptococcus alvearis* Preuss, 1868; Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From an infection (foulbrood?) in bees.

Streptococcus ambratus Trevisan. (Micrococco ambrato, Perroncito and Ajroldi, Giornale d. r. Accad. d. Med. d. Torino, *48*, 1885, 809; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From the respiratory tract of a horse.

Streptococcus anhaemolyticus Rolly. (*Streptococcus anhaemolyticus vulgaris* Zangemeister, Münch. med. Wochnschr., *57*, 1910, 1268; Rolly, Cent. f. Bakt., I Abt., Orig., *61*, 1912, 90.) Synonym of *Streptococcus saprophyticus* Mandelbaum (Ztschr. f. Hyg., *58*, 1907, 37; see Brown, Monograph No. 9, Rockefeller Inst. Med. Res., 1919, 87). From vaginal secretions, milk and saliva.

Streptococcus aphthicola Trevisan. (I generi e le specie delle Batteriacee, 1889, 30.) From the lesions of foot and mouth disease of cattle.

Streptococcus aromaticus van Beynum and Pette. (Directie Landbouw. Verslag. Landbouwk. Onderzoek., *42*, 1936, 360; also see Hoecker and Hammer, Iowa Agr. Exp. Sta. Res. Bull. 290, 1941, 317.) Produces diacetyl and small amounts of acetylmethylcarbinol in milk. From cream and butter.

Streptococcus articulorum Flügge. (Die Mikroorganismen, 2 Aufl., 1886, 153.) Associated with diphtheria. Trevisan (I generi e le specie delle Batteriacee, 1889, 30) considers this identical with *Streptococcus diphteriticus* Cohn (Beitr. z. Biol. d. Pflanz., *1*, Heft 2, 1872, 162).

Streptococcus asalignus Frost, Gumm and Thomas. (Jour. Inf. Dis., *40*, 1927, 703.) From milk.

Streptococcus aurantiacus Killian and Fehér. (Ann. Inst. Past., *55*, 1935, 619.) From Sahara Desert soil.

Streptococcus bombycis Sartirana and Paccanaro. (Cent. f. Bakt., I Abt., Orig., *40*, 1906, 331; probably not *Streptococcus bombycis* Zopf, Die Spaltpilze, 2 Aufl., 1884, 52.) From diseased silk worms (*Bombyx mori*). According to Paillot (Les maladies du ver à soie, Lyon, 1928, 171) this is the same as *Streptococcus pastorianus* Krassilstschik.

Streptococcus bonvicini Chester. (Streptococcus della leucaemia, Bonvicini, Cent. f. Bakt., I Abt., *21*, 1897, 211; Chester, Man. Determ. Bact., 1901, 59.) From a case of leucaemia in a dog.

Streptococcus bovinus Trevisan. (*Micrococcus bovinus* Trevisan, Rendiconti Reale Inst. Lombardo di Sci. e Lett., Ser. II, *12*, 1879; Trevisan, I generi e le specie delle Batteriacee, 1889, 30; not *Micrococcus bovinus* Migula, Syst. d. Bakt., *2*, 1900, 67; not *Streptococcus bovinus* Broadhurst, Jour. Inf. Dis., *17*, 1915, 321; not *Streptococcus bovinus* Frost and Engelbrecht, The Streptococci, 1940, 56.) From human throat; bovine, equine, feline and canine feces.

Streptococcus brevis von Lingelsheim.

(Ztschr. f. Hyg., *10*, 1891, 339 and 354.) Not pathogenic. From various human and animal sources.

Streptococcus brevis non hemolyticus Sachs. (Ztschr. f. Hyg., *63*, 1909, 466.) From tonsils, vagina and vulva.

Streptococcus brightii DeToni and Trevisan. (Streptococcus bei Morbus Brightii, Mannaberg, Cent. f. klin. Med., *9*, 1888, 537; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1057; *Streptococcus morbi brightii* Migula, Syst. d. Bakt., *2*, 1900, 28.) From urine of persons suffering from Bright's disease. Probably identical with *Streptococcus pyogenes*.

Streptococcus buccalis Blake. (Jour. Med. Res., *36*, 1917, 124.) From the mouth. Proposed to include both *Streptococcus mitis* and *Streptococcus salivarius*.

Streptococcus butyricus (Fitz) DeToni and Trevisan. (*Micrococcus butyricus* Fitz, Ber. d. deutsch. chem. Gesellsch., Denaeyer Bact. schizom., p. 35; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1064.) From bovine feces. Forms butyric acid from calcium lactate.

Streptococcus cadaveris Sternberg. (Man. of Bact., 1893, 611.) From liver of yellow fever cadaver.

Streptococcus caprinus Emoto. (Jour. Japan. Soc. Veter. Sci., *3*, 1924, 67.) From the cerebro-spinal fluid of goats. Pathogenic for goats.

Streptococcus capsulatus Hauduroy et al. (*Streptococcus capsulatus gallinarum* Dammann and Manegold, Deutsche tierärztl. Wochnschr., *13*, 1905, 577 and Arch. f. Tierheilk., *33*, 1907, 41; Hauduroy et al., Dict. d. Bact. Path., 1937, 511; not *Streptococcus capsulatus* Binaghi, Cent. f. Bakt., I Abt., *22*, 1897, 273.) Causes a disease of chickens.

Streptococcus carneus Migula. (*Micrococcus*?, List, Inaug. Diss., Leipzig, 1885, 49; Migula, Syst. d. Bakt., *2*, 1900, 36.) From the stomach of a sheep. Probably a micrococcus.

Streptococcus carnis Chester. (Diplococcus, Harrevelt, Cent. f. Bakt., I Abt., *26*, 1899, 121; Chester, Man. Determ. Bact., 1901, 60.) From meat.

Streptococcus carrosus Lindner. (50 Jubiläumsber. Westpreuss. Bot.-Zool. Vereins, Danzig, 1928, 254.) From Mexican pulque.

Streptococcus casei Burri. (Berichte d. Schweiz. Bot. Gesellsch., *51*, 1940, 102.) From Emmenthal cheese.

Streptococcus caucasicus Migula. (Streptococcus a, von Freudenreich, Cent. f. Bakt., II Abt., *3*, 1897, 87; Migula, Syst. d. Bakt., *2*, 1900, 42.) From kefir. Possibly related to *Streptococcus kefir*.

Streptococcus cerasinus (Lehmann and Neumann) Migula. (Micrococcus?, List, Inaug. Diss., Leipzig, 1885, 17; Kirschroter Micrococcus, Adametz, Mitteil. d. österreich. Versuchssta. f. Brauerei u. Mälzerei in Wien, Heft 1, 1888, 33; *Micrococcus cerasinus siccus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 34; *Micrococcus cerasinus* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 179; Migula, Syst. d. Bakt., *2*, 1900, 35; not *Micrococcus cerasinus* Migula, *ibid.*, 170.) From nasal secretions in a sheep; also from water.

Streptococcus charrini Trevisan. (Microbe de la septicémie consécutive au charbon, Charrin, Compt. rend. Soc. Biol., Paris, *36*, 1884, 526; Streptococcus Charrin, Flügge, Die Mikroorganismen, 2 Aufl., 1886, 164; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From the organs of a rabbit having anthrax.

Streptococcus cinereus Zimmermann. (Bakt. unserer Trink- u. Nutzwässer, Chemnitz, II Reihe, 1894, 64.) From water.

Streptococcus citreus (Eisenberg) Migula. (Micrococcus?, List, Inaug. Diss., Leipzig, 1885, 60; Crêmefarbiger Micrococcus, Adametz, Mitteil. d. österreich. Versuchssta. f. Brauerei u. Mälzerei in Wien, Heft 1, 1888, 31; *Micrococcus citreus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 36; Migula, Syst. d. Bakt., *2*, 1900, 37; not *Streptococcus citreus* Weiss, Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 179.)

From the pancreas of a sheep (List); from water (Adametz).

Streptococcus citrophilus van Beynum and Pette. (Directie Landbouw. Verslag. Landbouwk. Onderzoek., *42*, 1936, 360; also see Hoecker and Hammer, Iowa Agr. Exp. Sta. Res. Bull. 290, 1941, 317.) Produces diacetyl, acetylmethylcarbinol and volatile acids from citric acid. From cream and butter.

Streptococcus coli Migula. (*Streptococcus coli brevis* Escherich, Die Darmbakterien des Säuglings und ihre Beziehungen zur Physiologie der Verdauung, 1886, 86; Migula, Syst. d. Bakt., *2*, 1900, 33.) From stools in cases of infant diarrhoea.

Streptococcus continuosus Black. (Trans. Ill. State Dental Soc., *22*, 1886, 189.) From the mouth.

Streptococcus coronatus (Flügge) Trevisan. (*Micrococcus coronatus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 175; Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From the air.

Streptococcus cuniculi Bergey et al. (Manual, 1st ed., 1923, 50.) From natural infections of rabbits. Morphologically like *Streptococcus pyogenes*.

Streptococcus cystitidis Migula. (*Diplococcus ureae pyogenes* Rovsing, Die Blasenentzündungen, ihre Actiologie, Pathogenese und Behandlung, 1890, 39; Migula, Syst. d. Bakt., *2*, 1900, 12.) From a case of cystitis.

Streptococcus debilis Wilhelmy. (Arb. bakt. Inst. Karlsruhe, *3*, 1903, 13.) From meat extracts.

Streptococcus dentium (Trevisan) Trevisan. (*Micrococcus dentium* Trevican, Batt. Ital., 1879, 27; *Micrococcus foetidus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 172; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From carious teeth. Grows anaerobically in nutrient agar with the production of gas and strong odor.

Streptococcus desidens Trevisan. (*Micrococcus flavus desidens* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 177; Trevisan, I generi e le specie delle Batteriacee, 1889, 31; *Micrococcus desidens* Migula, Syst. d. Bakt., *2*, 1900, 143.) From the air.

Streptococcus diacetilactis Matuszewski, Pijanowski and Supinska. (Compt. rend. Inst. Bact. École Cent. Agron., Varsovie, Poland, No. 21, 1936, 1.) From milk. Probably *Streptococcus cremoris* Orla-Jensen.

Streptococcus diacetyl aromaticus. (Quoted from Karnad, Indian Jour. Vet. Sci., *9*, 1939, 349.) From milk. Produces an aroma in milk cultures.

Streptococcus disparis Glaser. (Jour. Agr. Res., *13*, 1918, 515.) From the alimentary canal of caterpillars.

Streptococcus endocarditicus DeToni and Trevisan. (Mikrokokken, Klebs, Arch. f. exper. Pathol., *9*, 1878, 52; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1057.) From cases of endocarditis.

Streptococcus enteritidis Chester. (Enteritisstreptokokken, Escherich, Jahrb. f. Kinderheilk., *49*, 1899, 161; Chester, Man. Determ. Bact., 1901, 59.) From cases of enteritis.

Streptococcus enteritis Chester. (*Streptococcus*, Hirsh, Cent. f. Bakt., I Abt., *22*, 1897, 372 and Libman, *ibid.*, 376; Chester, Man. Determ. Bact., 1901, 56; *Streptococcus enteritis* var. *libmanii* Chester, *ibid.*, 66.) From stools in cases of infant diarrhoea.

Streptococcus equarius Frost and Engelbrecht. (A Revision of the Genus *Streptococcus*, privately published, 1936, 3 pp. and The Streptococci, 1940, 65.) From a throat culture.

Streptococcus equinus Lehmann and Neumann. (Streptokokken die sich zu grossen Konvaluten zusammenballen, Behring, Cent. f. Bakt., *12*, 1892, 194; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 125.) From equine pneumonia. Relation to *Streptococcus equinus* Andrewes and Horder not clear.

Streptococcus felinus Bergey et al. (Manual, 1st ed., 1923, 50.) From natural infections in cats. Morphologically like *Streptococcus pyogenes*.

Streptococcus fermenti (Trevisan) Trevisan. (*Micrococcus fermenti* Trevisan, Batt. Ital., 1879, 19; *Micrococcus viscosus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 172; Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From a slimy growth in wines.

Streptococcus fischeli Chester. (Microorganismus No. 2, Fischel, Ztschr. f. Heilkunde, *12*, 1891, 7 and Cent. f. Bakt., *9*, 1891, 611; Chester, Man. Determ. Bact., 1901, 59.) From the blood of influenza patients.

Streptococcus foetidus Migula. (Stinkcoccus, Klamann, Allegem. med. Centralzeitung, 1887, 1347; *Diplococcus fluorescens foetidus* Eisenberg, Bakt. Diag., 1891, 10; Migula, Syst. d. Bakt., *2*, 1900, 38; *Streptococcus fluorescens* Chester, Man. Determ. Bact., 1901, 70; *Streptococcus fluorescens foetidus* Miquel and Cambier, Traité de Bact., Paris, 1902, 792.) From cases of ozena.

Streptococcus galleriae Chorine. (Compt. rend. Soc. Biol., Paris, *95*, 1926, 201.) From the bee moth (*Galleria mellonella*).

Streptococcus genitalium Dimock and Edwards. (Kentucky Agr. Exp. Sta. Res. Bull. 286, 1928, 162.) Found commonly in the genital tract of mares.

Streptococcus giganteus Migula. (*Streptococcus giganteus urethrae* Lustgarten and Mannaberg, Vierteljahrsschr. f. Dermatologie u. Syphilis, 1887, 918; Migula, Syst. d. Bakt., *2*, 1900, 39.) From human urethra and from urine.

Streptococcus gingivae. (Quoted from Annals Pickett-Thomson Res. Lab., *3*, 1927, 154.) From human gums and teeth.

Streptococcus granulatus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 55.) From cream cheese.

Streptococcus haematosaprus Trevisan. (Mikrokokken der Fäulniss, Flügge, Die Mikroorganismen, 2 Aufl., 1886, 173; Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From putrefying blood.

Streptococcus halitus Heim and Schlirf. (Cent. f. Bakt., I Abt., Orig., *100*, 1926, 39.) From deposit on the tongue.

Streptococcus havaniensis Sternberg. (Man. of Bact., 1893, 612.) From acid vomit of a yellow-fever patient.

Streptococcus hemolyticus I, II and *III* Holman. (Jour. Med. Res., *34*, 1916, 388.) From various human infections.

Streptococcus herbarum Schieblich. (Cent. f. Bakt., I Abt., Orig., *124*, 1932, 269.) From green plant material. Motile. Related to *Streptococcus lactis* except it is flagellated. Kolbmuller (Cent. f. Bakt., I Abt., Orig., *133*, 1935, 310) identifies this with *Enterococcus*.

Streptococcus hydrophoborum Trevisan. (Streptococcus bei Rabies, Babes, Ztschr. f. Hyg., *5*, 1888, 184; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From the brain in a case of rabies.

Streptococcus influentiae Trevisan. (I generi e le specie delle Batteriacee, 1889, 30.) From equine influenza.

Streptococcus influenzae Thomson and Thomson. (Grippestreptokokkus, Seligmann, Cent. f. Bakt., I Abt., Ref., *50*, 1911, 81; Thomson and Thomson, Monograph No. 16, Part I, Annals Pickett-Thomson Res. Lab., 1933.) Associated with influenza.

Streptococcus infrequens Holman. (Jour. Med. Res., *34*, 1916, 388.) From various human infections.

Streptococcus kirchneri Chester. (Diplococcus, Kirchner, Ztschr. f. Hyg., *9*, 1890, 528; Chester, Man. Determ. Bact., 1901, 57.) From sputum in cases of influenza.

Streptococcus kochii Trevisan. (I generi e le specie delle Batteriacee, 1889, 30.) From rabbit septicemia.

Streptococcus lacteus Schröter. (Kryptogam. Flora v. Schlesien, *3*, 1, 1886, 149.) From the air and dust.

Streptococcus lactis aromaticus Joshi and Ram Ayyar. (Indian Jour. Vet. Sci., *6*, 1936, 141.) Possibly *Streptococcus cremoris* Orla-Jensen. From cream.

Streptococcus lactis innocuus Stölting. (Inaug. Diss., Kiel, 1935, 16.) From ripening cheese.

Streptococcus lagerheimii var. *subterraneum* Migula. (Hansgirg, Oesterr. Zeitung, 1888, No. 7 and 8; Migula, Syst. d. Bakt., *2*, 1900, 41.) From the wall of a wine cellar.

Streptococcus (Diplococcus) lanceolatus ovium Gaertner. (Cent. f. Bakt., I Abt., Orig., *54*, 1910, 546.) From mastitis in sheep.

Streptococcus lapillus Heim and Schlirf. (Cent. f. Bakt., I Abt., Orig., *100*, 1926, 39.) From the oral cavity.

Streptococcus lentus Lehmann. (Lehmann, Deutsch. Arch. f. klin. Med., *150*, 1926, 144; *Streptococcus pyogenes lentus*, *ibid.*, 141; not *Streptococcus lentus* Brown, Rept. Proc. Third Internat. Congr. for Microbiol., New York, 1940, 173.) From urine, cervix, sputum and carious teeth.

Streptococcus libaviensis Flatzek. (Cent. f. Bakt., I Abt., Orig., *82*, 1919, 240; *Bacterium libaviense* Flatzek, *idem.*) From human feces. Motile.

Streptococcus lucae Trevisan. (*Micrococcus ulceris mollis* de Luca, 1886; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From chancroidal ulcers.

Streptococcus luteus Killian and Fehér. (Ann. Inst. Past., *55*, 1935, 619.) From Sahara Desert soil.

Streptococcus magnus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 54.) From Brie cheese.

Streptococcus malaperti Trevisan. (Micrococcus E, Malapert-Neuville, 1887; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From mineral water of hot springs at Schlangenbad.

Streptococcus malignus Trevisan. (*Streptococcus pyogenes malignus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 153; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From a diseased spleen. Probably identical with *Streptococcus pyogenes*.

Streptococcus mammitis bovis Hutchens. (Hutchens, in Besson, Pract. Bact. Microbiol. and Serum Therapy. Trans. of 5th ed., 1913, 613.) From mastitis in cattle.

Streptococcus margaritaceus Schröter. (In Cohn, Kryptog. Flora v. Schlesien, *3*, 1, 1886, 149.) From putrefying blood.

Streptococcus mathersi Muslow. (Green producing streptococcus, Tunnicliff, Jour. Amer. Med. Assoc., *71*, 1918, 1733; Mather's coccus, Jordan, Jour. Inf. Dis., *25*, 1919, 30; Muslow, *ibid.*, *31*, 1922, 295.) From sputum in cases of influenza and pneumonia.

Streptococcus maximus Weiss. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 180.) From a bean and carrot infusion.

Streptococcus melanogenes Schlegel. (Berl. tierarztl. Wochnschr., 1906, No. 25, 464.) Produces grayish-yellow pigment in gelatin. Associated with a disease of horses.

Streptococcus meningitidis Bonome. (Cent. f. Bakt., *8*, 1890, 172 and 703.) From exudates from cases of cerebrospinal meningitis.

Streptococcus merdarius Trevisan. (Streptococcus des selles, Cornil and Babes, Bactérica, 2nd ed., 1886, 118; Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From feces.

Streptococcus microapoikia Cooper, Keller and Johnson. (Amer. Jour. Dis. of Children, *47*, 1934, 388 and 596; these authors also use the trinomial *Streptococcus micro-apoikia enteritis*.) From human throat and feces in enteritis in children. See Manual, 5th ed., 1939, 351 for description of this species.

Streptococcus mirabilis Roscoe and Lunt. (Phil. Trans. Roy. Soc., London, *182*, 1892, 648.)

Streptococcus mixtus Bergey et al. (Manual, 1st ed., 1923, 49.) From a variety of pyogenic inflammations.

Streptococcus morbilli Ferry and Fisher. (Jour. Amer. Med. Assoc., *86*, 1926, 933.) From blood of persons in early stages of measles.

Streptococcus morbillosus Trevisan. (*Micrococcus morbillosus* Trevisan, Rendiconti Reale Inst. Lombardo di Sci. e Lett., Ser. II, *12*, 1879; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From human, canine and porcine measles.

Streptococcus murisepticus v. Lingels-

heim. (Ztschr. f. Hyg., *10*, 1891, 331 and *12*, 1892, 308.) Migula (Syst. d. Bakt., *2*, 1900, 6) considers this a synonym of *Streptococcus pyogenes*.

Streptococcus mutans Clarke. (Brit. Jour. Exp. Path., *5*, 1924, 142.) Shows extreme variability in colony formation. Regarded as the cause of dental caries.

Streptococcus nasalis (Hack) Migula. (*Micrococcus nasalis* Hack, according to Eisenberg, Bakt. Diag., 3 Aufl., 1891, 55; Migula, Syst. d. Bakt., *2*, 1900, 45; *Planococcus nasalis* Migula, *loc. cit.*, 274.) From nasal secretions. Considered motile.

Streptococcus necroseos Schröter. (Mikrokokkus der progressiven Gewebenekrose bei Mäusen, Koch, Untersuch. über die Ätiologie der Wundinfektionskrankheiten. Leipzig, 1878 or Gesamm. Werke v. Robert Koch, *1*, 1912, 87; Schröter, in Cohn, Kryptog. Flora v. Schlesien, *3*, 1, 1886, 150; *Streptococcus necroticus* Trevisan, Atti della Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885.) From gangrene in mice.

Streptococcus nomae Trevisan. (I generi e le specie delle Batteriacee, 1889, 30.) From gangrene of the mouth.

Streptococcus non-hemolyticus I, II and *III* Holman. (Jour. Med. Res., *34*, 1916, 388.) From various human and animal infections.

Streptococcus odontolyticus Belding and Belding. (Dental Items of Interest, *62*, 1940, 308.) From dental caries. Later stated by authors (Jour. Amer. Dent. Assoc., *30*, 1943, 713) to be a mucoid variant of *Streptococcus salivarius*.

Streptococcus opacus Heim and Schlirf. (Cent. f. Bakt., I Abt., Orig., *100*, 1926, 40.) From the oral cavity.

Streptococcus opportunus Brown. (Rept. Proc. Third Internat. Congr. for Microbiol., New York, 1940, 173.) Source not recorded. Belongs to Lancefield's Group B (Sherman, Chase and Niven, Jour. Bact., *41*, 1941, 101).

Streptococcus ovis Weimann. (Ztschr. f. Infectionskrankh. d. Haustiere, *9*, 1911, 255.) From infected sheep.

Streptococcus pallens Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 57.) From Gouda cheese.

Streptococcus pallidus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 58.) From Neufchâtel cheese.

Streptococcus parvulus Levinthal. (Cent. f. Bakt., I Abt., Orig., *106*, 1928, 195.) From the mucous membrane of the human throat.

Streptococcus pastorianus Krassilstschik. (Compt. rend. Acad. Sci. Paris, *123*, 1896, 427.) From silkworms.

Streptococcus perniciosus Zopf. (Zopf, Die Spaltpilze, 3 Aufl., 1885, 53; *Streptococcus perniciosus psittacorum* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 164; *Micrococcus perniciosus* Crookshank, Man. of Bact., 3rd ed., 1890, 252; *Streptococcus psittacorum* Migula, Syst. d. Bakt., *2*, 1900, 42.) From an infection of parrots. Found in nodules on the surface of the kidneys, lungs and spleen.

Streptococcus phytophthorus (Frank) Chester. (*Micrococcus phytophthorus* Frank, Cent. f. Bakt., II Abt., *5*, 1899, 134; Chester, Man. Determ. Bact., 1901, 67.) Associated with blight and rot of potato.

Streptococcus piima Macy. (Jour. Dairy Sci., *6*, 1923, 2.) From ropy milk, the Finnish piima.

Streptococcus pityocampae α Dufrenoy. (Compt. rend. Soc. Biol., Paris, *71*, 1919, 288.) From processionary moth larvae (*Cnethocampa pityocampa*). Motile. Gram-positive.

Streptococcus pityocampae β Dufrenoy (*loc. cit.*). From processionary moth larvae. Gram-negative.

Streptococcus pleomorphus von Wiesner. (Wien. klin. Wochnschr., 1917, 933 and 1918, 1101; see Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 224.) Occurred frequently during the influenza epidemic of 1918.

Streptococcus pneumosimilis Frost and Engelbrecht. (The Streptococci, 1940, 57.) From milk and from the throats of dairy employees. Not found in bovine feces.

Streptococcus polymorphus Heim. (Streptococcus, Kraskowska and Nitsch, Cent. f. Bakt., I Abt., Orig., *82*, 1918, 264; Heim, see Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 224.) From the throat.

Streptococcus productus Prévot. (Compt. rend. Soc. Biol., Paris, *135*, 1941, 105.) An anaerobic streptococcus from a gangrenous lung.

Streptococcus proteiformis var. *liquefaciens* Hauduroy et al. (*Enterococcus proteiformis liquefaciens* Hauduroy, Thèse Doctorat Méd., Strasbourg, 1921; Hauduroy et al., Dict. d. Bact. Path., 1937, 521.) From feces.

Streptococcus proteus Chester. (Streptococcus No. 52, Conn, Report Storrs Agr. Exp. Sta., 1894, 81; Chester, Man. Determ. Bact., 1901, 67.) From cream.

Streptococcus pseudohaemolyticus Cumming. (Jour. Path. and Bact., *30*, 1927, 279.) From sputum of patients with pulmonary tuberculosis.

Streptococcus putrefaciens Trevisan. (I generi e le specie delle Batteriacee, 1889, 31.) From putrefying blood.

Streptococcus pyogenes bovis Lucet. (Ann. Inst. Past., *7*, 1893, 325; also see Crookshank, Textbook of Bact., 4th ed., Philadelphia, 1900, 188.) From bovine pus.

Streptococcus pyogenes hominis Crookshank. (Textbook of Bact., 4th ed., Philadelphia, 1900, 187.) From human sources.

Streptococcus pyogenes nonhaemolyticus Thomson and Thomson. (Streptocoque pyogené nonhémolytique, Weissenbach, Compt. rend. Soc. Biol., Paris, *81*, 1918, 819; Thomson and Thomson, Ann. Pickett-Thomson Res. Lab., *3*, 1927, 183.) From feces and various human infections.

Streptococcus radiatus Klein. (Cent. f. Bakt., I Abt., *28*, 1900, 417.) From exudate from the udder of a cow.

Streptococcus rheumaticus Poynton and Paine. (Poynton and Paine, Lancet, *2*, September 22 and 29, 1900, 861; *Diplococcus rheumaticus* and *Micrococcus rheumaticus* Beaton and Walker, Brit. Med. Jour., January 31, 1903, 237; abst. in Cent. f. Bakt., I Abt., Ref., *33*, 1903, 528.) From cases of rheumatism and endocarditis.

Streptococcus rindfleischii Trevisan. (Streptococcus bei Mycosis fungoides, Rindfleisch, Deutsche med. Wchnschr., *11*, 1885, 233; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From skin infection (mycosis fungoides).

Streptococcus ruber Lundstrom. (Finska Läkaresällskapets Handlingar, *35*, 1893.) Red colonies.

Streptococcus rubiginosus Jamieson and Edington. (Brit. Med. Jour., *1*, 1887, 1265.) Associated with cases of scarlet fever. Probably identical with *Micrococcus pyogenes* Klein, according to Macé (Traité Pratique de Bact., Paris, 4th ed., 1901, 425).

Streptococcus rugosus Migula. (*Streptococcus ureae* (*non pyogenes*) *rugosus* Rovsing, Die Blasenentzündungen, ihre Aetiologie, Pathogenese und Behandlung, 1890, 44; Migula, Syst. d. Bakt., *2*, 1900, 30; *Streptococcus rugosus ureae* Miquel and Cambier, Traité de Bact., Paris, 1902, 829.) From cases of cystitis.

Streptococcus salivarius brevis and *Streptococcus salivarius tenuis* Veillon. (Quoted from Thomson and Thomson, Ann. Pickett-Thomson Res. Lab., *3*, 1927, 187 and 240.) From the mouth. See *Streptococcus tenuis*.

Streptococcus sanguineus Migula. (*Diplococcus pyogenes* Pasquale, Giorn. med. d. R. esercito e d. R. marina, 1890; Migula, Syst. d. Bakt., *2*, 1900, 36.) From a case of bone tuberculosis.

Streptococcus sanguinis Chester. (*Streptococcus sanguinis canis* Pitfield, Queen's Microscopic Bulletin, Philadelphia, 1897, 44; Chester, Man. Determ. Bact., 1901, 64.) From the blood of dogs.

Streptococcus sanguis White. (*Streptococcus s.b.e.* Loewe, Plummer, Niven and Sherman, Jour. Amer. Med. Assoc., *130*, 1946, 257; White, Thesis, Cornell Univ., 1946 quoted from White and Niven, Jour. Bact., *51*, 1946, 721.) From

blood in cases of subacute bacterial endocarditis.

Streptococcus saprogenes Trevisan. (I generi e le specie delle Batteriacee, 1889, 31.) From putrefying blood.

Streptococcus saprophyticus Mandelbaum. (Ztschr. f. Hyg., *58*, 1908, 37.) See *Streptococcus anhaemolyticus vulgaris*. From mucous membranes.

Streptococcus schmidti Trevisan. (Coccus bei Fadenziehende Milch, Schmidt-Mülheim, Arch. f. d. ges. Physiol., *27*, 1882, 490; Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From ropy milk.

Streptococcus seiferti DeToni and Trevisan. (Micrococcus bei Influenza, Seifert, in Volkmann, Sammlung Klin. Vorträge, 240; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1056.) From sputum and nasal secretions of influenza patients.

Streptococcus septicus Migula. (*Streptococcus septicus liquefians* Babes, Bakt. Unter. ü. septische Prozesse des Kindesalters, Leipzig, 1889, 22; *Streptococcus septicus liquefaciens* Babes, according to Eisenberg, Bakt. Diag., 3 Aufl., 1891, 312; Migula, Syst. d. Bakt., *2*, 1900, 27; not *Streptococcus septicus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 154.) From the blood and organs of a diseased child.

Streptococcus septopyaemicus Biondi. (Ztschr. f. Hyg., *2*, 1887, 194 and 225.) According to Migula (Syst. d. Bakt., *2*, 1900, 6) this is a synonym of *Streptococcus pyogenes*. From human saliva.

Streptococcus sornthalii (Adametz) Migula. (*Micrococcus sornthalii* Adametz, Cent. f. Bakt., II Abt., *1*, 1895, 465; Migula, Syst. d. Bakt., *2*, 1900, 20.) From milk and hard cheese.

Streptococcus sphagni Migula. (Syst. d. Bakt., *2*, 1900, 40.) From sphagnum in the Black Forest.

Streptococcus sputigenus Migula. (Syst. d. Bakt., *2*, 1900, 24.) From sputum.

Streptococcus stenos Bergey et al. (Manual, 1st ed., 1923, 50.) From a variety of human inflammatory conditions.

Streptococcus stramineus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 59.) From Schlosskäse.

Streptococcus subacidus Holman. (Jour. Med. Res., *34*, 1916, 388.) From various human infections.

Streptococcus suspectus Trevisan. (Streptococco dell' ematuria, 'Pisciasangue' dei bovini; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From blood and spleen in cases of bovine hematuria.

Streptococcus tenuis Veillon. (Arch. Méd. Exp. et Anat., *6*, 1894, 161.) From human mouth.

Streptococcus terricola van Steenberge. (van Steenberge, Ann. Inst. Past., *34*, 1920, 806; not *Streptococcus terricola* Killian and Fehér, Ann. Inst. Past., *55*, 1935, 619.) From garden soil.

Streptococcus toxicatus (Burrill) DeToni and Trevisan. (*Micrococcus toxicatus* Burrill, The Bacteria. Illinois Industrial Univ., 11th Ann. Rept., 1882, 42; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1065.) From diseased plant tissue.

Streptococcus trifoliatus Migula. (*Diplococcus ureae (non pyogenes) trifoliatus* Rovsing, Die Blasenentzündungen, ihre Aetiologie, Pathogenese und Behanglung, 1890, 43; Migula, Syst. d. Bakt., *2*, 1900, 29.) From cases of cystitis.

Streptococcus turbidus Lehmann and Neumann. (Bouillon trübende Streptokokken, Behring, Cent. f. Bakt., *12*, 1892, 193; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 125.) From various human infections, especially erysipelas. Presumably a smooth culture of *Streptococcus pyogenes*.

Streptococcus tyrogenus Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 50.) From cheeses.

Streptococcus ureae Migula. (*Streptococcus pyogenes ureae* Rovsing, Die Blas-

enentzündungen, ihre Aetiologie, Pathogenese und Behandlung, 1890, 45; Migula, Syst. d. Bakt., *2*, 1900, 28; not *Streptococcus ureae* Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From cases of cystitis.

Streptococcus urinae Migula. (*Diplococcus ureae* (*non pyogenes*) Rovsing, *loc. cit.*, 45; Migula, Syst. d. Bakt., *2*, 1900, 13.) From cases of cystitis.

Streptococcus vaccinae (Cohn) Zopf. (Microsphäeren der Vaccine, Cohn, Arch. f. path. Anat., *55*, 1872, 237; *Microsphaera vaccinae* Cohn quoted from Cohn, Beiträge z. Biol, d. Pflanzen, *1*, Heft, 2, 1872, 161; *Micrococcus vaccinae* Cohn, *idem;* Zopf, Die Spaltpilze, 3 Aufl., 1885, 52.) From lymph of cow pox pustules.

Streptococcus varicellae Trevisan. (Microbio della varicella, Bareggi, 1885, probably in Gazz. Med. ital. Lomb. Milano, 229-242; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From chicken-pox pustules.

Streptococcus variolae Trevisan. (Microsphäeren der Variola, Cohn, Arch. f. path. Anat., *55*, 1872, 237; *Micrococcus variolae* Cohn, 1872, quoted from Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From lymph of small pox pustules. Regarded by Cohn (Beiträge z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 161) as a variety of *Micrococcus vaccinae* Cohn.

Streptococcus variolae-ovinae (Plaut) DeToni and Trevisan. (*Micrococcus variolae ovinae* Plaut, Das organisirte Contagium der Schafpocken und die Mitigation desselben, Leipzig, 1882; DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1058.) From the lymph in sheep-pox pustules.

Streptococcus vermiformis Sternberg. (Wurmformiger *Streptococcus*, Maschek, Bakt. Unters. d. Leitmeritzer Trinkwasser, Jahresb. d. Oberrealschule zu Leitmeritz, 1887; Sternberg, Man. of Bact., 1893, 611.) From water.

Streptococcus versatilis Broadhurst. (Jour. Inf. Dis., *17*, 1915, 323.) From throat of dogs, horse and cattle feces, etc.

Streptococcus vini Migula. (*Micrococcus saprogenes vini II*, Kramer, Landwirtsch. Versuchsstat., *37*, 1890, 325 and Die Bakt. in ihren Beziehungen z. Landwirtsch. u. d. landwirtsch.-technisch. Gewerben, *2*, 1892, 140; Migula, Syst. d. Bakt., *2*, 1900, 33.) From wine.

Streptococcus viscosus Lehmann and Neumann. (Schleimiger Streptokokken, Behring, Cent. f. Bakt., *12*, 1892, 193; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 125.) From various human infections. Presumably a mucoid culture of *Streptococcus pyogenes*.

Streptococcus vitulorum Trevisan. (Micrococco della diarrea bianca dei vitellini, Perroncito, 1886; Trevisan, I generi e le specie delle Batteriacee, 1889, 30.) From white diarrhoea of calves.

Streptococcus vulgaris Loening. (Münch. med. Wochnschr., *57*, 1910, 173 and 247; *Streptococcus pyogenes vulgaris* Thomson and Thomson, Ann. Pickett-Thomson Res. Lab., *3*, 1927, 189.) Names applied to *Streptococcus pyogenes*.

Streptococcus weissii Trevisan. (Atti d. Accad. Fisio-Medico-Statistica in Milano, Ser. IV, *3*, 1885, 119.) From lung exudate in pleuropneumonia of cattle.

Streptococcus zythi Trevisan. (Torulacée de la bière malade, Pasteur; Trevisan, I generi e le specie delle Batteriacee, 1889, 31.) From spoiled beer.

Streptostaphylococcus parvulus Heurlin. (Heurlin, Bakt. Unters. d. Keimgehaltes im Genitalkanale der fiebernden Wöchnerinnen. Helsingsfors, 1910, 138.) From genital canal. Intermediate between *Streptococcus anaerobius* Krönig and *Staphylococcus parvulus* Veillon and Zuber.

Genus III. **Leuconostoc** *Van Tieghem* ***emend.*** *Hucker and Pederson.**

(Van Tieghem, Ann. Sci. Nat., *6*, Sér. 7, 1878, 170; *Betacoccus* Orla-Jensen, The Lactic Acid Bacteria. Mem. Acad. Sci. Danemark, Sec. d. Sci., *5*, Sér. 8, 1919, 146; Hucker and Pederson, New York Agr. Exp. Sta. Tech. Bul. 167, 1930, 66.) From Latin *leucus*, clear, colorless; M. L. *Nostoc*, a genus of blue-green algae.

Cells normally spherical. Under certain conditions, such as in acid fruits and vegetables, the cells may lengthen and become pointed or even elongated into a rod. Certain types grow with a characteristic slime formation in sucrose media. Grow on ordinary culture media, but growth is enhanced by the addition of yeast, tomato or other vegetable extracts. Generally, a limited amount of acid is produced, consisting of lactic and acetic acid; alcohol is also formed, and about one-fourth of the fermented glucose is changed to CO_2. Levo lactic acid is always produced, and sometimes dextro lactic acid also. Milk is rarely curdled. Fructose is reduced to mannitol. Habitat: Milk, plant juices.

The type species is *Leuconostoc mesenteroides* (Cienkowski) Van Tieghem.

Key to the species of genus **Leuconostoc.**

I. Acid from sucrose.
- A. Acid from pentoses.
  - 1. *Leuconostoc mesenteroides.*
- B. No acid from pentoses.
  - 2. *Leuconostoc dextranicum.*

II. No acid from sucrose.
- 3. *Leuconostoc citrovorum.*

1. **Leuconostoc mesenteroides** (Cienkowski) Van Tieghem. (*Ascococcus mesenteroides* Cienkowski, Arb. d. Naturf. Gesellsch. a. d. Univ. a. Charkoff, 1878, 12; Van Tieghem, Ann. Sci. Nat., *6*, Sér. 7, 1878, 170; *Leuconostoc indicum* Liesenberg and Zopf, Beitr. z. Physiol. u. Morph. niederer Organis., Heft 1, 1892, 19; *Streptococcus mesenterioides* Migula, Syst. d. Bakt., *2*, 1900, 25; *Leuconostoc agglutinans* Barendrecht, Cent. f. Bakt., II Abt., *7*, 1901, 627; *Leuconostoc aller* Zettnow, Ztschr. f. Hyg., *57*, 1907, 154; *Leuconostoc opalanitza* Zettnow, *loc. cit.*; *Betacoccus arabinosaceus* Orla-Jensen, The Lactic Acid Bacteria, 1919, 152; *Leuconostoc arabinosaceus* Holland, Jour. Bact., *5*, 1920, 223; *Bacillus pleofructi* Savage and Hunwicke, Spec. Rept. Food Investigation Board, London, 1923, 134; *Leuconostoc pleofructi* Pederson, N. Y. Agr. Exp. Sta. Tech. Bull. 150 and 151, 1929.) From Greek *mesenterium*, mesentery; *eidus*, form (like).

Probable synonym: *Leuconostoc soyae* Belenky, Bull. Sci., Res. Inst. for Leguminous Crops, Moscow (Russian), *5*, 1934, 132.

Spheres: 0.9 to 1.2 microns in diameter, occurring in pairs and short or long chains. In sucrose solutions the chains are surrounded by a thick, gelatinous, colorless membrane consisting of dextran. Gram-positive.

Glucose gelatin colonies: Small, white to grayish-white, raised, nodular.

* Revised by Prof. G. J. Hucker and Prof. Carl S. Pederson, New York State Experiment Station, Geneva, New York, September, 1938; further revision, December, 1943.

Glucose gelatin stab: Growth along entire stab. No liquefaction.

Sucrose broth: Abundant growth with massive formation of slimy material.

Potato: No visible growth.

Indole not formed.

Acid from glucose, fructose, galactose, mannose, xylose, arabinose, sucrose, and generally from lactose, raffinose, salicin and mannitol. Rarely acid from dextrin, starch, inulin, sorbitol, rhamnose or glycerol.

Nitrites not produced from nitrates.

Produces slime from sucrose. Most pronounced in sucrose gelatin stab.

Aerobic, facultative.

Optimum temperature 21° to 25°C.

Distinctive characters: Active slime producer in sucrose solutions.

Source: Slime in sugar factory.

Habitat: Most active of the genus. Encountered in fermenting vegetable and other plant materials. Frequently isolated from slimy sugar solutions.

2. **Leuconostoc dextranicum** (Beijerinck) Hucker and Pederson. (*Lactococcus dextranicus* Beijerinck, Folia Microbiologica, Delft, 1912, 377; *Betacoccus bovis* Orla-Jensen, The Lactic Acid Bacteria, Copenhagen, 1919, 152 (*Leuconostoc bovis* Holland, Jour. Bact., *5*, 1920, 223); *Streptococcus paracitrovorus* Hammer, Research Bul. 63, Iowa Agr. Exp. Sta., 1920; Hucker and Pederson, N. Y. Agr. Exp. Sta. Tech. Bull. 167, 1930, 67.) From Latin *dexter*, right; M. L. *dextranum*, dextran; M. L. *dextranicus*, related to dextran.

Note: The description of Streptococcus b, v. Freudenreich (Cent. f. Bakt., II Abt., *3*, 1897, 47) renamed *Streptococcus kefir* by Migula (Syst. d. Bakt., *2*, 1900, 44) is too indefinite to permit the determination of its exact relationship to the organisms in this genus. It is clear, however, that the *Streptococcus kefir* of these authors and that of Evans (Jour. Agr. Res., *13*, 1918, 235) were very similar to if not identical with *Leuconostoc dextranicum*. *Streptococcus distendens* Hammer (Iowa State Coll. Jour. Sci., *2*, 1927, 5) may also be identical with *Leuconostoc dextranicum*.

Spheres: 0.6 to 1.0 micron in diameter, occurring in pairs and in short chains. Gram-positive.

Gelatin stab: Gray filiform growth in stab.

Agar colonies: Small, gray, circular, slightly raised, entire.

Glucose broth: Slight grayish sediment.

Litmus milk: Acid, coagulation. Frequently shows slight reduction of litmus in bottom of tube.

Potato: No visible growth.

Indole not formed.

Nitrites not produced from nitrates.

Produce slime from sucrose in rapidly growing cultures.

Acid from glucose, fructose, galactose, maltose, sucrose, and generally from lactose and mannose. No acid from xylose, arabinose, glycerol, rhamnose, sorbitol, mannitol, starch, rarely raffinose, inulin or dextrin.

Aerobic, facultative.

Optimum temperature of growth 21° to 25°C.

Distinctive characters: Produces moderate amount of slime in sucrose solutions.

Source: Dairy starters.

Habitat: Found both in plant materials and in milk products.

3. **Leuconostoc citrovorum** (Hammer) Hucker and Pederson. (*Streptococcus citrovorus* Hammer, Research Bull. No. 63, Iowa Agr. Exper. Sta., 1920; Hucker and Pederson, N. Y. Agr. Exp. Sta. Tech. Bull. 167, 1930, 67.) From Latin *citrus*, the citron tree; M. L., lemon or orange, hence citric acid; *voro*, devour.

Spheres: 0.6 to 1.0 micron in diameter, occuring in pairs and chains. Gram-positive.

Gelatin stab: Filiform growth in stab. No liquefaction.

Agar colonies: Small, gray, entire, slightly raised.

Agar slant: Small, gray, discrete colonies.

Glucose broth: Slight gray sediment.

Litmus milk: Slightly acid with partial reduction of litmus.

Potato: No visible growth.

Indole not formed.

Nitrites not produced from nitrates.

Grows poorly on ordinary media without the addition of yeast extract or other growth accessory substance.

Acid from glucose, fructose, galactose and lactose. Generally does not form acid from mannose, sucrose, maltose, xylose, arabinose, rhamnose, raffinose, glycerol, dextrin, inulin, starch, salicin, mannitol or sorbitol.

Uses citric acid in milk.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Distinctive character: Non-slime producer.

Source: Dairy products.

Habitat: Found in milk and dairy products.

Appendix: This includes species that probably belong in this genus. The descriptions are too meager to permit drawing any definite conclusion regarding their relationship to the three species recognized above.

Bacterium laevolacticum Migula. (*Bacillus acidi laevolactici* Schardinger, Monatsh. f. Chemie, *11*, 1890, 544; Migula, Syst. d. Bakt., *2*, 1900, 406; *Bacterium acidi laevolactici* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 178.) From well water.

Leuconostoc lagerheimii Ludwig. (Ludwig, Lehrb. d. niederen Kryptog., 1892, 29; *Streptococcus lagerheimii* Migula, Syst. d. Bakt., *2*, 1900, 41.) From slimy sugar solutions.

Micrococcus gelatinogenus Bräutigam. (Pharmaceutische Centralhalle, 1891, No. 30.) From the air. Forms gum in sucrose media.

Micrococcus gummosus Happ. (Inaug. Diss., Basel, published in Berlin, 1893, 31.) From slimy sugar solutions.

Myxococcus betae Gonnermann. (Oesterr.- Ungar. Ztschr. f. Zuckerind. u. Landw., *136*, 1907, 883.) From sugar beet juice.

Streptococcus citrovorus-paracitrovorus Vas and Csiszár. (Milchwirtsch. Fortsch., *18*, 1936, 68.) From cream and butter.

Streptococcus hornensis Boekhout. (Cent. f. Bakt., II Abt., *6*, 1900, 162.) From slimy, sweetened condensed milk. A strong dextran former. Related to *Leuconostoc mesenteroides*.

Zoogloea termo Cohn. (Cohn, Nov. Act. Acad. Caes. Leop.-Carol. Nat. Cur., *24*, 1854, 123.) The only species in the genus *Zoogloea* as originally proposed. From running water. Scheibler used this name for a zoogloea-forming organism from slimy sugar solutions in Neue Ztschr. f. Rübenzucker- Ind., *1*, 1878, 366 and probably also in Ztschr. d. Vereins f. Rübenzucker- Ind., 1874, 330. The latter reference apparently is not available in America. See Buchanan, General Syst. Bact., 1925, 530 for a history of the genus *Zoogloea*.

TRIBE II. LACTOBACILLEAE WINSLOW ET AL.

(Jour. Bact., *5*, 1920, 211.)

Rods, often long and slender. Non-motile. Gram-positive. Pigment formation rare. When present, yellow or orange, to rust or brick-red in color. Poor surface growth (except in genus *Microbacterium*) because these bacteria are generally microaerophilic or anaerobic. Carbohydrates and polyalcohols are changed either by homofermentation to lactic acid or by heterofermentation to lactic, acetic, propionic or butyric acids, alcohol and carbon dioxide. Growth on potato is poor or absent. Gelatin is not liquefied. Nitrates are not reduced (except in genus *Microbacterium*). Several species grow at relatively high temperatures. May or may not produce catalase.

Key to the genera of tribe **Lactobacilleae.**

I. Always produce lactic acid from carbohydrates.
  a. Catalase negative. Microaerophilic.
    Genus I. *Lactobacillus*, p. 349.
  aa. Catalase positive. Aerobic.
    Genus II. *Microbacterium*, p. 370.
II. Ferments carbohydrates, polyalcohols and lactic acid with the formation of propionic and acetic acids, and carbon dioxide. Catalase positive.
    Genus III. *Propionibacterium*, p. 372.
III. Ferments carbohydrates, polyalcohols and lactic acid with the formation of butyric and acetic acids, and carbon dioxide. Generally catalase negative.
    Genus IV. *Butyribacterium*, p. 379.

Genus I. **Lactobacillus** *Beijerinck.**

(? *Dispora* Kern, Biol. Zent., *2*, 1882, 135; ?*Tyrothrix* Duclaux, Ann. Inst. Nat. Agron., *4*, 1882, 79; ?*Pacinia* Trevisan, Atti della Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 83; ?*Saccharobacillus* van Laer, Contributions à l'histoire des ferments des hydrates de carbone. Mém. Acad. Royale de Belgique, *43*, 1889; *Lactobacter* Beijerinck, Cent. f. Bakt., II Abt., *6*, 1900, 200; Beijerinck, Arch. néerl. d. sci. exact. et nat. Haarlem, Sér. 2, *7*, 1901, 212; *Streptobacillus* Rist and Khoury, Ann. Inst. Past., *16*, 1902, 70; ?*Brachybacterium* Troili-Petersson, Cent. f. Bakt., II Abt., *11*, 1903, 138; *Caseobacterium* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 336; *Plocamobacterium* Löwi, Wiener klin. Wochnschr., *33*, 1920, 730 (in part); *Lactobacterium* van Steenberge, Ann. Inst. Past., *34*, 1920, 806; *Bifidobacterium* Orla-Jensen, Le Lait, *4*, 1924, 469; *Acidobacterium* Heim, see Schlirf, Cent. f. Bakt., I Abt., Orig., *97*, 1925, 111: *Bifidibacterium* Prévot, Ann. Inst. Past., *60*, 1938, 303.) From M. L., lactic and *bacillus*, a rod.

Rods, usually long and slender. Microaerophilic. Carbohydrates and poly-alcohols are changed by homofermentation to lactic acid, or by heterofermentation to lactic and acetic acids, alcohols and carbon dioxide. Catalase negative. Found in fermenting animal (especially dairy) and plant products.

The type species is *Lactobacillus caucasicus* Beijerinck.

---

* Completely revised by Prof. Carl S. Pederson, New York State Experiment Station, Geneva, New York, in consultation with Prof. J. M. Sherman, Cornell University, Ithaca, New York and Prof. L. F. Rettger, Yale University, New Haven, Conn., June, 1938; further revision by Prof. Carl S. Pederson, January, 1945.

Key to the species of genus **Lactobacillus.**

I. Produce only traces of by-products other than lactic acid. Homofermentative.
  A. Optimum temperature 37° to 60°C or higher. Sub-genus *Thermobacterium* Orla-Jensen (The Lactic Acid Bacteria, 1919, 160).
    1. Acid from lactose.
      a. Optimum temperature 37° to 45°C.
        b. Produce levo lactic acid.
          1. *Lactobacillus caucasicus.*
          2. *Lactobacillus lactis.*
        bb. Produce inactive or dextro lactic acid.
          c. Microaerophilic.
            3. *Lactobacillus helveticus.*
            4. *Lactobacillus acidophilus.*
          cc. Anaerobic in freshly isolated cultures.
            5. *Lactobacillus bifidus.*
      aa. Optimum temperature 45° to 62°C; usually no acid from maltose.
        6. *Lactobacillus bulgaricus.*
        7. *Lactobacillus thermophilus.*
    2. No acid from lactose.
        8. *Lactobacillus delbrueckii.*
  B. Optimum temperature 28° to 32°C. Sub-genus *Streptobacterium* Orla-Jensen (*loc. cit.*, 166).
    1. Acid from lactose.
      a. Produces dextro lactic acid. Often prefers lactose to sucrose and maltose.
        9. *Lactobacillus casei.*
      aa. Produces inactive lactic acid.
        10. *Lactobacillus plantarum.*
    2. No acid from lactose.
        11. *Lactobacillus leichmannii.*

II. Produce considerable amounts of by-products other than lactic acid (carbon dioxide, alcohol and acetic acid; mannitol from fructose). Heterofermentative. Sub-genus *Betabacterium* Orla-Jensen (*loc. cit.*, 175).*
  A. Optimum temperature 28° to 32°C. Usually ferment arabinose.
    1. Does not ferment raffinose, and usually does not ferment sucrose or lactose.
        12. *Lactobacillus brevis.*
    2. Ferment raffinose, sucrose and lactose.
        13. *Lactobacillus buchneri.*
        14. *Lactobacillus pastorianus.*
  B. Optimum temperature 35° to 40°C or higher. Usually does not ferment arabinose.
        15. *Lactobacillus fermenti.*

---

* Also see discussion of *Betabacterium caucasicum*, p. 358.

1. **Lactobacilus caucasicus** Beijerinck. (*Bacillus caucasicus* Beijerinck, Arch. néerl. d. sci. exact. et nat., *23*, 1889, 428; Beijerinck, *ibid.*, Sér. 2, *7*, 1901, 212; not *Bacillus caucasicus* v. Freudenreich, Cent. f. Bakt., II Abt., *3*, 1897, 54 and 135; *Bacterium caucasicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 130; not *Bacterium caucasicum* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 209; not *Betabacterium caucasicum* Orla-Jensen, The Lactic Acid Bacteria, 1919, 175.) From Greek *Caucasia*, M. L. *caucasicus*, of the Caucasus.

The following is a possible or probable synonym: *Streptobacillus lebenis* Rist and Khoury, Ann. Inst. Past., *16*, 1902, 70.

Description taken from the two reports of Beijerinck (*loc. cit.*).

Rods: Thin and variable in size, occurring singly or in filaments. Non-motile. Non-spore-forming. Gram-positive (not recorded in early descriptions).

Gelatin: No liquefaction.

Wort gelatin: Small, white colonies.

Agar colonies: Small.

Broth: Carbohydrates necessary for growth.

Milk: Rapid acid production with coagulation, no action in casein.

Utilizes animal peptones with difficulty, utilizes vegetable peptones more readily.

Acid from glucose, sucrose, maltose and lactose. No action on starch. Action on other carbohydrates not studied. Lactose in milk converted to levo lactic acid with little carbon dioxide.

Microaerophilic.

Optimum temperature 40° to 44°C. Temperature range 25° to 45°C.

Source: From kefir and cheese.

Habitat: Occurs symbiotically with yeast in kefir.

Prototype: *Dispora caucasica* Kern. (Kern, Biol. Zent., *2*, 1882, 135; later in Bull. de la Soc. Imp. des Naturalistes de Moscow, *56*, 1882, 168; *Bacterium caucasicum* Zopf, Die Spaltpilze, 3 Aufl., 1885, 90; *Bacillus kaukasicus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 270; *Pacinia caucasica* Trevisan, I generi e le specie delle Batteriacee, 1889, 23.)

The description by Kern of an organism from kefir grains is confused probably because the organism (a spore former) which he isolated by the use of Cohn's solution was not the same as the presumably granulated lactobacillus he saw in microscopical preparations of kefir. Beijerinck was apparently the first to have isolated a lactobacillus from kefir in pure culture and to have given a sufficiently complete description to make reidentification possible. It should be noted that from the characters given, this could not have been the same species as that isolated later from kefir by v. Freudenreich (*loc. cit.*) and Orla-Jensen (*loc. cit.*).

2. **Lactobacillus lactis** (Orla-Jensen) Holland. (*Bacillus lactis acidi* Leichmann, Cent. f. Bakt., II Abt., *2*, 1896, 779; Milch. Zeitung, *25*, 1896, 67; *Thermobacterium lactis* Orla-Jensen, The Lactic Acid Bacteria, 1919, 164; *Lactobacillus lactis-acidi* Holland, Jour. Bact., *5*, 1920, 223; Holland, *idem.*) From Latin *lac*, milk.

Henneberg (Handb. der Gärungsbakt., 2 Aufl., *2*, 1926, 128) regards *Bacillus lactis acidi* Leichmann as identical with *Thermobacterium lactis* Orla-Jensen.

Rods: Long forms with a tendency to grow into threads, often strongly curling. Occur singly or in pairs in young vigorous cultures. Generally contain volutin grains. Gram-positive (not recorded in original description).

Milk: Acid produced followed by coagulation in one to four days. 1.7 per cent acid produced.

Acid from fructose, glucose, mannose, galactose, sucrose, maltose, lactose, raffinose and dextrin. Glycerol, xylose, arabinose, rhamnose, sorbitol, mannitol, inulin and starch not fermented. Salicin may or may not be fermented.

Forms levo lactic acid with only a trace of other products.

Temperature relations: Optimum 40°C.

Minimum 18° to 22°C. Maximum 50°C.

Source: From milk and cheese.

Habitat: Undoubtedly widely distributed in milk or milk products.

3. **Lactobacillus helveticus** (Orla-Jensen) Holland. (*Bacillus* ε, von Freudenreich, Cent. f. Bakt., II Abt., *1*, 1895, 173; also Landw. Jahrb. d. Schweiz, 1895, 211; *Bacillus casei* ε, v. Freudenreich and Thöni, Landw. Jahrb. d. Schweiz, 1904, 526; also Orla-Jensen, Cent. f. Bakt., II Abt., *13*, 1904, 609; *Caseobacterium* ε, Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 337; *Thermobacterium helveticum* Orla-Jensen, Maelkeri-Bakteriologie, 1916, 35; also the Lactic Acid Bacteria, 1919, 164; *Bacterium casei* ε, Holland, Jour. Bact., *5*, 1920, 221; Holland, *ibid.*, 223.) From Latin *helveticus*, Swiss.

Rods: 0.7 to 0.9 by 2.0 to 6.0 microns, occurring singly and in chains. Non-motile. Gram-positive.

Whey gelatin colonies: Does not grow readily at temperatures required for incubation of gelatin.

Lactose agar colonies: Small, grayish, viscid.

Milk: Acid, with coagulation; may become slimy.

Nitrites not produced from nitrates.

Acid from glucose, fructose, galactose, mannose, maltose, lactose, and smaller amounts from dextrin. The lactic acid is inactive.

Temperature relations: Optimum 40° to 42°C. Minimum 20° to 22°C. Maximum 50°C.

Microaerophilic.

Source: From sour milk and cheese.

Habitat: Widely distributed in dairy products.

4. **Lactobacillus acidophilus** (Moro) Holland. (*Bacillus acidophilus* Moro, Wiener klin. Wochnschr., *13*, 1900, 114; also Jahrb. f. Kinderheilkunde, *52*, 1900, 38; Holland, Jour. Bact., *5*, 1920, 215; *Plocamobacterium acidophilum* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 510; *Thermobacterium intestinale* Orla-Jensen, Orla-Jensen and Winther, Cent. f. Bakt., II Abt., *93*, 1936, 321.) From Latin *acidus*, sour; M. L. *acidus*, acid and Greek *philus*, loving.

Possible synonyms: Milchsäurebacillus, Boas and Oppler, Deutsche med. Wochnschr., *21*, 1895, 73; Diagnostik und Therapie d. Magenkrankheiten, II Teil, 1907, 265 (*Lactobacillus boas-oppleri* Bergey et al., Manual, 1st ed., 1923, 243); *Bacillus exilis* Tissier, La flore intestinale des nourrissons, Paris, 1900, 102; *Bacillus gastrophilus* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 424 (*Bacterium gastrophilum* Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 305); *Bacillus acetogenus* α Distaso, Cent. f. Bakt., I Abt., Orig., *59*, 1911, 49; *Bacillus acetogenus* β Distaso, *ibid.*, 51; *Bacillus acetogenus proteiformis* Distaso, *ibid.*, 52; *Bacillus acetogenus exilis* Distaso, *ibid.*, 53; *Bacillus paraexilis* Distaso, *ibid.*, *56*; *Bacillus dimorphus* Distaso, *ibid.*, 55; *Bacillus dimorphus* var. *longa* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 440; (*Bacteroides dimorphus* Bergey et al., Manual, 1st ed., 1923, 258); *Streptobacillus longus* Distaso, *ibid.*, 439; *Thermobacterium acidophilum* Henneberg, Cent. f. Bakt., II Abt., *91*, 1934, 102.

Description of Moro supplemented by material from Kulp and Rettger, Jour. Bact., *9*, 1924, 357; Curran, Rogers and Whittier, Jour. Bact., *25*, 1933, 595; and Rettger, Levy, Weinstein and Weiss, *Lactobacillus acidophilus*, Yale Univ. Press, New Haven, 1935.

Rods: 0.6 to 0.9 by 1.5 to 6.0 microns, occurring singly, in pairs and in short chains with rounded ends. Non-motile. Dimensions variable (Kulp and Rettger), (Curran, Rogers and Whittier). Gram-positive; old cultures often Gram-negative (Moro).

Gelatin: No growth at 20°C. No liquefaction.

Wort-agar (Moro) or tomato agar (Kulp and Rettger) plates: Surface colonies, peripheries a capilliform maze of long, delicate, twisted, fuzzy projections, center appears as a thick, dark, felt-like

mass. Deep colonies, small, irregularly shaped, with fine radiate or ramified projections.

Wort-agar slants: Growth scanty, limited, dry, veil-like.

Wort-broth: After 48 hours, fine, flocculent sediment. Other acid broths sediment whitish, slight turbidity.

Milk: Slow growth with small inoculum. Coagulates from the bottom up.

Potato: No growth.

Acid but no gas from glucose, sucrose and lactose (Moro). Acid from glucose, fructose, galactose, mannose, maltose, lactose and sucrose. Some cultures ferment raffinose and trehalose and have slight action on dextrin. Xylose, arabinose, rhamnose, glycerol, mannitol sorbitol, dulcitol and inositol not fermented (Kulp and Rettger). Inactive lactic acid and volatile acids formed from sugars (Curran, Rogers and Whittier).

No visible growth in carbohydrate-free media (Rettger, Levy, Weinstein and Weiss).

Optimum temperature 37°C. No growth at 20° to 22°C (Moro). Maximum temperature 43° to 48°C (Curran, Rogers and Whittier).

Not pathogenic for laboratory animals.

Microaerophilic.

Distinctive characters: Grows in acid media. Unless frequent transfers are made, organism may become Gram-negative and rapidly develop characteristic degeneration forms (Moro). The so-called original strains of *Bacillus acidophilus* from the Král collection, described and called *Microbacterium lacticum* by Orla-Jensen, do not have the characteristics given by Moro.

Source: From the feces of milk-fed infants. Also from the feces of older persons on high milk or lactose or dextrin-containing diets.

Habitat: As for source.

5. Lactobacillus bifidus (Tissier) Holland. (*Bacillus bifidus communis* and *Bacillus bifidus* Tissier, Recherches sur la flore intestinal des nourrissons, Paris, 1900, 85; *Bacteroides bifidus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 960; Holland, Jour. Bact., *5*, 1920, 223; *Nocardia bifida* Vuillemin, Encyclopédie Mycolog., Paris, *2*, Champignons Parasites, 1931, 132; *Actinomyces bifidus* Nannizzi, in Pollacci, Trat. Micopat. Umana, *4*, 1934, 13; *Cohnistreptothrix bifidus* Negroni and Fisher, Rev. Soc. Argentina Biol., *20*, 1944, 315.) From Latin *bifidus* split in two, cleft.

Possible synonyms: *Coccobacillus oviformis* Tissier, Ann. Inst. Past., *22*, 1908, 189 (*Bacterium oviforme* Le Blaye and Guggenheim, Manual pratique de diagnostique Bactériologie, Paris, 1914; *Bacteroides oviformis* Levine and Soppeland, Iowa Engineering Exp. Sta. Bul. 77, 1926, 35); *Bacillus ventriosus* Tissier, *loc. cit.* (*Bacteroides ventriosus* Eggerth, Jour. Bact., *30*, 1935, 281); *Diplobacillus acuminatus* Distaso, *loc. cit.* (*Bacteroides acuminatus* Bergey et al., Manual, 1st ed., 1923, 260).

Description supplemented from Weiss and Rettger, Jour. Bact., *28*, 1934, 501.

Small, slender rods: Average length 4.0 microns, 0.5 to 0.7 by 2 to 8 microns (Weiss and Rettger), occurring singly or in pairs and short chains, parallel to each other, very variable in appearance. Branched and club forms develop in some cultures. Non-motile. Gram-positive but stains irregularly in old cultures (Tissier).

Little or no growth in carbohydrate-free agar (Weiss and Rettger).

Deep sugar-agar colonies: After 3 days, solid with slightly irregular edge, whitish. Grow up to 3 cm from the surface forming a ring. Average diameter 3 mm. No gas.

Sugar broth: Good growth. Turbid within 3 days. Clears with flocculent precipitate.

Milk: Good growth with large inoculum. No coagulation (Tissier). May or may not coagulate milk (Weiss and Rettger).

Acid but no gas from glucose (Tissier). Acid from glucose, fructose, galactose,

sucrose, inulin and usually from dextrin, starch, maltose, raffinose and trehalose. A few strains form acid from lactose and salicin. The acid consists of inactive lactic acid and 18 to 25 per cent of volatile acid (Weiss and Rettger).

Optimum temperature 37°C. May show slight growth at 20°C. Killed at 60°C in 15 minutes.

Non-pathogenic for mice or guinea pigs.

Strict anaerobe (Tissier). Strict anaerobe in primary culture becoming microaerophilic (Weiss and Rettger).

Distinctive characters: Bifurcations and club-shaped forms (Tissier), particularly in infant feces and in primary culture (Weiss and Rettger).

Source: From feces of nursing infants.

Habitat: Very common in the feces of infants. May constitute almost the entire intestinal flora of breast-fed infants. Also present in smaller numbers with bottle-fed infants. Possibly more widely distributed than indicated in the intestines of warm-blooded animals.

5a. *Lactobacillus parabifidus* Weiss and Rettger. (*Bacterium bifidum* Orla-Jensen, The Lactic Acid Bacteria, 1919, 192; *Bacteroides bifidus* (Group 2) Eggerth, Jour. Bact., *30*, 1935, 295; *Lactobacillus bifidus II* or *Lactobacillus parabifidus* Weiss and Rettger, Jour. Bact., *35*, 1938, 17; Jour. Inf. Dis., *62*, 1938, 115.)

This is the more anaerobic variety of the bifid organisms from feces and seems to be more common in the intestine of adults. In contrast to *Lactobacillus bifidus*, it produces more volatile acid as well as dextro lactic acid, and ferments arabinose, xylose and melezitose but not mannose.

6. **Lactobacillus bulgaricus** (Luerssen and Kühn) Holland. (*Bacillus A*, Grigoroff, Revue Méd. Suisse romande, *25*, 1905; *Bacillus bulgaricus* Luerssen and Kühn, Cent. f. Bakt., II Abt., *20*, 1907, 241; *Thermobacterium bulgaricum* Orla-Jensen, The Lactic Acid Bacteria, 1919, 164; Holland, Jour. Bact., *5*, 1920, 215; *Acidobacterium bulgaricum* Schlirf, Cent. f. Bakt., I Abt., Orig., *97*, 1925, 116; *Plocamobacterium bulgaricum* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 511.) From Latin *bulgaricus*, of or related to Bulgaria.

Probable synonyms: *Lactobacillus longus* Beijerinck, Arch. néerl. d. sci. exact. et nat., Sér. 2, *7*, 1901, 212 (not *Lactobacillus longus* Bergey et al., Manual, 4th ed., 1934, 312); *Bacterium casei filans* Gorini, Rend. R. Acc. Lincei, *21*, 1912, 472; Cent. f. Bakt., II Abt., *37*, 1913, 1.

Description of Luerssen and Kühn supplemented by Grigoroff, *loc. cit.;* Cohendy, Compt. rend. Soc. Biol. Paris, *58*, 1906, 364; Kuntze, Cent. f. Bakt., II Abt., *21*, 1908, 737; Bertrand and Duchacek, Ann. Inst. Past., *23*, 1909, 402; White and Avery, Cent. f. Bakt., II Abt., *25*, 1910, 161; Rahe, Jour. Bact., *3*, 1918, 420; Orla-Jensen, The Lactic Acid Bacteria, 1919, 164; Kulp and Rettger, Jour. Bact., *9*, 1924, 357; Sherman and Hodge, Jour. Dairy Sci., *19*, 1936, 494.

Rods: Slender rods with rounded ends, often in chains. Non-motile. Gram-positive, older cultures showing unstained portions (Luerssen and Kühn).

Whey gelatin: No liquefaction (White and Avery).

Colonies: Flat, yellowish-white, 2 to 3 mm. Old cultures have dark centers. Deep colonies globular (Luerssen and Kühn).

Whey agar colonies: Circular to irregular (White and Avery).

Milk: Coagulation at 37°C. No gas. No decomposition of casein.

Potato: Yellow-white colonies (Luerssen and Kühn). No growth (Grigoroff), (Cohendy), (White and Avery).

Indole not formed (Grigoroff), (White and Avery).

Nitrites not produced from nitrates.

Results on acid production from sugars vary. Glucose, lactose and galactose are apparently always fermented while xylose, arabinose, sorbose, rhamnose, dulcitol, mannitol, dextrin, inulin and starch

are never fermented. Early workers (Gigoroff) (Cohendy) noted fermentation of fructose, maltose and sucrose. Later workers (Bertrand and Duchacek), (Orla-Jensen), (Rahe), (Kulp and Rettger), (Sherman and Hodge) noted variable or negative results on sucrose, maltose and unheated fructose.

Forms high acidity in milk. The lactic acid is inactive (Grigoroff), (Bertrand and Duchacek), (White and Avery) or levo (White and Avery), (Orla-Jensen) with small quantities of volatile acid (White and Avery).

Aerobic or anaerobic (Luerssen and Kühn). Microaerophilic (White and Avery). Anaerobic in fresh isolation (Sherman and Hodge).

Optimum temperature 45° to 50°C. Minimum 22°C (Luerssen and Kühn).

Distinctive characters: This species at present is regarded as including the high temperature organisms isolated from milk with difficulty. These ferment glucose, galactose and lactose but usually do not ferment sucrose, maltose or unheated fructose when freshly isolated.

Source: Originally isolated from yoghurt.

Habitat: Probably present in many milk products if held at high temperature.

7. **Lactobacillus thermophilus** Ayers and Johnson. (Jour. Bact., *9*, 1924, 291.) From Greek *thermos*, heat and *philus*, loving.

Description of Ayers and Johnson supplemented by material from Charlton, Jour. Dairy Sci., *15*, 1932, 393.

Rods: 0.5 by 3.0 microns. Stains irregularly. Non-motile (Charlton). Gram-positive.

Gelatin stab: No liquefaction.

Agar plate: Small colonies.

Agar slant: Slight, translucent growth (Charlton).

Broth: Turbid (Charlton).

Litmus milk: Acid.

Nitrites not produced from nitrates (Charlton).

Acid from glucose, lactose, sucrose, starch and trace from glycerol. No acid from salicin, mannitol, raffinose or inulin. (Ayers and Johnson). Acid from fructose, galactose, mannose, maltose, raffinose and dextrin. No acid from arabinose, xylose, glycerol, rhamnose, salicin, inulin or mannitol. Dextro lactic acid formed. (Charlton).

This is the thermophilic lactobacillus obtained from pasteurized milk which causes pin-point colonies on agar plates.

Temperature relations: Optimum temperature 50° to 62.8°C. Minimum 30°C. Maximum 65°C. Thermal death point 71°C for 30 minutes or 82°C for 2½ minutes.

Facultative anaerobe. Grows best aerobically.

Source: From pasteurized milk.

Habitat: Known only from pasteurized milk.

8. **Lactobacillus delbrueckii** (Leichmann) Beijerinck. (*Bacillus delbrückii* Leichmann, Cent. f. Bakt., II Abt., *2*, 1896, 284; *Bacillus acidificans longissimus* Lafar, Cent. f. Bakt., II Abt., *2*, 1896, 195; *Bacillus* (?) *acidificans* Migula, Syst. d. Bakt., *2*, 1900, 801; Beijerinck, Arch. néerl. d. sci. exactes et nat., Haárlem, Sér. 2, 7, 1901, 212; *Thermobacterium cereale* Orla-Jensen, The Lactic Acid Bacteria, 1919, 164; *Bacillus acidificans-longissimus* Holland, Jour. Bact., *5*, 1920, 216; *Lactobacillus acidificans-longissimus* Holland, *ibid.*, 216; *Lactobacillus cereale* Holland, *ibid.*, 223; *Lactobacterium delbrucki* (sic) van Steenberge, Ann. Inst. Past., *34*, 1920, 820.) Named for Prof. M. Delbrück, German bacteriologist.

Description of Leichmann supplemented by material from Henneberg, Cent. f. Bakt., II Abt., *11*, 1903, 154.

Rods: 0.5 to 0.8 by 2.0 to 9.0 microns (Henneberg), occurring singly and in short chains. Non-motile. Gram-positive.

Gelatin colonies: Small, gray, circular, not liquefied.

Agar colonies: Small, flat, crenated.

Agar slant: Narrow, translucent, soft, grayish streak.

Broth: Slightly turbid.

Milk: Unchanged.

Nitrites not produced from nitrates.

Acid from maltose and sucrose (Leichmann) and glucose, fructose, galactose and dextrin. No acid from xylose, arabinose, rhamnose, lactose, raffinose, trehalose, inulin, starch, mannitol or α-methyl-glucoside (Henneberg). Levo rotatory lactic acid is formed. Forms 1.6 per cent acid in mash.

This is the high temperature organism of fermenting mashes. In fresh isolations it apparently has a higher optimum temperature than when held in pure culture.

Optimum temperature 45°C.

Microaerophilic.

Source: From sour potato mash in a distillery.

Habitat: Fermenting vegetable and grain mashes.

9. **Lactobacillus casei** (Orla-Jensen) Holland. (*Bacillus α*, v. Freudenreich, Ann. d. Microg., *2*, 1890, 266; also Landw. Jahrb. d. Schweiz, 1891, 20; *Bacillus casei α*, von Freudenreich and Thöni, Landw. Jahrb. d. Schweiz, 1904, 526; also Orla-Jensen, Cent. f. Bakt., II Abt., *13*, 1904, 609; *Caseobacterium vulgare* Orla-Jensen, Maelkeri-Bakteriologie, 1916, 35; *Streptobacterium casei* Orla-Jensen, The Lactic Acid Bacteria, 1919, 166; *Bacterium casei α*, Holland, Jour. Bact., *5*, 1920, 221; Holland, *ibid.*) From Latin *caseus*, cheese.

Rods: Short or long chains of short or long rods. Non-motile. Gram-positive.

Milk: Acid with coagulation in 3 to 5 days or longer, may become slimy. Forms about 1.5 per cent lactic acid.

Utilizes casein and therefore important in cheese ripening.

Acid from glucose, fructose, mannose, galactose, maltose, lactose, mannitol and salicin. May or may not ferment sucrose. Mostly dextro lactic acid formed though a small amount of levo lactic acid may be formed. Only lactic acid produced with a trace of other by-products.

This is the more common lactic acid rod found in milk and milk products. Orla-Jensen distinguishes it from *Lactobacillus plantarum* in that it produces dextro lactic acid and usually ferments lactose more readily than sucrose or maltose.

Temperature relations: Optimum 30°C. Minimum 10°C. Maximum 37° to 40°C and with some strains 45°C.

Microaerophilic.

Source: From milk and cheese.

Habitat: Probably more widely distributed than indicated by isolations.

10. **Lactobacillus plantarum** (Orla-Jensen) Holland. (*Streptobacterium plantarum* Orla-Jensen, The Lactic Acid Bacteria, Copenhagen, 1919, 174; Holland, Jour. Bact., *5*, 1920, 225.) From Latin *planta*, sprout; M. L., a plant.

Probable synonyms: *Bacillus pabuli acidi II* Weiss, Inaug. Diss., Göttingen, 1898; Cent. f. Bakt., II Abt., *5*, 1899, 599 (*Lactobacillus pabuliacidi* Bergey et al., Manual, 1st ed., 1923, 247); *Bacillus cucumeris fermentati* Henneberg, Ztschr. f. Spiritusindustire, *26*, 1903, 22; Cent. f. Bakt., II Abt., *11*, 1903, 166 (*Lactobacillus cucumeris* Bergey et al., Manual, 1st ed., 1923, 250); *Bacillus wortmannii* Henneberg, Cent. f. Bakt., II Abt., *11*, 1903, 162 (*Lactobacillus wortmannii* Bergey et al., Manual, 3rd ed., 1930, 288); *Bacillus listeri* Henneberg, Ztschr. f. Spiritusindustrie, *26*, 1903, 22; Cent. f. Bakt., II Abt., *11*, 1903, 161 (*Lactobacterium listeri* van Steenberge, Ann. Inst. Past., *34*, 1920, 814; *Lactobacillus listeri* Bergey et al., Manual, 1st ed., 1923, 248); *Bacillus maercki* Henneberg, *loc. cit.*; *Bacillus leichmanni II* Henneberg, *loc. cit.*; *Bacillus beijerinckii* Henneberg, Ztschr. f. Spiritusindustrie, *26*, 1903, 22; see

Cent. f. Bakt., II Abt., *11*, 1903, 159 (*Lactobacillus beijerinckii* Bergey et al., Manual, 1st ed., 1923, 248); *Lactobacillus pentosus* Fred, Peterson and Anderson, Jour. Biol. Chem., *48*, 1921, 410; Jour. Biol. Chem., *53*, 1922, 111; *Lactobacillus arabinosus* Fred, Peterson and Anderson, Jour. Biol. Chem., *48*, 1921, 410; *Bacterium busae asiaticae* Tschekan, Cent. f. Bakt., II Abt., *78*, 1929, 89 (*Lactobacillus busaeasiaticus* Bergey et al., Manual, 3rd ed., 1930, 288); *Bacterium brassicae* Wehmer, Cent. f. Bakt., II Abt., *10*, 1903, 628 (*Lactobacillus brassicae* LeFevre, Abst. Bact., *6*, 1922, 25).

Description from Orla-Jensen supplemented by material from Pederson, Jour. Bact., *31*, 1936, 217.

Rods: Ordinarily 0.7 to 1.0 by 3.0 to 8.0 microns, occurring singly or in short chains, with rounded ends. Under favorable growth conditions these organisms tend to be short rods. Under adverse conditions they tend to be longer; for example, in tomato juice agar at 45°C (Pederson, N. Y. Agr. Exp. Sta. Tech. Bull. 150, 1929). In fermenting vegetables, the organisms tend to become longer as the acidity becomes greater. The organisms are usually longer in milk than in broths. Differences in morphology are well illustrated by Orla-Jensen. Non-motile. Gram-positive.

Gelatin-yeast extract-glucose stab: Filiform growth. No liquefaction.

Agar slant: Growth, if any, is very faint.

Broth: Turbid, clearing after a few days. A few strains flocculate.

Litmus milk: Acid, usually coagulated.

Nitrites not produced from nitrates.

The majority of strains form acid from glucose, fructose, mannose, galactose, arabinose, sucrose, maltose, lactose, raffinose and salicin, and to a lesser extent, from sorbitol, mannitol, dextrin, glycerol and xylose. Rhamnose, starch and inulin usually not fermented.

Lactic acid (usually inactive) with only small quantities of acetic acid and carbon dioxide is formed in the fermentation of hexose sugars. Acetic and lactic acid are produced from the pentoses. Forms up to 1.2 per cent acid in broth.

This species is the inactive lactic acid-producing rod from fermenting materials but is closely related to *Lactobacillus casei*. It ferments sucrose and maltose as readily as lactose.

Salt tolerance: Usually grows in salt up to 5.5 per cent.

Temperature relations: Optimum temperature 30°C. Minimum 10°C. Maximum 40°C. Thermal death point 65° to 75°C for 15 minutes.

Microaerophilic.

Sources from which isolated: Milk, cheese, butter, kefir, feces, fermenting potatoes, beets, corn, chard, bread dough, sauerkraut, cucumber pickles, tomato pickles, cauliflower pickles and spoiled tomato products.

Habitat: Widely distributed in nature, particularly in fermenting plant and animal products.

10a. *Lactobacillus plantarum* var. *rudensis* Breed and Pederson (not Peterson). (Jour. Bact., *36*, 1938, 667.) This chromogenic organism isolated from cheese is one of two species responsible for the development of rusty spots in cheese. It is impossible to determine whether the incompletely described species *Bacillus rudensis* Connell, Canadian Dept. of Agric., Dairying Service, Ottawa, Report for 1897, 7 is identical with this variety of *Lactobacillus plantarum* or with *Lactobacillus brevis* var. *rudensis* (see species No. 12a). This chromogenesis is produced in starch media under anaerobic conditions.

11. **Lactobacillus leichmannii** Bergey et al. (*Bacillus leichmanni I*, Henneberg, Ztschr. f. Spiritusindustrie, *26*, 1903, 22; see Cent. f. Bakt., II Abt., *11*, 1903, 163; Bergey et al., Manual, 2nd ed., 1925, 180.) Named for Prof. G. Leichmann, a German bacteriologist.

Probable synonym: *Bacillus leichmanni III*, Henneberg, *loc. cit.*

Rods: 0.6 by 2.0 to 4.0 microns, occurring singly and in short chains. The cells show two or more deeply-staining granules. Non-motile. Gram-positive.

Gelatin stab: No liquefaction.

Agar colonies: Small, clear with white centers.

Agar slant: Limited, grayish streak, better growth in stab.

Broth: Turbid.

Nitrites not produced from nitrates.

Acid from glucose, fructose, maltose, sucrose, trehalose, and slight amounts from galactose, mannitol and α-methyl-glucoside. Lactose, raffinose, arabinose, rhamnose, dextrin and inulin not fermented. Forms 1.3 per cent lactic acid in mash.

Optimum temperature 36°C. Maximum 40° to 46°C.

Microaerophilic.

The species is apparently similar to *Lactobacillus delbrueckii* but has a lower optimum temperature.

Source: From compressed yeast and from fermenting milk.

Habitat: Dairy and plant products.

12. **Lactobacillus brevis** (Orla-Jensen) Bergey et al. (*Bacillus* γ, v. Freudenreich, Landw. Jahrb. d. Schweiz, 1891, 22; *Bacillus casei* γ, v. Freudenreich and Thöni, Landw. Jahrb. d. Schweiz, 1904, 526; also Orla-Jensen, Cent. f. Bakt., II Abt., *13*, 1904, 604; *Betabacterium breve* Orla-Jensen, The Lactic Acid Bacteria, 1919, 175; Bergey et al., Manual, 4th ed., 1934, 312.) From Latin *brevis*, short.

Probable synonyms: *Bacillus brassicae fermentatae* Henneberg, Ztschr. f. Spiritusindustrie, *26*, 1903; Cent. f. Bakt., II Abt., *11*, 1903, 167 (*Lactobacillus fermentatae* Bergey et al., Manual, 1st ed., 1923, 252); *Bacillus panis fermentati* Henneberg, Ztschr. f. Spiritusindustrie, *25*, 1903; Cent. f. Bakt., II Abt., *11*, 1903, 168 (*Lactobacillus panis* Bergey et al., Manual, 1st ed., 1923, 251); *Bacillus acidophil-aerogenes* Torrey and Rahe, Jour. Inf. Dis., *17*, 1915, 437 (*Lactobacillus acidophil-aerogenes*, Holland, Jour. Bact., *5*, 1920, 216); *Lactobacillus pentoaceticus* Fred, Peterson and Davenport, Jour. Biol. Chem., *39*, 1919, 357; Peterson and Fred, *ibid.*, *42*, 1920, 273; *Lactobacillus pentoaceticus* var. *magnus* Iwasaki, Jour. Agr. Chem. Soc. Japan, *16*, 1940, 148; *Lactobacillus lycopersici* Mickle, Abst. Bact., *8*, 1924, 403; Mickle and Breed, New York Agr. Exp. Sta. Tech. Bull. 110, 1925; Pederson, *ibid.*, Tech. Bull. 150 and 151, 1929; *Bacterium soya* Saito, Cent. f. Bakt., II Abt., *17*, 1907, 20 (*Lactobacillus soyae* Bergey et al., Manual, 1st ed., 1923, 251).

Bacillus caucasicus von Freudenreich, Cent. f. Bakt., II Abt., *3*, 1897, 135 and *Betabacterium caucasicum* Orla-Jensen, The Lactic Acid Bacteria, 1919, 173 were isolated from kefir grains and considered to be the organism Kern isolated in 1882. They are gas-producing lactobacilli but are less active toward sugars than *Lactobacillus brevis*.

Description supplemented by material from Pederson, Jour. of Bact., *35*, 1938, 105.

Rods: 0.7 to 1.0 by 2.0 to 4.0 microns, with rounded ends, occurring singly and in short chains, and occasionally in long filaments which may show granulation. Non-motile. Gram-positive.

Gelatin: No liquefaction.

Agar slant: Growth, if any, faint.

Broth: Turbid, clearing after a few days.

Milk: Acid produced but no clot except with some freshly isolated strains.

Does not attack casein as a rule.

Is able to utilize calcium lactate as a source of carbon.

Acid from arabinose, xylose, glucose, fructose, galactose and maltose. Strains vary in fermentation of lactose, sucrose, mannose and raffinose. Salicin, mannitol, glycerol, rhamnose, dextrin, inulin and starch seldom fermented. Usually shows a particularly vigorous fermentation of arabinose.

Lactic acid usually inactive; acetic acid, ethyl alcohol and carbon dioxide

formed in fermentation of aldohexoses. Mannitol produced from fructose. Acetic and lactic acid produced from the pentoses.

This species includes the large group of gas-producing lactic acid rods ordinarily characterized by a marked fermentation of pentoses, particularly arabinose. They usually also ferment fructose more readily than glucose.

Temperature relations: Optimum 30°C. Growth poor below 15° and above 37°C. Maximum 38°C.

Source: From milk, kefir, cheese, feces, fermenting sauerkraut, ensilage, manure, soils, sour dough, and spoiled tomato products.

Habitat: Widely distributed in nature, particularly in plant and animal products.

12a. *Lactobacillus brevis* var. *rudensis* Breed and Pederson. (*Lactobacillus rudensis* Davis and Mattick, Proc. Soc. Agr. Bact., 1936, 3 (this organism is presumably the same as *Bacillus rudensis* Davis and Mattick, Jour. Dairy Res., *1*, 1929, 50); Breed and Pederson (not Peterson), Jour. Bact., *36*, 1938, 667.) This chromogenic variety isolated from cheese is a causative agent in the production of rusty spot in cheese. From a study of cultures, it is regarded as a chromogenic variety of *Lactobacillus brevis*. See also species No. 10a.

13. **Lactobacillus buchneri** (Henneberg) Bergey et al. (*Bacillus buchneri* Henneberg, Cent. f. Bakt., II Abt., *11*, 1903, 163; Bergey et al., Manual, 1st ed., 1923, 251.) Named for Prof. E. Buchner, a German bacteriologist.

Probable synonyms: *Bacillus wehmeri* Henneberg, Cent. f. Bakt., II Abt., *11*, 1903, 165 (*Lactobacillus wehmeri* Bergey et al., Manual, 1st ed., 1923, 249); *Bacillus hayducki* Henneberg, Cent. f. Bakt., II Abt., *11*, 1903, 163 (*Lactobacillus hayduckii* Bergey et al., Manual, 1st ed., 1923, 253); *Bacterium mannitopoeum* Müller-Thurgau, Cent. f. Bakt., II Abt., *20*, 1908, 396; *ibid.*, *36*, 1912, 129; *ibid.*, *48*, 1917 (*Lactobacillus mannitopoeus* Pederson, New York Agr. Exp. Sta. Tech. Bull. 150 and 151, 1929; *Lactobacillus mannitopoeus* var. *fermentus* Iwasaki, Jour. Agr. Chem. Soc. Japan, *16*, 1940, 148).

Description supplemented by material from Pederson, Jour. Bact., *35*, 1938, 107.

Rods: 0.35 by 0.7 to 4.0 microns, occurring singly, in pairs and chains or in filaments 25 microns or longer. Non-motile. Gram-positive.

Agar colonies: White to yellowish, adherent.

Agar slant: Growth, if any, faint.

Broth: Turbid, clearing after a few days.

Litmus milk: Usually unchanged but may be slightly acid with no reduction.

Nitrites not produced from nitrates.

Acid usually from arabinose, xylose, glucose, fructose, galactose, mannose, sucrose, lactose, maltose and raffinose. Mannitol, sorbitol, glycerol, rhamnose, salicin, inulin, dextrin and starch fermented by a few strains.

Lactic acid usually inactive. Acetic acid, ethyl alcohol and carbon dioxide formed in the fermentation of aldohexoses. Mannitol produced from fructose. Acetic and lactic acid from pentoses.

Strains of this species might be considered intermediates between *Lactobacillus brevis* and *Lactobacillus fermenti*.

Forms 1.3 per cent lactic acid in mash and 2.7 per cent alcohol.

Optimum temperature 32° to 37°C. Minimum 10° to 15°C. Maximum 44° to 48°C.

Source: From sour mash, pressed yeast, molasses, wine, catsup and sauerkraut.

Habitat: Widely distributed in fermenting substances.

14. **Lactobacillus pastorianus** (Van Laer) Bergey et al. (*Saccharobacillus pastorianus* Van Laer, Cont. l'Histoire des Ferments des Hydrates de Carbone, Acad. Roy. de Belge, 1892; *Bacillus pastorianus* Macé, Traité Pratique de Bact.,

4th ed., 1901, 957; *Lactobacterium pastorianum* van Steenberge, Ann. Inst. Past., *34*, 1920, 816; Bergey et al., Manual, 1st ed., 1923, 246.) Named for Pasteur, French chemist; from Latin *pastor*, a herdsman.

Probable synonyms: *Saccharobacillus pastorianus* var. *berolinensis* Henneberg, Cent. f. Bakt., II Abt., *8*, 1902, 186 (*Lactobacillus berolinensis* Bergey et al., Manual, 1st ed., 1923, 246); *Bacillus lindneri* Henneberg, Wochnschr. f. Brauerei, *18*, 1901, No. 30; Cent. f. Bakt., II Abt., *8*, 1902, 184 (*Lactobacillus lindneri* Bergey et al., Manual, 1st ed., 1923, 245); *Bacillus fasciformis* Schönfeld and Rommel, Wochnschr. f. Brauerei, *19*, 1902, No. 40; abst. in Cent. f. Bakt., II Abt., *9*, 1902, 807 (*Saccharobacillus berolinensis fasciformis* Henneberg, Handb. der Gärungsbakteriologie, *2*, 1926, 123; *Bacillus belorinensis* (sic, evidently intended for *Bacillus berolinensis*) Otani, Cent. f. Bakt., II Abt., *101*, 1939, 149).

Description supplemented by material from Henneberg, Cent. f. Bakt., II Abt., *8*, 1902, 184; Shimwell, Jour. Inst. Brewing, *41*, 1935, 481; and Pederson, Jour. Bact., *35*, 1938, 107.

Rods: 0.5 to 1.0 by 7.0 to 35.0 microns, occurring singly and in chains. Non-motile. Gram-positive.

Gelatin colonies: No growth.

Beer wort gelatin stab: Beaded to arborescent growth.

Beer wort agar colonies: Small, gray, raised, filamentous.

Agar slant: Little or no growth; better in stab.

Broth: Good growth in yeast extract. Turbid.

Litmus milk: Acid.

Nitrites not produced from nitrates.

Acid from arabinose, glucose, fructose, galactose, maltose, sucrose, dextrin, raffinose, trehalose and mannitol and slightly from lactose and starch. No acid from xylose, rhamnose or inulin. Forms 1.5 per cent acid in mash. Also forms CO_2 and alcohol, lactic, formic and acetic acid.

The species includes the ordinarily long rod types from spoiled beers. Apparently the same variations in regard to sugar fermentation may be found as are noted for similar species.

Optimum temperature 29° to 33°C. Minimum 11°C. Maximum 37°C.

Microaerophilic.

Source: From sour beer and from distillery yeast.

Habitat: Probably more widely distributed than indicated by isolations.

15. **Lactobacillus fermenti** Beijerinck. (Beijerinck, Arch. néerl. d. sci. exactes et nat., Sér. *2*, 7, 1901, 212; Smit, Ztschr. f. Gärungsphysiol., *5*, 1916, 273; *Lactobacterium fermentum* van Steenberge, Ann. Inst. Past., *34*, 1920, 816.) From Latin *fermentum*, ferment, yeast.

Probable synonyms: *Bacillus δ*, von Freudenreich, Cent. f. Bakt., II Abt., 1, 1895, 173; also Landw. Jahrb. d. Schweiz, 1895, 211; *Bacillus casei δ*, von Freudenreich and Thöni, Landw. Jahrb. d. Schweiz, 1904, 526; also Orla-Jensen, Cent. f. Bakt., II Abt., *13*, 1904, 609; *Betabacterium longum* Orla-Jensen, The Lactic Acid Bacteria, 1919, 174 (*Lactobacillus longus* Bergey et al., Manual, 4th ed., 1934, 312); *Bacterium gayonii* Müller-Thurgau and Osterwalder, Cent. f. Bakt., II Abt., *48*, 1917, 1 (*Lactobacillus gayonii* Pederson, New York Agr. Exp. Sta. Tech. Bull. 150 and 151, 1929); *Bacterium intermedium* Müller-Thurgau and Osterwalder, Cent. f. Bakt., II Abt., *48*, 1917, 1 (*Lactobacillus intermedium* Bergey et al., Manual, 3rd ed., 1930, 295); *Bacillus aderholdi* Henneberg, Cent. f. Bakt., II Abt., *11*, 1903, 166.

Description supplemented by material from Pederson, Jour. Bact., *35*, 1938, 106.

Rods: Variable, usually short (Beijerinck), 0.5 to 1.0 by 3.0 to 15.0 microns (Smit), sometimes in pairs or chains. Non-motile. Gram-positive (Smit).

Yeast extract-glucose-gelatin: Filiform, no liquefaction (Pederson).

Agar colonies: Flat, circular, small, translucent like droplets of water.

Agar slant: Growth, if any, scant.

Broth: Turbid, clearing after a few days.

Milk: Unchanged or slightly acid.

Nitrites not produced from nitrates.

Reduction of litmus, methylene blue, indigo carmine, sodium thiosulfate. Na_2SO_3 is reduced to H_2S (Smit).

Acid usually from glucose, fructose, maltose, sucrose and lactose (Beijerinck) and mannose, galactose, and raffinose; some strains ferment xylose; usually does not ferment arabinose, rhamnose, sorbitol, mannitol, inulin, dextrin, starch or salicin (Pederson).

Lactic acid, usually inactive; acetic acid, ethyl alcohol and carbon dioxide are formed in the fermentation of aldehexoses (Smit), (Pederson). Mannitol is formed in the fermentation of fructose (Beijerinck), (Smit). Acetic acid and lactic acid are produced from pentoses if they are fermented (Pederson).

These are the higher temperature gas-producing rods. They usually do not ferment the pentoses but when they do, the fermentation is seldom as active as that produced by strains of *Lactobacillus brevis*.

Temperature relations: Optimum 41° to 42°C. Minimum 15° to 18°C. Maximum 48° to 50°C.

Microaerophilic.

Source: From yeast, milk products, fermenting dough, potatoes or vegetables, tomato products and wine.

Habitat: Widely distributed in nature, particularly in fermenting plant or animal products.

Appendix I:* The following species probably should be included in the genus *Lactobacillus*. Many are duplicates of the species described in full, but the majority are so poorly characterized that they cannot be properly identified.

Acidobacterium aerogenes Schlirf. (Stäbchen Ka, Heim, Cent. f. Bakt., I Abt., Orig., *93*, 1924, 252; Schlirf, Cent. f. Bakt., I Abt., Orig., *97*, 1925, 114; *Plocamobacterium aerogenes* Lehmann, in Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 509.) Possibly *Lactobacillus brevis* Bergey et al. Produces acid and gas from glucose. From dental caries, mouth cavity and intestine.

Acidobacterium lactis Heim. (Heim, quoted from Schlirf, Cent. f. Bakt., I Abt., Orig., *97*, 1925, 113.) Schlirf says that this species is probably identical with *Bacillus necrodentalis* Goadby. Regarded by Lehmann (in Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 507–508) as identical with *Bacillus acidophilus* Moro; or it may be identical with *Streptobacterium casei* Orla-Jensen. From dental caries, deposit on tongue and in intestine.

Acidobacterium moroi Schlirf. (Stäbchen Kc, Heim, Cent. f. Bakt., I Abt., Orig., *93*, 1924, 252; Schlirf, Cent. f Bakt., I Abt., Orig., *97*, 1925, 114 *Plocamobacterium moroi* Lehmann, in Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 508.) From the intestine. Similar to *Acidobacterium lactis*. Kuchinka (Cent. f. Bakt., I Abt., Orig., *144*, 1939, 370) reports this organism as occurring in two cases of meningitis.

Bacillus bifidus aerobius Heurlin. (Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen. Helsinfors, 1910, 93.) From the genital canal. Resembles *Bacillus bifidus communis* Tissier.

Bacillus bifidus capitatus Heurlin. (Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen. Helsingfors, 1910, 175.) From the genital canal.

Bacillus carpathiens Kindraizuk. (Oesterr. Molkerei Zeit., *29*, 1912, 257.)

* Arranged by Prof. C. S. Pederson, New York State Experiment Station, Geneva, New York, March, 1945.

From the sour milk of the Carpathian region. Presumably *Lactobacillus bulgaricus*.

Bacillus circularis minor Heurlin. (Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen. Helsingfors, 1910, 170.) From the genital canal. Anaerobic.

Bacillus necrodentalis Goadby. (Goadby, Microorganisms in dental caries, Dental Cosmos, *42*, 1900, 213.) From dental caries.

Bacillus orenburgii Horowitz-Wlassowa. (Cent. f. Bakt., II Abt., *64*, 1925, 338.) From kumys (Caucasus). Presumably *Lactobacillus bulgaricus*.

Bacillus orientale Batchinsky. (Batchinsky, Arch. d. Gesellsch. d. Naturf. St. Petersburg, *42*, 1911; quoted from Horowitz-Wlassowa, Cent. f. Bakt., II Abt., *64*, 1925, 330.) From kumys in Ufa (U.S.S.R.). Presumably *Lactobacillus bulgaricus*.

Bacillus sardous Grixoni. (Annali di Med. Navale, *112*, 1905, 223 and Cent. f. Bakt., II Abt., *15*, 1905, 951; *Bacterium sardum miciurati* Bianco, Il Cesalpino, *8*, 1912, 33.) From gioddu (Sardinia). Presumably *Lactobacillus bulgaricus*.

Bacillus vaginae Kruse. (Scheidenbacillen, Doederlein, Das Scheidensekret und seine Bedeutung für das Puerperalfieber, Leipzig, 1892, 32; Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 358; *Bacillus vaginalis longus* Heurlin, Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen. Helsingsfors, 1910, 170; *Bacillus vaginalis* Jotten, Arch. f. Hyg., *91*, 1922, 149; Stäbchen Ke, Heim, Cent. f. Bakt., I Abt., Orig., *93*, 1924, 252; *Acidobacterium doederleinii* Heim, quoted from Schlirf, Cent. f. Bakt., I Abt., Orig., *97*, 1925, 104; *Plocamobacterium vaginae* Lehmann, in Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 510; *Lactobacillus doederlein* Gillespie and Rettger, Jour. Bact., *36*, 1938, 623.) Kruse (Allgemeine Mikrobiol., 1910, 287) considers this species a "langen Milchsäurebacillus" all of which he would group under the name *Bacillus lacticus* (not *Bacillus lacticus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 356 as this is *Streptococcus lactis* Löhnis). Jotten (*loc. cit.*) and Thomas (Jour. Inf. Dis., *43*, 1928, 218) consider this species identical with *Lactobacillus acidophilus* (Moro) Holland. From the secretion of the normal vagina. See *Bacillus crassus* Lipschütz.

Bacterium gracile Müller-Thurgau. (Cent. f. Bakt., II Abt., *20*, 1908, 396; Müller-Thurgau and Osterwalder, *ibid.*, *36*, 1912, 157; *ibid.*, *48*, 1917, 1; *Lactobacillus gracile* Bergey et al., Manual, 3rd ed., 1930, 297.) This organism which was isolated from wine is probably not a lactobacillus. It may belong to the genus *Leuconostoc* (subculture examined in 1936, C. S. Pederson).

Bacterium granulosum Lehmann and Neumann. (Körnchenbacillus, Luerssen and Kühn, Cent. f. Bakt., II Abt., *20*, 1907, 241; Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 306.) From yoghurt (Bulgaria). Presumably *Lactobacillus bulgaricus*.

Bacterium lactis commune Hohennadel. (Arch. f. Hyg., *85*, 1916, 237.) From feces. Similar to *Lactobacillus acidophilus* (Moro) Holland.

Bacterium mazun Weigmann, Gruber and Huss. (Milchsäurebakterium aus Mazun, Düggeli, Cent. f. Bakt., II Abt., *15*, 1905, 595; Weigmann et al., Cent. f. Bakt., II Abt., *19*, 1907, 78.) From mazun (Armenia). Presumably *Lactobacillus bulgaricus*.

Bacterium vermiforme Ward. (Phil. Tran. Roy. Soc. London, *183*, 1892, 149; *Bacillus vermiformis* Migula, Syst. d. Bakt., *2*, 1900, 652; *Betabacterium vermiforme* Mayer, Inaug. Diss., Univ. Utrecht, 1938.) Originally isolated from the ginger beer plant fermentation. This is presumably a slime-forming lactobacillus.

Bacteroides aerofaciens Eggerth and *Bacteroides biformis* Eggerth. (Jour. Bact., *30*, 1935, 282–283.) From feces. Possibly lactobacilli but their relationships are not definitely known.

Lactobacillus betadelbrueckii Kitahara. (Bull. Agr. Chem. Soc. Japan, Tokyo, *16*, 1940, 123.) From cereal mash.

Lactobacillus caneus Kitahara (*loc. cit.*). From cereal mash.

Lactobacillus ciliatus Kitahara (*loc. cit.*). From cereal mash.

Lactobacillus enzymothermophilus Buck. (Amer. Jour. Pub. Health, *32*, 1942, 1230.) A thermophilic (growth at 52° and 62°C) presumably spore-forming bacillus isolated from pasteurized milk.

Lactobacillus fructovorans Charlton, Nelson and Werkman. (Iowa State Coll. Jour. Sci., *9*, 1934, 1.) From salad dressing. Similar to *Lactobacillus brevis*.

Lactobacillus hilgardii Douglas and Cruess. (Food Research, *1*, 1936, 113.) This organism was isolated from wine but is not completely described and so cannot be compared with previously described species.

Lactobacillus hyochi Otani, *Lactobacillus hyochi* var. 1, Otani, *Lactobacillus hyochi* var. 2, Otani, *Lactobacillus filamentosus* Otani, *Lactobacillus alcoholphilus* Otani, and *Lactobacillus saprogenes* Otani. (Jour. Faculty of Agric., Hokkaido Imp. Univ., *39*, 1936, 2.) These organisms were isolated from sake. With the possible exception of the last type, they are probably identical with *Lactobacillus plantarum* or closely related species.

Lactobacillus odontolyticus Rodriguez. (*Bacillus acidophilus odontolyticus I* and *II*, McIntosh, James and Lazarus-Barlow, Brit. Jour. Exp. Med. and Path., *3*, 1922, 141; *Bacillus acidophilus odontolyticus*, *ibid.*, 145; *Lactobacillus odontolyticus* and *Lactobacillus odontolyticus* Types *I*, *II* and *III*, Rodriguez, Military Dent. Jour., *5*, 1922, 206; *Bacillus odontolyticus* McIntosh, James and Lazarus-Barlow, Brit. Jour. Exp. Med. and Path., *5*, 1924, 178; *Bacillus acidophilus-odontolyticus* Rosebury, Linton and Buchbinder, Jour. Bact., *18*, 1929, 395; *Lactobacillus odontolyticus I* and *II*, Topley and Wilson, Princ. Bact. and Immun., 2nd ed., 1936, 588.) From dental caries. Type I resembles and is possibly identical with *Bacillus acidophilus* Moro and Doederlein's bacillus (*Bacillus vaginae* Kruse). See Rosebury, Bact. Rev., *8*, 1944, 189 and Arch. of Path., *38*, 1944, 413. Type II shows considerable pleomorphism, short coccal forms appearing in the more alkaline media (McIntosh, James and Lazarus-Barlow, Brit. Jour. Exp. Med. and Path., *5*, 1924, 183). Types I, II and III of Rodriguez (*loc. cit.*) do not correspond with Types I and II of McIntosh et al. or with the groupings of Howe and Hatch (Jour. Med. Res., *36*, 1917, 481).

Lactobacillus panis acidi Nikolaev. (Wiss. Forschungsinst. Bäkerei-indust., U. S. S. R., *5*, 1933, 3–11.) Four isolations from bread dough designated by the Greek letters, α, β, γ_1 and γ_2.

Lactobacillus sake Katagiri, Kitahara, Fukami and Sugase. (Bull. Agric. Chem. Soc. Japan, *10*, 1934, 153.) From mash used in the manufacture of sake. Similar to *Lactobacillus plantarum*.

Lactobacillus xylosus Kitahara. (Bull. Agr. Chem. Soc. Japan, Tokyo, *16*, 1940, 123.) From cereal mash.

Lactobacterium cerevisiae van Steenberge. (Ann. Inst. Past., *34*, 1920, 806.) From beer.

Lactobacterium conglomeratum van Steenberge (*loc. cit.*, 812). From beer-wort.

Lactobacterium filatim van Steenberge (*loc. cit.*, 812). From beer-wort.

Lactobacterium floccogenum van Steenberge (*loc. cit.*, 812). From beer-wort.

Lactobacterium grave van Steenberge (*loc. cit.*, 814). From beer-wort.

Lactobacterium multivolaticum van Steenberge (*loc. cit.*, 814). From beer-wort.

Lactobacterium multivolatigenum van Steenberge (*loc. cit.*, 812). From beer-wort.

Lactobacterium oligoacidificans van Steenberge, (*loc. cit.*, 814). From beer-wort.

Lactobacterium parcifermentans van Steenberge (*loc. cit.*, 812). From beer-wort.

Lactobacterium terricola van Steenberge (*loc. cit.*, 806). From garden soil.

Lactobacterium viscogenum van Steenberge (*loc. cit.*, 814). From beer-wort.

Streptobacillus lebenis Rist and Khoury. (Rist and Khoury, Ann. Inst. Past., *16*, 1902, 70; *Bacillus lebeni* Kuntze, Cent. f. Bakt., II Abt., *21*, 1908, 744; *Streptobacillus lebensis* α and β Löhnis, Cent. f. Bakt., II Abt., *22*, 1909, 553; *Streptobacillus lebenis viscosus* and *Streptobacillus lebenis nonviscosus* Severin, Cent. f. Bakt., II Abt., *24*, 1909, 488; *Bacterium lebenis* Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 308.) From leben (Egypt and Near East). Presumably *Lactobacillus bulgaricus.*

Streptothrix dadhi Chatterjee. (Cent. f. Bakt., I Abt., Orig., *53*, 1910, 111.) From sour milk (dadhi) of India. Presumably *Lactobacillus bulgaricus.*

Thermobacterium jugurt Orla-Jensen. (Yoghurt bakterium, Kuntze, Cent. f. Bakt., II Abt., *21*, 1908, 737; Orla-Jensen, The Lactic Acid Bacteria, 1919, 164; *Lactobacillus jugurt* Holland, Jour. Bact., *5*, 1920, 225.) From jughurt (Bulgaria). Presumably *Lactobacillus bulgaricus.*

Thermobacterium mathiacolle Cecilia. (Le Lait, *20*, 1940, 385–390.) From sweetened condensed milk. Possibly a spore-former.

Appendix II:* The genus *Leptotrichia* Trevisan, 1879 is no longer recognized as a valid genus. While the confusion with *Leptothrix* Kützing, 1843 was corrected by Trevisan's work, the identity of the type species, *Leptotrichia buccalis*, is uncertain. Few of the species that have been placed in *Leptothrix* and *Leptotrichia* are well enough described to be recognized with certainty.

All descriptions of *Leptotrichia buccalis* published earlier than 1886 are based on microscopic observations only. This is also true of the three species of *Leptothrix* recognized by Miller (Die Mikroorganismen der Mundhöhle, Leipzig, 1889, 69–80). The species that he distinguished in this way are recognized in the seven editions of Lehmann and Neumann's Bakteriologische Diagnostik published from 1896 to 1927. Chester (Manual Determ. Bact., 1901, 371) also follows Miller's ideas in regard to the nature of the species of *Leptothrix.* These authors felt that the identity of the true *Leptotrichia buccalis* was doubtful.

On the other hand, Vignal (Arch. de Physiol. norm. et path., *8*, 1886, 337) isolated what he thought to be this organism, and it is his description that is used with minor changes by Eisenberg (Bakt. Diag., 3 Aufl., 1891, 134), Migula (Syst. d. Bakt., *2*, 1900, 445) and in all editions of Bergey's Manual (1923–1939) up to the present edition. A study of Vignal's work shows, however, that the filamentous organism that he isolated and grew readily in broth, agar and gelatin cultures was in all probability one of the common spore-formers. It grew but rarely on the plates inoculated with material from the mouth. As is clearly shown in his drawing and descriptions, it liquefied gelatin rather quickly with the formation of the characteristic wrinkled pellicle of a spore-former. Soon after, Arustamow (Wratsch, 1889, Nos. 3 and 4; abstract in Cent. f. Bakt., *6*, 1889, 349) isolated a similar aerobic, filamentous organism that grew readily at 37°C on agar and gelatin, but he also noted large numbers of very tiny colonies of a microaerophilic bacterium which may have been the lactobacilli or lactobacilli-like organisms of later authors. Even recent excellent reviews of the

* Completely rearranged by Prof. Robert S. Breed and Prof. Carl S. Pederson, New York State Experiment Station, Geneva, New York, March, 1945.

early literature (Buchanan, Systematic Bact., 1925, 345–353; Thjøtta, Hartmann and Bøe, Norske Videnkaps Akad. i Oslo, I, Math.-Nat. Klasse, No. 5, 1939, 41 pp.) or reviews of the voluminous studies of the past thirty years (Rosebury, Bact. Rev., *8*, 1944, 198) fail to clear away all of the confusion that has arisen.

Some investigators, such as Heim (Sitzber. d. physik.-med. Soz. in Erlangen for 1922–23, *54*, 1925, 121) and his co-workers, grew the mouth streptococci readily and thought them important as the cause of dental caries. Others following the lead of Kligler (Jour. Allied Dental Soc., *10*, 1915, 282 and 445) and Wherry and Oliver (Jour. Inf. Dis., *19*, 1916, 299) have found the most important organisms of caries to be the long, Gram-positive, granular, non-motile rods that grow like lactobacilli. But even here it is not altogether clear whether the high acid-producing (*Bacillus acidophilus odontolyticus* McIntosh, James and Lazarus-Barlow, British Jour. Exper. Path., *3*, 1922, 145) or the low acid-producing type (*Leptothrichia buccalis* Thjøtta et al., *loc. cit.*, 31) of rods really represents the *Leptothrix buccalis* of early observers. Some observers, e. g., Balleid (Brit. Dent. Jour., *48*, 1925, 289), have even identified a branching organism of the mouth, *Actinomyces israeli*, as *Leptotrichia buccalis* according to Rosebury (*loc. cit.*, 200).

As these mouth organisms are apparently better placed in other genera so far as they have been definitely identified, the genus and the species that have been described as belonging in it are merely listed here.

Genus A. **Leptotrichia** *Trevisan.*

(Trevisan, Reale Istituto Lombardo di Scienze e Lettere, Ser. II, *4*, 1879, 147; not *Leptothrix* Kützing, Phycologica Generalis, 1843, 198; *Bacteriopsis* Trevisan, Atti della Accad. Fisio-Medico-Statistica in Milano, Ser. IV, *3*, 1885, 103; *Rasmussenia* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 930; *Syncrotis* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 312.)

The type species is *Leptotrichia buccalis* (Robin) Trevisan.

Leptotrichia buccalis (Robin) Trevisan. (*Leptothrix buccalis* Robin, Histoire naturelle des végétaux parasites, Paris, 1853, 354; Trevisan, Reale Istituto Lombardo di Scienze e Lettere, Ser. II, *4*, 1879, 147; *Leptothrix III*, Rasmussen, Om Dryckning of Microorganismer fra Spyt of sunde Mannesker, 1883; *Rasmussenia buccalis* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 930; *Bacterium buccale* Migula, Syst. d. Bakt., *2*, 1900, 445; not *Leptothrix buccalis* Chester, Manual Determ. Bakt., 1901, 371; not *Bacillus buccalis* Chester, *ibid.*, 234; not *Bacillus buccalis* Trevisan, I generi e le specie delle Batteriacee, 1889, 15; *Syncrotis buccalis* Enderlein, Sitzungsber. Ges. Naturf. Freunde, Berlin, 1917, 312; *Bacillus buccalis* Holland, Jour. Bact., *5*, 1920, 217.) From the mouth.

Other species that have been associated with this genus are as follows:

Bacillus maximus buccalis Miller. (Deutsche med. Wchnschr., *14*, 1888, 612; *Bacillus buccalis* Trevisan, I generi e le specie delle Batteriacee, 1889, 15) From the mouth. Regarded by Goadby (The Mycology of the Mouth, London, 1903) and by Kligler (Jour. Allied Dental Soc., *10*, 1915, 152) as a spore-former.

Leptothrix asteroide Mendel. (Compt. rend. Soc. Biol., Paris, *81*, 1918, 471–475.) From the mouth. Rosebury (Bact. Rev., *8*, 1944, 202) thinks this Gram-negative, anaerobic organism belongs in *Bacteroides* Castellani and Chalmers.

Leptothrix anaerobius tenuis Lewkowicz. (Arch. méd. exp. anat. path., *13*, 1901, 633; *Leptothrix tenuis* Weinberg et al., Les Microbes Anaérobies, 1937, 844; *Pseudoleptothrix tenuis* Prévot, Ann. Inst. Past., *60*, 1938, 301.) From mouths of infants.

Leptothrix falciformis Beust. (Dental Cosmos, *50*, 1908, 594; Jour. Dent. Res., *16*, 1937, 379.) From the mouth.

Leptothrix filiformis Castellani and Chalmers. (*Bacillus* (*Leptothrix?*) *pyogenes filiformis* Flexner, Jour. Exp. Med., *1*, 1896, 211; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 1068.) From the genital tract and thoracic cavities of a rabbit with an acute pleuritis, pericarditis, pneumonia and acute endometritis. Gram-negative. Not regarded as identical with *Bacillus piliformis* Tyzzer (Jour. Med. Res., *37*, 1917, 307) which is a spore-former.

Leptothrix gigantea Miller. (Miller, Ber. d. deutsch. bot. Gesell., *1*, 1883, 221; *Leptotrichia gigantea* Trevisan, I generi e le specie delle Batteriacee, 1889, 10; *Rasmussenia gigantea* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 930.) From pyorrhœa in dogs, swine and sheep. This name was applied to a mixture of species.

Leptothrix haemoglobinophila sporulens Mackenzie. (In System of Bact., Med. Res. Council, London, *8*, 1931, 99.) From cerebro-spinal fluid. A Gram-negative spore-former.

Leptothrix innominata Miller. (Die Mikroorganismen der Mundhöhle, 1889, 51, Leipzig; *Pseudoleptothrix innominata* Prévot, Ann. Inst. Past., *60*, 1938, 301.) Prévot (*loc. cit.*) regards this species as type for his new genus *Pseudoleptothrix*. Proposed to include all filamentous forms from the mouth that resemble *Leptothrix buccalis* Robin.

Leptothrix insectorum Robin. (Histoire naturelle der végétaux parasites, Paris, 1853, 354.) From the rectums of insects.

Leptothrix maxima buccalis Miller. (Miller, Deutsche med. Wchnschr., *14*, 1888, 612; *Leptotrichia maxima* Trevisan, I generi e le specie delle Batteriacee, 1889, 10; *Rasmussenia maxima* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 930; *Leptothrix buccalis* Chester, Man. Determ. Bact., 1901, 371; *Bacillus maximus* Goadby, Mycology of the Mouth, 1903, 191.) From the mouth.

Leptothrix parasitica Kützing. (Kützing, Bot. Zeitg., 1847, 220; quoted from Winter, in Die Pilze, Rabenhorst's Kryptogamen Flora, 2 Aufl., *1*, 1880, 57; *Bacterium parasiticum* Billet, Bull. Sci. de la France et de la Belgique, Paris, *21*, 1890, 199.) From a brownish deposit on algae.

Leptothrix preputialis Vicentini. (Atti Accad. Med. Chir. di Napoli, *43*, 1890–91, quoted from Vicentini, Bacteria of the Sputa. Trans. by Stuter and Saieghi, London, 1897, 89.) From the urethra.

Leptothrix pyogenes cuniculi Muscatello. (Muscatello, 1899, quoted from Nannizzi, in Pollacci, Tratt. Micopat. Umana, *4*, 1934, 57; *Leptotrichia cunieuli* (sic) Nannizzi, *ibid.*, 57.) From spontaneous suppuration in a rabbit.

Leptothrix racemosa Vicentini. (Vicentini, Atti d. r. Accad. Med.-Chir. di Napoli, *46*, 1892, 459; *Leptotrichia racemosa* Nannizzi, in Pollacci, Tratt. Micopat. Umana, *4*, 1934, 56.) From the mouth. Conidia-like bodies are described. See Vicentini, Bact. of the Sputa, Eng. Trans. by Stuter and Saieghi, London, 1897 and Williams, Dental Cosmos, *41*, 1899, 330.

Leptothrix racemosa vincenti (sic) Mackenzie. (Leptothrix, Matthews, Pract., *74*, 1905, 197; Mackenzie, in System of Bact., Med. Res. Council, London, *8*, 1931, 94.) From localized empyema. Appears to be the same as Vicentini's organism.

Leptothrix vaginalis Donné. (Donné, quoted from Nannizzi, in Pollacci, Tratt. Micopat. Umana, *4*, 1934, 56; *Leptotrichia vaginalis* Nannizzi, *ibid.*, 56.) Saprophyte from the vagina.

Leptothrix vaginalis von Herff. (Ueber Scheidenmykosen, Samml. klin. Vortr. n. F., 1895, No. 137.) From a case of vaginal mycosis.

Leptothrix variabilis Rasmussen. (Rasmussen, Om Dryckning of Microorganismer fra Spyt of sunde Mannesker,

1883; *Leptothrix II*, Zopf, Die Spaltpilze, 3 Aufl., 1885, 107; *Leptotrichia variabilis* Trevisan, I generi e le specie delle Batteriacae, 1889, 10; *Rasmussenia variabilis* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 931.) From saliva.

Rasmussenia anceps De Toni and Trevisan. (*Leptothrix I*, Rasmussen, Om Dryckning of Microorganismer fra Spyt of sunde Mannesker, 1883; *Bacteriopsis rasmusseni* Trevisan, Atti della Accad. Fisio-Med.-Stat. in Milano, Ser. IV, *3*, 1885, 103; *Bacillus rasmusseni* Trevisan, I generi e le specie delle Batteriacee, 1889, 15; De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 930; *Leptotrichia anceps* Nannizzi, in Pollacci, Tratt. Micopat. Umana, *4*, 1934, 54.) From saliva.

Appendix III:* Many species of anaerobic, Gram-positive, non-spore-forming, largely parasitic rods have been described. These are similar in many ways to the species included in *Lactobacillus*. Prévot has arranged these in the following genera. Several are inadequately studied and scarcely deserve recognition. Some, as indicated, may belong in other genera, e.g., spore-formers belonging in genus *Clostridium*. Some species produce gas in sugar broths or have other characteristics (e.g., motility) that are unusual for the families that include Gram-positive, non-spore-forming rods.

Genus I. **Eubacterium** *Prévot*
(Ann. Inst. Past., *60*, 1938, 294.)

Non-motile, straight or curved rods. Usually occurring singly, in pairs or very short chains. Never show branching. Not capsulated. Gram-positive. Anaerobic.

1. *Eubacterium foedans* (Klein) Prévot. (*Bacillus foedans* Klein, Lancet, *1*, 1908, 1832; Prévot, Ann. Inst. Past., *60*, 1938, 294.) From salted ham.

2. *Eubacterium niosii* (Hauduroy et al.) Prévot. (Anaerobe Bacillus, Niosi, Cent. f. Bakt., I Abt., Orig., *58*, 1911, 193; *Bacteroides niosii* Hauduroy et al., Dict. d. Bact. Path., 1937, 65; Prévot, Ann. Inst. Past., *60*, 1938, 294.) From suppurative pleuritis.

3. *Eubacterium rectale* Prévot. (Un bacille anaérobie, Grooten, Compt. rend. Soc. Biol., Paris, *102*, 1929, 43; *Bacteroides rectalis* Hauduroy et al., Dict. d. Bact. Path., 1927, 72; Prévot, Ann. Inst. Past., *60*, 1938, 294.) From rectal ulcer.

4. *Eubacterium obsti* Prévot. (Bacillus B, Obst, Jour. Inf. Dis., *24*, 1919, 159 and 168; Prévot, Ann. Inst. Past., *60*, 1938, 294.) From stomach of sardines and from their food (small crustaceans).

5. *Eubacterium quartum* Prévot. (Anaerob No. IV, Rodella, Ztschr. f. Hyg., *41*, 1902, 474; Prévot. Ann. Inst. Past., *60*, 1938, 294.) From intestine of a child.

6. *Eubacterium quintum* Prévot. (Anaerob No. V, Rodella, Ztschr. f. Hyg., *41*, 1902, 475; Prévot, Man. de Class. et Determ., Monographie Inst. Past., 1940, 65.) From intestine of a child.

7. *Eubacterium ethylicum* Prévot. (*Bacillus gracilis ethylicus* Achalme and Rosenthal, Compt. rend. Soc. Biol., Paris, *57*, 1906, 1025; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From a human stomach.

8. *Eubacterium cadaveris* Prévot (see *Bacillus cadaveris butyricus* Buday). No spores observed.

9. *Eubacterium tortuosum* (Debono) Prévot. (*Bacillus tortuosus* Debono, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 233; *Bacteroides tortuosus* Bergey et al., Manual, 1st ed., 1923, 529; Prévot, Ann.

* Arranged by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, March, 1945.

Inst. Past., *60*, 1938, 295.) From human feces.

10. *Eubacterium aerofaciens* (Eggerth) Prévot. (*Bacteroides aerofaciens* Eggerth, Jour. Bact., *30*, 1935, 282; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From human feces.

11. *Eubacterium biforme* (Eggerth) Prévot. (*Bacteroides biformis* Eggerth, Jour. Bact., *30*, 1935, 283; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From human feces.

12. *Eubacterium limosum* (Eggerth) Prévot. (*Bacteroides limosus* Eggerth, Jour. Bact., *30*, 1935, 290; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From human feces. Pederson (Jour. Bact., *50*, 1945, 478) secured a culture of this species from Eggerth, and found that it fermented glucose with the production of higher fatty (presumably butyric) acids and lactic acid. The species should probably be placed in *Butyribacterium* Barker.

13. *Eubacterium disciformans* (Massini) Prévot. (*Bacillus disciformans* Massini, Ztschr. f. gesammte Exp. Med., *2*, 1913, 81; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From respiratory system and skin.

14. *Eubacterium poeciloides* (Roger and Garnier) Prévot. (*Bacillus poeciloides* Roger and Garnier, Bull. et Mem. Soc. Méd. des Hôpitaux Paris, *2*, 1906, 870; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From intestine.

15. *Eubacterium typhi exanthematici* Prévot (see *Corynebacterium typhi* Topley and Wilson).

17. *Eubacterium minutum* (Tissier) Prévot. (*Bacillus anaerobicus minutus* Tissier, Recherches sur la flore intestinale des nourissons, Paris, 1900; *Bacteroides minutus* Hauduroy et al., Dict. d. Bact. Path., 1937, 64; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From intestine of breast-fed infant.

18. *Eubacterium parvum* (Choukévitch) Prévot. (*Coccobacillus anaerobicus parvus* Choukévitch, Ann. Inst. Past., *25*, 1911, 256; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From large intestine of a horse.

19. *Eubacterium lentum* (Eggerth) Prévot. (*Bacteroides lentus* Eggerth, Jour. Bact., *30*, 1935, 280; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From human feces.

Genus II. **Catenabacterium** *Prévot.*
(Ann. Inst. Past., *60*, 1938, 294.)

Non-motile, straight or curved rods. Usually grow in long chains or filaments. No branching. Not capsulated. Gram-positive. Anaerobic.

1. *Catenabacterium helminthoides* (Lewkowicz) Prévot. (*Bacillus helminthoides* Lewkowicz, Arch. de Méd. Exp., *13*, 1901, 631; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From mouth of breast-fed infant.

2. *Catenabacterium filamentosum* Prévot. (Jungano, Compt. rend. Soc. Biol., Paris, *60*, 1909, 112 and 122; Prévot, Ann. Inst. Past., *60*, 1938, 295.) From intestine of a rat.

3. *Catenabacterium lottii* Prévot. (Lotti, Ann. Ig. Sper., *19*, 1909, 75; Prévot, Ann. Inst. Past., *60*, 1938, 296.) From human appendix and intestine.

4. *Catenabacterium catenaforme* (Eggerth) Prévot. (*Bacteroides catenaformis* Eggerth, Jour. Bact., *30*, 1935, 286; Prévot, Ann. Inst. Past., *60*, 1938, 296.) From human feces.

5. *Catenabacterium nigrum* (Repaci) Prévot. (*Streptobacillus gangrenae pulmonaris* Repaci, Compt. rend. Soc. Biol., Paris, *61*, 1910, 410; Prévot, Ann. Inst. Past., *60*, 1938, 296.) From gangrenous tissue found in a lung.

Genus III. **Ramibacterium** *Prévot.*
(Ann. Inst. Past., *60*, 1938, 294.)

Non-motile, straight or curved rods with frequent branching. Not capsulated. Gram-positive. Anaerobic.

1. *Ramibacterium ramosum* (Veillon and Zuber) Prévot. (*Bacillus ramosus* Veillon and Zuber, Arch. méd. exp. et anat. path., *10*, 1898, 542; *Nocardia ramosa* Vuillemin, Encyclopédie Mycolog., Paris, *2*, Champignons Parasites, 1931, 132; *Actinomyces ramosus* Nan-

nizzi, in Pollacci, Tratt. Micopat. Umana, *4*, 1934, 42; *Fusiformis ramosus* Topley and Wilson, Princ. Bact. and Immun., 2nd ed., 1936, 358; Hauduroy et al., Dict. d. Bact. Path., 1937, 71 regard *Bacillus poeciloides* (*Eubacterium poeciloides*) as a synonym; Prévot, Ann. Inst. Past., *60*, 1938, 296.) Commonly found in appendicitis.

2. *Ramibacterium ramosoides* (Rüneberg) Prévot. (*Bacillus ramosoides* Rüneberg, Arb. a. d. path. Inst. d. Univ. Helsingfors, *2*, 1908, 271, see Cent. f. Bakt., I Abt., Ref., *43*, 1909, 665; Prévot, Ann. Inst. Past., *60*, 1938, 296.) From peritoneal fluid in appendicitis.

3. *Ramibacterium pseudoramosum* (Distaso) Prévot. (*Bacillus pseudoramosus* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 441; *Bacteroides pseudoramosus* Bergey et al., Manual, 1st ed., 1923, 259; Prévot, Ann. Inst. Past., *60*, 1938, 296.) From human feces.

Genus IV. **Cillobacterium** *Prévot.*
(Ann. Inst. Past., *60*, 1938, 294.)

Motile, straight or curved rods. Peritrichous. Not capsulated. Gram-positive. Anaerobic.

1. *Cillobacterium moniliforme* (Repaci) Prévot. (*Bacillus moniliformis* Repaci, Compt. rend. Soc. Biol., Paris, *61*, 1910, 216; Prévot, Ann. Inst. Past., *60*, 1938, 296.) From the respiratory system.

2. *Cillobacterium endocarditis* (Routier and Braunberger) Prévot. (Bacille BG, Routier and Braunberger, Compt. rend. Soc. Biol., Paris, *115*, 1934, 611; Prévot, Ann. Inst. Past., *60*, 1938, 296.) From febrile endocarditis.

3. *Cillobacterium meningitis* Prévot. (Stamm S. V., Ghon, Mucha and Müller, Cent. f. Bakt., I Abt., Orig., *41*, 1906, 145 and 693; Prévot, Ann. Inst. Past., *60*, 1938, 297.) From meningitis following chronic otitis.

4. *Cillobacterium spatuliforme* Prévot (see *Bacillus tenuis spatuliformis* Distaso). Said to belong to *Bacillus welchii* group but no spores observed.

5. *Cillobacterium multiforme* Prévot (see *Bacillus multiformis* Distaso). Said to belong to *Bacillus welchii* group but no spores observed.

Genus V. **Bifidobacterium** *Orla-Jensen.*
(Orla-Jensen, Le Lait, *4*, 1924, 469; *Bifidibacterium* (sic) Prévot, Ann. Inst. Past., *60*, 1938, 303.)

Non-motile rods which may be swollen. The ends may be bifurcate or double bifurcate. Gram-positive. Anaerobic. This genus is regarded as one of four genera of lactic acid, rod-shaped bacteria by Orla-Jensen, and he states that the organisms in the genus form dextro rotatory lactic acid. It is placed in the Order *Actinomycetales* by Prévot.

1. *Bifidibacterium bifidum* (Tissier) Prévot. (Prévot, Ann. Inst. Past., *60*, 1938, 303.) See *Lactobacillus bifidus* (Tissier) Holland.

2. *Bifidibacterium appendicitis* Prévot. (Bacillus α Lotti, Ann. Ig. Sper., *19*, 1909, 75; Prévot, Ann. Inst. Past., *60*, 1938, 303.) From an infected appendix.

3. *Bifidibacterium constellatum* (White) Prévot. (*Bacillus constellatus* White, Jour. Path. and Bact., *24*, 1921, 69; Prévot, Ann. Inst. Past., *60*, 1938, 303.) From the intestine of bees.

4. *Bifidibacterium intestinalis* Prévot. (*Bacillus intestinalis tuberculiformis* Jacobsen. Also uses *Bacillus tuberculiformis* and *Bacillus tuberculiformis intestinalis*, Ann. Inst. Past., *22*, 1908, 315; Prévot, Ann. Inst. Past., *60*, 1938, 303.) From feces of an infant.

5. *Bifidibacterium cornutum* (Distaso) Prévot. (*Bacillus cornutus* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 443; *Bacteroides cornutus* Castellani and Chalmers, Man. Trop. Med., 1919, 960; Prévot, Ann. Inst. Past., *60*, 1938, 303.) From human mouth and intestine.

6. *Bifidibacterium bifurcatum* Prévot. (*Bacillus bifurcatus gazogenes* Choukévitch, Ann. Inst. Past., *22*, 1911, 348; Prévot, Ann. Inst. Past., *60*, 1938, 303.) From intestine of a horse.

Genus II. Microbacterium *Orla-Jensen.**

(The Lactic Acid Bacteria, 1919, 179.) From Greek *mikros*, small and M. L. *bacterium*, a small rod.

Small rods. Non-motile. Gram-positive. Produce lactic acid but no gas from carbohydrates. Surface growth on media is good. Produce catalase. Usually heat-resistant. Found in dairy products and utensils, fecal matter and soil.

The type species is *Microbacterium lacticum* Orla-Jensen.

Key to the species of genus Microbacterium.

I. Acid from starch; survives 85°C for 2½ minutes.
  1. *Microbacterium lacticum.*

II. No acid from starch; survives 71.6°C for 2½ minutes.
  2. *Microbacterium flavum.*

1. **Microbacterium lacticum** Orla-Jensen. (The Lactic Acid Bacteria, 1919, 179; *Corynebacterium lacticum* Jensen, Proc. Linnean Soc. of New So. Wales, *59*, 1934, 50.) From Latin *lac*, milk; M. L., pertaining to milk.

Small thin rods: 0.3 by 1.0 micron; may have coccus-like appearance. Non-motile. Granular. Gram-positive. Angular and pallisade arrangements of cells are characteristic.

Agar slant: White or at times slight greenish-yellow growth; adherent.

Gelatin: No liquefaction.

Milk: Acid, coagulation variable.

Nitrites usually not produced from nitrates.

Indole not formed.

Acid from glucose, fructose, mannose, galactose, maltose, lactose, dextrin and starch. No acid from xylose, arabinose, rhamnose, or raffinose. Dextro lactic acid formed.

Catalase is produced.

Temperature relations: Minimum 10°C. Optimum 30°C. Maximum 35°C. Survives 85°C for 2½ minutes in skim-milk.

Aerobic to facultative anaerobic.

Source: From cheese, milking equipment, grass, human and bovine feces. Orla-Jensen (*loc. cit.*, 180–181) identifies the *Bacillus acidophilus* cultures obtained by him from the Král collection as belonging to this species. The characters of the Král cultures deviate from the characters of *Bacillus acidophilus* as given by Moro.

Habitat: Human and bovine intestinal tract and probably soil.

2. **Microbacterium flavum** Orla-Jensen. (Orla-Jensen, The Lactic Acid Bacteria, 1919, 181; *Mycobacterium flavum* Jensen, Proc. Linnean Soc. of New So. Wales, *59*, 1934, 34.) From Latin *flavus*, yellow.

Rods: 0.5 by 1 to 2 microns. Granular and therefore sometimes confused with micrococci. Non-motile. Gram-positive.

Agar: Surface growth usually yellow and viscid.

Gelatin: No liquefaction.

Broth containing 10 per cent salt: Grows as flaky precipitate.

Milk: Slight acidity with no coagulation.

Nitrites produced from nitrates.

Indole not formed.

Acid from glucose, fructose, mannose, galactose, raffinose and mannitol. No acid from xylose, arabinose, rhamnose,

* Arranged by Prof. C. S. Pederson, New York State Experiment Station, Geneva, New York, June, 1938; further revision by Dr. M. L. Speck, Baltimore, Maryland, Sept., 1943.

sorbitol, inulin, starch, or salicin. Dextro lactic acid formed.

Catalase is produced.

Temperature relations: Optimum 30°C. Maximum 35°C. Minimum 20°C. Survives 71.6°C for 2½ but not 10 minutes.

Aerobic to facultative anaerobic.

Source: From milk, cheese, butter, milking equipment, bovine feces.

Habitat: Bovine intestinal tract and probably soil.

Appendix: While Orla-Jensen has placed the following species in the genus *Microbacterium*, the description is incomplete and the organism differs from the other species in the genus in several important characters. Therefore it is placed in this appendix.

Microbacterium liquefaciens Orla-Jensen. (Orla-Jensen, The Lactic Acid Bacteria, 1919, 182; *Corynebacterium liquefaciens* Jensen, Proc. Linnean Soc. of New So. Wales, *59*, 1934, 49.) From Latin *liqueo*, to be liquid; *facio*, to make.

Morphologically resembles *Microbacterium lacticum*.

Agar: Surface growth is faint yellowish-green.

Gelatin: Liquefied.

Milk: Rennet coagulation in 1 to 3 weeks; the casein is peptonized gradually.

Catalase is produced.

Temperature relations: Optimum 30°C. Withstands heating to 80°C.

Action on carbohydrates has not been described; Orla-Jensen states that very little acid is produced.

Source: From milk and more frequently from cheese.

Habitat: Presumably dairy products.

NOTE. The following species may belong here: *Bacterium caseolyticum* Kitahara, Jour. Agr. Chem. Soc. Japan, Tokyo, *14*, 1938, 121 and 1461. A Gram-positive, acid-forming and proteolytic rod said by the author to be related to *Microbacterium liquefaciens*.

Genus III. **Propionibacterium** *Orla-Jensen.**

(Cent. f. Bakt., II Abt., *22*, 1909, 337.) From M. L., propionic, and *bacterium*, a small rod or stick.

Non-motile. Non-spore-forming. Gram-positive bacteria growing under anaerobic conditions in neutral media as short diphtheroid rods, sometimes resembling streptococci; under aerobic conditions with heavy inoculum growing as long, irregular, club-shaped and branched cells. Metachromatic granules demonstrable with Albert's stain. Ferment lactic acid, carbohydrates, and polyalcohols with the formation of propionic and acetic acids and carbon dioxide. As a rule strongly catalase positive, sometimes weakly so. Strong tendency towards anaerobiosis; development very slow, macroscopically visible colonies generally not discernible in less than 5 to 7 days.† Nutritional requirements complex. Development best in yeast extract media with addition of lactates or simple carbohydrates. Optimum temperature 30°C. Found in dairy products, especially hard cheeses.

The type species is *Propionibacterium freudenreichii* van Niel.

Key to the species of genus **Propionibacterium.**

I. In yeast extract-glucose media growth occurs in the form of small streptococci. Dirty cream-colored growth in stabs, with slight surface growth of same color. Sucrose and maltose not fermented.
  A. Not fermenting lactose.
    1. *Propionibacterium freudenreichii.*
  B. Fermenting lactose.
    2. *Propionibacterium shermanii.*

II. In yeast extract-glucose media growth occurs in the form of typical short rods of diphtheroid appearance. Distinct surface growth in stabs. Sucrose and maltose are fermented.
  A. Growth brownish-red.
    1. Ferments raffinose and mannitol, but not sorbitol.
      3. *Propionibacterium rubrum.*
    2. Ferments sorbitol, but not raffinose and mannitol.
      4. *Propionibacterium thoenii.*
  B. Growth in stab cream-colored.
    1. Surface growth cream-colored.
      a. Ferments l-arabinose and rhamnose.
        5. *Propionibacterium zeae.*
    2. Surface growth yellow to orange.
      a. Growth in liquid media flocculent, as if agglutinated.
        6. *Propionibacterium peterssonii.*
      aa. Growth in liquid media dispersed, smooth.

---

* Revised by Prof. C. B. van Niel, Hopkins Marine Station, Pacific Grove, California, June, 1938; further revision by Prof. Van Niel, January, 1944.

† In an atmosphere containing 5 per cent carbon dioxide, growth is enhanced both aerobically and anaerobically. Contrary to the claim made by Krebs and Eggleston (Biochem. Jour., *35*, 1941, 676) a differential effect of carbon dioxide tension on aerobic and anaerobic development has never been observed.

b. Do not ferment dextrin, glycogen or starch.

7. *Propionibacterium jensenii.*

8. *Propionibacterium raffinosaceum.*

bb. Ferments dextrin, glycogen and starch.

9. *Propionibacterium technicum.*

III. In yeast extract-glucose media growth occurs in the form of highly irregular cells, giving the appearance of involution forms. Distinct surface growth in stabs. Both d- and l- arabinose are fermented.

A. Involution forms large, swollen spheres. Surface growth orange-yellow. Does not ferment xylose and rhamnose.

10. *Propionibacterium arabinosum.*

B. Involution forms long, irregular rods. Surface growth cream-colored. Ferments xylose and rhamnose.

11. *Propionibacterium pentosaceum.*

1. **Propionibacterium freudenreichii** van Niel. (*Bacterium acidi propionici a*, von Freudenreich and Orla-Jensen, Cent. f. Bakt., II Abt., *17*, 1906, 532; *Bacterium acidi propionici* var. *fuscum* Thöni and Allemann, Cent. f. Bakt., II Abt., *25*, 1910, 29; van Niel, The Propionic Acid Bacteria, Haarlem, 1928, 162; Werkman and Brown, Jour. Bact., *26*, 1933, 397.) Named for Eduoard von Freudenreich, the Swiss bacteriologist, who isolated this species.

Description taken from van Niel, and Werkman and Brown.

Small spherical cells, 0.5 to 0.6 micron, mostly in pairs and short chains. Little difference in morphology between growth from anaerobic solid media and neutral or acid liquid media. Aerobic growth irregular, club-shaped and branched, long rods. Non-motile. Show metachromatic granules. Gram-positive.

Yeast gelatin-lactate stab: No liquefaction.

Yeast agar-lactate stab: Dirty grayish-creamy development in stab; very slight surface growth of same color.

Liquid media: Distinctly turbid with grayish-creamy, ropy sediment.

Litmus milk: Slight development, faint reduction. Not coagulated.

Catalase positive.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, glucose, fructose, mannose and galactose with the formation chiefly of propionic and acetic acids, and carbon dioxide.

Acid from erythritol, adonitol, inositol and esculin. No acid from amygdalin, d- and l-arabinose, dextrin, dulcitol, glycogen, inulin, lactose, maltose, mannitol, melezitose, melibiose, perseitol, raffinose, rhamnose, sucrose or xylose.

Anaerobic.

Distinctive characters: Inability to ferment any of the disaccharides when inoculated in yeast extract-sugar media.

Source: From dairy products; raw market milk, Swiss cheese.

Habitat: Dairy products.

2. **Propionibacterium shermanii** van Niel. (*Bacterium acidi propionici d*, Sherman, Jour. Bact., *6*, 1921, 387; van Niel, The Propionic Acid Bacteria, Haarlem, 1928, 163; Werkman and Brown, Jour. Bact., *26*, 1933, 400.) Named for J. M. Sherman, the American bacteriologist, who isolated this species.

Description taken from van Niel, and Werkman and Brown.

Small spherical cells, 0.5 to 0.6 micron, mostly in pairs and short chains. Little difference in morphology between growth from anaerobic solid media and neutral or acid liquid media. Aerobic growth irregular, club-shaped and branched rods. Non-motile. Show metachromatic granules. Gram-positive.

Yeast gelatin-lactate stab: No liquefaction.

Yeast agar-lactate stab: Dirty grayish-creamy development in stab; very slight surface growth of same color.

Liquid media: Distinctly turbid with grayish-creamy, ropy sediment.

Litmus milk: Acid coagulation.

Catalase positive.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, glucose, fructose, mannose, galactose and lactose with the formation chiefly of propionic and acetic acids, and carbon dioxide. Occasionally arabinose is fermented.

Acid from erythritol, adonitol, arabitol, inositol and esculin. No acid from amygdalin, dextrin, dulcitol, glycogen, inulin, maltose, mannitol, melezitose, melibiose, perseitol, raffinose, rhamnose, salicin, sorbitol, sucrose, starch, trehalose or xylose.

Anaerobic.

Distinctive characters: Resembles *Propionibacterium freudenreichii* in every respect, but differs in its ability to ferment lactose.

Source: From dairy products; Swiss cheese and buttermilk.

Habitat: Dairy products.

3. **Propionibacterium rubrum** van Niel. (*Bacterium acidi propionici* var. *rubrum* Thöni and Allemann (in part), Cent. f. Bakt., II Abt., *25*, 1910, 8; van Niel, The Propionic Acid Bacteria, 1928, 164; Werkman and Brown, Jour. Bact., *26*, 1933, 414.) From Latin *ruber*, red.

Medium-sized, stoutish rods to elongated diplococci, 0.8 by 1.2 microns, occurring singly or in pairs, resembling diphtheroids rather than streptococci. Somewhat more slender in media without fermentable carbohydrate. Aerobic growth irregular, club-shaped and branched rods. Non-motile. Show metachromatic granules. Gram-positive.

Yeast gelatin-lactate stab: No liquefaction.

Yeast agar-lactate stab: Brownish-red development in stab, with appreciable dome-shaped surface growth of same color. (Also see Margolena and Hansen, Cent. f. Bakt., II Abt., *99*, 1938, 107.)

Liquid media: Turbidity in early stages, sediment red and smooth.

Litmus milk: Acid coagulation.

Catalase positive; very weak for aerobically grown cells.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, glucose, fructose, mannose, galactose, sucrose, maltose, lactose, raffinose and mannitol with the production chiefly of propionic and acetic acids and carbon dioxide.

Acid from erythritol, adonitol, arabitol, amygdalin, esculin, salicin, melezitose and trehalose. No acid from d- and l-arabinose, dextrin, dulcitol, glycogen, inulin, melibiose, perseitol, rhamnose, sorbitol, starch or xylose.

Less anaerobic than *Propionibacterium freudenreichii* and *Propionibacterium shermanii*.

Distinctive characters: Production of brownish-red pigment under anaerobic and aerobic conditions. Fermentation of raffinose and mannitol, not of sorbitol.

Source: From various dairy products.

Habitat: Dairy products.

4. **Propionibacterium thoenii** van Niel. (*Bacterium acidi propionici* var. *rubrum* Thöni and Allemann (in part), Cent. f. Bakt., II Abt., *25*, 1910, 8; van Niel, The Propionic Acid Bacteria, 1928, 164; Werkman and Brown, Jour. Bact., *26*, 1933, 412.) Named for Thöni, the Swedish bacteriologist, who isolated this organism.

Description taken from van Niel, and Werkman and Brown.

Medium sized, stoutish rods to elongated diplococci, 1.0 by 1.5 microns, occurring singly or in pairs, resembling

diphtheroids. In media without fermentable carbohydrate, small streptococci. Aerobic growth irregular, club-shaped and branched rods. Non-motile. Shows metachromatic granules. Gram-positive.

Yeast gelatin-lactate-stab: No liquefaction.

Yeast agar-lactate-stab: Brownish-red growth throughout stab, with appreciable dome-shaped surface growth of same color.

Liquid media: Turbidity in early stages, sediment smooth and red.

Litmus milk: Mostly acid coagulation.

Catalase positive.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, glucose, fructose, mannose, galactose, sucrose, maltose, lactose and sorbitol with the formation of propionic and acetic acids, and carbon dioxide.

Acid from adonitol, arabitol, erythritol, esculin, salicin and trehalose. No acid from amygdalin, arabinose, dextrin, dulcitol, glycogen, inulin, mannitol, melezitose, melibiose, perseitol, pectin, raffinose, rhamnose, starch or xylose.

Domke (Milchwirtsch. Forsch., *15*, 1933, 480) reports that this species may or may not ferment lactose and may or may not produce acid from esculin and salicin.

Less anaerobic than *Propionibacterium freudenreichii* and *Propionibacterium shermanii*.

Distinctive characters: Closely resembles *Propionibacterium rubrum* in morphology and in the production of brownish-red pigment under aerobic and anaerobic conditions. Differs from this species in its inability to ferment raffinose and mannitol, whereas fermentation of sorbitol occurs.

The biochemical characteristics of a ten-year-old stock culture have remained unchanged.

Source: From cheese and buttermilk.

Habitat: Dairy products.

5. **Propionibacterium zeae** Hitchner. (Hitchner, Jour. Bact., *23*, 1932, 40; *28*, 1935, 473; Werkman and Brown, Jour. Bact., *26*, 1933, 411.) From Greek *zea*, spelt, a kind of grain; M. L. *Zea*, a generic name.

Description of culture isolated by Hitchner.

Cells in neutral lactate media spherical, 0.8 micron, usually occurring as short streptococci. In carbohydrate media which turn acid during development, distinctly rod-shaped, 0.8 by 2.0 to 3.0 microns, with a slight tendency to the formation of club-shaped cells. Appearance typically diphtheroid. Aerobic growth irregular, club-shaped and branched rods. Non-motile. Show metachromatic granules. Gram-positive.

Yeast gelatin-lactate-stab: No liquefaction.

Yeast agar-lactate-stab: Cream-colored growth in stab, with distinct surface growth of same color.

Liquid media: Distinctly turbid; cream-colored; smooth sediment, very ropy.

Litmus milk: Coagulated, acid.

Catalase positive, especially when grown in neutral media.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, l-arabinose, rhamnose, glucose, fructose, mannose, galactose, sucrose, cellobiose, maltose, lactose and mannitol with the formation of propionic and acetic acids and carbon dioxide.

Acid from salicin. No acid from d-arabinose, dextrin, dulcitol, glycogen, inulin, starch or xylose.

Less anaerobic than *Propionibacterium freudenreichii* and *Propionibacterium shermanii*.

Distinctive characters: Cream-colored surface growth, ability to ferment l-arabinose and rhamnose, but not d-arabinose and xylose.

Source: Not definitely recorded,

Probably from silage.

Habitat: Dairy products.

6. **Propionibacterium peterssonii** van Niel. (*Bacterium acidi propionici c*, Troili-Petersson, Cent. f. Bakt., II Abt., *24*, 1909, 333; van Niel, The Propionic Acid Bacteria, 1928, 163; Werkman and Brown, Jour. Bact., *26*, 1933, 406.) Named for Gerda Troili-Petersson, the Swedish bacteriologist, who isolated this organism.

Description taken from van Niel, and Werkman and Brown.

Cells in neutral media spherical, 0.8 micron, occurring as short streptococci in clumps. In carbohydrate media which turn acid during development, rod-shaped cells in clumps, 0.8 by 1.5 to 2.0 microns. Aerobic growth, heavily swollen and branched rods. Non-motile. Show metachromatic granules. Gram-positive.

Yeast gelatin-lactate stab: No liquefaction.

Yeast agar-lactate stab: Cream-colored growth, dry and wrinkled, resembling that of *Mycobacterium spp.*

Liquid media: No turbidity, sediment a coherent layer, cream-colored.

Litmus milk: Acid, coagulated.

Catalase positive; aerobically developed growth very slightly so.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, glucose, fructose, mannose, galactose, sucrose, maltose and lactose with the formation of propionic and acetic acids, and carbon dioxide.

Acid from esculin and salicin. No acid from d- and l-arabinose, cellobiose, dextrin, dulcitol, glycogen, inulin, perseitol, pectin, raffinose, rhamnose, sorbitol, starch or xylose.

Less anaerobic than *Propionibacterium freudenreichii* and *Propionibacterium shermanii.*

Distinctive character: Growth in liquid media in clumps, giving the cultures the appearance of agglutinated bacteria. So far, the only species among the propionic acid bacteria possessing this characteristic.

Source: From cheese and soil.

Habitat: Dairy products.

7. **Propionibacterium jensenii** van Niel. (*Bacterium acidi propionici b*, von Freudenreich and Orla-Jensen, Cent. f. Bakt., II Abt., *17*, 1906, 532; van Niel, The Propionic Acid Bacteria, 1928, 163; Werkman and Brown, Jour. Bact., *26*, 1933, 404.) Named for Prof. S. Orla-Jensen, the Danish bacteriologist, who isolated this organism.

Description taken from van Niel, and Werkman and Brown.

In neutral media spherical to short rod-shaped cells, often in pairs or short chains, 0.8 by 0.8 to 1.5 microns, of typical diphtheroid appearance. Morphology little influenced by developing acidity. Aerobic growth, irregular long rods, swollen and branched. Non-motile. Metachromatic granules. Gram-positive.

Yeast gelatin-lactate stab: No liquefaction.

Yeast agar-lactate stab: Cream-colored growth in stab, orange-yellow, dome-shaped surface growth.

Liquid media: Turbid in early stages; cream-colored, smooth sediment.

Litmus milk: Coagulated, acid.

Catalase: Strongly positive.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, glucose, fructose, mannose, galactose, sucrose, maltose, lactose and sometimes raffinose and mannitol with the formation of propionic and acetic acids, and carbon dioxide.

Acid from adonitol, arabitol, erythritol, esculin, inositol and trehalose. No acid from arabinose, cellobiose, dextrin, dulcitol, glycogen, inulin, perseitol, pectin, rhamnose, salicin, sorbitol, starch or xylose.

Less anaerobic than *Propionibacterium freudenreichii*.

Distinctive characters: Morphologically similar to *Propionibacterium rubrum* and *Propionibacterium thoenii* from which it is chiefly distinguished by the failure to produce a red pigment under anaerobic conditions. The yellow surface growth distinguishes *Propionibacterium jensenii* from *Propionibacterium zeae*, as also the inability of the former to ferment l-arabinose and rhamnose.

Source: From cheese and butter.

Habitat: Dairy products.

8. **Propionibacterium raffinosaceum** Werkman and Kendall. (*Propionibacterium jensenii* var. *raffinosaceum* van Niel, The Propionic Acid Bacteria, 1928, 162; Werkman and Kendall, Iowa State Coll. Jour. Sci., *6*, 1931, 17; Werkman and Brown, Jour. Bact., *26*, 1933, 402.) From M. L. *raffinosum*, the sugar raffinose.

Description taken from van Niel, and Werkman and Brown.

Cells in neutral media spherical to short rod-shaped cells, 0.8 by 0.8 to 1.5 microns, of typical diphtheroid appearance. In media in which acid is produced the cells are somewhat longer rod-shaped, to 2 microns in length. Aerobic growth irregular, long rods, swollen and branched. Non-motile. Metachromatic granules. Gram-positive.

Yeast gelatin-lactate-stab: No liquefaction.

Yeast agar-lactate-stab: Cream-colored growth in stab; distinct, orange-yellow surface growth.

Liquid media: Turbid in early stages, cream-colored, smooth sediment.

Litmus milk: Coagulated, acid.

Catalase positive; aerobically grown only very slightly so.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, glucose, fructose, mannose, galactose, cellobiose, maltose, lactose, sucrose, raffinose and mannitol with the production of propionic and acetic acids, and carbon dioxide.

Acid from adonitol, amygdalin, arabitol, erythritol, esculin, inositol, melezitose, salicin and trehalose. No acid from d- and l-arabinose, dextrin, dulcitol, glycogen, inulin, melibiose, perseitol, pectin, rhamnose, sorbitol, starch or xylose.

Less anaerobic than *Propionibacterium freudenreichii*.

Distinctive characters: Differs from *Propionibacterium jensenii* in its somewhat greater length and the ability to ferment cellobiose and salicin; the behaviour of *Propionibacterium jensenii* towards raffinose and mannitol is not constant, and hence cannot be used as a differential character. Werkman and Kendall have reported different agglutination reactions for *Propionibacterium jensenii* and *Propionibacterium raffinosaceum*.

Source: From buttermilk.

Habitat: Dairy products.

9. **Propionibacterium technicum** van Niel. (Van Niel, The Propionic Acid Bacteria, 1928, 164; Werkman and Brown, Jour. Bact., *26*, 1933, 401.) From Greek *technicus*, technical; M. L., of industrial significance.

Description taken from van Niel.

In neutral media spherical cells, 0.8 micron, in pairs and short chains. In acid media short rods, 0.6 by 1.0 to 1.5 microns, often in pairs, with typical diphtheroid appearance. Aerobic growth in the form of irregular long rods, swollen and branched. Non-motile. Metachromatic granules. Gram-positive.

Yeast gelatin-lactate-stab: No liquefaction.

Yeast agar-lactate-stab: Cream-colored development in stab, with distinct yellow surface growth.

Liquid media: Turbid in early stages, cream-colored, somewhat flocculent sediment.

Litmus milk: Coagulation, acid.

Catalase positive.

Indole not formed.

Nitrites not produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, arabinose, glucose, galactose, fructose, mannose, lactose, maltose, sucrose, raffinose, dextrin, glycogen and starch with the formation of propionic and acetic acids, and carbon dioxide.

Acid from esculin, salicin and mannitol. No acid from dulcitol, inulin or xylose.

Anaerobic, but less so than *Propionibacterium freudenreichii*.

Distinctive characters: The ability to ferment the polysaccharides dextrin, glycogen and starch.

Source: From Edam and Tilsit cheese.

Habitat: Dairy products.

10. **Propionibacterium arabinosum** Hitchner. (Hitchner, Jour. Bact., *23*, 1932, 40; *28*, 1934, 473; Werkman and Brown, Jour. Bact., *26*, 1933, 410.) From M. L. *arabicum*, gum Arabic; M. L. *arabinosum*, arabinose.

Description of culture isolated by Hitchner.

Cells in neutral lactate media spherical, 0.8 micron, in pairs and short chains. In acid media swollen spheres and ellipsoidal cells occur, mostly 2.0 by 3.0 to 3.5 microns, often in pairs and short chains. Non-motile. Metachromatic granules. Gram-positive.

Yeast gelatin-lactate-stab: No liquefaction.

Yeast agar-lactate-stab: Cream-colored growth in stab, with distinct orange-yellow surface growth.

Liquid cultures: Turbid in early stages, cream-colored, smooth sediment.

Litmus milk: No coagulation.

Catalase very slightly positive.

Indole not formed.

Nitrite production not recorded.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, d- and l-arabinose, glucose, galactose, fructose, mannose, cellobiose, maltose, sucrose, raffinose and mannitol with the production of propionic and acetic acids, and carbon dioxide.

Acid from sorbitol. No acid from dulcitol, xylose, rhamnose, salicin or inulin.

Anaerobic, but less so than *Propionibacterium freudenreichii*.

Distinctive characters: The development of spherical involution forms in acid media, the almost complete absence of catalase, the ability to ferment both d- and l-arabinose, but not xylose and rhamnose.

Source: Not definitely stated.

Habitat: Dairy products.

NOTE: The strain obtained from Dr. E. B. Fred produced only minute amounts of acid from lactose and starch. It is questionable whether these carbohydrates are fermented.

11. **Propionibacterium pentosaceum** van Neil. (*Bacillus acidi propionici* von Freudenreich and Orla-Jensen, Cent. f. Bakt., II Abt., *17*, 1906, 532; van Niel, The Propionic Acid Bacteria, 1928, 163; Werkman and Brown, Jour. Bact., *26*, 1933, 408.) From M. L. *pentosum*, a pentose.

Description taken from van Niel, and Werkman and Brown.

In neutral lactate media cells spherical, 0.8 micron, in pairs and short chains. In media developing acidity long, irregular rods, swollen and branched, to 3 to 4 microns in length. Aerobic growth irregular, swollen and branched, long rods. Non-motile. Metachromatic granules. Gram positive.

Yeast gelatin-lactate stab: No liquefaction.

Yeast agar-lactate stab: Cream-colored development in stab, with abundant, cream-colored surface growth.

Liquid media: Turbid in early stages; smooth, creamy sediment, ropy.

Litmus milk: Coagulated, acid.

Catalase: Slightly positive.

Indole not formed.

Nitrites and free nitrogen produced from nitrates.

Ferments lactic and pyruvic acids, glycerol, dihydroxyacetone, d- and l-arabinose, xylose, rhamnose, glucose, galactose, fructose, mannose, cellobiose, lactose, maltose, sucrose, raffinose, mannitol and sorbitol with the formation of propionic and acetic acids, and carbon dioxide.

Acid from adonitol, arabitol, erythritol, esculin, inositol, salicin and trehalose. No acid from dextrin, dulcitol, glycogen, inulin, perseitol or pectin.

Anaerobic, but less so than any of the other species of the genus.

Distinctive characters: The formation of long, rod-shaped involution forms in acid media; the absence of pigment production, and the ability to ferment d- and l-arabinose, rhamnose and xylose.

Source: From Emmental cheese.

Habitat: Dairy products.

Appendix: Cultures of the following species have not been available for study. It is probable that these duplicate previously described species.

Propionibacterium amyloaceum var. *auranticum* Sakaguchi, Swasaki and Yamada. (Bull. Agric. Chem. Soc. Japan, *17*, 1941, 13.) From cheese. Resembles *Propionibacterium pentosaceum* closely.

Propionibacterium coloratum Sakaguchi et al. (*loc. cit.*). From cheese. Resembles *Propionibacterium thoenii.*

Propionibacterium globosum Sakaguchi et al. (*loc. cit.*). From cheese. Resembles *Propionibacterium shermanii.* Said not to ferment glycerol and erythritol.

Propionibacterium japonicum Sakaguchi et al. (*loc. cit.*). From cheese. Said not to ferment glycerol and erythritol.

Propionibacterium orientum Sakaguchi et al. (*loc. cit.*). From cheese. Ferments l-arabinose. Resembles *Propionibacterium shermanii.*

Janoschek (Cent. f. Bakt., II Abt., *106*, 1944, 321) has suggested a key for the identification of the species in this genus. This is based on chromogenesis and cultural characters. He recognizes three additional species: *Propionibacterium casei, Propionibacterium pituitosum* and *Propionibacterium sanguineum.*

Genus IV. Butyribacterium *Barker and Haas.**

(Jour. Bact., *47*, 1944, 301.) From the chemical term, butyric and M. L. *bacterium*, a small rod.

Non-motile, anaerobic to microaerophilic, straight or slightly bent rods. Gram-positive. Ferment carbohydrates and lactic acid forming acetic and butyric acids, and carbon dioxide. Generally catalase negative but sometimes weakly positive. Intestinal parasites.

The type species is *Butyribacterium rettgeri* Barker and Haas.

1. **Butyribacterium rettgeri** Barker and Haas. (Strain 32, Lewis and Rettger, Jour. Bact., *40*, 1940, 298; Barker and Haas, Jour. Bact., *47*, 1944, 303.) Named for L. F. Rettger, The American bacteriologist.

Rods: Straight or slightly bent, non-capsulated. 0.7 by 2.3 microns. Occur singly, in pairs and short chains. No branched cells observed but some cells have swollen club-shaped ends. Non-motile. Gram-positive.

Glucose-cysteine agar: Colonies circular, entire or finely irregular margin, translucent, often with opaque center, grayish-white with yellowish tinge, convex when small, later umbonate, glistening, smooth, finely granular. Develop slowly attaining a diameter of 1.5 mm in 7 days.

Tryptone-yeast extract-lactate agar: Colonies similar to above except larger (2 mm in 4 days at 37°C). Pulvinate rather than umbonate in cross sections.

Glucose-cysteine-broth: Abundant turbidity and sediment. No pellicle.

Agar stab (King and Rettger's medium, Jour. Bact., *44*, 1942, 302): Heavy growth in 2 days. Gas production often causes slight splitting of agar.

Acetic and butyric acid and CO_2 produced from glucose and maltose. Occasionally a small amount of visible gas is produced. Lactic acid fermented readily without visible gas. Arabinose, xylose, lactose, sucrose, trehalose, rhamnose, mannitol, sorbitol, dulcitol and glycerol are not fermented.

Not proteolytic.

Indole and hydrogen sulfide not formed.

Temperature relations: Optimum 37°C. Maximum 40 to 45°C. Minimum 15°C.

Generally catalase negative.

Anaerobic.

Source: From intestinal contents of a white rat.

Habitat: Presumably found generally in the intestine of mammals.

NOTES: Pederson (Jour. Bact., *50*, 1945, 478) has found that cultures of two species described by Eggerth (Jour. Bact., *30*, 1935, 289 and 290) produce higher fatty (presumably butyric) acids and lactic acid from glucose. These are named *Bacteroides avidus* and *B. limosus* by Eggerth. Probably these species belong in the genus *Butyribacterium*.

Bacillus cadaveris butyricus Buday (Cent. f. Bakt., I Abt., *24*, 1898, 374) may also belong in this genus.

---

* Prepared by Prof. C. S. Pederson, New York State Experiment Station, Geneva, New York, January, 1945; reviewed by Dr. H. A. Barker, Berkeley, California.

FAMILY VIII. CORYNEBACTERIACEAE LEHMANN AND NEUMANN.

(Bakt. Diag., 4 Aufl., *2*, 1907, 500.)

Non-motile (motile in *Listeria*) rods, frequently banded or beaded with metachromatic granules. May show marked diversity of form. Branching cells have been observed in a few species but these are uncommon. Generally Gram-positive but this reaction may vary depending on the nature of the cells. Where pigment is formed, it is grayish-yellow to orange or pink in color. Aerobic to microaerophilic. Anaerobic species have been reported. Gelatin may be liquefied and nitrites may be produced from nitrates. Animal and plant parasites and pathogens. Also from dairy products, soil and water.

Key to the genera of family **Corynebacteriaceae**.

I. Aerobic to microaerophilic, non-motile (or questionably motile) rods which are variable in form. Animal and plant parasites and pathogens, with some from dairy products, soil and water.

Genus I. *Corynebacterium*, p. 381.

II. Small aerobic rods with 1 to 4 flagella. Causes a monocytosis in warm-blooded animals.

Genus II. *Listeria*, p. 408.

III. Microaerophilic, non-motile rods to long filaments. Pathogenic on warm-blooded animals.

Genus III. *Erysipelothrix*, p. 410.

Genus I. **Corynebacterium** *Lehmann and Neumann.**

(Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 390; *Corynethrix* Czaplewski, Deutsche med. Wchnschr., *26*, 1900, 723; *Corynemonas* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 344; *Corynobacterium* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 309; *Plocamobacterium* Löwi, Wiener klin. Wchnschr., *33*, 1920, 730. From Greek *koryne*, club and M. L. *bacterium*, a small rod.

Slender, straight to slightly curved rods, with irregularly stained segments or granules. Frequently show pointed or club-shaped swellings at the ends. Snapping division produces angular and palisade (picket fence) arrangements of cells. Non-motile with possible exceptions as stated in the text. Gram-positive to variable, sometimes young cells and sometimes old cells being Gram-negative. Granules invariably Gram-positive. Generally quite aerobic, but microaerophilic or even anaerobic species occur. Catalase positive. They may or may not liquefy gelatin, and may or may not produce nitrites from nitrates. They may or may not ferment sugars, but they seldom produce a high acidity. Many species oxidize glucose completely to CO_2 and H_2O without producing visible gas. Some pathogenic species produce a powerful exotoxin. This group is widely distributed in nature. The best known species are parasites and pathogens on man and domestic animals. Other species have been found in birds and insects and the group is probably more widely distributed in the animal kingdom than this. Several species are well known plant pathogens while still other common species are found in dairy products, water and soil.

The type species is *Corynebacterium diphtheriae* (Flügge) Lehmann and Neumann.

---

* Rearranged by Prof. E. G. D. Murray, McGill University, Montreal, P. Q., Canada and Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, March, 1938; completely revised by Prof. E. G. D. Murray, Montreal, Prof. Robert S. Breed, Geneva and Prof. Walter H. Burkholder, New York State College of Agriculture, Ithaca, New York, February, 1945.

Key to the species of genus **Corynebacterium.**

I. From human sources.* Non-motile.†
  A. Aerobic. No liquefaction of gelatin.
    1. Acid from glucose and usually maltose and galactose. Usually no acid from sucrose. Causes diphtheria.
      1. *Corynebacterium diphtheriae.*
    2. Not as in 1.
      a. No acid from carbohydrates.
        2. *Corynebacterium pseudodiphtheriticum.*
      aa. Acid from glucose and sucrose.
        b. Highly pleomorphic, varying from cocci to rods.
          3. *Corynebacterium enzymicum.*
        bb. Rods with polar staining with club forms, diphtheroid in appearance.
          4. *Corynebacterium xerose.*
        bbb. Rods as above but characteristic salmon pink growth on coagulated blood serum.
          5. *Corynebacterium hoagii.*
  B. Microaerophilic to anaerobic. Growth feeble or none at all on gelatin.
    6. *Corynebacterium acnes.*

II. From domestic and laboratory animals. Non-motile.
  A. Acid from glucose.
    1. Grows poorly if at all on ordinary gelatin and agar. Slow liquefaction of serum gelatin and coagulated blood serum. Causes suppurative processes in cattle, swine, and other animals.
      7. *Corynebacterium pyogenes.*
    2. No liquefaction of gelatin or blood serum. Grows poorly, if at all, on ordinary gelatin and agar.
      a. Cause of pyelonephritis in cattle.
        8. *Corynebacterium renale.*
      aa. Found in caseous nodules resembling those of tuberculosis. Found in sheep, horses and some other animals.
        9. *Corynebacterium pseudotuberculosis.*
      aaa. From caseous nodules in mice.
        10. *Corynebacterium kutscheri.*
      aaaa. Causes a septicemia in mice.
        11. *Corynebacterium murisepticum.*
  B. No acid from carbohydrates. No liquefaction of gelatin.
    1. From milk and bovine udder.
      12. *Corynebacterium bovis.*

---

* Habitat relationships are used because comparative studies of the species in the genus are still completely lacking.

† The reports of motile species in this genus present a puzzling problem, particularly as the motile species of plant pathogens placed in the genus are polar flagellate. Some students of the group feel that, if motile species really exist, they should be placed in a separate genus. Others feel that a more careful study of the described polar flagellate species will show that these species really belong elsewhere. Where authors have reported motility, this fact is indicated in the text. It should be noted that similar uncertainties exist in regard to described cases of motility among the streptococci and lactobacilli.

2. From pneumonia in foals.
   13. *Corynebacterium equi.*

III. From insects. Non-motile.
   A. No acid from carbohydrates. Slow liquefaction of gelatin.
      14. *Corynebacterium paurometabolum.*

IV. Plant pathogens. Non-motile.
   A. Nitrites not produced from nitrates.
      1. Colonies cream-colored. Slow liquefaction of gelatin.
         a. Bluish granules in growth. Attacks alfalfa.
            15. *Corynebacterium insidiosum.*
         aa. No bluish granules. Causes ring rot of potatoes.
            16. *Corynebacterium sepedonicum.*
      2. Colonies yellow.
         a. No liquefaction of gelatin. Causes a wilt and canker of tomatoes.
            17. *Corynebacterium michiganense.*
   B. Nitrites produced from nitrates. Slow or no liquefaction of gelatin.
      1. Colonies yellow. Attack members of the grass family.
         18. *Corynebacterium rathayi.*
         19. *Corynebacterium agropyri.*
      2. Colonies orange. Parasitic on sweet peas, etc.
         20. *Corynebacterium fascians.*

V. From soil and water. Liquefaction of gelatin in all cases but sometimes very slow (7 weeks).
   A. Acid from glucose. Non-motile.
      1. Nitrites not produced from nitrates.
         21. *Corynebacterium helvolum.*
      2. Nitrites produced from nitrates.
         a. Cellulose digested.
            22. *Corynebacterium fimi.*
         aa. Cellulose not digested.
            23. *Corynebacterium tumescens.*
   B. No acid from glucose. Some indication of motility in No. 25.
      1. Cells coccoid to short, straight or curved rods.
         24. *Corynebacterium simplex.*
      2. Young cells curved rods in parallel bundles. These may grow out into filaments with branching.
         25. *Corynebacterium filamentosum.*

1. **Corynebacterium diphtheriae** (Flügge) Lehmann and Neumann. (*Microsporon diphthericum* Klebs (prototype), Verhandl. d. Congr. f. innere Med., *2*, 1883, 143; die Klebs'schen Stäbchen, Löffler, Mitteil. a. d. kaiserl. Gesundheitsamte, 1884; *Bacillus diphtheriae* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 225; *Pacinia loefleri* Trevisan, I generi e la specie delle Batteriacee, 1889, 23; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 350; *Bacterium diphtheriae* Migula, Syst. d. Bakt., *2*, 1900, 499.) From Greek *diphthera*, a piece of leather; M. L., the disease diphtheria.

Common name: Diphtheria bacillus; Klebs-Loeffler bacillus.

Rods, varying greatly in dimensions, 0.3 to 0.8 by 1.0 to 8.0 microns, occurring singly. The rods are straight or slightly curved, frequently swollen at one or both ends. The rods do not, as a rule, stain uniformly with methylene blue but

show alternate bands of stained and unstained material and in addition one or more metachromatic granules which are best shown by special stains. Non-motile. Gram-positive but not intensely so in older cultures.

Gelatin colonies: Slow development. Very small, grayish, lobulate.

Gelatin stab: Slight growth on surface and scant growth in stab. No liquefaction.

Agar slant: Scant, grayish, granular, translucent growth, with irregular margin.

Blood-tellurite media: Produces gray to black colonies.

Colony forms: Smooth (S) colony form: Round and umbonate or convex, with even margin and smooth surface. Opaque when viewed by transmitted light, glistening and somewhat moist in appearance when viewed by reflected light. Colonies about 1 to 3 mm in diameter. Growth frequently slowed or inhibited by the presence of potassium tellurite in the medium.

Rough (R) colony form: Flat, margin is very irregular. Surface is pitted and very uneven. Very little light reflected from surface. Translucent when viewed by transmitted light. Colonies about 1 to 5 mm in diameter.

Intermediate colony forms: Several colony forms are found in this group since the term includes all forms between the pure S form and the pure R form. Sr forms very nearly approach the S colonies and the sR forms nearly approach the pure R forms. The SR form shows properties distinct from either the S or R forms. The colonies are 3 to 5 mm in diameter. The margin usually shows indentations. The surface is raised but not convex; it may be nearly level or show a central elevation surrounded by a concentric depression and elevation.

Dwarf (D) colony form: Colonies very small, about 0.2 mm or less in diameter. Margin round and even. Surface convex.

All of the above colony forms have been isolated from cases of diphtheria (Morton, Jour. Bact., *40*, 1940, 768 ff.).

Broth: Uniform turbidity produced by S form, pellicle produced by SR form, sediment produced by the R form.

Litmus milk: Unchanged.

Potato: No visible growth.

Blood serum: Growth grayish to cream-colored, moist, smooth, slightly raised, margin entire. May be bright yellow or occasionally reddish (Hill, Sci., *17*, 1903, 375).

Indole is not formed.

Nitrites are produced from nitrates.

All strains form acid from glucose and fructose; some strains also ferment galactose, maltose, sucrose, dextrin and glycerol.

Does not hydrolyze urea (Merkel, Cent. f. Bakt., I Abt., Orig., *147*, 1941, 398).

A highly poisonous exotoxin is produced in fluid media. This toxin represents the principal disease-producing agency of the organism. Toxin production may fail in otherwise typical strains.

A highly potent antitoxin can be produced by repeated injection of toxin into experimental animals. The antitoxin possesses both curative and protective properties.

Serological types: In a study of 250 strains of *Corynebacterium diphtheriae* Murray (Jour. Path. and Bact., *41*, 1935, 439-45) was able to classify 228 strains into 11 serological types and 22 strains remained unclassified (Morton, Bact. Rev., *4*, 1940, 196).

McLeod et al. (Jour. Path. and Bact., *34*, 1931, 667; *ibid.*, *36*, 1933, 169; Lancet, *1*, 1933, 293) describe three types which have been confirmed by other workers; these are distinguishable by colony form on McLeod's blood-tellurite medium, they are antigenically different with subtypes, there is some difference between their toxins (Etris, Jour. Inf. Dis., *50*, 1934, 220) and the severity of disease is associated with the type.

Corynebacterium diphtheriae type *gravis*

grows with dark gray, daisy-head colonies; ferments dextrin, starch and glycogen; is not hemolytic; has very few small metachromatic granules; forms a pellicle, granular deposit and there is an early reversal of pH in broth.

Corynebacterium diphtheriae type *mitis* grows in convex, black, shiny, entire colonies; no fermentation of starch and glycogen and is variable with dextrin; hemolytic; metachromatic granules are prominent; diffuse turbidity, infrequent pellicle and there is a late reversal of pH in broth.

Corynebacterium diphtheriae type *intermedius* grows a small, flat, umbonate colony with a black center and slightly crenated periphery; not hemolytic; barring of bacilli is accentuated; there is no fermentation of starch and glycogen, and is variable with dextrin; forms no pellicle, a fine granular deposit and there is no reversal of pH in broth.

Ten years of observations in all parts of the world have shown (McLeod, Bact. Rev., 7, 1943, 1) that a small percentage of strains does not correspond closely to any of these three types. Variant strains are found most frequently in regions where the diphtheria is of mild or moderate severity.

Aerobic, facultative.

Optimum temperature 34° to 36°C. Grows well at 37°C.

Source: Commonly from membranes in the pharynx, larynx, trachea and nose in human diphtheria; from the seemingly healthy pharynx and nose in carriers; occasionally from the conjunctiva and infected superficial wounds. Found occasionally infecting the nasal passages and wounds in horses. Has been described from natural diseases in fowl.

Habitat: The cause of diphtheria in man. Pathogenic to guinea pigs, kittens and rabbits. For action on other animals see Andrews et al., Diphtheria. London, 1923, 170 ff.

2. Corynebacterium pseudodiphtheriticum Lehmann and Neumann. (Bacillus der pseudodiphtherie, Loeffler, Cent. f. Bakt., *2*, 1887, 105; G. von Hofmann-Wellenhof, Wien. med. Wochenschr., *38*, 1888, 65; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 361; *Bacillus pseudodiphthericus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 476; *Bacterium pseudodiphtheriticum* Migula, Syst. d. Bakt., *2*, 1900, 503; *Mycobacterium pseudodiphthericum* Chester, Man. Determ. Bact., 1901, 355; *Bacillus hoffmanii* (sic) Holland, Jour. Bact., *5*, 1920, 218; *Corynebacterium hoffmanii* (sic) Holland, *ibid.*, 220; *Corynebacterium pseudodiphtheriae* Holland, *ibid.*; *Corynebacterium pseudodiphthericum* Bergey et al., Manual, 2nd ed., 1925, 393.) From Greek *pseudus*, a falsehood; M. L., the disease diphtheria.

Common name: Pseudodiphtheria bacillus or Hofmann's bacillus.

Excellent historical discussions of this and related organisms are given by Bergey, Comparative Studies upon the Pseudo-diphtheria or Hofmann's Bacillus, the Xerosis Bacillus, and the Loeffler Bacillus. Contrib. from Lab. of Hyg., Univ. of Penn., No. 2, 1898, 19–54 and by Andrewes et al., Diphtheria. London, 1923, 382–388.

Rods, with rounded ends, 0.3 to 0.5 by 0.8 to 1.5 microns, fairly uniform in size, without swollen ends. Not barred but even staining interrupted by transverse, medial unstained septum; granules usually absent. Non-motile. Gram-positive.

Gelatin colonies: Small, grayish to cream-colored, smooth, homogeneous, entire.

Gelatin stab: Slight surface growth with little growth in stab. No liquefaction.

Agar colonies: Opaque, grayish to cream-colored, smooth, homogeneous, entire.

Agar slant: Moist, smooth, white to cream-colored, entire growth.

Loeffler's blood serum: As on agar.

Broth: Slightly turbid with slight, grayish sediment.

Litmus milk: Unchanged.

Potato: Slight, creamy-white, smooth, entire growth.

Indole not formed.

Nitrites produced from nitrates.

No acid from carbohydrate media.

Hydrolyzes urea (Merkel, Cent. f. Bakt., I Abt., Orig., *147*, 1941, 398).

Aerobic, facultative.

Optimum temperature 37°C.

Not pathogenic.

Source: From oral cavity of 26 out of 45 control cases.

Habitat: Normal throats.

3. **Corynebacterium enzymicum** (Mellon) Eberson. (An unusual diphtheroid bacillus, Mellon, Med. Record, New York, *81*, 1916, 240; *Bacillus enzymicus* Mellon, Jour. Bact., *2*, 1917, 297; Eberson, Jour. Inf. Dis., *23*, 1918, 29.) From Greek *en*, inside of; *zyme*, leaven; of an enzyme.

Rods, beaded and club-shaped, definitely pleomorphic, showing coccoid forms. Non-motile. Gram-positive.

Gelatin stab: Slight surface growth. No liquefaction.

Glucose agar: Bacillary form shows very small colorless colonies. Coccoid form shows heavy, yellowish-white, moist growths.

Blood agar: Same as on glucose agar.

Loeffler's blood serum: Fine, moist, confluent growth.

Glucose broth: Bacillary form shows granular sediment. Coccoid form shows diffuse, luxuriant growth.

Litmus milk: Acid, coagulated.

Potato: No growth.

Indole formation slight.

Slight production of nitrites from nitrates.

Acid from glucose, maltose, sucrose, dextrin and glycerol.

Aerobic, facultative.

Optimum temperature 37°C.

Pathogenic for rabbits, guinea pigs and mice.

Source: Lungs, blood and joints.

Habitat: From human sources so far as known.

4. **Corynebacterium xerose** (Neisser and Kuschbert) Lehmann and Neumann. (*Bacillus xerosis* Neisser and Kuschbert, Breslauer ärtzl. Ztschr., No. 4, 1883; Xerosebacillen, Kuschbert, Deutsche med. Wochnschr., *10*, 1884, 321 and 341; *Pacinia neisseri* Trevisan, I generi e le specie delle Batteriacee, 1889, 23; Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 405; *Bacterium xerosis* Migula, Syst. d. Bakt., *2*, 1900, 485.) From Greek *xerus*, dry.

An excellent historical discussion of this organism is given by Andrewes et al., Diphtheria. London, 1923, 377–382.

Rods, showing polar staining, occasionally club-shaped forms are seen. Non-motile. Gram-positive.

Plain gelatin colonies: Rarely develop.

Serum gelatin stab: No liquefaction.

Agar colonies: Minute, circular, almost transparent, raised, smooth, pearly white.

Agar slant: Thin, grayish, limited growth.

Loeffler's blood serum: Thin, grayish, adherent growth.

Broth: Clear, with slight, granular sediment.

Litmus milk: Unchanged.

Potato: No visible growth.

Indole not formed.

Nitrites not produced from nitrates.

Acid from glucose, fructose, galactose, maltose and sucrose.

Not pathogenic.

Aerobic, facultative.

Optimum temperature 37°C. Grows very slowly as low as 18° to 25°C (Eberson, Jour. Inf. Dis., *23*, 1918, 3).

Source: From normal and diseased conjunctiva.

Habitat: Probably identical with other species described from the skin and other parts of the body.

5. **Corynebacterium hoagii** (Morse) Eberson. (Bacillus X, Hoag, Boston Med. and Surg. Jour., *157*, 1907, 10; *Bacillus hoagii* Morse, Jour. Inf. Dis., *11*, 1912, 284; Eberson, Jour. Inf. Dis., *23*, 1918, 10.) Named for Hoag, the bacteriologist who first isolated the species.

Rods: 0.8 to 1.0 by 1.0 to 3.0 microns, occurring singly. Show polar staining in the shorter forms while the longer forms are barred and slightly club-shaped. Non-motile. Gram-positive.

Gelatin colonies: Small, dull, pale pink, entire.

Gelatin stab: Slight pink surface growth. No liquefaction.

Agar colonies: Small, pale pink, dull, granular, entire.

Agar slant: Filiform, dull, pink growth.

Broth: Turbid, with slight pink sediment.

Litmus milk: Slightly alkaline, with pink sediment.

Potato: Dull, filiform streak.

Indole not formed.

Nitrites not produced from nitrates.

Acid from glucose and sucrose but not maltose.

Blood serum: Dull, filiform, pink streak.

Aerobic.

Optimum temperature 30°C.

Source: From the throat. Air contamination of cultures.

Habitat: Unknown.

6. **Corynebacterium acnes** (Gilchrist) Eberson. (*Bacillus acnes* Gilchrist, Johns Hopkins Hosp. Repts., 9, 1901, 425; *Actinomyces acnes* Gilchrist, *ibid.*, 425; Eberson, Jour. Inf. Dis., *23*, 1918, 10; *Fusiformis acnes* Holland, Jour. Bact., *5*, 1920, 233; *Propionibacterium acnes* Douglas and Gunter, Jour. Bact., *52*, 1946, 22.) From M. L. *acne*, the disease acne.

Rods, vary in dimensions, usually 0.5 by 0.5 to 2.0 microns, sometimes slightly club-shaped. Show alternate bands of stained and unstained material. Non-motile. Gram-positive.

Growth in culture media very feeble.

Best growth occurs in shake cultures with soft, slightly acid, glucose agar.

Agar slant: Very small, circular transparent colonies which may later become rose-colored.

Loeffler's blood serum: Small, grayish colonies, which may later become rose-colored.

Broth: Clear.

Litmus milk: Soft coagulum.

Potato: No growth in aerobic cultures, but pink streak in anaerobic cultures.

Indole not formed.

Nitrites produced from nitrates.

Acid from glucose, sucrose (slight), maltose, mannitol and inulin. Produces propionic acid (Douglas and Gunter, *loc. cit.*).

Catalase produced.

Microaerophilic to anaerobic.

Optimum temperature 35° to 37°C.

Pathogenic for mice and gives rise to characteristic lesions.

Source: From acne pustules.

Habitat: Sebaceous glands, hair follicles and acne pustules.

NOTES: Even before 1901, several authors reported finding bacteria in acne pustules which were evidently diphtheroid in nature. Unna (Monatshefte f. prakt. Derm., *13*, 1891, 232) found an organism in acne pustules which he gave the name of Flaschenbacillus. Hodara (Monatshefte f. prakt. Derm., *18*, 1894, 586) reported the presence of two types of bacteria in acne lesions, the second of which he called Flaschenkugelbacillus. Sabouraud (Ann. Inst. Past., *11*, 1897, 134) gave a more accurate description of these diphtheroids which he reported to need an acid medium for growth. He called this bacterium, bacille de séborrhée grasse (*Bacillus sabouraudi* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 24).

Additional anaerobic species will be found in the appendix. These are *Corynebacterium typhi* which Eberson (*loc. cit.*, 19) and Hewlett (Med. Res. Council, Syst. of Bact., London, *5*, 1930, 145) regard as practically identical with *Corynebac-*

terium acnes, and eleven species listed by Prévot (Manual de Classification et de Détermination des Bactéries Anaérobies. Monographie, Inst. Past., Paris, 1940, 199–204) as follows: *Corynebacterium diphtheroides*, *C. avidum*, *C. renale cuniculi*, *C. lymphophilum*, *C. hepatodystrophicans*, *C. parvum*, *C. anaerobium*, *C. granulosum*, *C. adamsoni*, *C. liquefaciens*, and *C. pyogenes bovis*.

7. **Corynebacterium pyogenes** (Glage) Eberson. (*Bacillus liquefaciens pyogenes bovis* Lucet, Ann. Inst. Past. *7*, 1893, 327; *Bacillus liquefaciens pyogenes* Lucet, *ibid.*, 327; *Bacillus liquefaciens* Lucet, *ibid.*; Bakterium der multipler Abszessbildung der Schweine, Grips, Ztschr. f. Fleisch- u. Milchhyg., *8*, 1898, 166; *Bacillus pyogenes bovis* Künnemann, Arch. f. wiss. u. prakt. Tierheilk., *29*, 1903, 128; *Bacillus pyogenes* Glage, Ztschr. f. Fleisch- u. Milchhyg., *13*, 1903, 166; not *Bacillus pyogenes* Lucet, Ann. Inst. Past., *7*, 1893, 327; *Bacillus pyogenes suis* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 394; *Bacterium hyopyogenes* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 394; *Bacterium pyogenes suis* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 499; *Bacterium pyogenes* Ward, Jour. Bact., *2*, 1917, 519; not *Bacterium pyogenes* Chester, Man. Determ. Bact., 1901, 184; Eberson, Jour. Inf. Dis., *23*, 1918, 5; not *Corynebacterium pyogenes* Lewandowsky, Cent. f. Bakt., I Abt., Orig., *36*, 1904, 473; *Corynebacterium pseudopyogenes* Ochi and Zaizen, Jour. Jap. Soc. Vet. Sci., *15*, 1936, 12 and *16*, 1937, 8.) From Greek *pyum*, pus; *gignomai*, producing.

For description see Brown and Orcutt, Jour. Exp. Med., *32*, 1920, 244.

Rods: 0.2 by 0.3 to 2 microns in length. Smallest forms appear as scarcely visible points (common in old abscesses). Chains formed. Club forms may be present. Non-motile. Gram-positive.

Serum gelatin: Liquefaction.

No growth on ordinary agar.

Serum agar: Minute colonies after 36 to 48 hours. Surface colonies may increase to 3 mm in diameter. Colonies smoky brown by transmitted light and bluish-white by reflected light.

Bovine blood serum slants: Pit-like or more general areas of liquefaction.

Serum bouillon: Cloudy with fine flocculent grayish flakes that form a sediment like a streptococcus culture.

Milk: Coagulation after 48 hours at 37°C, with acid at bottom of tube. Separation of whey and peptonization.

Nitrites not produced from nitrates (Merchant, Jour. Bact., *30*, 1935, 108).

Indole not formed.

Acid formed in serum bouillon from glucose, sucrose, lactose, and xylose but not from raffinose, inulin, mannitol and salicin.

Beta hemolytic, not hemoglobinophilic though growth is favored by proteins as egg albumen, serum or blood (Brown and Orcutt, *loc. cit.*).

Optimum temperature 37°C. Growth range 20° to 40°C.

Intravenous injection of rabbits fatal.

Aerobic as well as anaerobic growth.

Source: From bovine pus.

Habitat: Found in abscesses in cattle, swine and other domestic animals.

8. **Corynebacterium renale** (Migula) Ernst. (*Bacillus renalis bovis* Bollinger, in Enderlen, Zeit. f. Tiermed., *17*, 1890, 346; *Bacillus pyelonephritis boum* (sic) Höflich, Monatsh. f. prakt. Tierheilk., *2*, 1891, 356; *Bacterium renale* Migula, Syst. d. Bakt., *2*, 1900, 504; *Bacillus renalis* Ernst, Cent. f. Bakt., I Abt., Orig., *39*, 1905, 550; Ernst, *ibid.*, *40*, 1905, 80; *Corynebacterium renalis bovis* Ernst, *ibid.*, 82.) From Latin *renalis*, kidney.

Description largely taken from Jones and Little, Jour. Exp. Med., *44*, 1926, 11.

Rods: 0.7 by 2 to 3 microns. Non-motile. Usually in masses, rarely single. Bacteria from tissues not as pleomorphic as those from the earlier transfer cultures although many show polar granules or swollen ends. Cultures grown in broth show coccoid forms and beaded rods with swollen ends. Gram-positive.

Gelatin: Grows poorly if at all. No liquefaction.

Agar: Small punctiform colonies.

Agar slants: Raised, grayish-white, and dry growth (Jones and Little). Others say cream-colored and moist.

Blood serum slants: Fine gray punctiform colonies in 24 hours at 37°C which are a little larger than on agar. Streak scarcely 1 mm in width. Glistening and slimy in fresh cultures. No liquefaction.

Litmus milk: Reduction and coagulation from the bottom. Slow digestion, becoming alkaline.

Broth: Sediment at end of 2 days with clear bouillon above.

Potato: Growth grayish-white; later, becoming a dingy yellow, turning the potato brown.

Acid from glucose. No acid from lactose, sucrose, maltose and mannitol. Some strains ferment fructose and mannose (Merchant, Jour. Bact., *30*, 1935, 109).

Shows a close serological relationship with *Corynebacterium pseudotuberculosis* (Merchant). Anaerobic.

Not pathogenic for laboratory animals. No toxin produced.

Optimum temperature 37°C.

Source: Found in pyelonephritis in cattle.

Habitat: Occurs in purulent infections of the urinary tract in cattle, sheep, horses and dogs.

9. **Corynebacterium pseudotuberculosis** (Buchanan) Eberson. (Nocard, Bull. de la Soc. Centr. de méd. Vet., 1885, 207; Pseudotuberculose-Bakterien, Preisz, Cent. f. Bakt., *10*, 1891, 568; *Bacillus pseudotuberculosis ovis* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 362; *Bacillus pseudotuberculosis* Buchanan, Veter. Bact., Phila., 1911, 238; not *Bacillus pseudotuberculosis* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 294; Eberson, Jour. Inf. Dis., *23*, 1918, 10; *Corynebacterium ovis* Bergey et al., Manual, 1st ed., 1923, 388; not *Corynebacterium pseudotuberculosis* Bergey et al., Manual, 2nd ed., 1925, 394; *Corynebacterium pseudotuberculosis bovis* (an evident typographical error) Thomson and Thomson, Ann. Pickett-Thomson Res. Lab., *2*, 1926, 132; *Corynebacterium pseudotuberculosis ovis* Hauduroy et al., Dict. d. Bact. Path., 1937, 159; *Corynebacterium preisz-nocardi* Hauduroy et al., *ibid.*, 159.) From Greek *pseudus*, a falsehood; Latin *tuberculum*, a small nodule; M.L., false tuberculosis.

Common name: Preisz-Nocard bacillus.

Slender rods: 0.5 to 0.6 by 1.0 to 3.0 microns, staining irregularly and showing clubbed forms. Non-motile. Gram-positive.

Gelatin colonies: Slight development.

Gelatin stab: No liquefaction.

Agar colonies: Thin, cream-colored to orange, folded, serrate, dry.

Loeffler's blood serum: Small, yellow, serrate colonies. No liquefaction.

Broth: No turbidity. Granular sediment. Pellicle formed (Carne, Jour. Path. and Bact., *49*, 1939, 316).

Litmus milk: Unchanged.

Potato: No growth.

Nitrites not produced from nitrates.

Acid from glucose, fructose, galactose, mannose, sucrose, lactose, maltose and dextrin. Some strains attack xylose.

Causes caseous lymphadenitis in sheep and ulcerative lymphangitis in horses. Forms an exotoxin.

Shows a close serological relationship with *Corynebacterium renale* (Merchant, Jour. Bact., *30*, 1935, 109).

Aerobic, facultative.

Optimum temperature 37°C.

Source: From necrotic areas in the kidney of a sheep.

Habitat: Found in caseous lymphadenitis in sheep and ulcerative lesions in horses, cattle and other animals.

10. **Corynebacterium kutscheri** (Migula) Bergey et al. (*Bacillus pseudotuberculosis murium* Kutscher, Ztschr. f. Hyg., *18*, 1894, 338; *Bacillus pseudotuberculosis murium* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896,

362; *Bacterium kutscheri* Migula, Syst. d. Bakt., *2*, 1900, 372; *Mycobacterium pseudotuberculosis* Chester, Manual Determ. Bact., 1901, 355; *Corynebacterium murium* Bergey et al., Manual, 1st ed., 1923, 386; Bergey et al., Manual, 2nd ed., 1925, 395.) Named for the bacteriologist Kutscher, who first isolated the species.

Rods with pointed ends, staining irregularly. Non-motile. Gram-positive.

Gelatin colonies: Small, white, translucent.

Gelatin stab: No growth on surface. White, filiform growth in stab. No liquefaction.

Agar colonies: Small, thin, yellowish-white, translucent, serrate.

Agar slant: Thin, white, translucent.

Loeffler's blood serum: Abundant growth. Not peptonized.

Broth: Slight turbidity. Crystals of ammonium magnesium phosphate are formed.

Litmus milk: Unchanged.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 37°C.

Source: From cheesy mass in lung of mouse.

11. **Corynebacterium murisepticum** v. Holzhausen. (Cent. f. Bakt., I Abt., Orig., *105*, 1927–28, 94.) From Latin *mus, muris*, a mouse; Greek *septicus*, putrefying, septic.

Slender rods: 1.2 to 1.5 microns in length, with polar granules. Grow out into long filaments. Non-motile. Gram-positive.

Gelatin stab: Feeble growth, with fimbriate outgrowth along line of puncture.

Egg glycerol broth: Good growth.

Loeffler's blood serum: Good growth.

Broth: Turbid.

Litmus milk: Acid. No coagulation.

Potato: Good growth.

Indole not formed.

Nitrates not reported.

Acid from glucose, fructose, galactose, maltose, lactose, sucrose, inulin and mannitol. Arabinose and isodulcitol are not attacked.

Hydrogen sulfide formed.

Pathogenic for mice.

Aerobic, facultative.

Optimum temperature 37°C.

Habitat: Septicemia in mice.

12. **Corynebacterium bovis** Bergey et al. (*B. pseudodiphtheria*, Bergey, The Source and Nature of Bacteria in Milk. Penn. Dept. Agr. Bull. 125, 1904, 11; Bergey et al., Manual, 1st ed., 1923, 388.) From Latin *bos, bovis*, ox; of cattle.

Rods, slender, barred, clubbed, 0.5 to 0.7 by 2.5 to 3.0 microns. Non-motile. Gram-positive.

Gelatin stab: Slight, gray, flat surface growth.

Agar colonies: Circular, gray, slightly raised, radiate, undulate, dry.

Agar slant: Thin, gray, filiform, dry growth.

Broth: Slight granular sediment.

Litmus milk: Slowly becoming deeply alkaline.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

No acid from carbohydrate media.

Blood serum: Thin, gray, filiform growth.

Causes rancidity in cream. Weakly lipolytic on tributyrin agar (Black, Jour. Bact., *41*, 1941, 99).

Optimum temperature 37°C.

Source: In fresh milk drawn directly from the cow's udder.

Note: Miss Alice Evans (personal communication) states that the organism from the udder which she described as *Bacterium lipolyticus* (sic) (*Bacillus abortus* var. *lipolyticus* Evans, Jour. Inf. Dis., *18*, 1916, 459; *Bacterium abortus* var. *lipolyticus* Evans, Jour. Bact., *2*,

1917, 185; Evans, Jour. Inf. Dis., *22*, 1918, 576; not *Bacterium lipolyticum* Huss, Cent. f. Bakt., II Abt., *20*, 1908, 474; *Alcaligenes lipolyticus* Pacheco, Revista da Sociedade Paulista de Med. Vet., *3*, 1933, 9) was probably a *Corynebacterium*. This is also regarded as probable by Steck (Die latente Infektion der Milchdrüse, Hanover, 1930) and by Bendixen (Ztschr. f. Infektionskrankh. d. Haustier., *43*, 1933, 106). Miss Evans also indicates that it is probable that the organism described by Bergey first in 1904 (*loc. cit.*) and later in the first edition of the Manual as *Corynebacterium bovis* was the same organism. This is further confirmed by Black (Jour. Bact., *41*, 1941, 99). A description of *Bacterium lipolyticum* Evans will be found in the Manual, 5th ed., 1939, 803.

13. **Corynebacterium equi** Magnussen. (Magnusson, Arch. f. Tierheilk. *50*, 22; *Corynebacterium pyogenes (equi)* Meissner and Wetzel, Deutsche Tierarztl. Wehnschr., *31*, 1923, 449; *Corynebacterium (pyogenes) equi roseum* Lütji, *ibid.*, 561; *Mycobacterium equi* Jensen, Proc. Linn. Soc. New So. Wales, *59*, 1934, 33; *Corynebacterium magnussonholth* Plum, Cornell Vet., *30*, 1940, 15; *Corynebacterium purulentus* Holtman, Jour. Bact., *49*, 1945, 161.) From Latin *equus*, horse.

Description from Dimock and Edwards, Kentucky Agri. Exper. Stat., Bull. 333, 1932; Bruner and Edwards, *ibid.*, Bull. 414, 1941; Merchant, Jour. Bact., *30*, 1935, 95; and Brooks and Hucker, Jour. Bact., *48*, 1944, 309.

Rods variable according to medium. Coccoid and ellipsoidal cells to rather long curved and sometimes clubbed forms. The latter are especially apt to occur in liquid media. Non-motile. Gram-positive.

Gelatin stab: Good growth. No liquefaction.

Agar colonies: Usually moist, smooth and glistening, tan to yellow (Brooks and Hucker, *loc. cit.*, p. 300) or pink to red chromogenesis (Merchant, *loc. cit.*, p. 107).

Agar slant: Moist heavy growth which may run down the slant (Dimock and Edwards, *loc. cit.*, p. 322).

Broth: Turbid with no pellicle and little sediment (Dimock and Edwards, *loc. cit.*, p. 322). Pellicle and final pH alkaline (Brooks and Hucker, *loc. cit.*, p. 309). Branched cells occur in 6 to 8 hour cultures in broth.

Loeffler's blood serum: Good growth with tan to yellow chromogenesis. No liquefaction.

Coagulated egg yolk: Vigorous salmon-pink growth. Dryer than on agar, resembling wrinkled growth of tubercle bacillus after two weeks.

Litmus milk: No change to slightly alkaline.

Potato: Abundant growth, usually tan, yellow or pink.

Indole not formed.

Hydrogen sulfide produced on appropriate media.

Nitrites produced from nitrates. No ammonia produced.

No acid from carbohydrate media. However, glucose stimulates growth.

Sodium hippurate: Not hydrolyzed.

Esculin: Not hydrolyzed.

No exotoxin demonstrated in filtrate of broth cultures.

No or slight hemolysis of horse blood.

Not pathogenic for laboratory animals.

Aerobic.

Temperature relations: Optimum 25° to 37°C. Maximum 37° to 45°C. Minimum 7° to 18°C.

Source: Originally isolated from infectious pneumonia of foals.

Habitat: Found in spontaneous pneumonia of foals and other infections in horses. Also in swine, cattle and buffaloes.

NOTE: Jensen (*loc. cit.*, 33) regards four cultures of soil bacteria isolated in Australia as identical with this organism.

Because of the acid-fast staining of the cells, especially when grown in milk for 3 to 7 days, he places this species in the genus *Mycobacterium*. Most cocci retain the stain completely, while the rods take the counterstain. Jensen thinks the organism a widespread soil saprophyte which under certain conditions acquires pathogenic properties. He points out the close relationship of this organism to *Bacterium aurantium-roseum* Honig (Mededeel. Deli Proefstat. te Medan, *7*, 1912, 223) isolated from fermenting tobacco. He also regards this species as closely related to *Mycobacterium coeliacum* Gray and Thornton. Red strains seem to be much like *Bacillus rubropertinctus* Hefferan and *Micrococcus* (*Staphylococcus*) *erythromyxa* Zopf.

14. **Corynebacterium paurometabolum** Steinhaus. (Jour. Bact., *41*, 1941, 763 and 783.) From Greek *paurus*, little; *metabole*, change or little action.

Rods: 0.5 to 0.8 by 1.0 to 2.5 microns, occurring singly, in pairs and in masses. Metachromatic granules present. Non-motile. Gram-positive.

Gelatin stab: Slow liquefaction at surface.

Agar colonies: White to gray, entire, circular, small, dry, somewhat granular.

Agar slant: Filiform to arborescent, thick, granular growth.

Broth: Abundant granular sediment but no turbidity. Pellicle.

Litmus milk: Alkaline.

Potato: Thick, raised, dry, granular, profuse, gray to light cream-colored growth.

Indole not produced.

Slight production of hydrogen sulfide.

Nitrites not produced from nitrates.

No action on the following carbohydrates: Glucose, lactose, sucrose, maltose, fructose, mannitol, galactose, arabinose, xylose, dextrin, salicin, raffinose, trehalose, sorbitol, inulin, dulcitol, glycerol, rhamnose, adonitol, mannose, esculin and inositol.

Aerobic.

Slight alpha hemolysis.

Non-pathogenic for guinea pigs.

A special semi-solid medium, the main nutritive constituents of which were proteose peptone, rabbit serum, gelatin, minced rabbit kidney and carbohydrates, was used for the original isolation. An incubation period of 4 to 7 days at 26°C was necessary for the initial isolation. Subsequent transfers to ordinary beef-infusion agar grew out in 24 to 48 hours.

Source: From media inoculated with the mycetome and ovaries of the bedbug, *Cimex lectularius* L. A very similar diphtheroid strain was isolated from the alimentary tract of the bagworm, *Thyridopteryx ephemeraeformis* Haw.

Habitat: Distribution in nature unknown.

*15. **Corynebacterium insidiosum** (McCulloch) Jensen. (*Aplanobacter insidiosum* McCulloch, Phytopath., *15*, 1925, 497; *Bacterium insidiosum* Stapp, in Sorauer, Handb. der Pflanzenkr., *2*, 5 Aufl., 1928, 178; *Phytomonas insidiosa* Bergey et al., Manual, 3rd ed., 1930, 278; Jensen, Proc. Linnean Soc. of New So. Wales, *59*, 1934, 41.) From Latin *insidiosus*, deceitful, dangerous.

Also see McCulloch, Jour. Agr. Res., *33*, 1926, 502.

Rods: 0.4 to 0.5 by 0.7 to 1.0 micron. Capsules present. Non-motile. Gram-positive.

Gelatin: Slow liquefaction.

Beef agar colonies: Pale yellow, circular, smooth, shining; edges entire; viscid. Blue granules found on the medium.

Milk: Coagulated after 16 to 20 days. No digestion. An apricot yellow sediment is deposited on the walls of the tube.

* Descriptions of Species nos. 15 to 20 inclusive prepared by Professor Walter H. Burkholder, Ithaca, New York.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S produced.

Acid from glucose, sucrose, lactose and glycerol.

Moderate diastatic action.

Grows in 5 per cent salt.

Optimum temperature 23°C. Maximum 31°C.

Aerobic.

Distinctive character: Bluish granules produced in culture.

Source: Isolated from diseased alfalfa plants.

Habitat: Vascular pathogen of alfalfa, *Medicago sativa*.

NOTE: Jensen (*loc. cit.*) regards this species as being almost identical with *Corynebacterium helvolum* Kisskalt and Berend. He isolated one strain from grass soil which he regards as a saprophytic strain of this species. Jensen emphasized the angular arrangement of young cells grown on agar and potato. A faint indication of reduction of nitrates and of diastatic action was obtained. He also reports a weak proteolysis of milk. Optimum reaction is given as pH 5.6 to 6.8. A slimy variant of the soil strain was isolated from an old culture in glucose broth which seemed to agree better in its characteristics with the organism as described by Jones and McCulloch than did the non-slimy strains.

15a. *Corynebacterium insidiosum* var. *saprophyticum* Jensen (*loc. cit.*, 42) is based on a non-infectious soil strain. This grew more vigorously with less definite yellow pigment on nutrient agar than the pathogenic strain. Blue-violet, insoluble pigment near edge of growth on glucose agar; no blue pigment on potato; no coagulation of milk; higher temperature maximum and more resistance to acid reaction than the pathogenic strains. From grass soil in Australia.

16. Corynebacterium sepedonicum (Spiekermann and Kotthoff) Skaptason and Burkholder. (*Bacterium sepedonicum nomen nudum* Spiekermann, Ill. Landw. Zeitung, *33*, 1913, 680; *Bacterium sepedonicum* Spiekermann and Kotthoff, Landw. Jahr., *46*, 1914, 674; *Aplanobacter sepedonicum* Erw. F. Smith, Intro. Bact. Dis. of Plants, 1920, 207; *Phytomonas sepedonica* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 411; Skaptason and Burkholder, Phytopath., *32*, 1942, 439.) From Greek *sepedonicus*, putrefactive.

Description from Stapp (Ztschr. f. Par., *5*, 1930, 756).

Rods: 0.3 to 0.4 by 0.8 to 1.0 micron. Pleomorphic. Non-motile. Gram-positive.

Gelatin: Liquefaction slight.

Agar colonies: Thin, smooth, translucent, glistening, whitish, 2 to 3 mm in diameter.

Broth: Weak growth. No pellicle. Light sediment.

Litmus milk: Little change in 6 weeks, after which litmus is reduced.

Indole not formed.

No H_2S production or feeble.

Glucose, galactose, fructose, arabinose, xylose, mannitol, glycerol and dulcitol are utilized.

Starch hydrolysis light.

Grows in 4 per cent salt.

Optimum temperature 20° to 23°C. Maximum temperature 31°C. Minimum 4°C.

Distinctive characters: Differs from *Corynebacterium michiganense*, in that it is white to cream-colored on various media and has a lower optimum temperature. *Corynebacterium michiganense* does not infect potatoes.

Source: Stapp used 17 cultures isolated from diseased potatoes.

Habitat: Causes ring rot of potato tubers in Germany.

17. Corynebacterium michiganense (Erw. Smith) Jensen. (*Bacterium michiganense* Erw. Smith, Science, *31*, 1910, 794; *Pseudomonas michiganensis* Stevens, The Fungi which Cause Plant

Diseases, 1913, 30; *Aplanobacter michiganense* Erw. Smith, Bacteria in Rel. to Plant Dis., *3*, 1914, 161; *Phytomonas michiganensis* Bergey et al., Manual, 1st ed., 1923, 191; Jensen, Proc. Linnean Soc. of New So. Wales, *59*, 1934, 47; *Erwinia michiganeae*, incorrectly attributed to Bergey by Jensen, *loc. cit.*, 47.) Latinized, of Michigan, where the disease produced by this pathogen was first reported.

Description from Bryan, Jour. Agr. Res., *41*, 1930, 825.

Rods: 0.6 to 0.7 by 0.7 to 1.2 microns. Non-motile. Capsules. Gram-positive. Characteristic angular growth with branching and club-shaped cells (Jensen, *loc. cit.*).

Beef agar colonies: Growth slow, mustard yellow, smooth, glistening, butyrous.

Chromogenesis: Develops yellowish-brown, light ochre-yellow to sepia brown colors on suitable media (Jensen, *loc. cit.*).

Gelatin: Slow liquefaction.

Broth: Turbidity slow and moderate.

Milk: Slow coagulation. No peptonization.

Nitrites not produced from nitrates.

Utilizes peptone, but not ammonia, nitrite, nitrate, tyrosine, asparagine or glutamic acid (Mushin, Austral. Jour. Exp. Biol. and Med., *16*, 1938, 326).

Indole not produced.

No H_2S produced.

Acid from glucose, sucrose, galactose, fructose, maltose, and slight acid from lactose, glycerol and mannitol.

Starch: Very weak diastatic action.

No growth in 3 per cent salt.

Optimum temperature 25° to 27°C. Maximum, 33°C. Minimum, 1°C.

Aerobic.

Source: From the bacterial canker of tomato.

Habitat: Pathogenic on tomato.

17a. ***Corynebacterium michiganense* var. *saprophyticum*** **Jensen (*loc. cit.*, 48). Grows more rapidly and with more moist** growth, has a higher temperature maximum and stronger proteolytic activity than the pathogenic strains. From grass soil in Australia.

18. **Corynebacterium rathayi** (Erw. Smith) Dowson. (*Aplanobacter rathayi* Erw. Smith, Science, *38*, 1913, 926, and Bact. in Rel. to Plant Dis., *3*, 1914, 155; *Phytomonas rathayi* Bergey et al., Manual, 1st ed., 1923, 192; *Bacterium rathayi* Stevens, Fungus Dis. of Plants, 1925, 21; Dowson, Brit. Myc. Soc. Trans., *25*, 1942, 313.) Named for E. Rathay, the Austrian plant pathologist who first isolated the species.

Rods: 0.6 to 0.75 by 0.75 to 1.5 microns. Non-motile. Not acid-fast. Capsules. Gram-positive.

Gelatin: Slow liquefaction after 7 weeks.

Agar colonies: Small, yellow, slow-growing.

Milk: Growth slow. Yellow ring.

Litmus milk: Alkaline and reduced.

Nitrites are produced from nitrates.

Potato plugs: Good, yellow, viscid growth.

Acid but no gas from glucose, sucrose and lactose.

Cohn's solution: No growth.

Heavy inoculum necessary in media.

Source: Isolated from slimy heads of *Dactylis glomerata* by E. Rathay in Austria.

Habitat: Pathogenic on *Dactylis glomerata*.

NOTE: *Bacillus mucilaginosus koeleriae* Aujeszky, Botanikai Kozlemenyek, *13*, (Foreign Supl. 41), 1914, 88; *Pseudomonas mucilaginosus koeleriae* Moesz, Schedis ad Flora Hungarica Exs. Cent. IV, No. 301, Sect. Bot. Mus. Nat. Hung., Budapest, 1915. The description of the bacterium is possibly that of the saprophyte, *Pseudomonas fluorescens*, but the description of the disease is that caused by *Corynebacterium rathayi*. The specimen *in schedis* is a head of grain that appears to be infected with *Corynebacterium rathayi*.

19. **Corynebacterium agropyri** (O'Gara) *comb. nov.* (*Aplanobacter agropyri* O'Gara, Phytopath., *6*, 1916, 343; *Phytomonas agropyri* Bergey et al., Manual, 1st ed., 1923, 190; *Bacterium agropyri* Stapp, in Sorauer, Handbuch d. Pflanzenkrankheiten, 5 Aufl., *2*, 1928, 37.) From Greek *agros*, field and *puros*, wheat; M. L. *Agropyron*, wheat grass.

Rods: 0.4 to 0.6 by 0.6 to 1.1 microns. Capsules. Non-motile. Gram-variable.

Gelatin: No liquefaction.

Nutrient agar slant: Meager, yellow, very viscid growth.

Broth: Light clouding with yellow precipitate.

Milk: Little changed. Yellow sediment formed.

Nitrites are produced from nitrates.

Acid but no gas from glucose, lactose, sucrose and glycerol.

Starch: Hydrolysis feeble.

Optimum temperature 25° to 28°C.

This species is very similar to and may be identical with *Corynebacterium rathayi* Dowson.

Source: From slimy heads of wheat grass.

Habitat: Found on wheat grass, *Agropyron smithii*.

20. **Corynebacterium fascians** (Tilford) Dowson. (*Phytomonas fascians* Tilford, 54th Rept. Ohio Agr. Exp. Sta. Bull. 561, 1936, 39; Jour. Agr. Res., *53*, 1936, 393; Unnamed pathogen, Lacey, Ann. Appl. Biol., *23*, 1936, 308; Dowson, Brit. Myc. Soc. Trans., *26*, 1942, 313.) From Latin *fascio*, producing a fasciation.

Rods: 0.5 to 0.9 by 1.5 to 4.0 microns. Non-motile. Gram-positive.

Gelatin: No liquefaction.

Potato-glucose agar colonies: Light cream-colored colonies appear after 72 hours. Punctiform, circular, later cadmium yellow to deep chrome.

Nutrient agar slant: After one week streak is filiform, flat, dull to glistening, smooth, opaque, cream-colored, and butyrous.

Broth: Slightly turbid. Fragile pellicle with distinct rim.

Milk: Litmus becomes blue. Other changes slight.

Nitrites are produced from nitrates.

Indole not formed.

Hydrogen sulfide is produced.

Acid but no gas from glucose, galactose, fructose, mannose, arabinose, xylose, maltose, sucrose, glycerol, mannitol and dextrin. No acid from rhamnose, lactose, raffinose and inulin.

Starch not hydrolyzed.

Grows in 8 per cent salt.

Optimum temperature 25° to 28°C.

Aerobic.

Source: Described from 15 single cell isolates from fasciated growths on sweet peas.

Habitat: Pathogenic on sweet pea, chrysanthemum, geranium, petunia, tobacco, etc.

21. **Corynebacterium helvolum** (Zimmerman) Kisskalt and Berend. (*Bacillus helvolus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 52; *Bacterium helvolum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 254; Kisskalt and Berend, Cent. f. Bakt., I Abt., Orig., *81*, 1918, 446; *Flavobacterium helvolum* Bergey et al., Manual, 1st ed., 1923, 114.) From Latin *helvus*, of a light bay color.

Original description supplemented from Jensen, Proc. Linn. Soc. New So. Wales, *59*, 1934, 37.

Rods: 0.5 by 1.0 micron, occurring singly. Show angular arrangement due to snapping division. Variable in morphology. Non-motile. Gram-positive.

Gelatin colonies: Small, circular, yellowish-gray. Liquefaction.

Gelatin stab: Slight development along the stab. Napiform liquefaction.

Agar colonies: Circular, pale yellow, smooth, slightly convex.

Agar slant: Pale yellow, plumose to spreading, moist, undulate.

Milk agar: Growth fair to very abun-

dant, white to pale yellow. Some strains form a pink pigment. Proteolytic zones clear and broad after 4 days.

Asparagine agar: Scant to good growth, smooth, glistening, white and cream-colored to lemon-yellow or even dull pink.

Broth: Turbid, with gray ring and yellowish sediment. After four days the sediment contains long, curved and branching rods. May resemble small mycelia.

Litmus milk: Slightly acid, with soft coagulum, becoming alkaline; peptonized. Litmus reduced.

Potato: Pale yellow, moist, plumose growth, becoming rough, dull. Slimy variants noted in one strain. A myceloid variant with dry wrinkled growth was found in another strain.

Indole not formed.

Nitrites not produced from nitrates.

Acid from glucose, glycerol and mannitol. Usually from arabinose, sucrose, galactose, fructose.

Aerobic, facultative.

Hydrogen sulfide produced on appropriate media.

Optimum temperature 25°C. Usually grows at 37°C.

Source: Originally isolated from water.

Habitat: A common soil *Corynebacterium*.

22. **Corynebacterium fimi** (McBeth and Scales) Jensen. (*Bacterium fimi* McBeth and Scales, Bur. of Plant Ind., U. S. Dept. Agr., Bull. 266, 1913, 30; *Cellulomonas fimi* Bergey et al., Manual, 1st ed., 1923, 166; *Bacillus fimi* Holland, Jour. Bact., *5*, 1920, 218; Jensen, Proc. Linn. Soc. New So. Wales, *59*, 1934, 48.) From Latin *fimus*, dung.

Description from Jensen (*loc. cit.*) who studied an authentic strain.

Rods present typical diphtheroid appearance with angular arrangement, 0.4 to 0.5 by 1.2 to 2.5 microns. Many longer, rregular, curved, club-shaped and branching cells on Sabouraud's (whey) agar. Non-motile. Gram-negative (McBeth and Scales). Gram-variable like some other corynebacteria (Jensen).

Gelatin colonies: Small, round, becoming lobate. Slow liquefaction.

Gelatin stab: Granular yellow growth. Infundibuliform liquefaction.

Cellulose agar colonies: Circular, raised, smooth, glistening, gray, entire.

Agar slant: Smooth, glistening, white to lemon-yellow growth.

Glucose and Sabouraud's agar: Growth less abundant and cream-colored.

Asparagine agar: Very scant growth, narrow, thin, glistening, white.

Broth: Uniform turbidity, soft cream-colored to yellow sediment after 3 weeks.

Litmus milk: Coagulated at 3 weeks at 37°C. Not at 28° to 30°C. Faintly acid.

Potato: Slow cream-colored to yellow growth.

Indole is formed.

Nitrites are produced from nitrates.

Ammonia is produced in peptone solutions.

Diastatic action doubtful.

Acid from glucose, fructose, arabinose, xylose, maltose, lactose, sucrose, raffinose, melezitose, dextrin, starch, salicin and glycerol. None or feebly produced from mannitol and dulcitol.

Causes rapid disintegration of cellulose (filter paper) in a 0.5 per cent peptone solution.

Aerobic, facultative.

Optimum temperature 20°C (McBeth and Scales). Better growth at 37°C than at 28° to 30°C (Jensen).

Source: Probably isolated from soil. Found in soils of Southern California (McBeth, Soil Sci., *1*, 1916, 443).

Habitat: Soil.

Bacterium liquatum McBeth and Scales (McBeth and Scales, Bur. Plant Ind., U. S. Dept. Agr., Bull. 266, 1913, 32; *Cellulomonas liquata* Bergey et al., Manual, 1st ed., 1923, 166) should be regarded as identical with this species as the only significant difference reported between the two species by the original authors was that *Bacterium liquatum* produced a

yellow chromogenesis more readily. This, however, does not appear to have occurred any more frequently than took place with the authentic culture of *Bacterium fimi* when tested by Jensen (*loc. cit.*).

23. **Corynebacterium tumescens** Jensen. (Jensen, Proc. Linn. Soc. New So. Wales, *59*, 1934, 45.) From Latin *tumescens*, swollen.

Rods show characteristic cytomorphosis in glucose agar, Sabouraud's (whey) agar and milk agar. Cells after 18 to 24 hours at 28° to 30°C are curved, often branched, show an angular arrangement. 0.5 to 0.8 by 2.5 to 6.0 microns. After 2 to 3 days many spherical to club-shaped cystites (3 microns in diameter) arise as local swellings of the rods. Staining intensely at first, they gradually change into large, irregular, poorly stained ghost cells which show deeply staining belts and granules. Irregular less swollen deeply stained rods and small cocci (0.4 to 0.5 micron) which resemble the granules in the cystites are also present. These cocci are living cells. Non-motile. Gram-positive.

Gelatin colonies: Small, opaque, yellow. Liquefaction after 3 to 4 weeks.

Milk agar: Cystites develop in almost pure culture. These sometimes have 2 to 4 small cocci attached to the wall so that they look like budding yeasts. When transferred to fresh agar, cystites either fail to grow or germinate with 2 to 4 slender germ tubes which regenerate the rods. Cystites are produced most abundantly at 37°C, sometimes not at all at 16° to 18°C.

Sabouraud's agar: Cystites sometimes 6 to 8 microns in diameter. Growth may be cream-colored or even grayish-pink.

Asparagine agar: Growth thin, flat, moist, colorless.

Broth: Faint uniform turbidity; after 2 to 3 weeks, a soft white to cream-colored sediment.

Milk: Thin white ring around surface. Soft coagulation after 18 to 20 days. Later, slow digestion. Faintly acid.

Potato: Slow but eventually good growth, restricted, glistening, viscid, cream-colored to grayish-orange.

Acid from glucose, arabinose, galactose, maltose and glycerol; occasionally from sucrose and mannitol.

Nitrites produced from nitrates.

Optimum reaction pH 6.2 to 6.8.

Slimy variants produced after 172 days growth in lithium solution.

Source: Two strains from grass soils and one from garden soil in Australia.

Habitat: Soil.

24. **Corynebacterium simplex** Jensen. (Proc. Linn. Soc. New So. Wales, *59*, 1934, 43.) From Latin *simplex*, simple.

Rods: 0.4 to 0.5 by 3.0 to 5.0 microns, curved and in parallel bundles. No branching in older cultures but the cells grow shorter, becoming almost coccoid. Angular arrangement. Non-motile. Gram-positive.

Gelatin: Colonies very small. Filiform growth along stab. Liquefaction after 4 days.

Asparagine agar: Fair to good growth, becoming moist and glistening. No pigment.

Glucose agar: Abundant growth. Spreading, smooth, glistening, cream-colored to grayish-yellow.

Broth: Uniform turbidity, grayish-yellow, viscid sediment.

Milk: Yellowish ring around surface. No coagulation. Complete digestion after 10 to 12 days. Reaction neutral.

Nitrites produced from nitrates.

Starch is not hydrolyzed.

Acid from sucrose. Alkaline reaction in other sugar broths.

Excellent growth at 37°C.

Resembles *Corynebacterium filamentosum* in cultural characters but does not form long filaments.

Source: From grass soil and red soil from Griffith, Australia.

Habitat: Soil.

25. **Corynebacterium filamentosum** Jensen. (Proc. Linn. Soc. New So.

Wales, *59*, 1934, 42.) From Latin *filamentosus*, full of threads.

Rods: Variable in shape. Young cells typically curved, vibrio-like, 0.5 to 0.8 by 2.0 to 7.0 microns, sometimes longer and branched. Always in parallel bundles. Usually non-motile but a few cells exhibit a peculiar oscillatory or rotatory movement. Gram-positive.

Gelatin: Colonies small, spherical, entire. Filiform white growth in stab. Liquefaction slow starting at end of 7 days.

Asparagine agar: Good characteristic growth, widely spreading, central part convex, smooth, glistening, white, sending dendritic projections into the broad marginal part. Usually produces light greenish-yellow soluble pigment.

Glucose agar: Growth less vigorous than on asparagine agar, flat, cream-colored to grayish-yellow, viscid.

Sabouraud (whey) agar: Similar to glucose agar.

Potato: Scant to no growth, flat, glistening, cream-colored to grayish-yellow, surrounded by a white halo.

Broth: Faint uniform turbidity. Soft, flaky, cream-colored sediment.

Milk: White to cream-colored surface ring and sediment. No coagulation. Digestion in 2 to 4 weeks. Neutral to faintly acid.

May produce nitrites from nitrates.

Starch is not hydrolyzed.

Acid from glycerol and arabinose. Strong and rapid alkaline formation in other sugar media.

Optimum reaction pH 5.4 to 5.5.

Excellent growth at 37°C.

Aerobic.

Regarded as being much like *Vibrio lingualis* Eisenberg and *Bacterium racemosum* Zettnow.

Source: From red soil from Griffith, Australia.

Habitat: Soil.

Appendix I:* The following four species of plant pathogens have an unusual combination of characters in that they are reported to be Gram-positive and polar flagellate. Cultures of two of the four species have been available for study and these and other characters have been rechecked by several persons. *Corynebacterium flaccumfaciens* shows many wedge-shaped cells and longer cells with a slight curve. It is motile with a single polar flagellum and shows Gram-positive with commonly used procedures for Gram-staining. *Corynebacterium poinsettiae* shows a straighter form of cell but in other characters is like *C. flaccumfaciens*. Prof. W. H. Burkholder and Dr. M. P. Starr really feel that these organisms are most closely related to other more typical corynebacteria. They are therefore placed for the present in this appendix, although by the characters used in the keys they would be placed in *Pseudomonadaceae*.

1. **Corynebacterium hypertrophicans** (Stahel) *comb. nov.* (*Pseudomonas hypertrophicans* Stahel, Phyt. Ztschr., *6*, 1933, 445; *Phytomonas hypertrophicans* Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 367.) From Greek *hyper-trophe*, hypertrophy.

Rods: 0.6 to 0.8 by 1.2 to 2.8 microns. Motile with a polar flagellum. Bipolar staining. Gram-positive.

Gelatin: No growth.

Agar colonies: Slow growing, circular, raised, wet-shining, white.

Broth plus sucrose: Growth good. No pellicle.

Milk: No visible change.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S produced.

Acid but no gas from glucose, fructose and sucrose. No acid from lactose and glycerol. The acids from sucrose are lactic and formic.

*Prepared by Prof. Walter H. Burkholder, New York State College of Agriculture, Ithaca, New York, May, 1945.

Aerobic.

Source: From witches' brooms.

Habitat: Pathogenic on *Eugenia latifolia*.

2. **Corynebacterium flaccumfaciens** (Hedges) Dowson. (*Bacterium flaccumfaciens* Hedges, Science, *55*, 1922, 433; Phytopath., *16*, 1926, 20; *Phytomonas flaccumfaciens* Bergey et al., Manual, 1st ed., 1923, 178; *Pseudomonas flaccumfaciens* Stevens, Plant Diseases of Fungi, 1925, 27; Dowson, Brit. Myc. Soc. Trans., *25*, 1942, 313.) From Latin *flaccus*, flabby or wilted; *facio*, to make; producing a wilt.

Rods: 0.3 to 0.5 by 0.6 to 3 microns. Motile with a single polar flagellum; also non-motile (Adams and Pugsley, Jour. Dept. Agr. Victoria., *32*, 1934, 306). Gram-positive.

Gelatin: Liquefaction feeble.

Beef agar slants: Rather moderate growth, glistening, flat, smooth, viscid and yellow.

Broth: Moderate turbidity in 24 hours. Pellicle formed.

Milk: Acid curd and slow peptonization.

Nitrites not produced from nitrates.

Indole not formed.

No H_2S formed.

Acid from glucose, lactose, sucrose and glycerol.

Starch not hydrolyzed.

Slight growth in 5 per cent salt.

Optimum temperature, 31°C. Maximum temperature 36° to 40°C.

Distinctive character: A strict vascular parasite of the bean.

Source: From wilted bean plants from South Dakota.

Habitat: Causes a wilt of beans and related plants.

3. **Corynebacterium poinsettiae** Starr and Pirone. (Phytopath., *32*, 1942, 1080; *Phytomonas poinsettiae*, *ibid.*) From M. L., old genus *Poinsettia*.

Rods: Average cells 0.3 to 0.8 by 1.0 to 3.0 microns. Pleomorphic with some cells 8.5 microns in length. Granules and capsules present. Motile with 1 (rarely 2) polar or lateral flagellum. Gram-positive.

Gelatin: Liquefaction.

Loeffler's blood-serum: Liquefaction.

Beef-extract agar colonies: Round, slightly convex, 0.1 to 1.0 mm in diameter, edges entire, smooth, non-viscid, colorless and almost transparent.

Potato glucose agar slants: Moderate growth, filiform, glistening, non-viscid, salmon to flesh color.

Beef-extract broth: Turbid in 24 hours, abundant pale salmon sediment. No pellicle.

Milk: Slight acidity but no other visible change for 2 weeks, then a soft curd, reduction of litmus, and complete peptonization.

Indole not produced.

Nitrites not produced from nitrates.

Hydrogen sulfide not formed.

Sodium hippurate not hydrolyzed.

Asparagine not utilized as carbon-nitrogen source. Uric acid not utilized; urea not hydrolyzed.

No lipolytic activity.

Voges-Proskauer test negative. Methyl red test negative.

Moderate to abundant acid, but no gas, from glucose, fructose, mannose, galactose, sucrose, maltose, cellobiose, melibiose, raffinose, glycerol, erythritol, salicin and amygdalin; weak acid from arabinose, xylose, lactose, trehalose, dextrin and adonitol; no acid from rhamnose, fucose, inulin, glycogen, mannitol, dulcitol, sorbitol and inositol.

Starch hydrolyzed.

No action on cellulose.

Tellurite reduced.

Aerobic.

Growth occurs after 24 hours from 15°C to 36°C; after 48 hours from 7°C to 12°C. No growth above 36°C or below 7°C at the end of a week.

Source: Fourteen cultures isolated from diseased stems of poinsettia, *Euphorbia pulcherrima*.

Habitat: Causes a canker of stems and spots on leaves of the poinsettia.

4. **Corynebacterium tritici** (Hutchinson) *comb. nov.* (*Pseudomonas tritici* Hutchinson, India Dept. of Agr., Bact. Ser., *1*, 1917, 174; *Phytomonas tritici* Bergey et al., Manual, 3rd ed., 1930, 248; *Bacterium tritici* Elliott, Bacterial Plant Pathogens, 1930, 234.) From Latin *triticum*, wheat; M. L., from the genus *Triticum*.

Rods: 0.8 by 2.4 to 3.2 microns. Motile with a polar flagellum. Gram-positive.

Gelatin: No liquefaction.

Agar colonies: Bright yellow becoming orange, glistening, moist, margins entire. Agar brownish.

Broth: Turbid. Thin pellicle.

Milk: Yellow surface and yellow precipitate. Little change.

Nitrites produced from nitrates.

No H_2S produced.

Acid but no gas from glucose and lactose.

This species is very similar to and may be identical with *Corynebacterium rathayi* Dowson.

Source: From slimy heads of wheat in India.

Habitat: Pathogenic on wheat, *Triticum aestivum*.

* **Appendix II**: By the use of names or by the descriptions given, authors have indicated that the following are related to the species placed in *Corynebacterium*. Many are incompletely described and may be identical with other recognized species.

Bacillus alcalifaciens Kurth. (*Bacillus pseudodiphtheriticus alcalifaciens* Kurth, Ztschr. f. Hyg., *28*, 1898, 429; *ibid.*, 431.) From patients suspected of having diphtheria.

Bacillus avium Migula. (Bacillus de la diphthérie aviaire, Loir and Ducloux, Ann. Inst. Past., *8*, 1894, 599; *Bacillus diphtheriae avium* Kruse, in Flügge, Die Mikroorganismen, 2 Aufl., *2*, 1896, 410; *Bacterium diphtheriae avium* (sic) Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 75; Migula, Syst. d. Bakt., *2*, 1900, 759.) Considered the cause of a diphtheria-like disease of birds in Tunis. Motile. Not now regarded as belonging in *Corynebacterium* (Andrewes et al., Diphtheria, London, 393).

Bacillus clavatus Kruse and Pasquale. (Kruse and Pasquale, Ztschr. f. Hyg., *16*, 1894, 50 and 62; not *Bacillus clavatus* Migula, Syst. d. Bakt., *2*, 1900, 597.) From the heart blood, kidney, etc., during autopsy of a person who died with liver abscesses following Egyptian dysentery. This is a pseudodiptheroid (Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 477) but is confused by Eberson (Jour. Inf. Dis., *23*, 1918, 5) and Thomson and Thomson (Ann. Pickett Thomson Res. Lab., *2*, 1926, 65) with anaerobic Bacillus No. III, a spore former isolated by Flügge (Ztschr. f. Hyg., *17*, 1894, 290) from boiled milk and named *Bacillus clavatus* by Migula (*loc. cit.*) in 1900.

Bacillus crassus Lipschütz. (Lipschütz, Bakt. Grundriss und Atlas der Geschlechtekrankheiten, Leipzig, 1913, 64; *Plocamobacterium crassum* Löwi, Wiener klin. Wchnschr., *33*, 1920, 733; not *Plocamobacterium vaginae* Lehmann, in Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 510.) This is the abundant Gram-positive bacillus found in ulcus vulvae acutum. It is the type species (monotypy) of the genus *Plocamobacterium* Löwi (*loc. cit.*). According to Löwi this organism liquefies coagulated blood serum and Lipschütz (Cent. f. Bakt., I Abt., Orig., *88*, 1922, 5) reports that, unlike lactobacilli, this organism will grow on protein media without the addition of sugar. Presumably therefore it is not a lactobacillus and is not identical with Doederlein's bacillus as claimed

* Prepared by Dr. R. F. Brooks, New York State Experiment Station, Geneva, New York, September, 1938; further revision by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, March, 1945.

by Lehmann (*loc. cit.*) It may belong in *Corynebacterium*. See *Bacillus vaginae* Kruse.

Bacillus diphtheriae vitulorum Flügge. (Bacillus der diphtherie beim Kalbe, Löffler, Mitt. a. d. kais. Gesundheitsamte, *2*, 1884, 421; Flügge, Die Mikroorganismen, 2 Aufl., 1886, 265.) From a disease of calves.

Bacillus diphtheroides Klein. (Cent. f. Bakt., I Abt., *28*, 1900, 418.) From bovine mastitis. Presumably identical with *Corynebacterium pyogenes* according to Eberson (Jour. Inf. Dis., *23*, 1918, 6).

Bacillus endocarditis griseus Weichselbaum. (Weichselbaum, Beiträge z. path. Anat. u. allgem. Path., *4*, 1887, 119.) From a case of endocarditis. A motile form. Regarded by Kruse (in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 433 and 479) as a diphtheroid. Because of its motility, it is not so regarded by Eberson (Jour. Inf. Dis., *23*, 1913, 4).

Bacillus pseudodiphtheriticus acidum aciens Kurth. (Ztschr. f. Hyg., *28*, 1898, 431.) From patients suspected of having diphtheria.

Bacillus pseudodiphtheriticus gazogenes Jacobsen. (Ann. Inst. Past., *22*, 1908, 308.) From feces. Reported to be a vigorous gas former. Eberson (Jour. Inf. Dis., *23*, 1918, 9) thinks this was an impure culture.

Bacillus septatus Gelpke. (Gelpke, in v. Graefe, Arch f. Opthal., *42*, 1896, No. 4; *Bacterium septatum* Gelpke, Arb. bakt. Inst. Karlsruhe, *2*, Heft 2, 1898, 73.) From acute epidemic catarrh. Presumably identical with *Corynebacterium xerose* according to Eberson (Jour. Inf. Dis., *23*, 1918, 3).

Bacillus variabilis lymphae vaccinalis Nakanishi. (Nakanishi, Cent. f. Bakt., I Abt., Orig., *27*, 1900, 641; *Corynethrix bovis* Czaplewski, Deutsche med. Wchnschr., *26*, 1900, 723.) From calf vaccine lymph. The organisms listed here as *Corynebacterium lymphae vaccinalis*, *Corynebacterium vaccinae* and *Bacillus variabilis lymphae vaccinalis* are probably identical.

Bacillus xerosis variolae Klein. (Rept. Local Gov. Board, London, *20*, 1890, 219, quoted from Thomson and Thomson, Ann. Pickett-Thomson Res. Lab., *2*, 1926, 121.) From vaccine pustules.

Bacterium acnes Migula. (Bacillus der Akne contagiosa des Pferdes, Dieckerhoff, Grawitz, Arch. f. pathol. Anat. u. Physiol., *102*, 1886, 148; *Bacillus grawitzii* Trevisan, I generi e le specie delle Batteriacee, 1889, 13; *Bacillus acnes-contagiosae* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 445; Migula, Syst. d. Bakt., *2*, 1900, 385; *Bacterium grawitzii* Chester, Manual Determ. Bact., 1901, 154.) From pus and scabs of pustules in acne-contagiosa in horses.

Bacterium candidus Galli-Valerio. (Cent. f. Bakt., I Abt., Orig., *36*, 1904, 465.) From infected leg, but not considered causative.

Bacterium coelicolor Müller. (Müller, Cent. f. Bakt., I Abt., Orig., *46*, 1908, 195; *Bacillus coelicolor* Godfrin, Contribution à l'étude des bactéries bleues et violettes, Thèse, Nancy, 1934.) Contaminant on serum agar plate.

Bacterium columbarum Migula. (Bacillus der diphtherie bei der Taube, Löffler, Mitt. a. d. kais. Gesundheitsamte, *2*, 1884, 421; *Bacillus diphtheriae columbarum* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 263; *Bacillus diphtheriae-columbarum* Trevisan, I generi e le specie delle Batteriacee, 1889, 13; *Bacterium diphtheriae columbarum* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 84; Migula, Syst. d. Bakt., *2*, 1900, 381; not *Bacterium columbarum* Chester, Manual Determ. Bact., 1901, 141; *Bacterium diphtheriae* Chester, Man. Determ. Bact., 1901, 141; not *Bacterium diphtheriae* Migula, Syst. d. Bakt., *2*, 1900, 499.) Associated with diphtheria in pigeons. Andrewes et al. (Diphtheria, London, 1923, 393) state that this organism does not belong in *Corynebacterium*.

Bacterium muris Klein. (Cent. f.

Bakt., I Abt., Orig., *33*, 1902, 488; *Bacillus muris* Mellon, Jour. Bact., *2*, 1917, 305.) Causative agent of hepatized lung in white rat.

Bacterium pseudopestis murium Galli-Valerio. (Cent. f. Bakt., I Abt., Orig., *68*, 1913, 188.) Causative agent of thyroid infection in rats. Gram-negative.

Bacterium ribberti Migula. (Bacillus der Darmdiphtherie des Kaninchens, Ribbert, Deutsch. med. Wochnschr., *13*, 1887, 141; *Bacillus diphtheriae cuniculi* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 412; *Bacterium diphtheriae cuniculi* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 84; Migula, Syst. d. Bakt., *2*, 1900, 369; *Bacterium cuniculi* Chester, Man. Determ. Bact., 1901, 141.) Associated with a diphtheritic inflammation of the intestines in rabbits.

Coccobacillus diphtheroides Manteufel. (Diphtheroid bacilli, Collis, Sheldon and Hill, Quart. Jour. Med., Ser. 2, *1*, 1932, 511; *Kokkobacillus diphtheroides* Bertrand, Med. Welt, *8*, 1934, 150; Manteufel, Cent. f. Bakt., I Abt., Orig., *138*, 1937, 308.) From polyarthritis.

Comma variabile Heurlin. (Heurlin, Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen. Helsingfors, 1910, 145.) From genital canal.

Corynebacterium acidum Eberson. (*Bacillus diphtheroides brevis* Graham-Smith, Jour. Hyg., *4*, 1904, 258; Eberson, Jour. Inf. Dis., *23*, 1918, 9.) From large abscess in mouth and ear.

Corynebacterium adamsoni Prévot. (Bacillus D, Adamson, Jour. Path. and Bact., *22*, 1919, 350 and 392; Prévot, Ann. Inst. Past., *60*, 1938, 304.) From infected war wounds.

Corynebacterium album Belenky and Popova. (Cent. f. Bakt., I Abt., Orig., *118*, 1930, 444.) From normal skin of calves and small-pox vaccine.

Corynebacterium anaerobium Prévot. (*Bacillus anaerobius diphtheroides* Massini, Ztschr. f. gesammte exper. Med., *2*, 1913, 81; Prévot, Ann. Inst. Past., *60*, 1938, 304.) From a complicated case of otitis media.

Corynebacterium annamensis Hauduroy et al. (Gillon, Thèse pour le Doctorat Vetérinaire, École Nationale Vetérinaire de Toulouse, France, 1930; Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 145.) Causative agent of a toxic abdominal infection of sheep in Annam, French Indo-China.

Corynebacterium arthritidis muris Fischl, Koech and Kussat. (Ztschr. f. Hyg., *112*, 1931, 421; *Corynebacterium arthritidis-muris* Hauduroy et al., Dict. d. Bact. Path., 1937, 147.) Causative agent of infected ankle joint in white mouse.

Corynebacterium ascitis Eberson. (Jour. Inf. Dis., *23*, 1918, 16.) From ascitic fluid.

Corynebacterium aurantiacum Eberson. (Jour. Inf. Dis., *23*, 1918, 14.) Orange-red growth. From lymph nodes; one culture from gland in Hodgkin's disease but not specific for the disease.

Corynebacterium auris (Graham-Smith) Eberson. (*Bacillus auris* Graham-Smith, Jour. Hyg., *4*, 1904, 258; Eberson, Jour. Inf. Dis., *23*, 1918, 8.) Indole is formed. From pus of ears of scarlet fever patients.

Corynebacterium avidum (Eggerth) Prévot. (*Bacteroides avidus* Eggerth, Jour. Bact., *30*, 1935, 289; Prévot, Ann. Inst. Past., *60*, 1938, 304.) Forms gas in some media. From the human intestine. Pederson (Jour. Bact., *50*, 1945, 478) secured a culture of this species from Eggerth, and found that it fermented glucose with the production of higher fatty (presumably butyric) acids, and lactic acid. The species should probably be placed in *Butyribacterium* Barker.

Corynebacterium blattellae Glaser. (Jour. Exp. Med., *51*, 1930, 907.) Found in the fat body of the German cockroach (*Blattella germanica*). For a more complete description see Manual, 5th ed., 1939, 978.

Corynebacterium bruneum Kisskalt and Berend. (*Bacterium bruneum γ arborescens*, quoted from Kisskalt and Berend, Cent. f. Bakt., I Abt., Orig., *81*, 1918, 446; Kisskalt and Berend, *idem.*) Source not given.

Corynebacterium cerebralis Eberson. (Jour. Inf. Dis., *23*, 1918, 17.) From the brain in a case of meningitis.

Corynebacterium ceruminis (Graham-Smith) Eberson. (*Bacillus ceruminis* Graham-Smith, Jour. Hyg., *4*, 1904, 258; Eberson, Jour. Inf. Dis., *23*, 1918, 8.) Indole is not formed. From normal and scarlet fever-infected ears.

Corynebacterium commune Martin. (Compt. rend. Soc. Biol., Paris, *81*, 1918, 991 and 998.) From the pharynx.

Corynebacterium cremoides (Lehmann and Neumann) Jensen. (*Bacterium cremoides* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 253; Jensen, Proc. Linn. Soc. New So. Wales, *59*, 1934, 40.) From tapwater, Würzburg. Lehmann and Neumann recognize this species as a *Corynebacterium* in the seventh edition of their determinative bacteriology (Bakt. Diag., 7 Aufl., *2*, 1927, 710) but do not use the binomial *Corynebacterium cremoides* except in the index, page 848. Jensen has reisolated this organism from soil in Australia. *Bacterium cocciforme* Migula (Kultur No. 2, Severin, Cent. f. Bakt., II Abt., *1*, 1895, 160; Migula, Syst. d. Bakt., *2*, 1900, 439) from manure is regarded by Jensen (*loc. cit.*) as closely related to this species.

Corynebacterium cuculi (Graham-Smith) Bergey et al. (*Bacillus cuculi* Graham-Smith, Jour. of Hyg., *4*, 1904, 315; Bergey et al., Manual, 1st ed., 1923, 387.) From the throat of a cuckoo. For a more complete description see Manual, 5th ed., 1939, 802.

Corynebacterium cuniculi Hauduroy et al. (*Bacillus pyogenes cuniculi* Cominotti, Clinica Veterinaria, *44*, 1921, 45; Hauduroy et al., Dict. d. Bact. Path., 1937, 147). Reported as Gram-variable by Cominotti, as Gram-negative by Hauduroy et al. Causative agent of suppurative infection of rabbit.

Corynebacterium cutis Hauduroy et al. (*Bacillus cutis communis* Nicolle, quoted from Costa, Troisser and Dauvaugne, Compt. rend. Soc. Biol., Paris, *81*, 1918, 1003; *Bacillus cutis* Costa, Troisser and Dauvaugne, *ibid.*, 1004; *Bacterium cutis commune* Nicolle, quoted from Debré and Letulle, La Presse Méd., *27*, 1919, 515; Hauduroy et al., Dict. d. Bact. Path., 1937, 148). From normal skin and nasal passages.

Corynebacterium delicatum Eberson. (Jour. Inf. Dis., *23*, 1918, 16.) From ascitic fluid. Also from blood.

Corynebacterium dermophilum (Rohde) Andrewes et al. (*Bacillus dermophilus* Rohde, Münch. med. Wchnschr., *68*, 1921, 234; Andrewes, Bulloch, Douglas, Dreyer, Fildes, Ledingham and Wolf, Diphtheria, London, H. M. Stationery Office, 1923, 391.) From the skin.

Corynebacterium diphtheroides Prévot. (Bacille diphtheroide, Jungano, Compt. rend. Soc. Biol., Paris, *61*, 1909, 112; Prévot, Ann. Inst. Past., *60*, 1938, 304.) Forms gas in some media. From the intestines of white rats.

Corynebacterium epidermidis Eberson. (Jour. Inf. Dis., *23*, 1918, 17.) From skin and pus pockets. Resembles *Corynebacterium suppuratum* Eberson.

Corynebacterium flocculens Eberson. (Jour. Inf. Dis., *23*, 1918, 17.) From a case of appendicitis.

Corynebacterium gallinarum Bergey et al. (*Bacillus diphtheroides gallinarum* Graham-Smith, Jour. of Hyg., *4*, 1904, 314; Bergey et al., Manual, 1st ed., 1923, 387.) From the throats of chickens. For a more complete description see Manual, 5th ed., 1939, 802.

Corynebacterium glandulae Eberson. (Jour. Inf. Dis., *23*, 1918, 14.) From lymph glands in Hodgkin's disease but not specific for the disease.

Corynebacterium granulomatis maligni de Negri and Mieremet. (Cent. f. Bakt., I Abt., Orig., *68*, 1913, 292.) Causative agent of human malignant granuloma.

Corynebacterium granulosum Prévot. (Bacille granuleux, Jungano, Compt. rend. Soc. Biol., Paris, *66*, 1909, 123; Prévot, Ann. Inst. Past., *60*, 1938, 304.) From the intestines of white rats.

Corynebacterium hepatodystrophicans (Kuczinski) Prévot. (*Bacillus hepatodystrophicans* Kuczinski, Der Erreger des Gelbfiebers-Wesen und Wirkung, Monographie, 1929, Berlin; Prévot, Ann. Inst. Past., *60*, 1938, 304.) Manteufel (Cent. f. Bakt., I Abt., Orig., *138*, 1937, 309) regards this species as identical with *Bacillus renale* (*cuniculi*) Manteufel and Herzberg. Common in the organs of monkeys infected with yellow fever virus.

Corynebacterium hodgkinii Bunting and Yates. (Bunting and Yates, Arch. Internal Med., *12*, 1913, 236; Johns Hopkins Hosp. Bull., *25*, 1914, 173; *Bacillus hodgkini* Mellon, Jour. Bact., *2*, 1917, 271; *Fusiformis hodgkini* Holland, Jour. Bact., *5*, 1920, 223.) From lymph glands in Hodgkin's disease. Not pathogenic. Thought by Fox (Jour. Med. Res., *32*, 1915, 309) and Eberson (Jour. Inf. Dis., *23*, 1918, 11) not to represent a definite species. Eberson recognized four separate species isolated from human lymph glands, three being from glands in Hodgkin's disease (*Corynebacterium aurantiacum*, *C. pseudodiphtheriae*, *C. glandulae* and *C. lymphophilum*).

Corynebacterium liquefaciens Prévot. (*Bacillus parvus liquefaciens* Jungano, Compt. rend. Soc. Biol., Paris, *65*, 1908, 618; Prévot, Ann. Inst. Past., *60*, 1938, 304; not *Corynebacterium liquefaciens* Andrewes et al., Diphtheria, London, 1923, 408; not *Corynebacterium liquefaciens* Jensen, Proc. Linn. Soc. New So. Wales, *59*, 1934, 49.) From human intestine.

Corynebacterium liquefaciens Andrewes et al. (*Bacillus diphtheroides liquefaciens* Graham-Smith, Jour. Hyg., *4*, 1904, 258; *Bacillus liquefaciens* Mellon, Jour. Bact., *2*, 1917, 290; Andrewes, Bulloch, Douglas, Dreyer, Fildes, Ledingham, and Wolf, Diphtheria, London, 1923, 408.) From mouth of a patient. Motile.

Corynebacterium lymphae vaccinalis Levy and Fickler. (Deutsch. med. Wchnschr., *26*, 1900, 418; *Corynebacterium pyogenes* Lewandowsky, Cent. f. Bakt., I Abt., Orig., *36*, 1904, 473.) From animal lymph.

Corynebacterium lymphophilum (Torrey) Eberson. (*Bacillus lymphophilus* Torrey, Jour. Med. Res., *34*, 1916, 79; Eberson, Jour. Inf. Dis., *23*, 1918, 23.) Anaerobic. From lymph glands in Hodgkin's disease, but not specific for the disease.

Corynebacterium maculatum (Graham-Smith) Ford. (*Bacillus maculatus* Graham-Smith, Jour. Hyg., *4*, 1904, 258; Ford, Textb. Bact., 1927, 277.) From throat. Regarded as a *Corynebacterium* by Eberson (Jour. Inf. Dis., *23*, 1918, 7).

Corynebacterium metritis Hauduroy et al. (Souckin, Sovetskaia Veter., No. 11, 1934; Hauduroy et al., Dict. d. Bact. Path., 1937, 156.) Causative agent of metritis in rabbit.

Corynebacterium miltinum Kisskalt. (Quoted from Kisskalt and Berend, Cent. f. Bakt., I Abt., Orig., *81*, 1918, 446). Source not given.

Corynebacterium nodosum (Migula) Eberson. (*Bacillus nodosus parvus* Lustgarten-Mannaberg, Vierteljahrschrift f. Dermatol. u. Syphilis, 1887, 914; *Bacterium nodosum* Migula, Syst. d. Bakt., *2*, 1900, 416; Eberson, Jour. Inf. Dis., *23*, 1918, 4.) Found in the normal human urethra.

Corynebacterium nubilum (Frankland and Frankland) Jensen. (*Bacillus nubilus* Frankland and Frankland, Ztschr. f. Hyg., *6*, 1889, 386; *Bacterium nubilum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 255; *Chromobacterium nubile* Ford, Textb. of Bact., 1927, 472; *Flavobacterium nubilum*, incorrectly ascribed to Bergey, by Jensen, Proc. Linn. Soc. New So. Wales, *59*, 1934, 44; Jensen, *idem*.) From water and soil. The identity of this species is doubtful. The original description by the Franklands is incomplete. Zimmerman (Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*,

1890, 28) thought he found the same organism and described it as Gram-negative. Lehmann and Neumann (Bakt. Diag., 1 Aufl., *2*, 1896, 255) who studied one of Zimmermann's cultures reported this culture as Gram-positive and non-motile, while the Franklands and Zimmermann speak of an active, circular motility of the very slender rods. Lehmann and Neumann later (Bakt. Diag., 7 Aufl., *2*, 1927, 710) list their *Bacterium nubilum* (with other Gram-positive, non-motile rods) as a possible *Corynebacterium*. Jensen failed to find anything that exactly corresponded to any of these descriptions but describes a small, Gram-positive, poorly-growing, pink to red, slow gelatin-liquefying rod which he says has little in common with corynebacteria as a new variety *Corynebacterium nubilum* var. *nanum*. Because the early cultures developed rhizoid growths in stiff gelatin before liquefaction, Zimmermann originally planned to call this species *Bacillus nebulosus* (*loc. cit.*, 29), a name that has been used by later authors for several different organisms. Attention should be called also to *Bacillus caudatus* Wright, an organism which Conn found to show occasional motility (polar) and named *Pseudomonas caudatus*. This common, slender, gelatin-liquefying, Gram-negative, white to yellow chromogenic rod is much like the Franklands' and Zimmermann's organism (see Conn, New York State Exp. Sta. Tech. Bull. 67, 1919, 38).

Corynebacterium paralyticans (Robertson) Ford. (*Bacillus paralyticans* Robertson, Rev. Neurol. and Psychiat., Edinburgh, *1*, 1903, 470; Ford, Textb. of Bact., 1927, 281.) From cerebrospinal fluid. A diphtheroid. Thought at one time to be the causal agent of general paralysis.

Corynebacterium parvum Prévot. (*Corynebacterium parvum infectiosum* Mayer, Cent. f. Bakt., I Abt., Orig., *98*, 1926, 370; Prévot, Man. de Class. et Déterm. des Bactéries Anaérobies, Monographie, Inst. Past., Paris, 1940, 202.) From blood in a post-natal fever.

Corynebacterium periplanetae Bergey et al. (*Corynebacterium periplanetae* var. *americana* Glaser, Jour. Exp. Med., *51*, 1930, 59; Bergey et al., Manual, 4th ed., 1934, 550.) Found in the fat body of the American cockroach (*Periplaneta americana*). For a more complete description see Manual, 5th ed., 1939, 798.

Corynebacterium plumosum (Fox) Ford. (*Mycobacterium plumosum* Fox, Cent. f. Bakt., I Abt., Orig., *70*, 1913, 148; Ford, Textb. Bact., 1927, 281.) From blood of patient with chronic endocarditis.

Corynebacterium pseudodiphtheriae Eberson. (Jour. Inf. Dis., *23*, 1918, 14.) Hemoglobinophilic. From tonsils.

Corynebacterium putidum Eberson. (*Bacillus diphtheroides liquefaciens* Graham-Smith, Jour. Hyg., *4*, 1904, 258; Eberson, Jour. Inf. Dis., *23*, 1918, 16.) From mouth. Cultures described by Graham-Smith liquefied gelatin and were sluggishly motile.

Corynebacterium pyogenes bovis (Roux) Prévot. (*Bacillus pyogenes bovis* Roux, Cent. f. Bakt., I Abt., Orig., *34*, 1905, 541; *Eubacterium pyogenes bovis* Prévot, Ann. Inst. Past., *60*, 1938, 295; Prévot, Man. de Class. et Déterm. des Bactéries Anaérobies, Monographie, Inst. Past., Paris, 1940, 204.) Common in bovine suppurations. Said by Roux to be identical with *Bacillus pyogenes bovis* Kunnemann. Prévot says it is probably identical with the pyogenic *Corynebacterium* of Lucet. See *Corynebacterium pyogenes* Eberson.

Corynebacterium renale cuniculi Prévot. (*Bacterium renale* and *Bacterium renale* (*cuniculi*) Manteufel and Herzberg, Cent. f. Bakt., I Abt., Orig., *116*, 1930, 266; *Bacillus renale* and *Bacillus renale* (*cuniculi*) Manteufel, *ibid.*, *138*, 1937, 306; Prévot, Ann. Inst. Past., *60*, 1938, 304.) Gram-variable. Forms gas in some media. From rabbit kidneys.

Corynebacterium ruedigeri (Mellon)

Ford. (Virulent pseudodiphtheria bacillus, Hamilton, Jour. Inf. Dis., *1*, 1904, 711; Ruediger's bacillus, Mellon, Jour. Bact., *2*, 1917, 285; *Bacillus ruedigeri* Mellon, *ibid.*, 290; Ford, Textb. Bact., 1927, 274.) From throats of fatal cases of scarlatina.

Corynebacterium segmentosum Eberson. (*Bacillus coryzae segmentosus* Cautley, Rept. Med. Officer of Health, Local Govt. Board, London, 1894–95, 455; *Bacillus septus* Benham, Brit. Med. Jour., *1*, 1906, 1023; Eberson, Jour. Inf. Dis., *23*, 1918, 17; *Bacillus segmentosus* Holland, Jour. Bact., *5*, 1920, 220.) Rods of variable dimensions, mostly resembling *Corynebacterium pseudodiphtheriticum* Lehmann and Neumann, but occasionally resembling *Corynebacterium diphtheriae* Lehmann and Neumann. Thomson and Thomson (Ann. Pickett-Thomson Res. Lab., *2*, 1926, 65) do not think Cautley's bacillus is recognizable. From nasal secretions.

Corynebacterium squamosum Belenky and Popova. (Cent. f. Bakt., I Abt., Orig., *118*, 1930, 444.) From normal skin of calves and small-pox vaccine. Nonhemolytic.

Corynebacterium striatum (Chester) Eberson. (*Bacillus striatus flavus* and *Bacillus striatus albus* von Besser, Beitr. z. path. Anat. u. Path., *6*, 1888, 349; *Bacterium striatus flavus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 111; *Bacterium striatum* Chester, Man. Determ. Bact., 1901, 171; *Bacillus flavidus* Morse, Jour. Inf. Dis., *11*, 1912, 281; *Corynebacterium flavidum* Holland, Jour. Bact., *5*, 1920, 218; Eberson, Jour. Inf. Dis., *23*, 1918, 5.) Eberson (*loc. cit.*, 7) states that *Bacillus diphtheroides citreus* Graham-Smith (Jour. Hyg., *4*, 1904, 258) corresponds with the yellow variety of this species. From nasal mucus. Resembles *Corynebacterium segmentosum*.

Corynebacterium suis Hauduroy et al. (Le bacille pyogenes suis, Colin and Rossi, Revue gén. de Méd. vetér., *40*, 1931, 137; Hauduroy et al., Dict. d. Bact. Path., 1937, 167). Causative agent of caseous suppuration of swine. Gram-negative.

Corynebacterium suppuratum Eberson. (Jour. Inf. Dis., *23*, 1918, 17.) From anal pus pocket. Resembles *Corynebacterium epidermidis* Eberson.

Corynebacterium thermophilus Zavagli. (Amer. Jour. Hyg., *15*, 1932, 504.) From raw and pasteurized milk. Grows better at 55°C than at 37°C.

Corynebacterium typhi Topley and Wilson. (*Bacillus typhiexanthematici* Plotz, Jour. Amer. Med. Assoc., *62*, 1913, 1556; La Presse Méd., *43*, 1914, 411; Plotz, Olitsky and Baehr, Jour. Inf. Dis., *17*, 1915, 17; not *Bacillus typhi exanthematici* Klebs, Proc. Internat. Med. Cong., *1*, 1881, 323; *Corynebacterium typhi-exanthematici* Eberson, Jour. Inf. Dis., *23*, 1918, 19; *Bacterium typhi-exanthematici* Holland, Jour. Bact., *5*, 1920, 222; *Fusiformis typhi-exanthematici* Holland, *ibid.*, 221; Topley and Wilson, Prin. of Bact. and Immun., 2nd ed., 1936, 349; *Eubacterium typhi-exanthematici* Prévot, Ann. Inst. Past., *60*, 1938, 295.) From blood of typhus fever patients.

Corynebacterium ulcerogenes Bergey et al. (*Corynebacterium diphtheriae ulcerogenes cutaneum* Mrongovius, Cent. f. Bakt., I Abt., Orig., *112*, 1929, 51; Bergey et al., Manual, 4th ed., 1934, 550.) From ulcerations of the skin (human). Resembles *Corynebacterium epidermidis* Eberson and *C. suppuratum* Eberson.

Corynebacterium vaccinae Galli-Valerio. (Cent. f. Bakt., I Abt., Orig., *36*, 1904, 465.) From vaccine pustules in calves.

Corynebacterium xerosis canis (Graham-Smith) Ford. (*Bacillus xerosis canis* Graham-Smith, Jour. Hyg., *4*, 1904, 258; Ford, Textb. Bact., 1927, 271.) From conjunctival sacs of dogs.

Corynethrix hominis, *C. equi*, *C. canis*, *C. anatis*, etc. Czaplewski. (Deutsche med. Wchnschr., *26*, 1900, 723.) Hypothetical species from the skin of the animals indicated.

Corynethrix pseudotuberculosis murium Bongert. (Ztschr. f. Hyg., *37*, 1901,

472.) From a multiple, necrotic, caseous pneumonia of mice inoculated with material from equine pneumonia. Regarded by the author as distinct from *Bacillus pseudotuberculosis murium* Kütscher. Placed in the genus *Corynethrix* Czaplewski (Deutsche med. Wchnschr., *26*, 1900, 723).

Lactobacillus meleagridis Johnson and Pollard. (Diplo-bacillus P_1, Johnson and Anderson, Jour. Inf. Dis., *58*, 1936, 340; Johnson and Pollard, Jour. Inf. Dis., *66*, 1940, 196.) From heart, liver and yolk of moribund turkey poults. Presumably a *Corynebacterium*, not a true *Lactobacillus*.

Einer sporogenen Pseudo-Diphtheriebazillus, De Simoni. (Cent. f. Bakt., I Abt., Orig., *24*, 1898, 294.) From nasal secretion in ozena. Produced spores only in milk and on potato. Thought by Eberson (Jour. Inf. Dis., *23*, 1918, 6) to have been a contaminated culture.

Organism in M. H., De Witt. (Jour. Inf. Dis., *10*, 1912, 40.) A motile, gas-producing diphtheroid isolated from a generalized diphtheria-like infection.

Appendix III:* The relationships of the following soil organism are not clear, but it apparently should be placed either in *Corynebacterium* or in a related genus (e.g., *Mycobacterium*). On agar it is rod-shaped and generally Gram-negative in young cultures, but coccoid and Gram-positive in old cultures, a condition noted by Mellon (Jour. Bact., *2*, 1917, 278) in connection with *Corynebacterium enzymicum*. Something similar is noted by Jensen (Proc. Linn. Soc. New So. Wales, *59*, 1934, 29–62) in his description of *Corynebacterium helvolum*. Krassilnikov, on the other hand (Cent. f. Bakt., II Abt., *90*, 1934, 432), suggests that this species really belongs to *Mycobacterium*, and, after seeing a culture furnished him by Conn, has become all the more convinced of this relationship (personal correspondence).

Krassilnikov's studies indicate that there is a group of soil bacteria that grow as rods in young cultures with a tendency to produce branching forms in liquid media and develop coccoid bodies as they grow older. The latter then even divide and multiply like cocci. He considers that practically all so-called micrococci found among soil cultures are really the older stages of *Mycobacterium spp.* It is very clear that Jensen and Krassilnikov, the two leading students of the saprophytic members of this group found in soil, do not agree as to what constitutes the genus *Mycobacterium*; their papers appeared almost simultaneously and clearly represent independent work. Krassilnikov's description of this genus comes closest to covering organisms like the following of any of the descriptions in the literature, but it is quite different from Jensen's idea of the genus. In fact, the descriptions given by the former author seem to be more like Jensen's conception of the genus *Corynebacterium*. Jensen, in his description, takes into account the relative acid-fast staining properties of the groups; but Krassilnikov does not mention either this property or the Gram stain. Inasmuch as the acid-fast property is regarded in the present classification as an important characteristic of *Mycobacterium*, the following species is included as an appendix, not of that genus, but of *Corynebacterium*. The relationships of these pleomorphic soil organisms must be regarded as decidedly obscure. Lochhead (Can. Jour. Res., Sec. C, *16*, 1938, 156) speaks of a *Bacterium globiforme* group and Conn (Jour. Bact., *48*, 1945, 359) has recently reported evidence in support of Lochhead's viewpoint. In all probability this group is identical in whole or in part with Krassilnikov's *Mycobacterium* of soil, although the correctness of his choice of this generic name may be questioned.

***Prepared by Prof. H. J. Conn, New York State Experiment Station, Geneva, New York, July, 1945.**

Bacterium globiforme Conn. (Conn, N. Y. Agr. Exp. Sta. Tech. Bull. 138, 1928 and 172, 1930; Cent. f. Bakt., II Abt., *76*, 1928, 77; *Achromobacter globiforme* Bergey et al., Manual, 3rd ed., 1930, 226.) From Latin, having the form of a globe or sphere.

Short rods: 0.4 to 0.6 by 0.6 to 0.8 micron, becoming coccoid in older cultures. In certain liquid synthetic media, branching forms with Gram-positive spherical granules are common. These granules have a tendency to be acid-fast. Non-motile. Rods usually Gram-negative; coccoid forms usually Gram-positive.

Gelatin colonies: Circular, punctiform.

Gelatin stab: Slow crateriform liquefaction.

Agar colonies: Circular, punctiform, translucent.

Agar slant: Filiform, flat, smooth, soft, translucent, glistening growth with translucent sheen.

Broth: Slight growth.

Nitrites produced from nitrates in synthetic agar media.

Glucose, sucrose, mannitol, and less readily lactose and various organic acids are utilized as sources of carbon and energy when grown in synthetic media. No visible gas production, and probably no acid except carbonic acid.

Nitrogen may be obtained from ammonium sulfate, asparagine, cystine, glycerol, aspartic acid, uric acid, tyrosin, potassium nitrate, urea and peptone.

Aerobic, facultative.

Optimum temperature 22°C.

Source: Seventy cultures isolated from soil.

Habitat: Widely distributed in soil.

Genus II. Listeria *Pirie.**

(*Listerella* Pirie, Publ. So. African Inst. for Med. Res., *3*, 1927, 163; not *Listerella* Jahn, Ber. d. deutsch. Bot. Ges., *24*, 1906, 538; not *Listerella* Cushman, Contr. Cushman Lab. Foram., Sharon, Mass., *9*, 1933, 32; Pirie, Science, *91*, 1940, 383.) Named for Joseph Lister, the English surgeon and bacteriologist.

Small rods, Gram-positive. Flagellation peritrichous. Aerobic. Catalase positive. Grow freely on ordinary media. Acid but no gas from glucose and a few additional carbohydrates. Pathogenic parasites. Infection characterized by a monocytosis. Parasitic on warm-blooded animals.

The type species is *Listeria monocytogenes* (Murray et al.) Pirie.

1. **Listeria monocytogenes** (Murray et al.) Pirie. (*Bacterium monocytogenes* Murray, Webb and Swann, Jour. Path. and Bact., *29*, 1926, 407; *Listerella hepatolytica* Pirie, Publ. S. African Inst. for Med. Res., *3*, 1927, 164; *Listerella monocytogenes* Pirie, *ibid.; Listerella monocytogenes hominis* Nyfeldt, Folia Haematologica, *47*, 1932; *Corynebacterium parvulum* Schultz, Terry, Brice and Gebhardt, Proc. Soc. Exp. Biol. Med., *31*, 1934, 1021; Pirie, Science, *91*, 1940, 383; *Bacillus monocytogenes* Tobia, Arch. ital. med. colon., *23*, 1942, 219; abst. in Cent. f. Bakt., I Abt., Ref., *144*, 1943, 199.) Derived from the Greek, meaning generating monocytes.

Small rods: 0.4 to 0.5 by 0.5 to 2.0 microns, with rounded ends, slightly curved in some culture media. Occur singly, in V-shaped or parallel pairs and in short chains. Motile, peritrichous (Paterson, Jour. Path. and Bact., *48*, 1939, 25) with four flagella at ordinary temperatures with tendency toward non-motility or single flagellum at 37°C (Griffin, Jour. Bact., *48*, 1944, 114). Not acid-fast. Gram-positive.

Gelatin: No liquefaction. Growth is confined to the needle track.

In 0.25 per cent agar, 8.0 per cent gelatin, 1.0 per cent glucose semisolid medium, growth along the stab in 24 hours at 37°C, followed by irregular cloudy or

* Revised by Prof. E. G. D. Murray, McGill Univ., Montreal, P. Q., Canada, September, 1938; further revision, January, 1945.

granular extensions into the medium; growth does not spread through the entire medium. This is characteristic (Seastone, Jour. Exp. Med., *62*, 1935, 203).

Sheep liver extract agar colonies: Circular, smooth, slightly flattened, transparent by transmitted and milk-white by reflected light. Viscid.

Sheep liver extract agar slant: Confluent, flat, transparent, viscid growth.

Peptone agar: Growth is thinner than on liver extract agar.

Blood agar: Improved growth with zone of hemolysis around colonies.

Peptone broth: Surface film with flocculent sediment.

Litmus milk: Slightly acid, decolorized. No coagulation.

Glycerol-potato: No apparent growth.

Inspissated ox serum: Grows as a very thin, transparent film.

Dorset's egg medium: Very thin film.

Indole not formed.

Hydrogen sulfide not formed.

Nitrites not produced from nitrates.

Acid but no gas from glucose, rhamnose and salicin promptly, more slowly from dextrin, sucrose, soluble starch and glycerol. Acid production may be variable and slow from maltose and lactose. No action on arabinose, galactose, xylose, mannitol, dulcitol, inulin and inositol.

All cultures give off a penetrating, rather unpleasant acid smell.

Aerobic, facultative.

Optimum temperature 37°C. Thermal death point 58° to 59°C in 10 minutes.

Animal inoculations: Injection of rabbits with cultures results in a very marked increase in monocytes circulating in the blood. This is the most striking character of the organism and is exhibited by strains derived from all sources. Infection is characterized by necrotic foci in various organs.

Serological characters: Agglutination and absorption of agglutinin reactions show a variation in degree with different strains but there is no definite indication that strains from different kinds of animal hosts are different species. Paterson (Jour. Path. and Bact., *57*, 1940, 427) concludes from his studies of the flagellar and somatic antigens of 54 cultures that four types may be recognized in this species. These do not bear any relation to the host species or to the geographical area from which they were isolated.

Possibly related to *Erysipelothrix* (Barber, Jour. Path. and Bact., *48*, 1939, 11).

Habitat and source: Lesions in organs, blood, cerebrospinal fluid of rabbits, guinea pigs, sheep, cattle, foxes, hogs, fowls, gerbilles and man, in all of which natural disease occurs. Many cases have proved fatal. The cause of infectious mononucleosis in man (Nyfeldt, *loc. cit.*).

Appendix: The following binomials have also been proposed for species in this genus.

Bacterium hepatis Hülphers. (Sven. Vet.-Tidskrift, *2*, 1911, 271.) From necrosis of the liver of a rabbit. Nyfeldt (Skand. Vet.-Tidskrift, *30*, 1940, 284) regards this as a synonym of *Listerella monocytogenes*. However, failure to ferment lactose, rhamnose, sucrose and salicin with fermentation of xylose, and failure to infect guinea pigs and chickens indicate a possible difference between the two species.

Listerella hibiscus liquefaciens Nakahama. (Jour. Agr. Chem. Soc. Japan, *16*, 1940, 345.) From retted kenaf (*Hibiscus*).

Listerella hominis, *Listerella bovina*, *Listerella gallinarum*, *Listerella cunicula* and *Listerella gerbilli* Wramby. (Skand. Vet.-Tidskrift, *34*, 1944, 280.) These names are given to indicate cultures of *Listerella monocytogenes* from man, cattle, chickens, rabbits and gerbilles, respectively.

Listerella ovis Gill. (Australian Vet. Jour., *13*, 1937, 47.) Causes circling disease of sheep.

Burn (Jour. Bact., *30*, 1935, 573) reports, but does not name, a new species in this genus.

Genus III. **Erysipelothrix** *Rosenbach.**

(Ztschr. f. Hyg., *63*, 1909, 367.) From Greek *erysipelas*, a disease; and *thrix*, hair or thread.

Rod-shaped organisms with a tendency to the formation of long filaments. The filaments may also thicken and show characteristic granules. Non-motile. Gram-positive. Microaerophilic. Catalase negative. Grow freely on ordinary media. Acid but no gas from glucose and a few additional carbohydrates. Parasitic on mammals.

The type species is *Erysipelothrix rhusiopathiae* (Migula) Winslow et al.

1. **Erysipelothrix rhusiopathiae** (Migula) Winslow et al. (Bacillus des Schweinerotlaufs, Loeffler, Arb. a. d. k. Gesundheitsamte, 1, 1886, 46; *Bacillus thuillieri* Trevisan, I generi e le specie delle Batteriacee, 1889, 13; *Pasteurella thuillieri* DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 995; *Bacillus rhusiopathiae suis* Kitt, Bakterienkunde u. path. Mikroscopie, 1893, 284; *Bacterium erysipelatos suum* (sic) Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 24; *Bacterium rhusiopathiae suis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 98; *Bacterium rhusiopathiae* Migula, Syst. d. Bakt., *2*, 1900, 43; *Mycobacterium rhusiopathiae* Chester, Man. Determ. Bact., 1901, 352; *Erysipelothrix porci* Rosenbach, Ztschr. f. Hyg., *63*, 1909, 367; Winslow et al., Jour. Bact., *5*, 1920, 198; *Bacillus erysipelatos-suis* Holland, Jour. Bact., *5*, 1920, 218; *Erysipelothrix erysipelatos-suis* Holland, *ibid. Bacillus ruboris suis* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 24; *Nocardia thuillieri* Vuillemin, Encyclopédie Mycologique, Paris, *2*, 1931, 125; *Actinomyces thuillieri* Nannizzi, in Pollacci, Tratt. Micopat. Umana, *4*, 1934, 45.) From Greek *rhusius*, reddish; *pathus*, a disease; red disease.

Description taken in part from Karlson, Jour. Bact., *35*, 1938, 205.

Slender rods: 0.2 to 0.3 by 0.5 to 1.5 microns, occurring singly and in chains. Non-motile. Gram-positive.

Gelatin colonies: Hazy, bluish-gray, racemose; situated a little below the surface, growing slowly.

Gelatin stab: Small, fimbriate colonies in the stab, at times definitely arborescent. No surface growth. No liquefaction.

Agar slant: Scant growth, translucent, moist, homogeneous.

Broth: Slight turbidity, with scant, grayish sediment.

Litmus milk: May become slightly acid.

Indole not formed.

Potato: Usually no growth.

Blood serum shows scant growth.

No gas from carbohydrates. Acid from glucose, galactose, fructose, lactose and more slowly from mannose and cellobiose. No acid from arabinose, xylose, rhamnose, maltose, melibiose, sucrose, trehalose, raffinose, melezitose, dextrin, starch, inulin, amygdalin, salicin, glycerol, erythritol, adonitol, mannitol, sorbitol, dulcitol or inositol.

Esculin not hydrolyzed.

Hydrogen sulfide produced.

Voges-Proskauer test negative.

Methyl red test negative.

Methylene blue-reduction test negative.

Narrow green zone of hemolysis develops around deep colonies on blood agar.

Catalase negative.

Out of 43 strains studied serologically (Watts, Jour. Path. and Bact., *50*, 1940, 355), 38 appeared to be of one antigenic group, and 5 of another.

---

* **Revised by Prof. Robert S. Breed, New York State Experiment Station, August, 1938; further revision, January, 1945.**

Optimum pH 7.6.

Microaerophilic.

Optimum temperature 37°C.

Source: From cases of swine erysipelas.

Habitat: The cause of swine erysipelas. Transmissible to gray and white mice, rabbits and pigeons. Has been transmitted to man by accidental inoculation.

2. **Erysipelothrix muriseptica** (Flügge) Rosenbach. (Bacillus der Mäuseseptikämie, Koch, Mittheil. a. d. kaiserl. Gesundheitsamte, *1*, 1881, 93; *Bacillus insidiosus* Trevisan, Car. di alc. nuov. gen. di Batter., 1885, 10; *Bacillus murisepticus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 250; *Bacillus murinus* Schroeter, in Cohn, Kryptogamen Flora v. Schlesien, *3*, 1886, 162; *Bacterium murisepticum* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, la, 1895, 24; *Mycobacterium murisepticum* Chester, Manual Determ. Bact., 1901, 353; Rosenbach, Ztschr. f. Hyg., *63*, 1909, 367; *Pasteurella muriseptica* Bergey et al., Manual, 1st ed., 1923, 265; not *Pasturella muriseptica* Topley and Wilson, Princip. Bact. and Immun., *1*, 1931, 482.) From Latin *mus*, *muris*, a mouse; Greek *septicus*, putrefying, septic.

Rods: 0.5 by 0.8 to 1.0 micron, occurring singly. Non-motile. Gram-positive.

Gelatin colonies: Very small, whitish, dew-like, with indefinite margin.

Gelatin-stab: Filiform growth in stab, arborescent. No liquefaction.

Agar slant: Very slight, clear, dew-like streak.

Litmus milk: Unchanged.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Microaerophilic.

Optimum temperature 37°C.

Source: From cases of mouse septicemia.

Habitat: In fatal septicemia in white mice following injection of putrid meat infusion. Not infectious for field mice.

3. **Erysipelothrix erysipeloidis** (Lehmann and Neumann) Rosenbach. (Cladothrix des Erythema migrans, Rosenbach, Arch. klin. Chirurg., *36*, 1887, 2; *Oospora rosenbachi* Sauvagais and Radais, 1892, according to Brumpt, Précis de Parasit., Paris, 4th ed., 1927, 1201; *Oospora erysipeloidis* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 392; *Streptothrix rosenbachii* Kruse in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 61; *Actinomyces erysipeloidis* Lachner-Sandoval, Ueber Strahlenpilze Strassburg, 1898, 64; *Discomyces rosenbachi* Gedoelst, Champ. Paras. Homme, 1902, 177; *Streptothrix erysipeloides* Caminiti, Cent. f. Bakt., I Abt., Orig., 1907, 198; Rosenbach, Ztschr. f. Hyg., *63*, 1909, 367; *Nocardia rosenbachi* Castellani and Chalmers, Man. Trop. Med., 2nd ed., 1913, 815; *Babesia erysipeloides* Chalmers and Christopherson, Ann. Trop. Med. and Parasit., *10*, 1916, according to Nannizzi, in Pollacci, Tratt. Micopat. Umana, *4*, 1934, 45; *Actinomyces rosenbachii* Holland, Jour. Bact., *5*, 1920, 216; *Bacterium erysipeloidis* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 499.) From Greek *erysipelas*, erysipelas; *idus*, shape, appearance.

Rosenbach (*loc. cit.*) made a comparative study of the three species in this genus and came to the conclusion that they were different, although closely allied to each other. However, Rickmann (Ztschr. f. Hyg., *64*, 1909, 362) concluded that they were identical.

Source: Isolated by Rosenbach (Verhandl. d. deutsch. Gesellsch. f. Chirurg., *2*, 1887, 75) in cases of human erysipeloid.

FAMILY IX. ACHROMOBACTERIACEAE BREED.

(Jour. Bact., *50*, 1945, 124.)

Rods, small to medium in size, cells usually uniform in shape. No branching on ordinary media, if at all. Gram-negative, rarely Gram-variable. Peritrichous or non-motile. Growth on agar slants non-chromogenic to grayish-yellow, brownish-yellow or yellow to orange. The pigment does not diffuse through the agar. Characterized by lack of power or feeble powers of attacking carbohydrates. May form acid from hexoses but no gas. May or may not reduce nitrates. May or may not liquefy gelatin. Do not liquefy agar or attack cellulose, and are not phosphorescent. Litmus milk may become faintly acid but not sufficiently acid to curdle. Usually the reaction remains unchanged or becomes alkaline. Generally salt water, fresh water and soil forms and, less commonly, parasites. Some plant pathogens may belong here.

Key to the genera of family **Achromobacteriaceae.**

I. Non-chromogenic or at most little or no chromogenesis on agar or gelatin media.
   A. Litmus milk turned alkaline. No acid from carbohydrates.

      Genus I. *Alcaligenes*, p. 412.

   B. Litmus milk slightly acid (never curdled), unchanged or alkaline. Acid usually produced from hexose sugars.

      Genus II. *Achromobacter*, p. 417.

II. Produces yellow to orange chromogenesis.

   A. Litmus milk slightly acid (never curdled) unchanged or alkaline. Acid usually produced from hexose sugars.

      Genus III. *Flavobacterium*, p. 427.

Genus I. **Alcaligenes** *Castellani and Chalmers.**

(Manual Trop. Med., 3rd ed., 1919, 936.) From M.L., alkali and Latin *genio*, to produce.

Peritrichous to monotrichous, or non-motile rods. Gram-negative to Gram-variable. Do not produce acid or gas from carbohydrates. May or may not liquefy gelatin and solidified blood serum. Turn litmus milk alkaline and may or may not peptonize it. Do not form acetylmethylcarbinol. Chromogenesis when it occurs is grayish-yellow, brownish-yellow or yellow. Generally occur in the intestinal tract of vertebrates or in dairy products.

The type species is *Alcaligenes faecalis* Castellani and Chalmers.

---

* Revised by Prof. H. J. Conn, New York State Experiment Station, Geneva, New York, June, 1938; further revision by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, June, 1945.

Key to the species of genus **Alcaligenes.**

I. Gelatin not liquefied.
  A. Motile.
    1. Does not produce ropiness in milk. Found in the intestinal tract.
      1. *Alcaligenes faecalis.*
    2. Produces ropiness in milk.
      2. *Alcaligenes viscosus.*
  B. Non-motile.
    1. Found in the intestinal tract.
      3. *Alcaligenes metalcaligenes.*

II. Gelatin liquefied.
  A. Motile.
    1. Milk peptonized; blood serum liquefied.
      4. *Alcaligenes bookeri.*
    2. Milk not peptonized; blood serum not liquefied.
      5. *Alcaligenes recti.*
  B. Non-motile.
    1. Milk peptonized, slimy.
      6. *Alcaligenes marshallii.*

1. **Alcaligenes faecalis** Castellani and Chalmers. (*Bacillus faecalis alcaligenes* Petruschky, Cent. f. Bakt., I Abt., *19*, 1896, 187; *Bacterium fecalis alcaligenes* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 73; *Bacterium alcaligenes* Lehmann and Neumann, Bakt. Diag., 2 Aufl., 1899, 242; *Bacillus alcaligenes* Migula, Syst. d. Bakt., *2*, 1900, 737; Castellani and Chalmers, Manual Trop. Med., 1919, 936; *Bacillus fecalis-alcaligenes* Holland, Jour. Bact., *5*, 1920, 218; *Bacterium fecalis-alcaligenes* Holland, *ibid.*; *Vibrio alcaligenes* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 548: *Bacterium faecale alcaligenes* Monias, Jour. Inf. Dis., *43*, 1928, 330.) From Latin *faex*, dregs; M. L., fecal.

Rods: 0.5 by 1.0 to 2.0 microns, occurring singly and in pairs, and occasionally in long chains. Motile with peritrichous flagella. In some strains, the majority of the individual cells show only a single flagellum. This is apt to be in a lateral rather than in the polar position. Gram-negative.

Gelatin colonies: Circular, grayish, translucent.

Gelatin stab: Gray surface growth. No liquefaction.

Agar colonies: Transparent with opaque center, undulate margin.

Agar slant: White, glistening, opalescent, undulate margin.

Broth: Turbid, with thin pellicle, and viscid sediment. Gives off ammonia.

Litmus milk: Alkaline.

Potato: Scanty to abundant, yellowish to brownish growth.

Indole not formed.

Nitrite production from nitrates variable.

No acid or gas from carbohydrate media.

No characteristic odor.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Feces, abscesses related to intestinal tract, occasionally blood stream.

Habitat: Intestinal canal. Generally considered non-pathogenic.

1a. *Alcaligenes faecalis* var. *radicans* Evans (Public Health Rpts., *46*, 1931, 1676) is a gelatin liquefying strain.

2. **Alcaligenes viscosus** (Weldin and Levine) Weldin. (*Bacillus lactis viscosus* Adametz, Cent. f. Bakt., *9*, 1891, 698; *Bacillus viscosus lactis* Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 359; *Bacterium viscosus lactis* Chester, Delaware Agr. Exp. Sta. 9th Ann. Rept., 1897, 89; *Bacterium lactis viscosum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 198 (Eng. ed., 1901, 196); *Bacterium subviscosum* Migula, Syst. d. Bakt., *2*, 1900, 326; Group I, varieties 1, 2, 3, 4 and 5 of Harrison, Rev. Gén. du Lait, *5*, 1905, 100; *Bacterium visco-coccoidium* Buchanan and Hammer, Iowa Agr. Exp. Stat. Research Bull. 22, 1915, 260; *Bacillus lactis-viscosus* Holland, Jour. Bact., *5*, 1920, 218; *Bacterium lactis-viscosus* Holland, *idem*; *Bacterium viscosum* Weldin and Levine, Abst. Bact., *7*, 1923, 16 (not *Bacterium viscosum* Migula, Syst. d. Bakt., *2*, 1900, 647); *Lactobacillus viscosus* Bergey et al., Manual, 1st ed., 1923, 244; *Achromobacter viscosum* Bergey et al., Manual, 2nd ed., 1925, 169; Weldin, Iowa State College Jour. Sci., *1*, 1927, 186.) From Latin *viscosus*, viscous.

Description taken largely from Long and Hammer, Iowa State Coll. Jour. of Sci., *10*, 1936, 262.

Rods: 0.6 to 1.0 by 0.8 to 2.6 microns, almost spherical cells frequently found, occurring singly, in pairs or short chains. Motile (Adametz, *loc. cit.*); non-motile (Long and Hammer, *loc. cit.*). Gram-negative, rarely Gram-positive. Capsules produced in milk cultures.

Gelatin colonies: Small, gray becoming yellowish.

Gelatin stab: White surface growth with villous growth in stab. No liquefaction.

Agar colonies: After 3 to 4 days, circular, 4 to 6 mm in diameter, white, viscid, shining, edge entire.

Agar slant: Abundant, white, spreading, viscid, shining.

Broth: Turbid with thin pellicle and some sediment. Ropiness generally produced.

Litmus milk: Ropiness produced. Pellicle formed. Alkaline. No coagulation.

Potato: Moderately heavy, dirty-white, spreading, shining growth.

Indole not formed.

Nitrites ordinarily not produced or produced only in a trace from nitrates.

No H_2S produced.

Slight, if any, acid production from carbohydrates.

Fat is hydrolyzed.

Methyl red reaction negative.

Voges-Proskauer reaction negative.

Temperature relations: Growth occurs at 10° and at 20°C. At 37° and at 40°C growth variable.

Aerobic.

Source: Originally isolated from water.

Habitat: Found in water and around dairy barns, dairy utensils. Produces ropiness in milk.

Long and Hammer (Iowa State Coll. Jour. Sci., *10*, 1936, 264) have described a variety of this species (*Alcaligenes viscosus* var. *dissimilis*) which does not produce ropiness in milk.

3. **Alcaligenes metalcaligenes** Castellani and Chalmers. (Castellani and Chalmers, Man. Trop. Med., 1919, 936; *Bacterium metalcaligenes* Weldin and Levine, Abst. Bact., *7*, 1923, 13; *Achromobacter metalcaligenes* Bergey et al., Manual, 2nd ed., 1925, 169.) From Greek *meta*, in common with; M. L., resembling *alcaligenes*.

Rods: 0.6 by 1.5 microns, with rounded ends, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin stab: No liquefaction.

Agar colonies: Circular, raised, smooth, amorphous, entire, gray.

Agar slant: Gray, scanty, filiform, contoured, viscid.

Broth: Membranous pellicle with heavy sediment.

Litmus milk: Alkaline.

Potato: Scanty, glistening, smooth, sometimes faint pink.

Indole not formed.

Nitrite production from nitrates variable.

Starch not hydrolyzed.

Blood serum not liquefied.

No action on carbohydrates.

Aerobic, facultative.

Optimum temperature 22°C.

Habitat: Intestinal canal.

4. **Alcaligenes bookeri** (Ford) Bergey et al. (Bacillus A of Booker, Trans. Ninth Internat. Med. Congress, *3*, 1887, 598; *Bacillus bookeri* Ford, Studies from the Royal Victoria Hospital, Montreal, *1*, 1903, 31; Bergey et al., Manual, 1st ed., 1923, 236; *Bacterium bookeri* Levine and Soppeland, Eng. Exp. Sta., Iowa State College, Bul. 77, 1926, 55.) Named for the bacteriologist who first isolated this species.

Rods: 0.5 by 1.5 to 2.0 microns, occurring singly. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, brown, variable in size.

Gelatin stab: Slow, saccate liquefaction, becoming stratiform.

Agar colonies: Thin, transparent, with opaque center and indistinct margin.

Agar slant: Abundant, yellowish to yellowish-brown.

Broth: Turbid, with viscid sediment. No pellicle.

Litmus milk: Alkaline. Soft curd. Litmus reduced. Peptonization.

Potato: Luxuriant, yellowish-white, moist. Medium is darkened.

Indole not formed.

Nitrites not produced from nitrates.

No acid or gas from carbohydrate media.

Blood serum: Yellowish-brown growth. Gradual liquefaction.

No characteristic odor.

Aerobic, facultative.

Optimum temperature 37°C.

Source: From alvine discharges of children suffering with cholera infantum.

Habitat: Intestinal canal.

5. **Alcaligenes recti** (Ford) Bergey et al. (*Bacterium recti* Ford, Studies from the Royal Victoria Hospital, Montreal, *1*, 1903, 31; Bergey et al., Manual, 1st ed., 1923, 236.) From Latin *rectus*, rectum.

Rods: 0.5 by 1.5 to 2.0 microns, occurring singly, in pairs and in chains. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Variable in size and shape, circular to oval, brown.

Gelatin stab: Rapid, saccate liquefaction.

Agar colonies: Large, grayish-white, with opaque center. Slightly spreading.

Agar slant: Grayish-white, echinulate.

Broth: Turbid. No pellicle.

Litmus milk: Alkaline. No peptonization.

Potato: Luxuriant, moist, brownish-red.

Indole not formed.

Nitrites produced from nitrates.

No acid or gas from carbohydrate media.

Blood serum: Abundant white growth. No liquefaction.

No characteristic odor.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Found but once from coecum and rectum (Ford).

Habitat: Intestinal canal.

6. **Alcaligenes marshallii** Bergey et al. (Bacillus B of Marshall, Cent. f. Bakt., II Abt., *11*, 1903, 739; *Bacterium lactis marshalli* Conn, Esten and Stocking, Ann. Rept. Storrs Agr. Exp. Station, 1906, 141; Bergey et al., Manual, 1st ed., 1923, 237.) Named for Prof. C. E. Marshall, the American bacteriologist who first isolated this species.

Rods: 0.3 by 1.2 microns, occurring singly. Non-motile. Gram-negative.

Gelatin colonies: Gray, granular, irregular, glistening.

Gelatin stab: Slow, infundibuliform liquefaction.

Agar slant: Filiform, gray to creamy-white, raised, becoming lemon-yellow.

Broth: Turbid, with gray ring and viscid sediment.

Litmus milk: Alkaline, slimy, peptonized, strong odor.

Potato: Luxuriant, lemon-yellow, smooth.

Indole not formed.

Nitrites not produced from nitrates.

No acid or gas from carbohydrates.

Aerobic, facultative.

Optimum temperature 30°C.

Habitat: Milk.

Appendix: The following species have also sometimes been regarded as belonging in the genus *Alcaligenes*, or possess characters that indicate that they belong in this genus.

Achromobacter alcaliaromaticum (Berlin) Bergey et al. (*Bacterium alcaliaromaticum* Berlin, Rev. de Microbiol. et Epidemiol., *6*, 1927; Bergey et al., Manual, 3rd ed., 1930, 212.) From feces. See Manual, 5th ed., 1939, 509 for a description of this species. This species is much like *Alcaligenes faecalis*.

Achromobacter cystinovorum Barber and Burrows. (Biochem. Jour., 30, 1936, 599.) From soil. See Manual, 5th ed., 1939, 516 for a description of this species. This species is much like *Alcaligenes marshallii*.

Achromobacter lipidis (Anderson) Allison, Anderson and Cole. (*Bacterium lipidis* Anderson, Internat. Assoc. Milk Dealers, Proc. 30th Ann. Convention, Labora ory Section, October, 1937, 19; Allison, Anderson and Cole, Jour. Bact., *36*, 1938, 571.) From rancid cream. See Manual, 5th ed., 1934, 521 for a description of this species. This species is much like *Alcaligenes metalcaligenes*.

Alcaligenes albus Bergey et al. (*Bacterium lactis album* Conn, Esten, and Stocking, Ann. Rept., Storrs Agr. Exp. Station, 1906, 143; Bergey et al., Manual, 1st ed., 1923, 237.) From udder of cow. Gram-positive. See Manual, 5th ed., 1939, 100 for a description of this species.

Alcaligenes alcalinofoetidus Hauduroy et al. (*Bacillus alcalinofoetidus* Castellani, Jour. Trop. Med., 1930, 134; Hauduroy, Ehringer, Urbain, Guillot and Magrou, Dictionnaire des bactéries pathogènes. Paris, 1937, 29.) From tonsils of persons having an offensive breath.

Alcaligenes ammoniagenes (Cooke and Keith) Bergey et al. (*Bacterium ammoniagenes* Cooke and Keith, Jour. Bact., *13*, 1927, 315; Bergey et al., Manual, 3rd ed., 1930, 367.) From feces of infants. Gram-positive. See Manual, 5th ed., 1939, 99 for a description of this species.

Alcaligenes denieri Corbet. (Organism No. 6, Denier and Vernet, Le Caoutchouc, *17*, 1920, 10193; Quart. Jour. Rubber Research Inst., Malaya, *2*, 1930, 152.) From the latex of *Hevea brasiliensis* (para rubber tree). Gram-positive. See Manual, 5th ed., 1939, 99, for a description of this species.

Alcaligenes faecalis var. *mariense* Hauduroy et al. (*Bacillus mariense* Klimenko quoted from Besson, Technique Microbiologique, p. 904; Hauduroy et al., Dict. Path. Bact., Paris, 1937, 31.) A hydrogen sulfide producing variety.

Alcaligenes lenis De Assis. (Boletim do Inst. Vital Brasil, Niteroi, No. 14, 1930, 1.) From human blood stream.

Alcaligenes stevensae Brown. (Amer. Museum Novit., No. 251, 1927, 6.) From crushed egg masses of the moth (*Malacosoma americana*). Said to be related to *Alcaligenes bronchisepticus*.

Bacillus coeci Ford. (Ford, Studies from Royal Victoria Hosp., Montreal, *1*, No. 5, 1903, 45.) Found in stomach and rectum of a single human subject. Much like *Alcaligenes bookeri*.

Bacillus pylori Ford. (Ford, Studies from Royal Victoria Hosp., Montreal *1*, No. 5, 1903, 44.) Found in the human stomach. Liquefied gelatin and peptonized casein but did not liquefy blood serum.

Flavobacterium fecale Bergey et al. (*Bacillus fecale aromaticum* Stutzer, Cent. f. Bakt., I Abt., Orig., 91, 1923, 87; Bergey et al., Manual, 3rd ed., 1930, 150.) From feces. Resembles *Alcaligenes marshallii*. See Manual, 5th ed., 1939, 545 for a description of this species.

Genus II. **Achromobacter** *Bergey et al.**

(Bergey et al., Manual, 1st ed., 1923, 132; *Achromobacterium* Richards, Proc. Soc. Agr. Bact. (British), 15th Ann. Conf., 1944, 14.) From Greek *achroma*, without color and *bactrum*, a staff or rod.

Non-pigment-forming (at most no pigment formed on agar or gelatin) rods. Motile with peritrichous flagella or non-motile. Gram-negative to Gram-variable. Litmus milk faintly acid to unchanged or alkaline. Occur in salt to fresh water and in soil.

The type species is *Achromobacter liquefaciens* (Eisenberg) Bergey et al.

Key to the species of genus **Achromobacter.**

I. Motile. Flagella peritrichous.
- A. Gelatin liquefied.
  - 1. Litmus milk unchanged.
    - a. Nitrites not produced from nitrates.
      - 1. *Achromobacter liquefaciens.*
    - aa. Nitrites are produced from nitrates.
      - 2. *Achromobacter thalassius.*
      - 3. *Achromobacter iophagum.*
  - 2. Litmus milk acid.
    - a. Nitrites are produced from nitrates.
      - 4. *Achromobacter delicatulum.*
- B. Gelatin not liquefied.
  - 1. Litmus milk unchanged.
    - a. Nitrites are produced from nitrates.
      - 5. *Achromobacter aquamarinus.*
      - 6. *Achromobacter cycloclastes.*
  - 2. Litmus milk slightly acid.
    - a. Nitrites not produced from nitrates.
      - 7. *Achromobacter superficiale.*

II. Non-motile.
- A. Gelatin liquefied.
  - 1. Litmus milk unchanged.
    - a. Nitrites slowly produced from nitrates.
      - 8. *Achromobacter stenohalis.*
    - aa. Nitrites not produced from nitrates.
      - 9. *Achromobacter butyri.*

  - 2. Litmus milk acid, reduced in 5 days.
    - a. Nitrites are produced from nitrates.
      - 12. *Achromobacter delmarvae.*

---

* Partially rearranged before his death by Prof. D. H. Bergey, Philadelphia, Pennsylvania, September, 1937; further revision by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, August, 1945.

1. **Achromobacter liquefaciens** (Eisenberg) Bergey et al. (*Bacillus liquefaciens* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 112; not *Bacillus liquefaciens* Doyen, Jour. d. connaiss. médic., 1889, 108; not *Bacillus liquefaciens* Lucet, Ann. Inst. Past., 7, 1893, 327; not *Bacillus liquefaciens* Migula, Syst. d. Bakt., *2*, 1900, 723; *Bacillus sternbergii* Migula, Syst. d. Bakt., *2*, 1900, 726; Bergey et al., Manual, 1st ed., 1923, 135.) From Latin, liquefying.

Description emended by Bergey et al. (*loc. cit.*). This is reported to be a common water organism by Lustig (Diag. d. Bakt. des Wassers, 1893, 86), by Frankland and Frankland (Microorganisms in Water, 1894, 461) and by Horrocks (Bact. Exam. of Water, 1901, 54).

Short, rather thick rods, with rounded ends, occurring singly. Motile, possessing peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, gray, entire, slimy. Liquefaction. In time a putrid odor.

Gelatin stab: Napiform liquefaction.

Agar slant: Dirty-white, spreading growth.

Broth: Turbid.

Litmus milk: Unchanged.

Potato: Light yellow streak.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Habitat: Water.

2. **Achromobacter thalassius** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 279.) From Greek *thalassius*, marine, of the sea.

Rods: 0.6 to 0.7 by 0.8 to 2.3 microns, with some variation in shape, occurring singly, in pairs and short chains and many cells lying side by side. Motile by means of peritrichous flagella. Gram-negative but cell walls tend to retain stain.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: 1 mm, circular, white.

Gelatin stab: Napiform liquefaction. Filiform growth along line of stab.

Agar colonies: Punctiform, rough, translucent, raised.

Agar slant: Moderate, glistening, beaded, watery, butyrous growth with no pigment.

Sea-water broth: No pellicle, slight turbidity, scanty powdery sediment.

Fresh-water broth: Fair growth.

Litmus milk: No visible change. Casein not digested.

Potato: No visible growth.

Indole not formed.

Nitrites are produced from nitrates.

Does not ferment glucose, lactose, maltose, sucrose, xylose, mannitol, glycerol, or salicin.

Starch not hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Marine bottom deposits.

3. **Achromobacter iophagum** (Gray and Thornton) Bergey et al. (*Bacterium iophagum* Gray and Thornton, Cent. f. Bakt., II Abt., *78*, 1928, 89; Bergey et al., Manual, 3rd ed., 1930, 204.) From Greek *ius*, a poison and *phagein*, to eat or devour.

Rods: 0.8 to 1.0 by 1.0 to 5.0 microns. Motile by means of peritrichous flagella. Gram-negative.

Gelatin colonies: Quickly liquefied.

Gelatin stab: Liquefied.

Agar colonies: Circular or amoeboid, whitish, flat, raised, smooth, translucent, entire.

Agar slant: Filiform, white to buff, flat, undulate.

Broth: Turbid.

Litmus milk: Unchanged.

Nitrites produced from nitrates.

Starch hydrolyzed.

Acid from glucose and sucrose. Occasionally from maltose and glycerol.

Attacks phenol and naphthalene.

Aerobic, facultative.

Optimum temperature 30° to 35°C.

Source: Fifteen cultures from soil.

Habitat: Soil.

4. **Achromobacter delicatulum** (Jordan) Bergey et al. (*Bacillus delicatulus* Jordan, Report Mass. State Bd. of Health, 1890, 837; *Bacterium delicatulus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 82; Bergey et al., Manual, 1st ed., 1923, 137.) From Latin *delicatus*, soft, delicate; M. L. *delicatulus*, somewhat delicate.

Characters added to Jordan's description by Bergey (*loc. cit.*) from his private notes are indicated. Steinhaus (Jour. Bact., *42*, 1941, 771) apparently found the same organism and has added other characters.

Rods: 1.0 by 2.0 microns, occurring singly (Jordan). Motile, possessing peritrichous flagella. Gram-negative (Bergey).

Gelatin colonies: Whitish, homogeneous, with radiate margin.

Gelatin stab: Infundibuliform liquefaction.

Agar slant: Whitish, glistening.

Broth: Turbid, with gray pellicle and sediment.

Litmus milk: Acid. Slow reduction and peptonization (Steinhaus).

Potato: Thin, gray streak.

Acid from glucose, sucrose, maltose and lactose (slow) (Steinhaus).

No hydrolysis of starch (Steinhaus).

No H_2S produced (Steinhaus).

Indole not formed (Bergey).

Nitrites produced from nitrates.

Aerobic, facultative.

Optimum temperature 30° to 35°C.

Source: From the effluent of a septic tank (Jordan). From water (Bergey). From the alimentary tract of an adult Colorado potato beetle (*Leptinotarsa decemlineata* Say) (Steinhaus).

Habitat: Presumably widely distributed in nature.

5. **Achromobacter aquamarinus** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 264.) From Latin *aqua*, water, and *marinus*, sea.

Rods: 0.8 by 1.2 to 2.0 microns, with rounded ends, occurring singly. Motile by means of a few peritrichous flagella. Gram-negative.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: 2 mm, convex, circular, entire, whitish.

Gelatin stab: Poor growth, no liquefaction, no pigment.

Agar colonies: 2 mm, convex, smooth, circular.

Agar slant: Moderate, beaded, glistening, butyrous growth with no pigment.

Sea-water broth: Surface ring, moderate turbidity, heavy viscous sediment.

Fresh-water broth: Poor growth.

Litmus milk: No visible change. Casein not digested.

Potato: No visible growth.

Indole not formed.

Nitrites rapidly produced from nitrates.

Produces acid but no gas from glucose and maltose. Does not ferment lactose, sucrose, mannitol, glycerol, xylose, or salicin.

Starch not hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Fats are hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Found in sea water and on submerged slides.

Habitat: Sea water.

6. **Achromobacter cycloclastes** (Gray and Thornton) Bergey et al. (*Bacterium cycloclastes* Gray and Thornton, Cent. f. Bakt., II Abt., *73*, 1928, 89; Bergey et al., Manual, 3rd ed., 1930, 212.) From Greek *cyclus*, ring and *clastus*, breaking in pieces.

Rods: 1.0 to 1.5 by 1.5 to 8.0 microns. Motile with 1 to 12 peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, white, raised, smooth, glistening, entire.

Gelatin stab: No liquefaction. Nail head growth.

Agar colonies: Circular to amoeboid, white, flat to convex, smooth, glistening, translucent with opaque center, entire.

Agar slant: Filiform, pale buff, raised, smooth, glistening, undulate.

Broth: Turbid.

Nitrites produced from nitrates.

Starch not hydrolyzed.

Litmus milk unchanged.

No acid from carbohydrate media.

Attacks phenol and naphthalene.

Aerobic, facultative.

Optimum temperature 30° to 35°C.

Source: Three cultures from soil.

Habitat: Soil.

7. **Achromobacter superficiale** (Jordan) Bergey et al. (*Bacillus superficialis* Jordan, Report Mass. State Bd. of Health, 1890, 833; *Bacterium superficialis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 94; Bergey et al., Manual, 1st ed., 1923, 144.) From Latin *superficialis*, lying on the surface.

Characters added to Jordan's description by Bergey (*loc. cit.*) from his private notes are indicated.

Rods: 1.0 by 2.2 microns, occurring singly (Jordan). Motile, possessing peritrichous flagella. Gram-negative (Bergey).

Gelatin colonies: Small, circular, gray, translucent.

Gelatin stab: Scanty surface growth. Slow liquefaction.

Agar slant: Limited, gray, filiform.

Broth: Slightly turbid.

Litmus milk: No change. Later becoming slightly acid.

Potato: No growth (Jordan). Limited growth (Bergey). Abundant (Steinhaus).

Indole not formed (Bergey).

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 25° to 30°C.

Source: Sewage. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species as occurring in the slime and feces of the cod (*Gadus callarias*) and dogfish (*Squalus acanthias*). An organism apparently identical with this organism has been found by Steinhaus (Jour. Bact., *42*, 1944, 771) in the intestines of beetle larvae (*Urographus fasciata* DeG.).

Habitat: Presumably widely distributed in nature.

8. **Achromobacter stenohalis** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 257.) From Greek *stenus*, narrow or close, and *halinus*, salty; adapted to a slight change of salinity only.

Rods: 0.8 to 0.9 by 0.8 to 1.6 microns, occurring singly, in pairs and short chains. Non-motile. Capsulated. Gram-negative.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: 1 mm, whitish, circular, convex, entire. No pigment.

Gelatin stab: Very slow crateriform liquefaction. Napiform in 50 days.

Agar colonies: Small, circular, opalescent, lobate edge, convex with slightly raised margin, smooth.

Agar slant: Moderate, beaded, glistening, opalescent, beaded growth with no pigment.

Sea-water broth: Moderate turbidity, viscid sediment, no pellicle or ring.

Fresh-water broth: No visible growth.

Litmus milk: No visible change. Casein not digested.

Potato: No visible growth.

Indole not produced.

Nitrites slowly produced from nitrates.

No acid or gas from glucose, lactose, maltose, sucrose, mannitol, glycerol, xylose, or salicin.

Starch not hydrolyzed.

Hydrogen sulfide not produced.

Ammonia produced from peptone but not from urea.

Fats are not hydrolyzed.

Aerobic, facultative (poor anaerobic growth).

Optimum temperature 20° to 25°C.

Source: Sea water, marine mud, and marine phytoplankton.

Habitat: Sea water.

9. **Achromobacter butyri** Bergey et al. (*Micrococcus butyri-aromafaciens* Keith, The Technology Quarterly, *10*, 1897, 247; *Bacillus butyri aromafaciens* Grimm, Cent. f. Bakt., II Abt., *8*, 1902, 589; Bergey et al., Manual, 1st ed., 1923, 148; *Bacterium butyriaromafaciens* Omeliansky, Jour. Bact., *8*, 1923, 400.) From Latin *butyrum*, butter.

Rods: 0.5 to 1.0 micron, nearly spherical, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin colonies: White, circular, smooth, glistening.

Gelatin stab: White surface growth, liquefaction with white sediment.

Agar slant: Abundant, white, glistening.

Broth: Turbid, with ring and sediment.

Litmus milk: Reaction unchanged. Aromatic odor.

Potato: Slow and limited, white growth.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Milk.

10. **Achromobacter stationis** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 273.) From Latin *statio*, anchorage.

Ovoid rods: 0.4 by 0.5 to 0.6 microns, occurring singly or in chains of two to three. Non-motile. Gram-positive but easily destained.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: 0.5 to 1 mm, circular, convex, grayish-white.

Gelatin stab: Very slow napiform liquefaction.

Agar colonies: 1 to 2 mm, convex, lobate edge, smooth, colorless.

Agar slant: Moderate, glistening, filiform, butyrous growth with no pigment.

Sea-water broth: Heavy pellicle, no turbidity, granular growth along walls, scanty sediment.

Fresh-water broth: Good growth.

Litmus milk: Becomes alkaline. Casein not digested.

Potato: No visible growth.

Indole not formed.

Nitrites rapidly produced from nitrates.

Produces acid but no gas from glucose. Does not ferment lactose, maltose, sucrose, mannitol, glycerol, xylose, or salicin.

Starch not hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Found in film of marine fouling organisms.

Habitat: Sea water.

11. **Achromobacter eurydice** (White) Bergey et al. (*Bacterium eurydice* White, U. S. Dept. of Agr., Bur. of Entomol., Circ. 157, 1912, 3 and U. S. Dept. of Agr. Bull. 810, 1920, 15; Bergey et al., Manual, 2nd ed., 1925, 170.) From Greek *Eurydice*, the wife of Orpheus.

Rods: Small, slender, with slightly rounded ends, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin stab: A bluish-gray growth occurs along the line of inoculation. No liquefaction.

Glucose agar colonies: Bluish-gray, circular, smooth, glistening, entire.

Broth: Uniform turbidity with viscid sediment.

Litmus milk: Unchanged.

Acid from glucose but little or no action on other carbohydrates.

Potato: Slight, grayish growth.

Aerobic, facultative.

Innocuous when fed to bees. Not pathogenic when inoculated subcutaneously in rabbits.

Source: Occurs as a secondary invader in European foulbrood of bees.

Habitat: Unknown.

12. **Achromobacter delmarvae** Smart. (Smart, Jour. Bact., *23*, 1932, 41 and Jour. Agr. Research, *51*, 1935, 363.) From *Delmarva*, coined from Del., Mar. and Va., the regions in which the species was found.

Short rods: Average size 0.75 by 1.5 microns, with rounded ends, occurring singly, in pairs and in short chains. Non-motile. Gram-negative.

Gelatin colonies: Similar to agar colonies.

Gelatin stab: Scanty growth. No liquefaction.

Beef-infusion agar colonies: Small, circular, raised, edges smooth, glistening, translucent, bluish-white, amorphous, margin entire.

Agar stab: Abundant growth. Surface growth round, smooth, glistening, bluish-white, raised. Filiform growth the whole length of stab, but growth best at top.

Agar slant: Abundant filiform growth, raised, glistening, smooth, translucent, bluish-white, no odor; old cultures slightly viscid. Medium unchanged.

Nutrient broth: Turbid. Delicate white pellicle. Sediment abundant, white, slightly stringy. No odor. Color of medium unchanged.

Sterile milk: Slow growth. No peptonization. Coagulation in 12 to 14 days. Milk turns chocolate brown beginning at top.

Litmus milk: Acid with reduction of litmus in 5 days. Coagulation with return of pink color in 12 to 14 days. Browning of medium.

Potato: Abundant growth, grayish-white, glistening, smooth, raised. Medium changed from white to smoke-gray.

Indole not formed.

Nitrites produced from nitrates in 7 days at 26°C.

No H_2S produced.

Ammonia not formed.

Diastatic action weak.

Acid but no gas from glucose, lactose, glycerol and mannitol. Alkaline reaction and no gas from sucrose.

Optimum pH 7.0.

Temperature relations: Optimum 26°C. Good growth up to 31°C. Very slight growth at 37° and at −8°C.

Facultative anaerobe.

Source: Isolated from fresh strawberries from Delaware, Maryland and Virginia.

Habitat: Unknown.

Appendix: Many of the following species were described before Gram and flagella stains had been perfected. Hence it is impossible to identify them definitely as belonging to *Achromobacter*. Comparative study is needed in other cases before the remaining species can be placed in their proper place in the genus.

Achromobacter acidum (Chester) Bergey et al. (Species No. 56 of Conn, Storrs Agr. Exper. Sta., 7th Ann. Rept. for 1894, 1895, 83; *Bacterium acidum* Chester, Man. Determ. Bact., 1901, 146; Bergey et al., Manual, 1st ed., 1923, 151.) From milk. See Manual, 4th ed., 1934, 246 for a description of this organism.

Achromobacter agile (Ampola and Garino) Bergey et al. (*Bacillus denitrificans agilis* Ampola and Garino, Cent.

f. Bakt., II Abt., *2*, 1896, 673; *Bacterium denitrificans agilis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 76; *Bacterium agile* H. Jensen, Cent. f. Bakt., II Abt., *4*, 1898, 408; *Bacillus denitrificans* Migula, Syst. d. Bakt., *2*, 1900, 796; not *Bacillus denitrificans* Chester, Man. Determ. Bact., 1901, 274; *Bacillus agilis* Chester, Man. Determ. Bact., 1901, 226; not *Bacillus agilis* Tschistowitsch, Berl. klin. Wchnschr., 1892, 512; Bergey et al., Manual, 1st ed., 1923, 138.) From cow manure. See Manual, 4th ed., 1934, 219 for a description of this organism.

Achromobacter album (Eisenberg) Bergey et al. (*Bacillus albus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 171; *Bacterium albus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 76; Bergey et al., Manual, 1st ed., 1923, 141.) From water. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species from the slime on cod (*Gadus callarias*). See Manual, 4th ed., 1934, 222 for a description of this organism.

Achromobacter amylovorum (Rubentschick) Bergey et al. (*Urobacterium amylovorum* Rubentschick, Cent. f. Bakt., II Abt., *64*, 1925, 168; *ibid.*, *66*, 1926, 161; Bergey et al., Manual, 3rd ed., 1930, 225.) From sewage slime. See Manual, 5th ed., 1939, 514 for a description of this organism.

Achromobacter anaerobium Shimwell. (Jour. Inst. Brewing, *43*, 1937, 507.) From spoiled beer.

Achromobacter aromafaciens (Chester) Bergey et al. (Species No. 41 of Conn, Storrs Agr. Exper. Sta., 7th Ann. Rept. for 1894, 1895, 57; *Bacterium connii* Migula, Syst. d. Bakt., *2*, 1900, 440; not *Bacterium connii* Chester, Man. Determ. Bact., 1901, 146; *Bacterium aromafaciens* Chester, *loc. cit.*, 148; Bergey et al., Manual, 1st ed., 1923, 151.) From milk sent from Uruguay to Chicago World's Fair. See Manual, 5th ed., 1939, 519 for a description of this organism.

Achromobacter arcticum Rusakowa and Butkewitsch. (Microbiology (Russian), *10*, 1941, 137; abst. in Cent. f. Bakt., II Abt., *105*, 1942, 140.) From sea water (Barents Sea).

Achromobacter candicans (Frankland and Frankland) Bergey et al. (*Bacillus candicans* G. and P. Frankland, Ztschr. f. Hyg., *6*, 1889, 397; *Bacterium candicans* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 130; Bergey et al., Manual, 1st ed., 1923, 149.) From soil. See Manual, 5th ed., 1939, 520 for a description of this organism.

Achromobacter centropunctatum (Jensen) Bergey et al. (*Bacterium centropunctatus* H. Jensen, Cent. f. Bakt., II Abt., *4*, 1898, 410; *Bacillus centropunctatus* Chester, Man. Determ. Bact., 1901, 225; Bergey et al., Manual, 1st ed., 1923, 139.) From cow manure. See Manual, 4th ed., 1934, 220 for a description of this organism.

Achromobacter coccoideum (Chester) Bergey et al. (Species No. 16 of Conn, Storrs Agr. Exper. Sta., 6th Ann. Rept. for 1893, 1894, 51; *Bacterium coccoideum* Chester, Man. Determ. Bact., 1901, 147; Bergey et al., Manual, 1st ed., 1923, 152.) From ripening cream. See Manual, 5th ed., 1939, 520 for a description of this organism.

Achromobacter connii (Chester) Bergey et al. (Culture No. 55, Conn, Storrs Agr. Exp. Sta., 7th Annual Rept. for 1894, 1895, 83; *Bacterium connii* Chester, Man. Determ. Bact., 1901, 146; Bergey et al., Manual, 1st ed., 1923, 149.) From milk. See Manual, 4th ed., 1934, 243 for a description of this organism.

Achromobacter dendriticum (Lustig) Bergey et al. (*Bacillus dendriticus* Lustig, Diagnostica dei batteri delle acque, Torino, 1890 and Diagnostik der Bakterien des Wassers, 1893, 99; *Bacterium dendriticus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 103; Bergey et al., Manual, 2nd ed., 1925, 156.) From water. See Manual, 5th ed., 1939, 504 for a description of this organism.

Achromobacter epsteinii Peshkov. (Peshkov, Jour. of Biology (Russian), *6*, 1937, 1003.) From water of a carp pond near Moscow.

Achromobacter fermentationis (Chester) Bergey et al. (*Bacterium fermentationis* Chester, Del. Agr. Exp. Sta. Rept. 1899, 53; Bergey et al., Manual, 1st ed., 1923, 152.) From soil. See Manual, 4th ed., 1934, 247 for a description of this organism. In Chester, Man. Determ. Bact., 1901, 231 this is listed as a synonym of *Bacillus foetidus-liquefaciens* Tavel, Ueber Aetiol. der Strumitis, Basel, 1892.

Achromobacter filefaciens (Jensen) Bergey et al. (*Bacterium filefaciens* H. Jensen, Cent. f. Bakt., II Abt., *4*, 1898, 401; Bergey et al., Manual, 1st ed., 1923, 153.) From dust. See Manual, 4th ed., 1934, 247 for a description of this organism.

Achromobacter formosum (Ravenel) Bergey et al. (*Bacillus formosus* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 12; not *Bacillus formosus* Bredemann and Heigener, Cent. f. Bakt., II Abt., *93*, 1935, 101; *Bacterium formosus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 91; Bergey et al., Manual, 1st ed., 1923, 136.) From soil. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 24, 1934, 308) reports this species from fillets of haddock (*Melanogrammus aeglefinus*). See Manual, 5th ed., 1939, 505 for a description of this organism.

Achromobacter galophilum Bergey et al. (Culture No. 27, Baranik-Pikowsky, Cent. f. Bakt., II Abt., *70*, 1927, 373; Bergey et al., Manual, 3rd ed., 1930, 223.) From sea water. See Manual, 5th ed., 1939, 514 for a description of this organism.

Achromobacter gasoformans (Eisenberg) Bergey et al. (Gasbildner Bacillus, Tils, Zeitschr. f. Hyg., *9*, 1890, 315; *Bacillus gasoformans* Eisenberg, Bakt. Diagnostik, 1891, 107; *Bacterium gasoformans* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 93; Bergey et al., Manual, 1st ed., 1923, 137.) From water. See Manual, 5th ed., 1939, 503 for a description of this organism. Gas bubbles observed in plain gelatin stab.

Achromobacter geminum (Chester) Bergey et al. (*Bacillus geminus minor* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 28; *Bacterium geminus minor* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 72; *Bacillus geminus* Chester, Man. Determ. Bact., 1901, 216; Bergey et al., Manual, 1st ed., 1923, 142.) From soil. See Manual, 5th ed., 1939, 508 for a description of this organism.

Achromobacter guttatum (Zimmermann) Bergey et al. (*Bacillus guttatus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 56; *Bacterium guttatus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 94; Bergey et al., Manual, 1st ed., 1923, 140.) From water. See Manual, 5th ed., 1939, 508 for a description of this organism.

Achromobacter halophilum Bergey et al. (Culture No. 36, Baranik-Pikowsky, Cent. f. Bakt., II Abt., *70*, 1927, 373; Bergey et al., Manual, 3rd ed., 1930, 220.) From sea water. See Manual, 5th ed., 1939, 513 for a description of this organism.

Achromobacter hartlebii (Jensen) Bergey et al. (*Bacterium hartlebii* H. Jensen, Cent. f. Bakt., II Abt., *4*, 1898, 449; *Bacillus hartlebii* Chester, Man. Determ. Bact., 1901, 226; Bergey et al., Manual, 1st ed., 1923, 139.) From soil. See Manual, 4th ed., 1934, 219 for a description of this organism.

Achromobacter hyalinum (Jordan) Bergey et al. (*Bacillus hyalinus* Jordan, Report, Mass. State Bd. of Health, 1890, 835; *Bacterium hyalinus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 95; Bergey et al., Manual, 1st ed., 1923, 138.) From sand in a septic tank. See Manual, 4th ed., 1934, 216 for a description of this organism. Also reported by Hatcher (Jour. Elisha Mitchell Sci. Soc.,

55, 1939, 332) from the feces of a cockroach (*Periplaneta americana*). Litmus milk acid and coagulated. Gram-negative.

Achromobacter inunctum (Pohl) Bergey et al. (*Bacillus inunctus* Pohl, Cent. f. Bakt., *11*, 1892, 143; *Bacterium inunctus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 94; Bergey et al., Manual, 1st ed., 1923, 141.) From water. See Manual, 4th ed., 1934, 221 for a description of this organism.

Achromobacter lacticum Bergey et al. (Kramer, Die Bakteriologie der Landwirtschaft, *2*, 1892, 24; Bergey et al., Manual, 1st ed., 1923, 152.) From slimy milk. See Manual, 5th ed., 1939, 519 for a description of this organism. This appears to refer to Loeffler's slimy milk bacillus, more correctly known as *Bacterium pituitosum* Migula.

Achromobacter larvae (Stutzer and Wsorow) Bergey et al. (*Enterobacillus larvae* Stutzer and Wsorow, Cent. f. Bakt., II Abt., *71*, 1927, 119; Bergey et al., Manual, 3rd ed., 1930, 227.) From intestinal tract of normal and diseased caterpillars of winterwheat cutworm (*Euxoa segetum*). See Manual, 5th ed., 1939, 541 for a description of this organism.

Achromobacter liquidum (Frankland and Frankland) Bergey et al. (*Bacillus liquidus* G. and P. Frankland, Ztschr. f. Hyg., *6*, 1889, 382; *Bacterium liquidum* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 137; *Pseudomonas liquida* Chester, Man. Determ. Bact., 1901, 311; Bergey et al., Manual, 1st ed., 1923, 145.) From water. See Manual, 5th ed., 1939, 511 for a description of this organism.

Achromobacter litorale (Russell) Bergey et al. (*Bacillus litoralis* Russell, Ztschr. f. Hyg., *11*, 1891, 199; *Bacterium litoralis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 94; *Pseudomonas litoralis* Migula, Syst. d. Bakt., *2*, 1900, 879; Bergey et al., Manual, 1st ed., 1923, 138.) See Manual, 5th ed., 1939, 503 for a description of this organism. From mud bottom, Gulf of Naples.

Achromobacter litorale var. 2, Bois and Roy. (Naturaliste Canadien, *71*, 1945, 259.) From intestine of the codfish (*Gadus callarias L.*).

Achromobacter middletownii (Chester) Bergey et al. (Species No. 53 of Conn, Storrs Agr. Exper. Sta., 7th Ann. Rept. for 1894, 1895, 82; *Bacterium middletownii* Chester, Man. Determ. Bact., 1901, 147; Bergey et al., Manual, 1st ed., 1923, 151.) From milk. See Manual, 4th ed., 1934, 245 for a description of this organism.

Achromobacter mucidus Alford and McCleskey. (Proc. Louisiana Acad. Sci., 7, 1943, 25.) From crab meat having musty odor.

Achromobacter nijibetsui Takeda. (Cent. f. Bakt., II Abt., *94*, 1936, 48.) From fish hatchery water. Not pathogenic to salmon eggs.

Achromobacter nitrovorum (Jensen) Bergey et al. (*Bacterium nitrovorum* H. Jensen, Cent. f. Bakt., II Abt., *4*, 1898, 450; Bergey et al., Manual, 1st ed., 1923, 154.) From horse manure. See Manual, 4th ed., 1934, 248 for a description of this organism.

Achromobacter perolens Turner. (Australian Jour. Exp. Biol. and Med. Sci., *4*, 1927, 57.) From musty eggs.

Achromobacter pestifer (Frankland and Frankland) Bergey et al. (*Bacillus pestifer* G. and P. Frankland, Philosoph. Trans. Roy. Soc., London, B, *178*, 1888, 277; *Bacterium pestifer* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 96; Bergey et al., Manual, 1st ed., 1923, 140.) From dust. See Manual, 5th ed., 1939, 507 for a description of this organism.

Achromobacter pikowskyi Bergey et al. (Culture No. 25, Baranik-Pikowsky, Cent. f. Bakt., II Abt., *70*, 1927, 373; Bergey et al., Manual, 3rd ed., 1930, 222.) From sea water. See Manual, 5th ed., 1939, 514 for a description of this organism.

Achromobacter pinnatum (Ravenel) Bergey et al. (*Bacillus pinnatus*

Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 32; *Bacterium pinnatus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 72; Bergey et al., Manual, 1st ed., 1923, 142). From soil. S.e Manual, 4th ed., 1934, 223 for a description of this organism.

Achromobacter ravenelii Bergey et al. (*Bacillus geminus major* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 27; *Bacillus raveneli* Chester, Man. Determ. Bact., 1901, 217; Bergey et al., Manual, 1st ed., 1923, 143.) From soil. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species from the slime on cod (*Gadus callarias*). See Manual, 4th ed., 1934, 224 for a description of this organism.

Achromobacter refractans (Wright) Bergey et al. (*Bacillus refractans* Wright, Mem. Nat. Acad. Sci., *7*, 1894, 442; *Bacterium refractans* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 82; Bergey et al., Manual, 1st ed., 1923, 150.) From water. See Manual, 4th ed., 1934, 244 for a description of this organism.

Achromobacter reticulare (Jordan) Bergey et al. (*Bacillus reticularis* Jordan, Rept. Mass. State Bd. of Health, 1890, 834; Bergey et al., Manual, 1st ed., 1923, 144.) From the effluent of a septic tank. See Manual, 5th ed., 1939, 510 for a description of this organism.

Achromobacter rodonatum (Ravenel) Bergey et al. (*Bacillus rodonatus* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 40; *Bacterium rodonatus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 83; Bergey et al., Manual, 1st ed., 1923, 150.) From soil. See Manual, 4th ed., 1934, 244 for a description of this organism.

Achromobacter rugosum (Chester) Bergey et al. (Species No. 27, Conn, Storrs Agr. Exp. Sta., 1893, 54; *Bacillus rugosus* Chester, Man. Determ. Bact., 1901, 220; not *Bacterium rugosum* Henrici, Arb. Bakt. Inst. Tech. Hochschule Karlsruhe, *1*, 1894, 43; not *Bacillus rugosus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 438; *Bacterium geminus major* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 73; Bergey et al., Manual, 1st ed., 1923, 143.) From soil. See Manual, 4th ed., 1934, 224 for a description of this organism.

Achromobacter sewerinii Bergey et al. (Kultur No. 3, Sewerin, Cent. f. Bakt., II Abt., *1*, 1895, 162; *Vibrio denitrificans* Sewerin, Cent. f. Bakt., II Abt., *3*, 1897, 517; Bergey et al., Manual, 1st ed., 1923, 140.) From horse manure.

Achromobacter solitarium (Ravenel) Bergey et al. (*Bacillus solitarius* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 29; *Bacterium solitarius* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 71; Bergey et al., Manual, 1st ed., 1923, 143.) From soil. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species from the slime on cod (*Gadus callarias*). See Manual, 5th ed., 1939, 509 for a description of this organism.

Achromobacter stutzeri (Lehmann and Neumann) Bergey et al., (*Bacillus denitrificans II*, Burri and Stutzer, Cent. f. Bakt., II Abt., *1*, 1895, 392; *Bacterium stutzeri* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 237; *Bacillus nitrogenes* Migula, Syst. d. Bakt., *2*, 1900, 793; *Bacillus stutzeri* Chester, Man. Determ. Bact., 1901, 225; Bergey et al., Manual, 3rd ed., 1930, 207.) From horse manure. See Manual, 4th ed., 1934, 221 for a description of this organism.

Achromobacter tiogense (Wright) Bergey et al. (*Bacillus tiogensis* Wright, Memoirs Nat. Acad. Sci., *7*, 1894, 441; *Bacterium tiogensis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 82; Bergey et al., Manual, 1st ed., 1923, 150.) From water. See Manual, 4th ed., 1934, 244 for a description of this organism.

Achromobacter ubiquitum (Jordan) Bergey et al. (*Bacillus ubiquitus* Jordan, Rept. Mass. State Bd. of Health, 1890, 830; *Bacterium ubiquitus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 144; Bergey et al., Manual, 1st ed., 1923,

153.) From sewage, water and dust. See Manual, 5th ed., 1939, 517 for a description of this organism.

Achromobacter venenosum (Vaughan) Bergey et al. (*Bacillus venenosus* Vaughan, Amer. Jour. Med. Sci., *104*, 1892, 191; Bergey et al., Manual, 1st ed., 1923, 141.) From water. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species from the slime on cod (*Gadus callarias*) and the feces of dogfish (*Squalus acanthias*). See Manual, 4th ed., 1934, 222 for a description of this organism.

Achromobacter visco-symbioticum (Buchanan and Hammer) Bergey et al. (*Bacillus visco-symbioticum* Buchanan and Hammer, Iowa Agr. Exp. Sta. Res. Bull. 22, 1915, 261; *Escherichia symbiotica* Bergey et al., Manual, 1st ed., 1923, 202; Bergey et al., 3rd ed., 1930, 209.) From ropy milk. See Manual, 4th ed., 1934, 223 for a description of this organism.

Genus III. **Flavobacterium** *Bergey et al.**

(Bergey et al., Manual, 1st ed., 1923, 97; *Flavobacter* Stewart, Jour. Mar. Biol. Assoc. Un. Kingdom, *13*, 1932, 41.) From Latin *flavus*, yellow and *bacterium*, a small rod.

Rods of medium size forming a yellow to orange pigment on culture media. Motile with peritrichous flagella or non-motile. Generally Gram-negative. Characterized by feeble powers of attacking carbohydrates, occasionally forming acid from hexoses but no gas. Occur in water and soil.

The type species is *Flavobacterium aquatile* (Frankland and Frankland) Bergey et al.

Key to the species of genus **Flavobacterium.**

I. Non-motile, and slow or no liquefaction of gelatin.
- A. Litmus milk unchanged.
  - 1. Nitrites not produced from nitrates.
    - 1. *Flavobacterium aquatile.*

II. Motile with peritrichous flagella.
- A. Gelatin liquefied.
  - 1. Litmus milk unchanged.
    - a. Nitrites produced from nitrates.
      - 2. *Flavobacterium diffusum.*
      - 3. *Flavobacterium okeanokoites.*
      - 4. *Flavobacterium rigense.*
    - aa. Nitrites not produced from nitrates.
      - b. From fresh water.
        - 5. *Flavobacterium devorans.*
      - bb. From sea water.
        - 6. *Flavobacterium marinotypicum.*
        - 7. *Flavobacterium marinovirosum.*
        - 8. *Flavobacterium halohydrum.*
        - 9. *Flavobacterium neptunium.*

---

* Partially rearranged before his death by Prof. D. H. Bergey, Philadelphia, Pennsylvania, Sept., 1937; further revision by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, June, 1945.

2. Litmus milk alkaline.
   a. Nitrites produced from nitrates.
      10. *Flavobacterium suaveolens.*
      11. *Flavobacterium rhenanus.*
   aa. Nitrites not produced from nitrates.
      12. *Flavobacterium marinum.*
      13. *Flavobacterium harrisonii.*

B. Gelatin not liquefied.
1. Litmus milk unchanged.
   a. Nitrites not produced from nitrates.
      14. *Flavobacterium invisible.*
2. Litmus milk acid.
   a. Nitrites not produced from nitrates.
      15. *Flavobacterium lactis.*

III. Non-motile.

A. Gelatin liquefied.
1. Litmus milk unchanged.
      16. *Flavobacterium sewanense.*
2. Litmus milk reduced.
   a. Nitrites not produced from nitrates.
      17. *Flavobacterium arborescens.*
3' Litmus milk alkaline.
   a. Nitrites produced from nitrates.
      18. *Flavobacterium lutescens.*
      19. *Flavobacterium fucatum.*
4. Litmus milk peptonized.
   a. Nitrites not produced from nitrates.
      20. *Flavobacterium esteroaromaticum.*
5. Litmus milk acid.
   a. Nitrites produced from nitrates.
      21. *Flavobacterium balustinum.*
      22. *Flavobacterium dormitator.*
6. Action on litmus milk not recorded. Rust-colored on blood agar.
      23. *Flavobacterium ferrugineum.*

B. Gelatin not liquefied.
1. Litmus milk unchanged.
   a. Nitrites produced from nitrates.
      24. *Flavobacterium proteus.*
   aa. Nitrites not produced from nitrates.
      25. *Flavobacterium breve.*
      26. *Flavobacterium solare.*

C. Action on gelatin not recorded.
1. Litmus milk unchanged.
   a. Nitrites produced from nitrates.
      27. *Flavobacterium flavotenue.*

1. Flavobacterium aquatile (Frankland and Frankland) Bergey et al. (*Bacillus aquatilis* G. and P. Frankland, Ztschr. f. Hyg., *6*, 1889, 381; *Bacterium aquatilis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 96; Bergey et

al., Manual, 1st ed., 1923, 100.) From Latin *aquatilis*, aquatic.

Description taken from Frankland and Frankland and from studies by Dr. E. Windle Taylor, Metropolitan Water Board, London, on freshly isolated cultures.

Rods: 0.5 by 2.5 microns, with rounded ends, occurring singly, in pairs and in chains. Oscillatory movement only; long threads often remaining motionless (Franklands). Gram-negative (Taylor).

Gelatin colonies: Center yellow-brown, with radiate arrangement of bundles of threads. Colorless margin. Very slow liquefaction (none in 6 weeks, Taylor).

Gelatin stab: Yellow surface growth. Slow liquefaction.

Agar slant: Yellow, smooth, glistening limited growth.

Broth: Turbid with whitish sediment. No pellicle.

Litmus milk: Unchanged (Taylor).

Potato: Limited, yellow streak to no growth.

Indole not formed (Taylor).

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 25°C.

Distinctive characters: Resembles *Flavobacterium arborescens* microscopically; easily distinguished from this organism by its much slower and limited growth on ordinary gelatin and agar media, the marked difference in the appearance of colonies and the inability of *Flavobacterium aquatile* to produce more than a limited growth on potato.

Source: Isolated from the water of deep wells in the chalk region of Kent, England where it occurred as a practically pure culture. Found abundantly and re-isolated by Taylor, 1941 from the same sources (personal communication).

Habitat: Water.

Note: The peritrichous, nitrate reducing and ammonia producing organism identified by Bergey (*loc. cit.*) in 1923, as *Flavobacterium aquatile* appears to have been something resembling *Flavobacterium diffusum*.

2. **Flavobacterium diffusum** (Frankland and Frankland) Bergey et al. (*Bacillus diffusus* G. and P. Frankland, Ztschr. f. Hyg., *6*, 1889, 396; *Bacterium diffusus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 97; Bergey et al., Manual, 1st ed., 1923, 100.) From Latin *diffusus*, spreading out, diffuse.

Description completed from Harrison (Canadian Jour. Res., *1*, 1929, 233) as indicated.

Rods: 0.5 by 1.5 microns, occurring singly and in chains. Motile, possessing peritrichous flagella. Gram-negative (Harrison).

Gelatin colonies: Thin, bluish-green, spreading, later faint yellow.

Gelatin stab: Thin, glistening, yellowish-green surface growth. Slow crateriform liquefaction.

Agar slant: Thin, light yellow, glistening.

Broth: Turbid, with greenish-yellow sediment.

Litmus milk: Unchanged (Harrison).

Potato: Thin, smooth, greenish-yellow, glistening growth.

Indole not formed (Harrison).

Nitrites produced from nitrates (Harrison).

Slight acidity from glucose. No acid from sucrose and lactose (Harrison).

Aerobic, facultative.

Optimum temperature 25° to 30°C.

Source: Originally found in soil. Found also by Tataroff (Die Dorpater Wasserbakterien, Dorpat, 1891, 58) in fresh water and by Harrison (*loc. cit.*) from skin of halibut from both the Atlantic and Pacific shores of Canada.

Habitat: Soil, fresh and sea waters.

3. **Flavobacterium okeanokoites** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 270.) From Greek *Oceanus*, the ocean god, the ocean and *coites*, bed.

Rods: 0.8 to 0.9 by 1.2 to 1.6 microns, with rounded ends, many coccoid, occurring singly and in long chains.

Motile by means of peritrichous flagella. Gram-negative.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: Small, circular, convex, entire, rust or orange colored, digest gelatin.

Gelatin stab: Slow napiform liquefaction, yellow growth.

Agar colonies: 2 mm, circular, entire, smooth, convex.

Agar slant: Moderate, filiform, glistening, butyrous growth with yellow pigment.

Sea-water broth: No pellicle, moderate turbidity, moderate viscid sediment.

Fresh-water broth: Good growth.

Litmus milk: No visible change. Casein is digested.

Potato: No visible growth.

Indole not formed.

Nitrites slowly produced from nitrates.

Does not produce acid or gas from glucose, lactose, maltose, sucrose, glycerol, mannitol, xylose, or salicin.

Starch not hydrolyzed.

Hydrogen sulfide is formed.

Ammonia produced from peptone but not from urea.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Marine mud.

Habitat: Sea water.

4. **Flavobacterium rigense** Bergey et al. (*Bacillus brunneus rigensis* Bazarewski, Cent. f. Bakt., II Abt., *15*, 1905, 1; Bergey et al., Manual, 1st ed., 1923, 100.) From Riga, the name of the city where the species was isolated.

Rods: 0.75 by 1.7 to 2.5 microns, occurring singly. Motile, possessing peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, entire to undulate, grayish-white, homogeneous.

Gelatin stab: Smooth, yellowish surface growth. Infundibuliform liquefaction. Brownish-yellow sediment.

Agar slant: Narrow, whitish streak, becoming yellowish-brown, spreading. Pigment is water and alcohol soluble. Insoluble in ether.

Broth: Turbid with pellicle and brownish sediment. Cells capsulated.

Litmus milk: Unchanged.

Potato: Yellow, spreading growth. The growth turns brownish.

Hydrogen sulfide not formed.

Indole not formed.

Nitrites produced from nitrates.

Aerobic, facultative.

Optimum temperature 30°C. Brownish colors develop best at lower temperatures. Orange-yellow colors develop best at 37°C.

Habitat: Soil.

5. **Flavobacterium devorans** (Zimmermann) Bergey et al. (*Bacillus devorans* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 48; *Bacterium devorans* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 96; Bergey et al., Manual, 1st ed., 1923, 102.) From Latin *devorans*, devouring.

Characters added to Zimmermann's description by Bergey (*loc. cit.*) from his private notes are indicated. Steinhaus (Jour. Bact., *42*, 1941, 771) apparently found the same organism.

Rods: 0.7 by 0.9 to 1.2 microns, occurring singly, in pairs and chains. Motile (Zimmermann), possessing peritrichous flagella (Bergey). Gram-negative (Zimmermann).

Gelatin colonies: Circular, white, granular to filamentous, becoming yellowish-gray.

Gelatin stab: Slow infundibuliform liquefaction.

Agar slant: Thin, gray, spreading.

Broth: Turbid.

Litmus milk: Unchanged.

Potato: No growth (Zimmermann). Yellowish-gray streak (Bergey).

Indole not formed.

Nitrites not produced from nitrates (Bergey).

Aerobic, facultative.

Optimum temperature 25° to 30°C.

Source: From water at Chemnitz (Zimmermann). From water (Bergey). From alimentary tract of the nine-spotted lady beetle (*Coccinella novemnotata* Habst.) (Steinhaus).

Habitat: Water.

6. **Flavobacterium marinotypicum** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 268.) From Latin *marinus*, of the sea and *typicus*, typical.

Rods: 0.5 to 0.7 by 1.4 to 2.0 microns, occurring almost entirely as single cells. Motile by means of four or more peritrichous flagella. Gram-negative.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: Very minute, yellow, with slow liquefaction.

Gelatin stab: Crateriform liquefaction becoming stratiform. Filiform along line of stab.

Agar colonies: Minute, circular, entire, convex, yellow.

Agar slant: Scanty, filiform, butyrous, shiny growth with yellow pigment.

Sea-water broth: Scanty, yellowish pellicle, heavy turbidity, slight viscid sediment.

Fresh-water broth: Good growth.

Litmus milk: Decolorized, neutral, greenish pellicle, slow peptonization.

Potato: Abundant, shiny, greenish-yellow growth. Potato darkened.

Indole not formed.

Nitrites not produced from nitrates.

Produces acid but no gas from glucose and glycerol. Does not ferment lactose, sucrose, mannitol, xylose, or salicin.

Starch not hydrolyzed.

Hydrogen sulfide is formed.

Ammonia produced from peptone but not from urea.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Sea water and marine mud.

Habitat: Sea water.

7. **Flavobacterium marinovirosum** ZoBell and Upham. (Bull. Scripps. Inst. of Oceanography, Univ. Calif., *5*, 1944, 271.) From Latin *marinus*, of the sea, and *virosus*, covered with slimy liquid or ooze.

Rods: 0.7 to 0.8 by 0.8 to 2.8 microns, with rounded ends, occurring singly and in long chains. Motile by means of peritrichous flagella. Gram-negative.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: Small, circular, raised, rust-colored. Slowly digest gelatin.

Gelatin stab: Crateriform liquefaction becoming stratiform. Light orange pigment.

Agar colonies: 1 to 2 mm, circular, convex, entire, smooth.

Agar slant: Moderate, filiform, glistening, mucoid growth with grayish-yellow pigment.

Sea-water broth: Heavy turbidity, no pellicle, abundant viscid sediment.

Fresh-water broth: Good growth.

Litmus milk: No visible change. Casein is digested.

Potato: No visible growth.

Indole not formed.

Nitrites not produced from nitrates.

Does not ferment glycerol, glucose, lactose, maltose, sucrose, mannitol, xylose, or salicin.

Starch not hydrolyzed.

Hydrogen sulfide is formed.

Ammonia produced from peptone but not from urea.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Sea water and marine mud.

Habitat: Sea water.

8. **Flavobacterium halohydrium** ZoBell and Upham. (Bull. Scripps Inst. of

Oceanography, Univ. Calif., *5*, 1944, 278.) From Greek *hals*, salt and *hydror*, water.

Short rods: 0.6 by 0.8 to 1.0 microns, occurring singly. Motile by means of many peritrichous flagella. Gram-negative.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: Small, circular, orange.

Gelatin stab: Napiform liquefaction becoming crateriform. Beaded along line of stab.

Agar colonies: 2 mm, pulvinate, circular, entire, smooth.

Agar slant: Moderate, glistening, echinulate, butyrous growth with yellow pigment.

Sea-water broth: Yellow surface ring, heavy turbidity, moderate viscid sediment.

Fresh-water broth: No visible growth.

Litmus milk: No visible change. Casein not digested.

Very poorly tolerant of increases or decreases in salinity.

Potato: No visible growth.

Indole not formed.

Nitrites not produced from nitrates.

Produces acid but no gas from glucose, lactose, maltose, sucrose, and salicin. Does not ferment glycerol, mannitol, or xylose.

Starch is hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Sea water and marine mud.

Habitat: Sea water.

9. **Flavobacterium neptunium** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 278.) From Latin *Neptunius*, god of the sea.

Rods: 0.5 to 0.6 by 1.6 to 4.5 microns, many bent rods, occurring singly and in short chains. Motile by means of long, peritrichous flagella. Gram-negative.

All media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: Small, circular, darker centers, sink in gelatin, faintly yellow.

Gelatin stab: Slow napiform liquefaction. Filiform growth along line of stab.

Agar colonies: 2 mm, circular, smooth, entire, convex, dark centers with buff pigment.

Agar slant: Luxuriant, echinulate, glistening, slightly mucoid growth with buff to yellow pigment. Agar discolored brown.

Sea-water broth: Heavy pellicle, scanty turbidity, scanty sediment.

Fresh-water broth: No visible growth.

Litmus milk: No visible change. Casein not digested.

Potato: No visible growth.

Indole not formed.

Nitrites not produced from nitrates.

Produces acid but no gas from glucose, lactose, maltose, and salicin. Does not ferment glycerol, mannitol, xylose, or sucrose.

Starch is hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Marine bottom deposits.

Habitat: Sea water.

10. **Flavobacterium suaveolens** Soppeland. (Jour. Agr. Res., *28*, 1924, 275.) From Latin *suaveolens*, of a sweet odor.

Rods: 0.6 to 0.8 by 1.0 to 1.2 microns, with rounded ends, occurring singly and in pairs. Motile, with peritrichous flagella. Gram-negative on plain agar. Gram-positive in young culture on milk powder agar.

Gelatin stab: Rapid stratiform liquefaction. Medium becomes brown.

Agar colonies: Small, circular, smooth, yellow, amorphous, undulate margin.

Agar slant: Moderate, flat, glistening, opaque, butyrous, yellow, with aromatic odor.

Broth: Turbid with scanty sediment. Aromatic odor, becoming cheesy.

Litmus milk: Peptonized. Alkaline.

Potato: Abundant, yellow, glistening, becoming brown.

Indole formed.

Nitrites are produced from nitrates.

Hydrogen sulfide formed.

Slight acid but no gas from glucose, sucrose and glycerol. No acid from lactose.

Starch hydrolyzed.

Blood serum is liquefied.

Aerobic, facultative.

Optimum temperature 25°C.

Source: Dairy wastes.

Habitat: Unknown.

11. **Flavobacterium rhenanus** (Migula) Bergey et al. (Rhine water bacillus of Burri, Frankland and Frankland, Micro-organisms in Water, 1894, 483; *Bacillus rhenanus* Migula, Syst. d. Bakt., *2*, 1900, 713; *Bacillus rheni* Chester, Manual Determ. Bact., 1901, 251; Bergey et al., Manual, 1st ed., 1923, 103.) Named for the Rhine River.

Characters added to Burri's description by Bergey (*loc. cit.*) from his private notes are indicated. Steinhaus (Jour. Bact., *42*, 1941, 771) apparently found the same organism and has added other characters.

Rods: 0.7 by 2.5 to 3.5 microns, with rounded ends, occurring singly and in chains (Burri). Motile, possessing peritrichous flagella (Bergey). Gram-negative (Bergey).

Gelatin colonies: Convex, colorless, transparent, becoming yellowish.

Gelatin stab: Infundibuliform liquefaction.

Agar colonies: Small, smooth, convex, entire.

Glycerol agar slant: Thin, shining, honey-colored. Growth dry and tough.

Broth: Turbid, with orange-colored pellicle and sediment.

Litmus milk: Soft coagulum, becoming slightly alkaline with yellow ring.

Potato: Moist, glistening, thin, flat, orange to rust-colored.

Indole not formed (Bergey).

Nitrites produced from nitrates (Bergey).

Acid from glucose, maltose, and sucrose but not lactose (Steinhaus).

No hydrolysis of starch (Steinhaus).

No H_2S produced (Steinhaus).

Aerobic facultative.

Optimum temperature 30°C.

Source: From Rhine River water (Burri). From water (Bergey). From eggs in ovary of a walking stick (*Diapheromera femorata* Say) (Steinhaus).

Habitat: Presumably widely distributed in nature.

12. **Flavobacterium marinum** Harrison. (Canadian Jour. of Research, *1*, 1929, 234.) From Latin *marinus*, pertaining to the sea.

Rods: 0.8 by 1.2 to 1.3 microns, with rounded ends. Occur singly and in pairs. Motile with 4 to 5 peritrichous flagella. Encapsulated. Gram-variable. Show blue granules in Gram-negative rods.

Gelatin colonies: Circular, iridescent, whitish margin with pale yellow center. Liquefaction.

Gelatin stab: Saccate to stratiform liquefaction.

Agar colonies: Circular, pale yellow, smooth, convex, granular, reticulate edge.

Agar slant: Amber-yellow, slightly raised, spreading, smooth, glistening, transparent.

Ammonium phosphate agar: Scant growth.

Broth: Turbid, sediment.

Litmus milk: Alkaline. Digestion without coagulation. Clear serum.

Potato: Abundant, amber-yellow, becoming dirty yellow, spreading, glistening.

Indole not formed.

Nitrites not produced from nitrates. Trace of ammonia formed.

Faint acidity from glucose. No action on lactose or sucrose.

Loeffler's blood serum not liquefied. Faint yellow spreading growth.

No H_2S formed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Isolated from living halibut obtained at 30 to 50 fathoms, Pacific Ocean. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species as occurring in the slime and feces of cod (*Gadus callarias*), halibut (*Hippoglossus hippoglossus*) and skate (*Raja erinacea*).

Habitat: Skin and feces of fishes.

13. **Flavobacterium harrisonii** Bergey et al. (Variety No. 6, Harrison, Rev. gén. du Lait, *5*, 1905, 129; *Bacillus lactis harrisonii* Conn, Esten and Stocking, Ann. Rept. Storrs Agr. Exp. Sta., 1906, 169; Bergey et al., Manual, 1st ed., 1923, 104.) Named for Prof. F. C. Harrison, the Canadian bacteriologist who first isolated this species.

Rods: 0.25 to 0.75 by 0.3 to 3.5 microns, occurring singly and occasionally in short chains. Motile, possessing peritrichous flagella. Gram-negative.

Gelatin colonies: Small, gray, glistening, lobular, citron-yellow, slimy.

Gelatin stab: Villous growth in stab. Slow crateriform to napiform liquefaction.

Agar slant: Luxuriant, viscous, spreading, becoming dirty, to brownish citron-yellow.

Broth: Turbid, with viscid ring and gelatinous sediment, sweetish odor, alkaline.

Litmus milk: Colorless to gray and slimy, becoming yellow, alkaline.

Potato: Luxuriant, yellow, spreading, slimy.

Indole not formed.

Glucose, lactose, maltose and sucrose broth turn alkaline with a disagreeable odor. Reaction of glycerol broth remains neutral.

Aerobic, facultative.

Optimum temperature 25°C.

Source: Slimy milk.

Habitat: Unknown.

14. **Flavobacterium invisibile** (Vaughan) Bergey et al. (*Bacillus invisibilis* Vaughan, American Jour. Med. Sci., *104*, 1892, 191; *Bacterium invisibilis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 77; Bergey et al., Manual, 1st ed., 1923, 109.) From Latin *invisibilis*, not visibile.

Rods: 0.6 to 0.7 by 1.2 to 2.0 microns, occurring singly. Motile, possessing peritrichous flagella. Gram-negative.

Gelatin colonies: Pale yellow, burr-like, with irregular margin.

Gelatin stab: Scanty growth on surface. Good growth in stab. No liquefaction.

Agar colonies: White, convex, smooth, serrate.

Agar slant: Limited, thick, white streak.

Broth: Turbid.

Litmus milk: Unchanged.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 35°C.

Habitat: Water.

15. **Flavobacterium lactis** Bergey et al. (*Bacillus aromaticus lactis* Grimm, Cent. f. Bakt., II Abt., *8*, 1902, 584; *Bacillus aromaticus* Grimm, *ibid.*, 589; not *Bacillus aromaticus* Pammel, Bull. 21, Iowa Agr. Exp. Sta., 1893, 792; Bergey et al., Manual, 1st ed., 1923, 108.) From Latin *lac*, milk.

Rods: 0.7 to 1.0 by 3.5 to 4.0 microns, occurring singly, in pairs and in chains. Motile, possessing peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, light yellow, slimy. Concentrically ringed, undulate.

Gelatin stab: Slimy surface growth. No liquefaction.

Agar slant: Slimy, yellowish, smooth, moist.

Broth: Turbid, with abundant sediment.

Litmus milk: Slightly acid.

Potato: Thick, slimy, brownish, with yellowish margin.

Indole not formed.

Nitrites not produced from nitrates.

Cultures have pleasant odor.

Aerobic, facultative.

Optimum temperature 25°C.

Source: Isolated from milk.

Habitat: Unknown.

16. **Flavobacterium sewanense** (Kalantarian and Petrossian) Bergey et al. (*Bacterium sewanense* Kalantarian and Petrossian, Cent. f. Bakt., II Abt., *85*, 1932, 431; Bergey et al., Manual, 4th ed., 1934, 160.) From M. L., Sevan, a lake in Armenia.

Straight or curved rods: 1.0 to 2.0 by 4.0 to 5.0 microns on Molisch's agar; on meat extract agar and potato agar they are short or even coccoid. Ends rounded, occurring singly or in pairs. Non-motile. Gram reaction not given. Presumably negative.

Gelatin stab: Slow liquefaction.

Agar colonies: Circular, raised, glistening, dirty white. Deep colonies yellow and lens-shaped.

Agar slant: Abundant, dirty yellow, glistening, raised.

Broth: Turbid with characteristic growth forms. Pellicle formed in old cultures.

Milk: Unchanged.

Potato: Yellow, raised, glistening, with darkening of the medium.

No visible gas produced from carbohydrates.

Crystals of calcium carbonate form in old cultures on $CaCl_2$ and Molisch's agar.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Isolated from pellicle formed on surface of fish infusions in Lake Sevan and tap waters containing 1 per cent $CaCl_2$.

Habitat: Sea water. Thought to produce deposits of $CaCO_3$ in Lake Sevan, S. S. R. Armenia.

17. **Flavobacterium arborescens** (Frankland and Frankland) Bergey et al. (*Bacillus arborescens* Frankland and Frankland, Ztschr. f. Hyg., *6*, 1889, 379; also see Tils, Ztschr. f. Hyg., *9*, 1890, 312; Zimmermann, Bakt. unserer Trink- u. Nutzwässer, *2*, 1894, 20; and Wright, Mem. Nat. Acad. Sci., *7*, 1894, 446, var. a and b; *Bacterium arborescens* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 106; Migula, Syst. d. Bakt., *2*, 1900, 468 uses *Bacillus arborescens* in the text by mistake as *Bacterium* is used for other species in the genus and *Bacterium arborescens* is used in the index, p. 1058; not *Bacillus arborescens* Chester, Man. Determ. Bact., 1901, 249; *Erythrobacillus arborescens* Holland, Jour. Bact., *5*, 1920, 217; Bergey et al., Manual, 1st ed., 1923, 113.) From Latin *arborescens*, becoming a tree or tree-like.

Rods: 0.5 by 2.5 microns, occurring singly and in chains. Non-motile (Franklands). Gram-negative (Zimmermann).

Gelatin colonies: Radiate branching filaments. Center yellowish, border translucent.

Gelatin stab: Liquefied with yellow deposit.

Agar slant: Dirty orange growth.

Broth: Turbid, with orange sediment. No pellicle.

Litmus milk: Slow coagulation; litmus reduced. Reaction unchanged (Wright).

Potato: Deep orange, luxuriant growth.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 30°C.

May belong to *Corynebacterium* (Lehmann and Neumann, Bakt. Diag., 7 Aufl. *2*, 1927, 709).

Source: From river and lake water.

Habitat: Water.

17a. *Bacillus arborescens* Chester. (*Bacillus arborescens non-liquefaciens* Ravenel, Mem. Nat. Acad. Sci., *8*, 1896,

39; *Bacterium arborescens non-liquefaciens* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 103; not *Bacterium arborescens non-liquefaciens* von Rigler, Hyg. Rund., *12*, 1902, 479; Chester, Man. Determ. Bact., 1901, 249.) Regarded by author as a non-liquefying strain of *Bacillus arborescens* Frankland and Frankland. Not a yellow chromogen. From soil.

18. **Flavobacterium lutescens** (Migula) Bergey et al. (Der gelbe Bacillus, Lustig, Diagnostik der Bakterien des Wassers, 1893, 78; *Bacterium lutescens* Migula, Syst. d. Bakt., *2*, 1900, 476; Bergey et al., Manual, 1st ed., 1923, 114.) From Latin *lutum*, yellow; *lutescens*, becoming yellowish.

Rods: 0.5 by 0.95 micron, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin colonies: Circular, yellow, lobate.

Gelatin stab: Slow liquefaction.

Agar slant: Pale yellow, becoming golden yellow.

Broth: Turbid.

Litmus milk: Alkaline.

Potato: Luxuriant, golden-yellow growth.

Indole not formed.

Nitrites produced from nitrates.

Aerobic, facultative.

Optimum temperature 30° to 35°C.

Source: From water. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species as occurring in the slime of the cod (*Gadus callarias*).

Habitat: Fresh and salt water.

19. **Flavobacterium fucatum** Harrison. (Canadian Jour. of Research, *1*, 1929, 232.) From Latin *fucatus*, painted, colored.

Rods: 0.8 to 1.0 by 2.5 to 3.5 microns, slightly bent, with rounded ends. Granular with diphtheroid forms at 37°C. Non-motile. Gram-negative.

Gelatin colonies: Circular, yellow, entire, paler at edges.

Gelatin stab: Crateriform liquefaction.

Agar colonies: Circular, buff-yellow, smooth, shiny, convex to pulvinate, granular, entire.

Agar slant: Moderate, light buff-yellow, spreading, shiny, smooth.

Ammonium phosphate agar: Good growth in 6 days.

Broth: Turbid, becoming clear, pellicle and yellow sediment.

Litmus milk: Alkaline. Peptonized. Clear serum. Yellow sediment.

Potato: Abundant, pale buff-yellow, smooth, spreading, becoming orange-yellow.

Indole not formed.

Nitrites produced from nitrates.

Traces of ammonia formed.

No acid from glucose, lactose or sucrose.

Loeffler's blood serum not liquefied. Light buff-yellow growth becoming ochraceus salmon.

No H_2S formed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Repeatedly isolated from living halibut obtained at 30 to 50 fathoms, Pacific Ocean. Also isolated by Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) from cod (*Gadus callarias*) and dogfish (*Squalus acanthias*).

Habitat: Skin of fishes.

20. **Flavobacterium esteroaromaticum** (Omelianski) Bergey et al. (*Bacterium esteroaromaticum* Omelianski, Jour. Bact., *8*, 1923, 407; Bergey et al., Manual, 3rd ed., 1930, 149.) From M. L., ester and Greek *aromaticus*, aromatic.

Rods: 0.5 by 1.0 to 3.0 microns. Non-motile. Gram reaction not recorded.

Gelatin stab: Crateriform liquefaction with odor of musk melons.

Agar colonies: Circular, yellow-brown, with fimbriate margin and a fruity aroma.

Broth: Turbid, slight sediment. Faint fruity aroma.

Litmus milk: Peptonized. Cheesy odor.

Potato: Abundant growth. Disagreeable odor.

Loeffler's blood serum: Liquefied.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia formed.

Hydrogen sulfide formed.

Fat hydrolyzed.

Methylene blue reduced.

No acid from carbohydrates.

Aerobic, facultative.

Optimum temperature 30°C.

Source: Accidental contaminant in rabbit brain containing rabies virus.

Habitat: Presumably widely distributed.

21. **Flavobacterium balustinum** Harrison. (Canadian Jour. Research, *1*, 1929, 234.)

Rods: 0.6 by 2.0 to 4.0 microns, forming short chains. Non-motile. Gram-negative.

Gelatin colonies: Circular, bright yellow center, entire.

Gelatin stab: Liquefied.

Agar colonies: Punctiform, cadmium-yellow, convex, shiny, transparent.

Agar slant: Egg yolk-yellow, semi-transparent streak, smooth, shiny, becoming brownish-yellow.

Ammonium phosphate agar: Slight yellow growth.

Broth: Turbid, with yellow sediment.

Litmus milk: Slightly acid with yellow sediment.

Potato: Scant, yellow growth.

Indole not formed.

Nitrites (trace) produced from nitrates. Ammonia not formed.

Faint acidity from glucose. No action on lactose or sucrose.

Loeffler's blood serum not liquefied. Egg yolk-like growth.

No H_2S formed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Isolated from living halibut obtained at 30 to 50 fathoms, Pacific Ocean.

Habitat: Skin of fishes.

22. **Flavobacterium dormitator** (Wright) Bergey et al. (*Bacillus dormitator* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 442; *Bacterium dormitator* Chester, Ann. Rept. Del. Agr. Exp. Sta., *9*, 1897, 109; Bergey et al., Manual, 1st ed., 1923, 115.) From Latin *dormitator*, one who sleeps.

Description completed from Harrison (Canadian Jour. Res., *1*, 1929, 233) whose cultures differed in some particulars from Wright's.

Rods with conical ends, occurring singly, in pairs and in chains. Non-motile. Gram-negative (Harrison).

Gelatin colonies: Small, yellow, slightly granular, liquefying.

Gelatin stab: Infundibuliform liquefaction, yellow sediment.

Agar slant: Yellow, glistening, translucent.

Ammonium phosphate agar: Slight yellow growth.

Broth: Turbid, with slight pellicle and yellow sediment.

Litmus milk: Slightly acid; litmus reduced. Harrison reports no reduction.

Potato: Slight, transparent, yellow growth.

Indole not formed (Harrison).

Nitrite (trace) produced from nitrates (Harrison).

Acid from glucose, sucrose, glycerol and mannitol. No acid from lactose, raffinose, and inulin (Harrison).

Aerobic, facultative.

Optimum temperature 30°C.

Source: Originally isolated from fresh water at Philadelphia. Later isolated by Harrison (*loc. cit.*) from skin of halibut taken in Pacific ocean off Canada. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this

species as occurring in the slime of a haddock (*Melanogrammus aeglefinus*).

Habitat: Fresh and salt water.

23. **Flavobacterium ferrugineum** Sickles and Shaw. (Jour. Bact., *28*, 1934, 421.) From Latin *ferrugineus*, resembling rust.

Small, slender rods: Less than 0.5 by 0.7 to 1.0 micron, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin: Liquefaction in one week at 37°C; at room temperature liquefaction slower, napiform; yellow sediment along line of puncture.

Blood agar colonies: Dull, rust-colored, 1 mm in diameter, round, entire, umbilicate, rather dry.

Agar colonies: Similar to blood agar colonies but yellowish-gray in color.

Blood agar slants: Moderate growth, rust-colored, rather dry.

Agar slants: Growth very slight, thin, yellowish-gray.

Beef-infusion broth: No growth.

Beef extract broth: Moderate even turbidity. Adding type-specific carbohydrate results in a heavier growth with yellow sediment.

Potato: Moderate growth, bright orange in color. Potato darkened.

Very active hydrolysis of starch.

Acid but no gas from glucose, lactose, sucrose, maltose, dextrin and inulin; very slight action on mannitol; no action on salicin.

Limits of growth: Optimum pH 7.0 to 7.5. Minimum 6.5. Maximum 9.0.

Temperature relations: Optimum 35° to 37°C. Minimum 22°C. Maximum 39°C. Thermal death point 52°C for 10 minutes. Enzyme produced by strain against pneumococcus carbohydrate withstands 56°C for 10 minutes.

Facultative aerobe.

Distinctive character: Decomposes the non-type-specific carbohydrate obtained from a degraded type I pneumococcus.

Source: Several strains isolated from swamps and other uncultivated soils.

Habitat: Soil.

24. **Flavobacterium proteus** Shimwell and Grimes. (Bacterium Y, Shimwell and Grimes, Jour. Inst. Brewing, *42*, N.S. *23*, 1936, 119; Shimwell and Grimes, *ibid.*, 348.) From Latin *Proteus*, a sea god who often changed in form.

Rods: 0.8 to 1.2 by 1.5 to 4.0 microns, occurring singly or in chains, and having rounded ends. Highly pleomorphic. Thickened filaments and spindle-shaped swellings common. Probably non-motile. Gram-negative.

Wort-gelatin plate: Surface colonies irregular, up to 1 mm in diameter, grayish-white or yellowish, flat or slightly raised, margin entire to lobate or crenate. Deep colonies circular, small, yellowish.

Wort-gelatin streak: Scanty, filiform or beaded, slightly raised, at first almost transparent, later more opaque and whitish-buff.

Wort-gelatin stab: Scanty, filiform or beaded, almost colorless. No liquefaction.

Wort-agar plate: Colonies small, pale, buff-colored, resembling bread-crumbs in shape.

Wort-agar streak: Similar to wort-gelatin streak. Sometimes a slight metallic sheen on old cultures.

Broth: Turbid in 24 hours at 30°C, with a slight surface scum.

Litmus milk: Unchanged.

Potato: A slight, barely visible growth consisting of a narrow filiform dirty yellow line.

Indole not produced.

Nitrites are produced from nitrates.

Acetymethylcarbinol not produced.

Starch not hydrolyzed.

Small amount of acid and gas from glucose and maltose. Trace of acid but no gas from sucrose. No acid or gas from lactose.

Acid, gas and ethyl alcohol produced in small quantity from wort together with a pronounced parsnip-like odor.

Optimum pH 5.0. No growth at pH 4.0.

Temperature relations: Optimum 32°C.

Good growth at 18° C. Thermal death point 54° C for five minutes.

Aerobic, facultative.

Distinctive character: Extreme pleomorphism in media of neutral or slightly alkaline reaction.

Source: Isolated from brewers' yeast.

Habitat: The common short rod bacterium of brewers' yeast.

25. **Flavobacterium breve** (Frankland and Frankland) Bergey et al. (Kurzer Canalbacillus, Mori, Ztschr. f. Hyg., *4*, 1888, 53; *Bacillus brevis* G. and P. Frankland, Microorganisms in Water, 1894, 429; not *Bacillus brevis* Migula, Syst. d. Bakt., *2*, 1900, 583; *Bacterium breve* Chester, Man. Determ. Bact., 1901, 172; Bergey et al., Manual, 1st ed., 1923, 116.) From Latin *brevis*, short.

Rods: 0.8 to 1.0 by 2.5 microns, showing polar staining. Non-motile. Gram-negative.

Gelatin colonies: Minute, pale yellow, compact growth in 2 to 3 weeks.

Gelatin stab: Thin, yellowish growth on surface. Beaded growth in stab. No liquefaction.

Agar slant: Yellowish growth in 2 to 3 days.

Broth: Turbid with white sediment.

Blood serum: Growth of light gray color in 2 to 3 days.

Litmus milk: Unchanged.

Potato: No growth.

Aerobic, facultative.

Optimum temperature 35°C.

Habitat: Water.

26. **Flavobacterium solare** (Lehmann and Neumann) Bergey et al. (*Bacterium solare* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 258; Bergey et al., Manual, 1st ed., 1923, 116.) From Latin *solaris*, solar.

Rods: 0.3 to 0.4 by 1.0 micron, occurring singly, in pairs and in chains. Non-motile. Gram-negative.

Gelatin colonies: Circular, yellow, glistening, translucent. Projecting rays.

Gelatin stab: Yellow, arborescent growth in stab. No liquefaction.

Agar slant: Pale yellow, raised, arborescent.

Broth: Clear.

Litmus milk: Unchanged.

Potato: Soft, yellowish-brown streak.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 30°C.

Distinctive character: Resembles *Flavobacterium arborescens* in type of growth.

Source: Würzburg tap water. Gibbons (Contrib. to Canadian Biol. and Fish., *8*, No. 22, 1934, 279) reports this species as occurring in the slime of a skate (*Raja erinacea*) and of a hake (*Urophycis tenuis*).

Habitat: Fresh and salt water.

27. **Flavobacterium flavotenue** Schrire. (Trans. Royal Soc. South Africa, *17*, 1928, 45.) From Latin *flavus*, tawny yellow and *tenuis*, slender. Probably intended to mean, yellow and slender.

Small rods: Non-motile. Gram-negative.

Agar colonies: Small, circular, lemon yellow, raised, entire.

Agar slant: Filiform, lemon yellow.

Broth: Turbid.

Litmus milk: Unchanged.

Potato: Moist, yellow streak.

Indole not formed.

Nitrites are produced from nitrates.

Acid from glucose, galactose and xylose.

Pathogenic to white mice and guinea pigs.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Isolated from a mold-like growth in a frog (*Xenopus laevis*).

Habitat: Unknown.

Appendix: Some of the following species were described before Gram and flagella stains had been perfected.

Hence it is impossible to identify them definitely as belonging in *Flavobacterium*. Comparative study is needed in some cases before other species listed here can be placed in their proper place in the genus.

Flavobacterium acidificum Steinhaus. (Jour. Bact., *42*, 1941, 772.) From the intestine of the grasshopper (*Conocephalus fasciatus* De G.), the Colorado potato beetle (*Leptinotarsa decemlineata* Say), several unidentified lady beetle larvae, and the white cabbage butterfly (*Pieris rapae L.*).

Flavobacterium antenniforme (Ravenel) Bergey et al. (*Bacillus antenniformis* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 25; *Bacterium antenniformis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 91; Bergey et al., Manual, 1st ed., 1923, 104.) From soil. See Manual, 5th ed., 1939, 531 for a description of this organism.

Flavobacterium aurantiacum (Frankland and Frankland) Bergey et al. (*Bacillus aurantiacus* G. and P. Frankland, Zeitschr. f. Hyg., *6*, 1889, 390; *Bacterium aurantiacus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 109; Bergey et al., Manual, 1st ed., 1923, 107; *Chromobacterium aurantiacum* Topley and Wilson, Princ. Bact. and Immun., *1*, 1931, 405.) From water. See Manual, 5th ed., 1939, 533 for a description of this organism.

Flavobacterium aurantinum (Hammer) Bergey et al. (*Bacillus aurantinus* Hammer, Research Bull. No. 20, Iowa Exp. Sta., 1915, 149; Bergey et al., Manual, 1st ed., 1923, 107.) From milk. See Manual, 5th ed., 1939, 541 for a description of this organism.

Flavobacterium aurescens (Ravenel) Bergey et al. (*Bacillus aurescens* Ravenel, Memoirs Nat. Acad. Sci., *8*, 1896, 8; not *Bacillus aurescens* Frankland and Frankland, Philo. Trans. Roy. Soc. London, B, 1878, 271; *Bacterium aurescens* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 105; Bergey et al., Manual, 1st ed., 1923, 102.) From soil. Gibbons (Contrib. Canadian Biol. and Fish., *8*, No. 24, 1934, 307) found this species in fillets of haddock (*Melanogrammus aeglefinus*). See Manual, 4th ed., 1934, 142 for a description of this organism.

Flavobacterium brunneum (Copeland) Bergey et al. (*Bacillus brunneus* Copeland, Rept. Filtration Commission, Pittsburgh, 1899, 348; Bergey et al., Manual, 1st ed., 1923, 112.) From water. See Manual, 5th ed., 1939, 541 for a description of this organism. This may be *Bacillus brunneus* Schroeter, but not *Bacillus brunneus* Eisenberg. The latter forms spores.

Flavobacterium buccalis (Chester) Bergey et al. (Bacillus g, Vignal, Arch. d. phys. norm. et path., Sér. 3, *8*, 1886, 365; *Bacillus buccalis minutus* Sternberg, Manual of Bact., 1893, 643; *Bacterium buccalis minutus* Chester, Ann. Rept. Del. Col. Agr. Expt. Sta., *9*, 1897, 108; *Bacterium vignali* Migula, Syst. d. Bakt., *2*, 1900, 443; *Bacterium bucallis* (sic) Chester, Man. Determ. Bact., 1901, 167; not *Bacterium buccale* Migula, Syst. d. Bakt., *2*, 1900, 445; *Bacillus vignalis* Nepveux, Thèse Fac. Pharm., Paris and Nancy, 1920, 112; Bergey et al., Manual, 1st ed., 1923, 113.) From saliva. See Manual, 5th ed., 1939, 541 for a description of this organism.

Flavobacterium butyri Bergey et al. (*Bacillus aromaticus butyri* Severin, Cent. f. Bakt., II Abt., *11*, 1903, 264; Bergey et al., Manual, 1st ed., 1923, 106.) From sour cream. Produces an agreeable odor. See Manual, 5th ed., 1939, 534 for a description of this organism.

Flavobacterium chlorum Steinhaus. (Jour. Bact., *42*, 1941, 772.) From the intestine of the nine-spotted lady beetle (*Coccinella novemnotata* Habst.).

Flavobacterium denitrificans (Lehmann and Neumann) Bergey et al. (*Bacillus denitrificans I*, Burri and Stutzer, Cent. f. Bakt., II Abt., *1*, 1895, 360; *Bacterium denitrificans I*, Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 77; *Bacterium denitrificans* Lehmann and Neu-

mann, Bakt. Diag., 2 Aufl., *2*, 1899, 273; *Pseudomonas stutzeri* Migula, Syst. d. Bakt., *2*, 1900, 929; *Bacillus denitrificans* Chester, Man. Determ. Bact., 1901, 224; Bergey et al., Manual, 1st ed., 1923, 109; *Chromobacterium denitrificans* Topley and Wilson, Princ. Bact. and Immun., *1*, 1931, 405.) From horse manure. See Manual, 5th ed., 1939, 534 for a description of this organism.

Flavobacterium desidiosum (Wright) Bergey et al. (*Bacillus decidiosus* (sic) Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 443; not *Bacillus desiduosus* McBeth, Soil Sci., *1*, 1916, 450; *Bacterium desidiosus* and *Bacterium decidiosus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 107 and 133; *Flavobacterium deciduosum* Bergey et al., Manual, 1st ed., 1923, 114.) From water. Gibbons (Contrib. Canadian Biol. and Fish., *8*, No. 24, 1934, 308) found this species in fillets of haddock (*Melanogrammus aeglefinus*). See Manual, 5th ed., 1939, 544 for a description of this organism.

Flabobacterium flavescens (Pohl) Bergey et al. (*Bacillus flavescens* Pohl, Cent. f. Bakt., *11*, 1892, 144; Bergey et al., Manual, 1st ed., 1923, 107.) From water. See Manual, 5th ed., 1939, 535 for a description of this organism.

Flavobacterium flavum (Fuhrmann) Bergey et al. (*Bacillus flavus* Fuhrmann, Cent. f. Bakt., II Abt., *19*, 1907, 117; Manual, 1st ed., 1923, 101.) From beer. See Manual, 4th ed., 1934, 141 for a description of this organism.

Flavobacterium gelatinum Sanborn. (Jour. Bact., *19*, 1930, 376.) From sea water.

Flavobacterium halmephilum Elazari-Volcani. (Studies on the microflora of the Dead Sea, Thesis, Hebrew Univ., Jerusalem, 1940, VIII and 85.) From the Dead Sea. A yellow halophilic species.

Flavobacterium halophilum Bergey et al. (Culture No. 30 of Baranik-Pikowsky, Cent. f. Bakt., II Abt., *70*, 1927, 373; Bergey et al., Manual, 3rd ed., 1930, 147.) From sea water. See Manual, 5th ed., 1939, 540 for a description of this organism.

Flavobacterium lacunatum (Wright) Bergey et al. (*Bacillus lacunatus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 435; *Bacterium lacunatus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 110; Bergey et al., Manual, 1st ed., 1923, 117.) From water. See Manual, 5th ed., 1939, 552 for a description of this organism.

Flavobacterium matzoonii (Chester) Bergey et al. (Species No. 46 of Conn, Storrs Agr. Exper. Sta., 7th Ann. Rept. for 1894, 1895, 80; *Bacillus matazooni* (sic) Chester, Man. Determ. Bact., 1901, 236; Bergey et al., Manual, 1st ed., 1923, 107.) From matzoon, a fermented milk from Armenia. See Manual, 5th ed., 1939, 536 for a description of this organism.

Flavobacterium ovale (Wright) Bergey et al. (*Bacillus ovalis* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 435; *Bacterium ovalis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 111; not *Bacterium ovale* Migula, Syst. d. Bakt., *2*, 1900, 458; Bergey et al., Manual, 1st ed., 1923, 117.) From water. See Manual, 5th ed., 1939, 551 for a description of this organism.

Flavobacterium plicatum (Zimmermann) Bergey et al. (*Bacillus plicatus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 54; not *Bacillus plicatus* Frankland and Frankland, Phil. Trans. Roy. Soc. London, *178*, B, 1887, 273; Bergey et al., Manual, 1st ed., 1923, 105.) From water. Gram-negative. Non-motile. See Manual, 5th ed., 1939, 532 for a description of this organism. See p. 684.

Flavobacterium pruneaeum Sanborn. (Jour. Bact., *19*, 1930, 376.) From sea water.

Flavobacterium radiatum (Zimmermann) Bergey et al. (*Bacillus radiatus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 58; *Bacillus radiatus aquatilis* Frankland and Frankland, Microorg. in Water,

London, 1894, 458; Bergey et al., Manual, 1st ed., 1923, 104.) From water. See Manual, 5th ed., 1939, 531 for a description of this organism. Gram-variable. Slight motility of shorter rods.

Flavobacterium schirokikhii (H. Jensen) Bergey et al. (Salpeter zerstörenden Bacillus, Schirokikh, Cent. f. Bakt., II Abt., *2*, 1896, 205; *Bacterium schirokikhi* H. Jensen, *ibid.*, *4*, 1898, 409; *Bacillus denitrificans* Chester, Man. Determ. Bact., 1901, 274; Bergey et al., Manual, 1st ed., 1923, 100). From horse manure. See Manual, 5th ed., 1939, 527 for a description of this organism.

Flavobacterium stolanatum (Adametz and Wichmann) Bergey et al. (*Bacillus stolonatus* Adametz and Wichmann, Mitt. Oest. Versuchsstat. f. Brauerei u. Mälz., Wien, Heft 1, 1888, 884; *Bacterium stolonatus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 76; Bergey et al., Manual, 1st ed., 1923, 106.) See Manual, 5th ed., 1939, 535 for a description of this organism. From water.

Flavobacterium tremelloides (Tils) Bergey et al. (*Bacillus tremelloides* Tils, Ztschr. f. Hyg., *9*, 1890, 292; *Bacterium tremelloides* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 105; Bergey et al., Manual, 1st ed., 1923, 105.) From river water at Freiburg. Forms a yellow, slimy milk. See Manual, 5th ed., 1939, 532 for a description of this organism.

Flavobacterium (Halobacterium) marismortui Elazari-Volcani. (Studies on the Microflora of the Dead Sea, Thesis, Hebrew Univ., Jerusalem, 1940, V and 48.) From the Dead Sea. This species and *Flavobacterium (Halobacterium) halobium* and *Flavobacterium (Halobacterium) trapanicum* are placed in a new subgenus of *Flavobacterium* named *Halobacterium*. All produce red pigment. The flagellation of these species was not determined. They may be polar flagellate, see *Pseudomonas salinaria* and *P. cutirubra*.

Flavobacterium (Halobacterium) halobium (Petter) Elazari-Volcani. (Microbe du rouge de morue, Le Dantec, Compt. rend. Soc. Biol., Paris, *58*, 1902, 136; *Bacillus halobius ruber* Klebahn, Mitteil. a. d. Inst. f. allg. Bot. Hamburg, *4*, 1919, 47; *Bacterium halobium* Petter, Over rood en andere bacterien van gesouten visch, Diss., Utrecht, 1932; Elazari-Volcani, Studies on the Microflora of the Dead Sea, Thesis, Hebrew Univ., Jerusalem, 1940, V and 59.) From reddened salted codfish.

Flavobacterium (Halobacterium) trapanicum (Petter) Elazari-Volcani. (*Bacterium trapanicum* Petter, Over rood en andere bacterien van gezouten visch, Diss., Utrecht, 1932; Elazari-Volcani, Studies on the Microflora of the Dead Sea, Thesis, Hebrew Univ. Jerusalem, 1940, V and 59.) From the Dead Sea.

FAMILY X. ENTEROBACTERIACEAE RAHN.

(Cent. f. Bakt., II Abt., *96*, 1937, 280.)

Gram-negative straight rods. Motile with peritrichous flagella, or non-motile. Grow well on artificial media. All species attack glucose forming acid, or acid and visible gas (H_2 present). Characteristically nitrites are produced from nitrates (exceptions in *Erwinia* only). Antigenic composition is best described as a mosaic which results in serological interrelationships among the several genera, even extending to other families. Many animal parasites, and some plant parasites causing blights and soft rots. Frequently occur as saprophytes causing decomposition of plant materials containing carbohydrates.

NOTE: Early attempts to develop a satisfactory basis for the recognition of species among the coliform-dysentery-typhoid group of bacteria are reviewed by Winslow, Kligler and Rothberg (Jour. Bact., *4*, 1919, 429). These were largely based on differences in motility, production of indole, ability to liquefy gelatin, and, more particularly, differences in the ability to ferment carbohydrates, especially such compounds as glucose, lactose, sucrose, dulcitol and salicin. The more recent attempts to express differences in species of coliform bacteria by means of the IMViC reaction are reviewed by Parr (Amer. Jour. Public Health, *26*, 1936, 39; Bact. Rev., *3*, 1939, 1), this cryptic symbol indicating the indole test, methyl red acid determination, acetylmethylcarbinol production (Voges-Proskauer reaction) and the utilization of salts of citric acid. Stuart, Griffin and Baker (Jour. Bact., *36*, 1938, 391) and Griffin and Stuart (Jour. Bact., *40*, 1940, 83) have applied these tests plus cellobiose fermentation to a study of a long series of cultures.

Capsulated types of coliform bacteria are still placed in this edition of the MANUAL in a separate genus, *Klebsiella*, although there is some question about the separation of these from the species in *Escherichia* and *Aerobacter*.

Meanwhile, the Kauffmann and White Antigenic Schema has been successfully applied to the recognition of serological groups and types among salmonellas and related organisms. The groupings recognized are outlined in the Salmonella Subcommittee Reports submitted to the 2nd and 3rd Congresses of Microbiology (Jour. Hyg., *34*, 1934, 333 and Proc. 3rd Internat. Cong. for Microbiology, 1940, 832). The successful use of antigenic structure in this field has stimulated a study of the use of H and O antigens as a means of classifying the coliform group (Stuart, Baker, Zimmerman, Brown and Stone, Jour. Bact., *40*, 1940, 101) but this method of classifying the species of coliform bacteria has not proved particularly helpful as yet.

During this same period there has been an increasing appreciation of the closeness of the relationship between certain common chromogenic bacteria (*Serratia*) and the coliform bacteria (Breed and Breed, Cent. f. Bakt., II Abt., *71*, 1927, 435). Moreover, the close relationship between bacteria producing soft rots of living vegetable and other plant tissue (now included in *Erwinia*) and the coliform bacteria has become more evident in recent studies (Waldee, Iowa State Coll. Jour. Sci., *19*, 1945, 435). Many intermediate types are found in rotting vegetable materials, these rotting types having the ability to attack protopectin (Burkey, Iowa State Coll. Jour Sci., *3*, 1928, 57) but not to cause soft rots of living plant tissue.

Borman, Stuart and Wheeler (Jour. Bact., *48*, 1944, 351) have proposed a rearrangement of the species in the family *Enterobacteriaceae* which combines many forms that have previously been regarded as separate species, or even as belonging in separate genera. Only the future can determine which of all of these views best expresses the relationships of the bacteria belonging in the Family *Enterobacteriaceae*.—The Editors.

Key to the tribes of family **Enterobacteriaceae.**

I. Ferment lactose with the formation of acid and visible gas within 24 hours at 37°C or within 48 hours at 25° to 30°C. Some transitional forms produce acid and gas from lactose slowly.

Tribe I. *Escherichеae,* p. 444.

II. Plant parasites. Ferment lactose with formation of acid, or acid and visible gas. Usually attack middle lamellar substance in plant tissues, causing soft rots.

Tribe II. *Erwineae,* p. 463.

III. Ordinarily chromogenic producing a pink, red or orange-red pigment. Occasionally non-pigmented. Ferment glucose and lactose with formation of acid, or acid and visible gas.

Tribe III. *Serrateae,* p. 479.

IV. Lactose not fermented within 30 days either at 37°C or at 25° to 30°C. Urea decomposed within 48 hours.

Tribe IV. *Proteae,* p. 486.

V. Lactose rarely fermented within 30 days either at 37°C or at 25° to 30°C. Urea not decomposed within 48 hours.

Tribe V. *Salmonelleae,* p. 492.

TRIBE I. ESCHERICHEAE BERGEY, BREED AND MURRAY.

(Preprint, Manual, 5th ed., October, 1938, vi.)

Ferment glucose and lactose with the formation of acid and visible gas within 24 hours at 37°C, or within 48 hours at 25° to 30°C. Some forms produce acid and gas from lactose slowly (occasionally not at all). Do not liquefy gelatin except slowly in *Aerobacter cloacae.*

Key to the genera of tribe **Escherichеae.***

I. Acetylmethylcarbinol not produced. Methyl red test positive. Salts of citric acid may or may not be used as a sole source of carbon.

Genus I. *Escherichia,* p. 444.

II. Acetylmethylcarbinol produced. Methyl red test negative. Salts of citric acid used as sole source of carbon.

Genus II. *Aerobacter,* p. 453.

III. Acetylmethylcarbinol may or may not be produced. Methyl red test variable. Salts of citric acid may or may not be used as sole source of carbon. Gas not as abundant as in previous genera. Capsulated forms from respiratory, intestinal and genito-urinary regions.

Genus III. *Klebsiella,* p. 457.

Genus I. **Escherichia** *Castellani and Chalmers*†.

(Castellani and Chalmers, Manual Trop. Med., 3rd ed., 1919, 941; *Colibacterium* Orla-Jensen, Jour. Bact., *6*, 1921, 272; *Colobactrum* (in part) Borman, Stuart and

---

* Levine (Jour. Bact., *1*, 1916, 153) was the first to show the inverse correlation between the methyl red and Voges-Proskauer tests and used these characters for the primary separation of the *Escherichia coli* section and the *Aerobacter aerogenes* section (Amer. Jour. Public Health, 7, 1917, 784).

† Completely revised by Prof. M. W. Yale, New York State Experiment Station, Geneva, New York, Nov., 1938; further revision, July, 1943.

Wheeler, Jour. Bact., *48*, 1944, 357.) Named for Theodor Escherich, who first isolated the type species.

Short rods fermenting glucose and lactose with acid and gas production. Acetylmethylcarbinol is not produced. Methyl red test positive. Carbon dioxide and hydrogen produced in approximately equal volumes from glucose. Generally not able to utilize uric acid as a sole source of nitrogen. Found in feces and is occasionally pathogenic to man (colitis, cystitis, etc.). It is, however, also widely distributed in nature.

The type species is *Escherichia coli* (Migula) Castellani and Chalmers.

Key to the species of genus **Escherichia.**

I. Citric acid and salts of citric acid not utilized as sole source of carbon.
  A. Hydrogen sulfide not produced.
    1. *Escherichia coli.*

II. Citric acid and salts of citric acid utilized as sole source of carbon.
  A. Hydrogen sulfide produced.
    2. *Escherichia freundii.*
  B. Hydrogen sulfide not produced.
    3. *Escherichia intermedium.*

1. **Escherichia coli** (Migula) Castellani and Chalmers. (*Bacterium coli commune* Escherich, Die Darmbakterien des Neugeborenen und Säuglings, 1885; *Bacillus escherichii* Trevisan, I generi e le specie delle Batteriacee, 1889, 15; *Bacillus coli communis* Sternberg, Manual of Bacteriology, 1893, 439; *Bacillus coli* Migula, in Engler and Prantl, Natürlichen Pflanzenfam., *1*, 1a, 1895, 27; *Bacterium coli* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 224; *Bacillus coli verus* Durham, Jour. Exp. Med., *5*, 1900, 371; *Bacillus coli communis verus* Durham, *ibid.*, 353; *Aerobacter coli* Beijerinck, Cent. f. Bakt., II Abt., *6*, 1900, 193; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 941; *Bacillus coli-communis* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 483; *Bacterium coli-communis* Holland, Jour. Bact., *5*, 1920, 217; *Colobactrum coli* Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 358.) From Latin *colon*, the large intestine.

NOTE: Weldin (Iowa State Jour. Sci., *1*, 1927, 121) considers the following identical with the above: *Bacillus cavicida* Flügge, Die Mikroorganismen, 1886, 268 or more probably Brieger, Berlin. klin. Wochnschr., 1884, No. 14; Bacillus C, Booker, Trans. Ninth Internat. Med. Congress, *3*, 1887, 598; *Bacillus schafferi* von Freudenreich, Landw. Jahrb. d. Schweiz, *4*, 1890, 17; *Bacterium cavicida* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 130; *Bacterium schafferi* Chester, *ibid.*, 74; *Bacillus mustelae septicus* Matzuschita, Bakt. Diag., 1902; *Bacillus communis* Jackson, Jour. Inf. Dis., *8*, 1911, 241; not *Bacillus communis* Migula, Syst. d. Bakt., *2*, 1900, 725; *Escherichia cavicida* Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 942; *Escherichia schaefferi* Bergey et al., Manual, 1st ed., 1923, 196.

Oesterle (Cent. f. Bakt., I Abt., Orig., *134*, 1935, 115) has described a yellow strain *Bacterium coli flavum*, Parr (Proc. Soc. Exp. Biol. and Med., *35*, 1937, 563) a golden-brown strain *Bacterium aurescens* (not *Bacterium aurescens* Migula, Syst. d. Bakt., *2*, 1900, 466), and Tittsler (Jour. Bact., *33*, 1937, 450) reddish-orange strains which are regarded as pigmented variants of *Escherichia coli.*

Rods: Usually 0.5 by 1.0 to 3.0 microns, varying from almost coccoid forms to long rods, occurring singly, in pairs and short chains. Motile or non-motile. Motile

strains have peritrichous flagella. Not usually capsulated. Non-spore-forming. Gram-negative.

Gelatin colonies: Opaque, moist, grayish-white, entire.

Gelatin stab: Grayish-white, spreading, undulate. No liquefaction.

Agar colonies: Usually white, sometimes yellowish-white, rarely yellow, yellow-brown, golden-brown, reddish-orange or red; entire to undulate, moist, homogeneous. Atypical forms occur frequently.

Agar slant: Usually white, sometimes yellowish-white, rarely yellow, yellow-brown, golden-brown, reddish-orange or red growth; moist, glistening, spreading.

Broth: Turbid, with heavy grayish sediment. No pellicle.

Litmus milk: Rapid acid formation with development of gas, usually coagulation, curd may or may not be broken up, no peptonization of the curd. Litmus may or may not be reduced.

Potato: Abundant, grayish to yellowish-brown, spreading.

Indole usually formed.

Nitrites produced from nitrates.

Blood agar plates: Different strains vary widely in their action, some being hemolytic (Buchgraber and Hilkó, Cent. f. Bakt., I Abt., Orig., *133*, 1935, 449).

Heat resistance: Usually destroyed in 30 minutes at 60°C, but certain heat-resistant strains may withstand this exposure (Ayers and Johnson, Jour. Agr. Res., *3*, 1914, 401; Stark and Patterson, Jour. Dairy Sci., *19*, 1936, 495).

Antigenic structure: An antigenically heterogeneous species.

Methyl red test positive (Clark and Lubs, Jour. Inf. Dis., *17*, 1915, 160); Voges-Proskauer test negative (Durham, Jour. Exp. Med., *5*, 1901, 373); inverse correlation between methyl red and Voges-Proskauer tests (Levine, Jour. Bact., *1*, 1916, 153).

Citric acid and salts of citric acid not utilized as sole source of carbon (Koser, Jour. Bact., *8*, 1923, 493).

Uric acid not utilized as sole source of nitrogen (Koser, Jour. Inf. Dis., *23*, 1918, 377); uracil utilized as sole source of nitrogen (Mitchell and Levine, Jour. Bact., *35*, 1938, 19).

Gas ratio: Approximately equal volumes of carbon dioxide and hydrogen, ratio 1:1, produced from glucose (Harden and Walpole, Proc. Roy. Soc., Ser. B, *77*, 1905, 399; Rogers, Clark and Davis, Jour. Inf. Dis., *14*, 1914, 411).

Catalase produced.

No H_2S produced in peptone iron agar (Levine, Epstein and Vaughn, Amer. Jour. Public Health, *24*, 1934, 505; Tittsler and Sandholzer, Amer. Jour. Public Health, *27*, 1937, 1240). More sensitive indicators give positive tests for H_2S (Hunter and Weiss, Jour. Bact., *35*, 1938, 20).

Trimethyleneglycol not produced from glycerol by anaerobic fermentation (Braak, Onderzoekingen over Vergisting van Glycerine, Thesis, Delft, 1928, 166; Werkman and Gillen, Jour. Bact., *23*, 1932, 167).

Acid and gas from glucose, fructose, galactose, lactose, maltose, arabinose, xylose, rhamnose and mannitol. Sucrose, raffinose, salicin, esculin, dulcitol and glycerol may or may not be fermented. Variable fermentation of sucrose and salicin (Sherman and Wing, Jour. Bact., *33*, 1937, 315; Tregoning and Poe, Jour. Bact., *34*, 1937, 473). Inulin, pectin and adonitol rarely fermented. Dextrin, starch, glycogen and inositol not fermented. Cellobiose (Jones and Wise, Jour. Bact., *11*, 1926, 359) and α-methylglucoside (Koser and Saunders, Jour. Bact., *24*, 1932, 267) not fermented. Certain strains produce variants which ferment lactose slowly or not at all (Rennebaum, Jour. Bact., *30*, 1935, 625). Some strains of slow-lactose-fermenters appear to be intermediate between the coliform and paratyphoid groups (Sandiford, Jour. Path. and Bact., *41*, 1935, 77). See Twort (Proc. Royal Soc. London, *79*, 1907, 329) for utilization of unusual glucosides; Dozois et al. (Jour. Bact., *30*, 1935, 189 and *32*, 1936, 499)

for utilization of certain sugar alcohols and their anhydrides; Poe and Klemme (Jour. Biol. Chem., *109*, 1935, 43) for utilization of rare sugars. See Winslow, Kligler and Rothberg (Jour. Bact., *4*, 1919, 429) for review of literature relative to classification.

Fecal odor produced.

Aerobic, facultative.

Growth requirements: Good growth on ordinary laboratory media. Optimum growth temperature 30° to 37°C. Growth takes place at 10°C and at 45°C. Gas produced from glucose at 45° to 46°C. Eijkmann test positive (Eijkmann, Cent. f. Bakt., I Abt., Orig., *37*, 1904, 74; Perry and Hajna, Jour. Bact., *26*, 1933, 419).

Source: From feces of infants.

Habitat: Normal inhabitant of the intestine of man and all vertebrates. Widely distributed in nature. Frequently causes infections of the genito-urinary tract. Invades the circulation in agonal stages of diseases.

1a. *Escherichia coli* var. *acidilactici* (Topley and Wilson) Yale.

Dis., *8*, 1911, 241; possibly *Bacillus lacticus* Macé, Traité pratique de bact., 1913, 452; not *Bacillus lacticus* Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 356; *Bacterium duodenale* Ford, Studies from Victoria Hospital, Montreal, *1*, 1903, 17 (according to Perkins, Jour. Inf. Dis., *37*, 1925, 247); *Encapsulatus acidi lactici* Castellani and Chalmers, Manual of Trop. Med., 1919, 934; *Bacillus lactici-acidi* Holland, Jour. Bact., *5*, 1920, 218; *Bacterium acidi-lactici* Holland, *ibid.*; (*Encapsulata*) *Bacillus duodenale* Perkins, Jour. Inf. Dis., *37*, 1925, 247; *Escherichia acidi-lactici* Bergey et al., Manual, 1st ed., 1923, 199; *Bacterium coli* var. *acidi lactici* Topley and Wilson, Princip. Bact. and Immun., *1*, 1931, 446; Yale, in Manual, 5th ed., 1939, 393.)

Identification: Includes strains of *Escherichia coli* which do not attack either sucrose or salicin. It is generally thought that Hueppe's cultures were contaminated with a spore-former.

Source: From milk.

1b. *Escherichia coli* var. *neapolitana* (Topley and Wilson) Yale. (Neapeler Bacterien, Emmerich, Deut. med. Wehnschr., *10*, 1884, 299; *Bacillus neapolitanus* Flügge, Die Mikroorganismen, 1886, 270; *Bacterium neapolitanus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 138; *Escherichia neapolitana* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 942; *Bacterium coli* var. *neapolitanum* Topley and Wilson, Princip. Bact. and Immun., *1*, 1931, 446; Yale, in Manual, 5th ed., 1939, 393.)

Identification: Includes strains of *Escherichia coli* which ferment sucrose and salicin.

Source: From cholera patients or cadavers, originally thought to be the cause of cholera.

1c. *Escherichia coli* var. *communior* (Topley and Wilson) Yale. (*Bacillus coli communior* Durham, Jour. Exp. Med., *5*, 1900, 353; *Bacillus communior* Ford, Studies from Victoria Hosp., Montreal, *1*, 1903, 17; *Bacterium communior* Jackson, Jour. Inf. Dis., *8*, 1911, 241; *Bacillus coli-communior* Holland, Jour. Bact., *5*, 1920, 217; *Bacterium coli-communior*

Holland, *idem*; *Escherichia communior* Bergey et al., Manual, 1st ed., 1923, 200; *Bacterium coli* var. *communior* Topley and Wilson, Princip. Bact. and Immun., *1*, 1931, 446; Yale, in Manual, 5th ed., 1939, 393.)

Yale (Cornell Vet., *23*, 1933, 306) regards *Bacterium astheniae* Dawson (15th Ann. Rpt., Bur. Anim. Ind., U.S.D.A., 1898, 329; *Bacillus astheniae* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 487; *Escherichia astheniae* Bergey et al., Manual, 1st ed., 1923, 205) as a synonym of *Escherichia communior*.

Identification: Includes strains of *Escherichia coli* which ferment sucrose but not salicin. Levine (Iowa Eng. Exp. Sta. Bul. 62, 1921, 38) recognizes a strain which ferments salicin.

2. **Escherichia freundii** (Braak) Yale. (*Bacterium freundii* Braak, Onderzoekingen over vergisting van glycerine. Thesis, Delft, 1928, 140; *Citrobacter freundii* Werkman and Gillen, Jour. Bact., *23*, 1932, 176; Yale, in Manual, 5th ed., 1939, 394; *Colobactrum freundii* Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 358.) Named for A. Freund, who first observed that trimethyleneglycol was a product of fermentation (1881).

Minkewitsch (Ztschr. f. Hyg., *111*, 1930, 180) proposed the name *Bacterium coli citrovorum* for the intermediates but this name is not acceptable since it is a trinomial.

Werkman and Gillen (Jour. Bact., *23*, 1932, 177) emended the description of *Bacterium freundii*, and created the genus *Citrobacter*. The following species renamed by Werkman and Gillen are regarded as identical with *Escherichia freundii*: *Citrobacter album*, *Citrobacter decolorans*, *Citrobacter diversum* and *Citrobacter anindolicum*.

Tittsler and Sandholzer (Jour. Bact., *29*, 1935, 349) and Carpenter and Fulton (Amer. Jour. Pub. Health, *27*, 1937, 822) suggest that the intermediates which give a positive methyl red and a negative Voges-Proskauer test be allocated to the genus *Escherichia*. Other strains are apparently more nearly related to the genus *Aerobacter* than to the genus *Escherichia* since they produce acetylmethylcarbinol. Barritt (Jour. Path. and Bact., *42*, 1936, 441; *44*, 1937, 679) has shown that some of the intermediates form traces of acetylmethylcarbinol which can be detected by the α-naphthol test, but not by the standard Voges-Proskauer test as described in the Manual of Methods for the Pure Culture Study of Bacteria (Soc. Amer. Bact., 1937, 17).

Rods: Short rods with rounded ends, occurring singly, in pairs and short chains. Motile or non-motile. Gram-negative.

Gelatin stab: Liquefaction by 4 out of 15 cultures (Werkman and Gillen, Jour. Bact., *23*, 1932, 177). No liquefaction by any strains (Tittsler and Sandholzer, Jour. Bact., *29*, 1935, 353; Carpenter and Fulton, Amer. Jour. Pub. Health, *27*, 1937, 822).

Agar slant: Smooth, gray, shining, filiform and butyrous growth.

Litmus milk: Acid in 2 days; coagulation may or may not take place; no peptonization.

Potato: Abundant, yellowish-white growth.

Indole may or may not be formed (Werkman and Gillen, *loc. cit.*; Tittsler and Sandholzer, *loc. cit.*).

Nitrites produced from nitrates.

Methyl red test positive. Voges-Proskauer test negative (Koser, Jour. Bact., *9*, 1924, 59). Some strains give a positive methyl red and a positive Voges-Proskauer test (Parr, Jour. Bact., *36*, 1938, 1).

Citric acid utilized as sole source of carbon; uric acid not utilized as the sole source of nitrogen (Koser, *loc. cit.*; Werkman and Gillen, *loc. cit.*, 167).

Catalase produced.

Hydrogen sulfide produced in proteose peptone, ferric citrate agar (Levine,

Epstein and Vaughn, Amer. Jour. Pub. Health, *24*, 1934, 505; Tittsler and Sandholzer, Amer. Jour. Pub. Health, *27*, 1937, 1240).

Trimethyleneglycol produced from glycerol by anaerobic fermentation (Braak, *loc. cit.*, 146; Werkman and Gillen, *loc. cit.*, 167).

Acid and gas from glucose, fructose, galactose, arabinose, xylose, raffinose, lactose, maltose, mannose, rhamnose, trehalose, glycerol, mannitol and sorbitol. Sucrose, salicin, dulcitol, adonitol and inositol may or may not be fermented. Cellobiose usually fermented while α-methyl-glucoside may or may not be fermented (Tittsler and Sandholzer, *loc. cit.*; Carpenter and Fulton, *loc. cit.*). No acid or gas from amygdalin, dextrin, erythritol, glycogen, inulin or melezitose.

Aerobic, facultative.

Growth requirements: Good growth on ordinary laboratory media. Optimum growth temperature 30° to 37°C. Gas not produced in Eijkman test when carried out at 45° to 46°C (Levine, Epstein and Vaughn, *loc. cit.*). No gas at 44°C (Wilson, Med. Res. Council, London, Special Rept. Ser. 206, 1935, 165).

Habitat: Normally found in soil and water and to a varying degree in the intestinal canal of man and animals. Widely distributed in nature.

3. **Escherichia intermedium** (Werkman and Gillen) Vaughn and Levine. (*Citrobacter intermedium* Werkman and Gillen, Jour. Bact., *23*, 1932, 178; Vaughn and Levine, Jour. Bact., *44*, 1942, 498.)

Citrobacter glycologenes Werkman and Gillen (*loc. cit.*) is also regarded as a synonym of *Escherichia intermedium*. Vaughn and Levine (*loc. cit.*) give a new description of *Escherichia intermedium* based on a study of 27 cultures.

Rods: Short rods with rounded ends. Occurring singly, in pairs and short chains in young nutrient agar or broth cultures. Actively motile with peritrichous flagella or non-motile. Gram-negative.

Gelatin stab: No liquefaction after 60 days at 20°C.

Agar slant: Smooth to wrinkled surface, grayish-white, abundant, raised and butyrous growth.

Nutrient broth: Turbid with slight ring at surface.

Litmus milk: Acid, sometimes coagulation and reduction, no proteolysis.

Potato: Growth abundant, white to ivory color.

Levine's eosine-methylene blue agar: Well-isolated colonies vary from 1 to 4 mm in size. No confluence of neighboring colonies. Colonies are slightly to moderately raised with surfaces varying from flat to convex and usually smooth and glistening but sometimes dull, rough and granular.

By transmitted light two types of colonies have been observed: (1) Colonies having almost the same appearance throughout but with a distinctly lighter center, the color being similar to the medium. (2) Colonies having a dark brownish central area which diffuses out to a lighter margin.

By reflected light three types of colonies have been observed: (1) Dark, button-like, concentrically ringed colonies possessing a strong, greenish-metallic sheen so characteristic for *Escherichia coli*. (2) Colonies with dark, purplish, wine-colored centers surrounded by a light pink zone. Some colonies are concentrically ringed. (3) Pink colonies with no suggestion of sheen but sometimes concentrically ringed.

Indole may or may not be formed.

Nitrites produced from nitrates.

Fermentation of glucose: The end products characteristic for the genus *Escherichia* are formed. Carbon dioxide and hydrogen gases are formed in approximately equimolar proportions (gas ratio 1:1) besides significant quantities of ethyl alcohol, and acetic, lactic and succinic acids with only traces of formic acid. Acetylmethylcarbinol and 2-3

butylene glycol have not been found (Voges-Proskauer test negative).

Salts of citric acid are utilized as a sole source of carbon.

Catalase produced.

Hydrogen sulfide not detected in proteose peptone ferric-citrate agar.

Acid or acid and gas produced from xylose, arabinose, rhamnose, glucose, fructose, mannose, galactose, lactose, maltose, trehalose and mannitol. No acid or gas from melezitose, amygdalin and erythritol. Sucrose, raffinose, cellobiose, α-methyl-glucoside, adonitol, dulcitol, glycerol, inositol, sorbitol, starch, aesculin, salicin and sodium malonate may or may not be fermented.

Aerobic, facultative.

Temperature requirements: Growth at 10°C and at 45° to 46°C. Optimum growth temperature 30° to 37°C. Gas not produced in Eijkman tests, although some cultures show growth at 45° to 46°C.

Salt tolerance: Most cultures ferment glucose in the presence of sodium chloride in a concentration of 6.0 to 7.0 per cent. A few cultures tolerate 8.0 per cent sodium chloride.

pH range: Optimum about pH 7.0. Growth occurs at pH 5.0 to pH 8.0.

Habitat: Normally found to a varying degree in soil, water and in the intestinal canal of man and animals. Widely distributed in nature.

Appendix: The following described species have been placed in *Escherichia* or may belong here:

Bacillus alcalescens Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 37; also see Jour. Med. Res., *6*, 1901, 211; not *Bacillus alkalescens* Andrews, Lancet, *194*, 1918, 560; *Escherichia alcalescens* Bergey et al., Manual, 1st ed., 1923, 202.) From feces.

Bacillus asiaticus Castellani. (Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 262; not *Bacillus asiaticus* Sakharoff, Ann. Inst. Past., *8*, 1893, 550; *Salmonella asiaticus* Castellani and Chalmers, Manual of Trop. Med., 3rd ed. 1919, 940; *Proteus asiaticus* Bergey et al Manual, 1st ed., 1923, 211; *Bacterium asiaticum* Weldin and Levine, Abst. Bact., *1*, 1923, 13.) From feces. Ferments lactose slowly or not at all.

Bacillus asiaticus mobilis Castellani. (Valérie 21, Boycott, Jour. Hyg., *6*, 1906, 33; Castellani, Ann. di Med., Nav. e Colon., *11*, 1916, 453; *Salmonella asiaticus mobilis* Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 940; *Bacterium valeriei* Weldin and Levine, Abst. Bact., *7*, 1923, 13; *Proteus valeriei* Bergey et al., Manual, 1st ed., 1923, 211.) From feces. A motile variety which Alves (Jour. Path. and Bact., *44*, 1937, 485) found to be identical with *Bacillus asiaticus*.

Bacillus chylogenes Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 62; also see Jour. Med. Res., *6*, 1901, 219.) From feces.

Bacillus coli immobilis Kruse. (Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 339; *Bacterium coli immobilis* Chester, Del. Agr. Exp. Sta., 9th Ann. Rept., 1897, 128; *Enteroides entericus* Castellani, Jour. Hyg., *7*, 1907, 1; *Bacillus schafferi* MacConkey, Jour. Hyg., *9*, 1909, 86; not *Bacillus schafferi* von Freudenreich, Landwirtschl. Jahrb. den Schweiz, *4*, 1890, 17; *Bacillus entericus* Castellani and Chalmers, Manual of Trop. Med., 1st ed., 1910, 990; not *Bacillus entericus* Ford, Studies from Royal Victoria Hosp., Montreal, *1*, (5), 1903, 40; *Escherichia schaefferi* Bergey et al., Manual, 1st ed., 1923, 196; *Bacterium coli* var. *immobilis* Winslow et al., Jour. Bact., *4*, 1919, 486; *Bacterium schafferi* Weldin and Levine, Abst. Bact., *7*, 1923, 13; not *Bacterium schafferi* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 74; *Escherichia enterica* Weldin, Iowa State Coll. Jour. Sci., *1*, 1927, 134.) From feces. These were all described as non-motile variants of *Escherischia coli* (see Weldin, *loc. cit.*).

Bacillus coli mutabilis Neisser.

(Neisser, Cent. f. Bakt., I Abt., Ref. (Supp.), *38*, 1906, 98; *Bacterium coli mutabile* Massini, Arch. f. Hyg., *61*, 1907, 250; *Escherichia coli mutabilis* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 943; *Escherichia coli-mutabile* Deere et al., Jour. Bact., *31*, 1936, 625.) From feces. An unstable variant closely related to *Escherichia coli* characterized by irregular lactose fermentation. When cultured on lactose indicator agar, it appears not to ferment lactose. After some days, lactose-fermenting papillae appear growing on or out of the original colonies. Subcultures from these secondary colonies give typical lactose fermentation but subculture from the primary colony, avoiding contact with the papillae, gives delayed fermentation of lactose and when again plated will produce non-fermenting colonies on which fermenting papillae later appear.

Bacillus gastricus Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 58; also see Jour. Med. Res., *6*, 1901, 213; *Escherichia gastrica* Bergey et al., Manual, 1st ed., 1923, 203.) From feces.

Bacillus gruenthali Morgan. (Das gruenthaler Bacterium, Fischer, Ztschr. f. Hyg., *39*, 1902, 447; Morgan, Brit. Med. Jour., *1*, 1905, 1257; *Bacillus acidi lactici* var. *gruenthali* Levine, Jour. Bact., *3*, 1918, 270; *Bacterium acidilactici* var. *gruenthali* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 486; *Escherichia gruenthali* Castellani and Chalmers, Manual of Trop. Med., 1919, 942; *Bacterium gruenthali* Weldin and Levine, Abst. Bact., *3*, 1923, 13.) From feces.

Bacillus iliacus Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 61; also see Jour. Med. Res., *6*, 1901, 213; *Escherichia iliacus* Bergey et al., Manual, 1st ed., 1923, 203; *Proteus iliacus* Bergey et al., Manual, 4th ed., 1934, 363.) From feces.

Bacillus infrequens Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 42; also see Jour. Med. Res., *6*, 1901, 219.) From feces.

Bacillus jejunales Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 66; also see Jour. Med. Res., *6*, 1901, 219.) From feces.

Bacillus leporis Migula. (*Bacillus leporis lethalis* Sternberg, Manual of Bacteriology, 1893, 453; *Bacterium leporis lethalis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 97; Migula, Syst. Bakt., *2*, 1900, 651; *Eberthella leporis* Bergey et al., Manual, 1st ed., 1923, 229; *Escherichia leporis* Bergey et al., Manual, 2nd ed., 1925, 221.) From feces.

Bacillus para-gruenthali Castellani. (Castellani, 1914, quoted from Castellani and Chalmers, Ann. Past. Inst., *34*, 1920, 614; *Escherichia paragruenthali* Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 942; *Bacterium coli* var. *paragruenthali* Weldin and Levine, Abst. Bact., *3*, 1923, 13.) From feces. Weldin and Levine (Iowa State Coll. Jour. Sci., *1*, 1926, 132) regard this species as identical with *Bacillus gruenthali* Morgan.

Bacillus plebeius Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 41; also see Jour. Med. Res., *6*, 1901, 213; *Escherichia plebeia* Bergey et al., Manual, 1st ed., 1923, 203.) From feces.

Bacillus subalcalescens Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 37; also see Jour. Med. Res., *6*, 1901, 217.) From feces.

Bacillus subgastricus Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 58; also see Jour. Med. Res., *6*, 1901, 219.) From feces.

Bacillus vekanda Castellani. (Castellani, Jour. Trop. Med. and Hyg., *20*, 1917, 181; *Enteroides vekanda* Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 941; *Bacterium vekanda* Weldin and Levine, Abst. Bact., *7*, 1923, 13; *Escherichia vekanda* Bergey et al., Manual, 1st ed., 1923, 197.) From feces.

Bacillus vesiculiformans Henrici.

(Henrici, Arb. Bakt. Inst. Hochsch. Karlsruhe, *1*, 1894, 25; *Escherichia vesiculiformans* Bergey et al., Manual, 2nd ed., 1925, 222.) From cheese.

Bacterium chymogenes Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 63; also see Jour. Med. Res., *6*, 1901, 219.) From feces.

Bacterium coli alcaligenes Chiari and Löffler. (Cent. f. Bakt., I Abt., Orig., *96*, 1925, 95.) From feces.

Bacterium coli anindolicum Lembke. (Lembke, Arch. f. Hyg., *26*, 1896, 299; *Bacillus anindolicum* Chester, Man. Determ. Bact., 1901, 207; *Escherichia anindolica* Bergey et al., Manual, 3rd ed., 1930, 325.) From feces.

Bacterium coli imperfectum Roelcke. (Cent. f. Bakt., I Abt., Orig., *145*, 1939, 109.) From feces. Lactose not fermented.

Bacterium formicum Omelianski. (Omelianski, Cent. f. Bakt., II Abt., *11*, 1904, 184; *Achromobacter formicum* Bergey et al., Manual, 1st ed., 1923, 144; *Escherichia formica* Bergey et al., Manual, 2nd ed., 1925, 220.) From soil.

Bacterium galactophilum Ford. (Ford, Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 39; also see Jour. Med. Res., *6*, 1901, 217; *Escherichia galactophila* Bergey et al., Manual, 1st ed., 1923, 202.) From feces.

Bacterium succinicum Sakaguchi and Tada. (Cent. f. Bakt., II Abt., *101*, 1940, 341.) From cheese.

Bacterium uromutabile Koch. (Cent. f. Bakt., I Abt., Orig., *133*, 1935, 209.) From genito-urinary infections. A non-lactose-fermenting variety that developed the ability to ferment lactose slowly.

Bacterium vesiculosum Henrici. (Arb. bakt. Inst. Karlsruhe, *1*, Heft 1, 1894, 37; *Bacillus vesiculosus* MacConkey, Jour. Hyg., *9*, 1909, 86; *Escherichia vesiculosa* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 942.) From cheese.

Escherichia alba Schrire. (Trans. Royal Soc. So. Africa, *17*, 1928, 43.) From feces.

Escherichia brasiliensis Mello. (Sao Paulo Medico, Anno 10, *2*, 1937, 11.) From feces.

Escherichia colofoetida (Castellani) Hauduroy et al. (*Bacillus colofoetidus* Castellani, Jour. Trop. Med. and Hyg., 1930, 134; Hauduroy et al., Dict. d. Bact. Path., 1937, 226.) From feces.

Escherichia coloides (Castellani) Castellani and Chalmers. (*Bacillus coloides* var. *A* and *Bacillus coloides* var. *B*, Castellani; Castellani and Chalmers, Manual of Trop. Med., 1919, 942 and 946.) From feces.

Escherichia colotropicalis (Castellani) Castellani and Chalmers. (*Bacillus colotropicalis* Castellani, 1907; see Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 942 and 946.) From feces.

Escherichia ellingeri (Metalnikov and Chorine) Bergey et al. (*Coccobacillus ellingeri* Metalnikov and Chorine, Ann. Inst. Past., *42*, 1928, 1635; Bergey et al., Manual, 3rd ed., 1930, 330.) Causes fatal infection in insects as *Pyrausta nubilalis* Hübn. (European corn borer) and *Galleria mellonella* L. (bee moth). See Manual, 5th ed., 1939, 606 for a description of this species.

Escherichia khartoumensis (Chalmers and Macdonald) Hauduroy et al. (*Bacillus khartoumensis* Chalmers and Macdonald, 1915; see Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 948; *Enteroides khartoumensis* Castellani and Chalmers, *ibid.*, 941; Hauduroy et al., Dict. d. Bact. Path., 1939, 230.) From feces.

Escherichia metacoli (Castellani) Castellani and Chalmers. (*Bacillus metacoli* Castellani, 1915; see Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 942 and 948.) From feces.

Escherichia metacoloides (Castellani) Castellani and Chalmers. (*Bacillus metacoloides* Castellani; see Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 942 and 950.) From feces.

Escherichia paradoxa (Toumanoff) Hauduroy et al. (*Colibacillus paradoxus* Toumanoff, Bull. Soc. Centr. de Méd. Vétér., *80*, 1927, 367; Hauduroy et al., Dict. d. Bact. Path., 1937, 231.) From feces.

Escherichia paraenterica (Castellani) Hauduroy et al. (*Bacillus paraentericus* Castellani, Manual of Trop. Med., 1st ed., 1910, 991; *Enteroides paraenterica* Castellani and Chalmers, *ibid.*, 3rd ed., 1919, 941; Hauduroy et al., Dict. d. Bact. Path., 1937, 231.) From feces.

Escherichia pauloensis Mello. (Ass. Paulista de Medicina, *11*, 1937, 73.) From feces.

Escherichia pseudocoli (Castellani) Castellani and Chalmers. (*Bacillus pseudo-coli* Castellani, Manual of Trop. Med., 1st ed., 1910, 990; Castellani and Chalmers, Manual Trop. Med., 3rd ed., 1919, 942.) From feces.

Escherichia pseudo-coliformis (Castellani) Hauduroy et al. (*Bacillus pseudo-coliformis* Castellani, 1917; see Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 952; Hauduroy et al., Dict. d. Bact. Path., 1937, 233.) From feces.

Escherichia pseudocoloides (Castellani) Castellani and Chalmers. (*Bacillus pseudocoloides* Castellani, 1916; see Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 954; *ibid.*, 942; *Bacterium pseudo-coloides* Weldin and Levine, Abst. Bact., *7*, 1923, 13.) From feces.

Escherichia pseudocoscoroba Castellani and Chalmers. (*Bacillus coscoroba* MacConkey, Jour. Hyg., *6*, 1906, 570; not *Bacillus coscoroba* Trétrop, Ann. Inst. Past., *14*, 1900, 224; *Bacterium coscorobae* Bergey and Deehan, Jour. Med. Res., *19*, 1908, 182; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 942; *Bacillus communior* var. *coscoroba* Winslow, Kligler and Rothberg, Jour. Bact., 4, 1919, 486; *Escherichia coscoroba* Weldin, Iowa State Coll. Jour. Sci., *1*, 1926, 139.) From feces and sewage. This organism described by MacConkey is quite different from the organism described by Trétrop (see *Pasteurella* appendix).

Escherichia pseudodysenteriae Bergey et al. (*Bacterium pseudodysenteriae* Kruse, Deutsche Med. Wchnschr., *27*, 1901, 386; Bergey et al., Manual, 1st ed., 1923, 198.) From feces of normal persons and of dysentery patients.

Genus II. Aerobacter *Beijerinck.**

(Beijerinck, Cent. f. Bakt., II Abt., *6*, 1900, 193; *Aerogenesbacterium* Orla-Jensen, Jour. Bact., *6*, 1921, 272; *Colobactrum* (in part) Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 357.) From Latin, air or gas, and rod.

Short rods, fermenting glucose and lactose with acid and gas production. Methyl red test negative; Voges-Proskauer test positive. Form two or more times as much carbon dioxide as hydrogen from glucose; trimethyleneglycol not produced from glycerol by anaerobic fermentation; citric acid and salts of citric acid utilized as sole source of carbon. Grow readily on ordinary media. Facultative anaerobes. Widely distributed in nature.

The type species is *Aerobacter aerogenes* (Kruse) Beijerinck.

NOTE: Kligler (Jour. Inf. Dis., *15*, 1914, 187) found the fermentation of glycerol to be inversely correlated with gelatin liquefaction and considered the former the more reliable due to occasional loss of gelatin liquefying ability. This was confirmed by Levine (Amer. Jour. Pub. Health, *7*, 1917, 784) who reports that the two characters do not correlate perfectly. Griffin and Stuart (Jour. Bact., *40*, 1940, 93ff.) find a similar correlation of characters but feel that because these characters do not correlate perfectly, it would be better to combine the two species into a single species.

---

* Completely revised by Prof. M. W. Yale, New York State Experiment Station, Geneva, New York, Nov., 1938; further revision, July, 1943.

Key to the species of genus **Aerobacter.**

I. Glycerol fermented with acid and gas.
   A. Gelatin not liquefied (rarely liquefied).
      1. *Aerobacter aerogenes.*

II. Glycerol fermented with no visible gas.
   A. Gelatin liquefied.
      2. *Aerobacter cloacae.*

1. **Aerobacter aerogenes** (Kruse) Beijerinck. (*Bacterium lactis aerogenes* Escherich, Fortschr. d. Med., *3*, 1885, 515; *Bacterium lactis* Baginsky, Ztschr. f. phys. Chem., *12*, 1888, 437; not *Bacterium lactis* Lister, Quart. Jour. Micro. Sci., *13*, 1873, 380; *Bacterium aceticum* Baginsky, *ibid.*; *Bacillus lactantium* Trevisan, I generi e le specie delle Batteriacee, 1889, 15; *Bacillus lactis aerogenes* Sternberg, Manual of Bacteriology, 1893, 447; *Bacillus aerogenes* Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 340; not *Bacillus aerogenes* Miller, Deutsche med. Wchnschr., *12*, 1886, 119; *Bacterium aerogenes* Chester, Del. Agr. Exp. Sta., 9th Ann. Rept., 1897, 53; not *Bacterium aerogenes* Miller, *loc. cit.*; Beijerinck, Arch. néerl. d. sci. exact. et nat., *4*, 1900, 1; *Encapsulatus lactis-aerogenes* Castellani and Chalmers, Manual of Trop. Med., 1919, 934; (*Encapsulata*) *Bacillus aerogenes* Perkins, Jour. Inf. Dis., *37*, 1925, 254; *Colobactrum aerogenes* Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 358.) From Latin, gas-producing.

Rods: 0.5 to 0.8 by 1.0 to 2.0 microns, occurring singly. Frequently capsulated. (A variety showing a transverse arrangement of the capsule has been named *Aerobacter transcapsulatus* by Thompson, Jour. Bact., *28*, 1934, 41.) Usually non-motile. Gram-negative.

Gelatin colonies: Thick, porcelain-white, opaque, moist, smooth, entire.

Gelatin stab: Thick, spreading, white, opaque surface growth. No liquefaction.

Agar colonies: Thick, white, raised, moist, smooth, entire. More convex than colonies of *Escherichia coli* and often mucoid.

Agar slant: Abundant, thick, white, moist, glistening, spreading growth.

Broth: Turbid, with pellicle and abundant sediment.

Litmus milk: Acid with coagulation. No peptonization.

Potato: Thick, yellowish-white to yellowish-brown, spreading with nodular outgrowths over the surface.

Indole may or may not be formed (Ford, Studies from the Royal Victoria Hospital, Montreal, *1*, 1901–1903, 16; Bardsley, Jour. Hyg. (Eng.), *34*, 1934, 38; Wilson, Med. Res. Council, London, Spec. Rept. Ser. 206, 1935, 161).

Nitrites produced from nitrates.

Methyl red test negative (Clark and Lubs, Jour. Inf. Dis., *17*, 1915, 160); Voges-Proskauer test positive (Durham, Jour. Exp. Med., *5*, 1901, 373); inverse correlation between methyl red and Voges-Proskauer tests (Levine, Jour. Bact., *1*, 1916, 153).

Citric acid and salts of citric acid utilized as sole source of carbon (Koser, Jour. Bact., *8*, 1923, 493).

Uric acid utilized as sole source of nitrogen (Koser, Jour. Inf. Dis., *23*, 1918, 377).

Gas ratio: Two or more volumes of carbon dioxide to one of hydrogen formed from glucose (Harden and Walpole, Proc. Roy. Soc. Series B, *77*, 1905, 399; Rogers, Clark and Davis, Jour. Inf. Dis., *14*, 1914, 411).

Catalase produced.

Hydrogen sulfide not produced in peptone iron agar (Levine, Epstein and Vaughn, Amer. Jour. Pub. Health, *24*, 1934, 505; Tittsler and Sandholzer, Amer. Jour. Pub. Health, *27*, 1937, 1240). More sensitive indicators give positive

tests for hydrogen sulfide (Hunter and Weiss, Jour. Bact., *35*, 1938, 20).

Trimethyleneglycol not produced from glycerol by anaerobic fermentation (Braak, Onderzoekingen over Vergisting van Glycerine, Thesis, Delft, 1928, 212; Werkman and Gillen, Jour. Bact., *23*, 1932, 167).

Sodium hippurate hydrolyzed (Hajna and Damon, Amer. Jour. Hyg., *19*, 1934, 545).

Acid and gas from glucose, galactose, lactose, fructose, arabinose, maltose, raffinose, cellobiose, salicin, esculin, starch, dextrin, glycerol, mannitol, sorbitol and inositol, α-methyl-glucoside usually fermented (Koser and Saunders, Jour. Bact., *24*, 1932, 267). Sucrose, inulin, dulcitol and adonitol may or may not be fermented. Protopectin not fermented. Variable fermentation of sucrose and mannitol (Sherman and Wing, Jour. Bact., *33*, 1937, 315).

Aerobic, facultative.

Growth requirements: Good growth on ordinary laboratory media. Optimum growth temperature about 30°C. Grows better at temperatures below 30°C than does *Escherichia coli*. Usually destroyed in 30 minutes at 60°C, but certain heat-resistant strains may withstand this exposure (Ayers and Johnson, Jour. Agr. Res., *3*, 1914, 401; Stark and Patterson, Jour. Dairy Sci., *19*, 1936, 495). Gas not produced in Eijkmann test when carried out at 45° to 46°C (Eijkmann, Cent. f. Bakt., I Abt., Orig., *37*, 1904, 74; Levine, Epstein and Vaughn, Amer. Jour. Pub. Health, *24*, 1934, 505).

Habitat: Normally found on grains and plants and to a varying degree in the intestinal canal of man and animals. Widely distributed in nature.

2. Aerobacter cloacae (Jordan) Bergey et al. (*Bacillus cloacae* Jordan, Rept. Mass. State Bd. of Health, Part II, 1890, 836; *Bacterium cloacae* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 239; *Bacillus lactis cloacae* Conn, Esten and Stocking, Storrs Agr. Exp. Sta., Conn., 18th Ann. Rept. for 1906, 180; *Cloaca cloacae* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 938; Bergey et al., Manual, 1st ed., 1923, 207.) From Latin *cloaca*, sewer.

The following are also regarded as identical with *Aerobacter cloacae: Aerobacter liquefaciens* Grimes and Hennerty, Sci. Proc. Royal Dublin Society, (N. S.) *20*, 1931, 93; not *Aerobacter liquefaciens* Beijerinck, Cent. f. Bakt., II Abt., *6*, 1900, 199 (monotrichous); *Bacillus levans* Wolffin, Arch. f. Hyg., *21*, 1894, 279 and Lehmann, Cent. f. Bakt., *15*, 1894, 350 (*Bacterium levans* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 235; *Cloaca levans* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 938; *Aerobacter levans* Bergey et al., Manual, 1st ed., 1923, 208).

Rods: 0.5 to 1.0 by 1.0 to 2.0 microns, occurring singly. Usually motile possessing peritrichous flagella. Not capsulated. Gram-negative.

Gelatin colonies: Thin, circular, bluish, translucent.

Gelatin stab: Slow liquefaction. Liquefying power sometimes lost (Kligler, Jour. Inf. Dis., *15*, 1914, 199).

Agar colonies: Circular, thick, opaque with white center, entire.

Agar slant: Porcelain-white, smooth, glistening, spreading growth.

Broth: Turbid, with thin pellicle.

Litmus milk: Acid, coagulation, gas, slow peptonization.

Potato: Growth yellowish, moist, glistening.

Indole not formed (Levine, Epstein and Vaughn, *loc. cit.*; Wilson, Med. Res. Council, London, Spec. Rept. Ser. 206, 1935, 161).

Nitrites produced from nitrates.

Methyl red test negative; Voges-Proskauer test positive.

Citric acid and salts of citric acid utilized as sole source of carbon (Koser, Jour. Bact., *8*, 1923, 493).

Uric acid utilized as sole source of

nitrogen (Koser, Jour. Inf. Dis., *23*, 1918, 377).

Gas ratio: Glucose fermented with at least two volumes of carbon dioxide to one of hydrogen (Rogers, Clark and Davis, Jour. Inf. Dis., *14*, 1914, 411).

Catalase produced.

Hydrogen sulfide not produced in peptone iron agar (Levine, Epstein and Vaughn, Amer. Jour. Pub. Health, *24*, 1934, 505).

Sodium hippurate not hydrolyzed (Hajna and Damon, Amer. Jour. Hyg., *19*, 1934, 545).

Acid and gas from glucose, fructose, galactose, arabinose, xylose, lactose, maltose, raffinose, dextrin, salicin, trehalose, mannitol, sorbitol, cellobiose and α-methyl-glucoside. Sucrose usually fermented. Inulin, esculin, starch, dulcitol, rhamnose and protopectin not attacked. Glycerol fermented with no visible gas (Kligler, *loc. cit.*, 187; Levine, Amer. Jour. Pub. Health, *7*, 1917, 784). Starch rarely fermented (Levine, *ibid.*). See Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 429 for review of literature.

Fecal odor produced.

Aerobic, facultative.

Growth requirements: Good growth on ordinary laboratory media. Optimum growth temperature 30° to 37°C. Gas not produced in Eijkmann test when carried out at 45° to 46°C (Levine, Epstein and Vaughn, *loc. cit.*).

Habitat: Found in human and animal feces, sewage, soil and water.

Appendix: The following described species have been placed in *Aerobacter* or may belong here:

Actinobacter polymorphus Duclaux. (Duclaux, Ann. Inst. Nat. Agron., *5*, 1882, 110; *Bacillus actinobacter* Migula, Syst. d. Bakt., *2*, 1900, 689.) Causes swelling of cheese. Possibly this was *Aerobacter cloacae*.

Aerobacter chinense Bergey et al. (*Bacillus capsulatus chinensis* Hamilton, Cent. f. Bakt., II Abt., *4*, 1898, 230; *Bacterium chinense* Migula, Syst. d. Bakt., *2*, 1900, 357; Bergey et al., Manual, 1st ed., 1923, 207.) From India ink.

Aerobacter decolorans Burkey. (Iowa State Coll. Jour. Sci., *3*, 1928, 77.) From rotted potato and hay infusions.

Aerobacter diversum Burkey. (Iowa State Coll. Jour. Sci., *3*, 1928, 77.) From soil.

Aerobacter faeni Burkey. (Iowa State Coll. Jour. Sci., *3*, 1928, 77.) From hay infusions.

Aerobacter hibernicum Grimes and Hennerty. (Sci. Proc. Royal Dublin Society, (N.S.) *20*, 1931, 92.) From butter.

Aerobacter leporis Botta. (Giorn. Batteriol. e Immunol., *23*, 1939, 217.) From liver abscess in a rabbit.

Aerobacter melezitovorum Burkey. (Iowa State Coll. Jour. Sci., *3*, 1928, 77.) From soil.

Aerobacter pectinovorum Burkey. (Iowa State Coll. Jour. Sci., *3*, 1928, 77.) From creek water.

Aerobacter oxytocum (Trevisan) Bergey et al. (*Bacillus oxytocus perniciosus* Flügge, Die Mikroorganismen, 1886, 268; *Bacillus oxytocus* Trevisan, I generi e le specie delle Batteriacee, 1889, 17; *Bacterium oxytocus perniciosus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 139; *Bacterium oxytocum* Migula, Syst. d. Bakt., *2*, 1900, 394; *Escherichia oxytocus* Castellani and Chalmers, Manual of Trop. Med., 3rd ed., 1919, 942; Bergey et al., Manual, 1st ed., 1923, 206.) From old milk.

Aerobacter paraoxytocum Mello. (Jorn. Dos Clinicos, No. 15, 1937.) From a dental abscess.

Bacillus aceris Edson and Carpenter. (Edson and Carpenter, Vermont Agr. Exp. Sta. Bull. 167, 1912, 475; *Achromobacter aceris* Bergey et al., Manual, 4th ed., 1934, 218.) From slimy maple sap. See Manual, 5th ed., 1939, 506 for a description of this organism. Identified by Fabian (Ind. and Eng. Chem., *27*, 1935, 349) as *Aerobacter aerogenes*.

Bacillus aromaticus Pammel. (Pammel, Bull. No. 21, Iowa Agr. Exper. Sta., 1893, 792; Pammel and Pammel, Cent. f. Bakt., II Abt., *2*, 1896, 633; *Bacterium aromaticus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 100; *Flavobacterium aromaticum* Bergey et al., Manual, 1st ed., 1923, 105.) From cabbage. Used as a starter for cheese making. Acid and gas from glucose and sucrose. See Manual, 5th ed., 1939, 533 for a description of this organism.

Bacillus guillebeau a, *b* and *c*, von Freudenreich. (Ann. de Micrographie, *2*, 1890, 353.) From mastitis milk. Culture *a* may well have been *Aerobacter aerogenes*, *b* appears to have been *A. cloacae* while *c* was a mucoid variant (see Sternberg, Man. of Bact., 1893, 725).

Bacillus subcloacae Ford. (Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 60; also see Ford, Jour. Med. Res., *6*, 1901, 213.) From feces.

Bacterium liquefaciens Ford. (Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 59; also see Ford, Jour. Med. Res., *6*, 1901, 215.) From feces. While Ford regards this species as identical with *Bacillus liquefaciens* Eisenberg, neither is adequately described and they differ in important characters. The same holds true for *Bacillus liquefaciens* Fuller and Johnson, Jour. Exp. Med., *4*, 1899, 627.

Bacterium margaritaceum Migula. (Perlschnurbacillus, Maschek, Bakteriol. Untersuch. d. Leitmeritz. Trinkwässer, Leitmeritz, 1887; Migula, Syst. d. Bakt., *2*, 1900, 422 and 1059.) From water. Possibly identical with *Aerobacter aerogenes*.

Bacterium subliquefaciens Ford. (Studies from the Royal Victoria Hosp., Montreal, *1*, (5), 1903, 59; also see Ford, Jour. Med. Res., *6*, 1901, 219.) From feces.

Bacterium zeae Comes. (Bacterial Disease of Corn, Burrill, Ill. Agr. Exp. Sta. Bull. 6, 1889, 164; Comes, Crittogamia Agraria, *1*, 1891, 500; *Bacillus secalis* Ludwig, Lehrbuch der niederen Kryptogamen, 1892, 95; *Bacillus zeae* Russell, Bacteria in their relation to vegetable tissue, Thesis, Johns Hopkins Univ., Baltimore, 1892, 36.) From corn blight. Moore (Agric. Sci., *8*, 1894, 368) identified a culture received from Burrill as *Bacillus cloacae* Jordan.

Burkey (Iowa State College Jour. Sci., *3*, 1928, 77) described five species (*Aerobacter indologenes*, *Aerobacter motorium*, *Aerobacter mitificans*, *Aerobacter salicinovorum* and *Aerobacter pseudoproteus*) which are regarded as varieties of *Aerobacter cloacae*.

Genus III. **Klebsiella** *Trevisan.**

(Trevisan, Atti della accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 105; *Calymmatobacterium* Aragão and Vianno, Mem. Inst. Oswaldo Cruz, *4*, 1912, 222; *Encapsulatus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 934.) Named for Edwin Klebs (1834–1913), early German bacteriologist.

Short rods, somewhat plump with rounded ends, mostly occurring singly. Encapsulated in the mucoid phase. Non-motile. Gram-negative. Fermentation reactions are highly variable but usually a number of carbohydrates are fermented. Nitrites are produced from nitrates. Aerobic, growing well on ordinary culture media. Encountered frequently in the respiratory, intestinal and genito-urinary tracts of man, but may be isolated from a variety of animals and materials.

The type species is *Klebsiella pneumoniae* (Schroeter) Trevisan.

---

* Rearranged by Prof. M. W. Yale, New York State Experiment Station, Geneva, New York, Nov., 1938; further revision by Dr. O. B. Chapman, Syracuse Medical College, Syracuse, New York, December, 1945.

1. **Klebsiella pneumoniae** (Schroeter) Trevisan. (Pneumoniecoccus, Friedlaender, Arch. f. Path. Anat., *87*, 1882, 319; *Bacterium pneumonie crouposae* Zopf, Die Spaltpilze, 3 Aufl., 1885, 66; *Klebsiella crouposa* Trevisan, Atti della Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 105; *Hyalococcus pneumoniae* Schroeter, in Cohn, Kryptogamen Flora von Schlesien, *3*(1), 1886, 152; *Bacillus pneumoniae* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 204; Trevisan, Rend. d. R. Istit. Lombardo, Ser. 2, *20*, 1887, 94; *Klebsiella friedlanderi* Trevisan, I generi e le specie delle Batteriacee, 1889, 26; *Bacillus mucosus capsulatus* Paulsen, Mittheil. f. d. Verein Schleswig-Holsteiner Aerzte, *2*, 1893, No. 7; *Bacterium pneumoniae* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 200; *Bacterium pneumonicum* Migula, Syst. d. Bakt., *2*, 1900, 350; *Bacillus friedlanderi* Macé, Traité Pratique de Bact., 4th ed., 1901, 771; *Encapsulatus pneumoniae* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 934; *Coccobacillus friedlanderi* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 20; *Proteus pneumoniae* Weldin, Iowa State Coll. Jour. Sci., *1*, 1926, 149; *Bacterium friedlander* Weldin, *idem; Bacillus mucosus-capsulatus* Mason and Beattie, Arch. of Internal Med., *42*, 1928, 331.) From Greek, of pneumonia.

Rods: 0.3 to 0.5 by 5.0 microns, with rounded ends, often four to five times as long as broad, occurring singly and in pairs. Encapsulated. Non-motile. Gram-negative.

Gelatin colonies: Dirty-white, smooth, opaque, entire, slightly raised.

Gelatin stab: Dirty-white surface growth. Filiform growth in stab. No liquefaction. Gas bubbles.

Agar colonies: White, shiny, convex, smooth, glistening, entire.

Agar slant: Slimy, white, somewhat translucent, raised growth.

Broth: Turbid, with thick ring or film.

Litmus milk: Variable.

Potato: Yellowish, slimy, raised growth. Gas is formed.

Nitrites produced from nitrates.

Indole variable, usually not formed.

Fermentation of carbohydrates highly variable. Acid and gas may be formed from glucose, lactose, sucrose, fructose, galactose, maltose, mannitol and inositol.

Methyl red test variable.

Acetylmethylcarbinol production variable.

Blood agar: Usually no hemolysis.

Utilization of citrate as a sole source of carbon variable.

Aerobic, facultative.

Optimum temperature 37°C.

Common name: Friedländer's pneumobacillus.

Source: Originally isolated from sputum in pneumonia.

Habitat: Associated with infections of the respiratory, intestinal and genitourinary tracts of man. Encountered in infections of animals and may be isolated from a wide variety of sources.

NOTE: The difficulty experienced in distinguishing members of this genus from those of *Escherichia* and *Aerobacter* is recognized. The members of these three genera exist in at least three growth phases, mucoid (capsulated), smooth and rough.

Working with the mucoid phase of *Klebsiella*, Julianelle (Jour. Exp. Med., *44*, 1926, 113, 683, 735; *52*, 1930, 539) described three serological types, A, B and C on the basis of capsular specific polysaccharides. There is evidence that other types exist. The presence of a generic specific somatic antigen pattern has not been definitely accepted.

Appendix: The following organisms may be placed in *Klebsiella*. The evidence for differentiating them into distinct species is so meagre that for the present it may be better to consider them as varieties of *Klebsiella pneumoniae*.

Klebsiella adanti Hauduroy et al.

(Dict. d. Bact. Path., 1937, 260.) From a case of pyelocystitis.

Klebsiella capsulata (Sternberg) Bergey et al. (Kapselbacillus, Pfeiffer, Ztschr. f. Hyg., *6*, 1889, 145; *Bacillus capsulatus* Sternberg, Manual of Bact., 1893, 431; *Bacterium capsulatum* Migula, Syst. d. Bakt., *2*, 1900, 349; *Encapsulatus pfeifferi* Bergey et al., Manual, 1st ed., 1923, 239; Bergey et al., Manual, 2nd ed., 1925, 265.) From purulent exudate from stomach of a guinea pig.

Klebsiella crassa Trevisan. (*Bacillus sputigenus crassus* Kreibohm, Inaug. Diss., Göttingen, 1889; abst. in Cent. f. Bakt., *7*, 1890, 313; *Bacillus crassus sputigenus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 260; Trevisan, I generi e le specie delle Batteriacee, 1889, 25; *Bacterium sputigenes crassus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 88; *Bacterium crassum* Chester, Man. Determ. Bact., 1901, 151.) From sputum.

Klebsiella cuniculi Hauduroy et al. (*Bacillus capsulatus pyaemiae cuniculi* Koppinayi, Ztschr. f. Tiermed., *11*, 1907, 429; Hauduroy et al., Dict. d. Bact. Path., 1937, 262.) From pleuropericarditis in a rabbit.

Klebsiella genitalium (Dimock and Edwards) Hauduroy et al. (*Encapsulatus genitalium* Dimock and Edwards, Jour. Amer. Veter. Assoc., *70*, 1927, 469; Hauduroy et al., Dict. d. Bact. Path., 1937, 264.) From infections in the genito-urinary organs of mares.

Klebsiella granulomatis (Aragão and Vianna) Bergey et al. (*Calymmatobacterium granulomatis* Aragão and Vianna, Mem. do Inst. Oswaldo Cruz, Rio de Janeiro, *4*, 1912, 211; *Encapsulatus inguinalis* Bergey et al., Manual, 1st ed., 1923, 238; Bergey et al., Manual, 2nd ed., 1925, 264.) From granuloma inguinale.

Klebsiella ozaenae (Abel) Bergey et al. (*Bacillus mucosus ozaenae* Abel, Cent. f. Bakt., *13*, 1893, 167; *Bacillus ozaenae* Abel, *ibid.*, 172; not *Bacillus ozaenae* Migula, Syst. d. Bakt., *2*, 1900, 645, 662; ?*Bacillus capsulatus mucosus* Fasching, Sitzgsber. Wien. Akad., III Abt., *100*, 1891 (*Bacterium capsulatus mucosus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 130; *Bacterium faschingii* Migula, Syst. d. Bakt., *2*, 1900, 355; *Bacillus capsulatus-mucosus* Holland, Jour. Bact., *5*, 1920, 217; *Bacterium mucosum capsulatum* Holland, *ibid.*, 221; *Bacterium mucosum-capsulatum* Holland, *ibid.*, 217); *Bacterium ozaenae* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 204; *Bacterium mucosus ozaena* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 138; *Encapsulata ozenae* Bergey et al., Manual, 1st ed., 1923, 240; Bergey et al., Manual, 2nd ed., 1925, 266.) From cases of ozena.

Klebsiella paralytica Cahn, Wallace and Thomas. (Wallace, Lyell, Thomas, Alvin and Cahn, Proc. Soc. Exp. Biol., *29*, 1932, 1908; Cahn, Wallace and Thomas, Science, *76*, 1932, 385; Wallace, Cahn and Thomas, Jour. Inf. Dis., *53*, 1933, 386; *Klebsiella alcis* Hauduroy et al., Dict. d. Bact. Path., 1937, 260.) From intestine of tick (*Dermacentor albipictus*) and thought to be the cause of tick paralysis of moose.

Klebsiella rhinoscleromatis Trevisan. (Rhinoscleromabacillus, v. Frisch, Wien. med. Wchnschr., 1882; Cornil, Progrès Medical, 1883; Trevisan, Rend. d. R. Istit. Lombardo, Ser. 2, *20*, 1887, 95; *Bacterium rhinoscleromatis* Migula, Syst. d. Bakt., *2*, 1900, 352; *Bacterium nasalis* Chester, Man. Determ. Bact., 1901, 134; *Bacillus rhinoscleromatis* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 491.) From cases of rhinoscleroma.

*Appendix I. Tribe Eschericheae: Borman, Wheeler and Stuart (Jour. Bact., *48*, 1944, 361) place coliform-like bacteria that are slow lactose-fermenters in a separate genus *Paracolobactrum* as follows:

Genus A. **Paracolobactrum** *Borman, Stuart and Wheeler.*

(Paracolibacille, Widal and Nobecourt, Semaine Méd., *17*, 1897, 285; Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 361.)

Short rods characterized by consistently delayed fermentation of lactose (occasionally negative). Glucose is fermented with formation of visible gas. Certain forms attack carbohydrates characteristically at 20° to 30°C but not at 37°C. Antigenic relationships to other genera in the family are common, even with respect to major antigens.

The type species is *Paracolobactrum aerogenoides* Borman, Stuart and Wheeler.

Key to the species of genus **Paracolobactrum.**

I. Acetylmethylcarbinol produced.
  1. *Paracolobactrum aerogenoides.*

II. Acetylmethylcarbinol not produced.
  A. Citric acid utilized as a sole source of carbon.
    2. *Paracolobactrum intermedium.*
  B. Citric acid not utilized as a sole source of carbon.
    3. *Paracolobactrum coliforme.*

1. **Paracolobactrum aerogenoides** Borman, Stuart and Wheeler. (Para-aerogenes, Stuart, Wheeler, Rustigian and Zimmerman, Jour. Bact., *45*, 1943, 117; Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 361.) Latinized, resembling *aerogenes.*

Characters as for *Aerobacter aerogenes* and *Aerobacter cloacae* except for consistently delayed fermentation of lactose.

Source: From human gastroenteritis.

Habitat: Surface water, soils, grains, as well as the intestinal tract of animals, including man.

2. **Paracolobactrum intermedium** Borman, Stuart and Wheeler. (Parafreundii, Stuart et al., Jour. Bact., *45*, 1943, 117; Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 361.) From Latin *intermedius*, intermediate.

Characters as for *Escherichia freundii* and *Escherichia intermedium* except for consistently delayed fermentation of lactose.

Source: From human gastroenteritis.

Habitat: Surface water, soil, grains, as well as the intestinal tract of animals, including man.

3. **Paracolobactrum coliforme** Borman, Stuart and Wheeler. (Para-coli, Stuart et al., Jour. Bact., *45*, 1943, 117; Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 361.) Latinized, resembling *coli.*

Characters as for *Escherichia coli* except for consistently delayed fermentation of lactose.

Source: From human gastroenteritis.

Habitat: Surface water, soil, grains, as well as intestinal tract of animals, including man.

NOTE: The following also belong here:

Bacterium paracoli Stutzer and Wsorow. (Non-lactose-fermenting *Bacterium coli*, Gilbert and Lion, Semaine Méd., *13*, 1893, 130; Stutzer and Wsorow, Cent. f. Bakt., II Abt., *71*, 1927, 115.) From intestines of healthy larvae of a moth (*Euxoa segetum*).

Salmonella para-colon (Day) Hauduroy et al. (*Bacillus para-colon* Day; see Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 264; also Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 950; Hauduroy et al., Dict. d. Bact. Path., 1937, 461.)

* Prepared by Dr. E. K. Borman, Bureau of Laboratories, State Department of Health, Hartford, Connecticut, July, 1945.

*Appendix II. Tribe Eschericheae: Gram-negative, peritrichous to non-motile rods similar to organisms placed in *Paracolobactrum*, *Serratia* and *Salmonella* have recently been described as causing diseases of reptiles, birds and mammals. They may be grouped here although they have been placed in several different genera.

1. **Bacterium sauromali** Conti and Crowley. (Jour. Bact., *36*, 1938, 269.) From a generic name of lizards, *Sauromalus*.

Short rods: 0.2 to 0.5 by 1.0 to 2.0 microns, with rounded ends, occurring in groups. Motile with 4 to 6 peritrichous flagella. Gram-negative.

Gelatin: Infundibuliform liquefaction complete in 3 days at 37°C. Black sediment. Medium browned.

Agar slant: Growth abundant, spreading, convex, faint yellowish-green, glistening, smooth, translucent, butyrous. Decided odor. Medium greened.

Nutrient broth: After 1 day at 37°C, moderate turbidity. Ring. Decided odor. Scanty flocculent sediment.

Milk: Alkaline and complete peptonization in ten days.

Indole not formed.

Potato: Growth yellowish-green to olive.

Blood medium: Complete alpha hemolysis in 48 hours.

Peptone medium: Slight fluorescent greenish-yellow pigmentation.

Nitrites produced from nitrates.

Ammonia is produced.

Acid and gas from glucose, sucrose, maltose, galactose, fructose, salicin and mannitol. Acid but not gas from glycerol. No acid from lactose, arabinose, xylose, dextrin, inulin, dulcitol or starch.

Hydrogen sulfide produced.

Catalase positive.

Methyl red test positive.

Pathogenic for animals.

Temperature relations: Optimum 37°C. Minimum 20°C. Maximum 45°C.

Aerobic.

Source: From a tumor-like growth on the chuckawalla (*Sauromalus varius*).

Habitat: Causes tumors in lizards.

2. **Serratia anolium** Duran-Reynals and Clausen. (Jour. Bact., *33*, 1937, 369.) From a generic name of lizards, *Anolis*.

Rods: 0.2 to 0.4 by 1.0 to 2.0 microns, occurring singly, in pairs, in clusters and palisades. Pleomorphic, other forms being 4 to 5 microns in length, curved, occasionally club-like, or 10 to 15 microns long and surrounded by a capsular material, or occasionally small and coccus-like. Motile (Duran-Reynals and Clausen) with 1 to 4 peritrichous flagella (Breed). Non-acid-fast. Gram-negative.

Gelatin stab: Rapid growth. Liquefaction infundibuliform. After 6 to 10 days a thick soft pellicle and blackish sediment is formed.

Agar colonies: After 24 hours at 37°C, isolated colonies are low, convex, margin entire or slightly undulate. Colonies translucent, butyrous, glistening, smooth, 1.0 to 2.5 mm in diameter. While some colonies retain their smooth character, others become larger, striated and wrinkled, showing opaque, radiated folds with irregularly crenated edges and a rougher texture. Penetrating acid smell produced.

Agar slant: After 24 hours at 37°C, abundant, confluent, raised, whitish, butyrous, glistening, with entire or undulate edges.

Broth: Moderate growth with uniform turbidity. A pellicle is formed which disintegrates forming a ring on the walls of the tube. Sediment. Faint fluorescent yellowish coloration.

No visible gas in glucose broth (Breed).

Peptone water: After 6 to 10 days marked turbidity, medium darkened, blackish sediment formed.

Litmus milk: Coagulation and digestion. Partial discoloration of the litmus.

---

* Prepared by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, June, 1946.

Potato: Growth abundant, butyrous, glistening, raised, pinkish.

Indole not formed.

Blood is hemolyzed.

Loeffler's serum: Abundant, glistening growth. Liquefaction.

No H_2S produced.

Ammonia is produced.

Although Duran-Reynals and Clausen report nitrites not produced from nitrates, a retest of their cultures by Breed has shown that nitrites are actively produced from nitrates.

Acid from glucose, fructose, sucrose, mannitol, maltose, galactose and salicin. Dextrin, lactose, inulin, dulcitol, xylose and arabinose slightly attacked or not at all.

Pigment production: Water-soluble pigment produced. Pink coloration best shown on glycerol potato. Reddish coloration best shown in peptone water with 2 per cent glucose, the yellow coloration in glucose broth and the black coloration in the sediment of liquefied gelatin and peptone water. Some non-pigmented strains.

Temperature relations: Grows well at 20°C. Growth more abundant at 37°C. Practically no growth at 10°C. Thermal death point 60°C for 20 minutes.

Aerobic.

Pathogenicity: Pathogenic for amphibians, reptiles and to some extent fish. Lesions are produced in the iguanid lizards (*Anolis equestris* and *Anolis carolinensis*), the gekkonid lizards (*Tarentola mauritanica* and *Hemidactylus brookii*), the garter snake (*Thamnophis butleri*) and the brown snake (*Storeria dekayi*), the musk turtle (*Sternothaerus odoratus*), the toad (*Bufo americanus*), the frog (*Rana pipiens*) and the catfish (*Ameiuras melas*). When the inoculated animal is kept at 37°C, the disease becomes general and usually is fatal. Non-pathogenic for warm-blooded animals (Clausen and Duran-Reynals, Amer. Jour. Path., *13*, 1937, 441).

Source: From tumor-like lesions in Cuban lizards (*Anolis equestris*). Also isolated from iguanid lizards (*Basiliscus vittatus*) from Mexico by Clausen and Duran-Reynals (*loc. cit.*).

Habitat: The cause of a natural, non-fatal, contagious disease of lizards.

3. **Salmonella sp.** (Type Arizona). (*Salmonella sp.*, Dar es salaam Type var. from Arizona, Caldwell and Ryerson, Jour. Inf. Dis., *65*, 1939, 245; *Salmonella arizona* Kauffmann, Acta Path. et Microbiol. Scand., *17*, 1940, or *19*, 1942; Arizona culture, Edwards, Cherry and Bruner, Jour. Inf. Dis., *73*, 1943, 236; *Salmonella arizona* Group, Edwards, Jour. Bact., *49*, 1945, 513.)

Ferments lactose and liquefies gelatin. Antigenic structure: XXXIII: z_4, z_{23}, z_{26}: —.

Source: Isolated by Caldwell and Ryerson (*loc. cit.*) from horned lizards, Gila monsters and chuckawallas. Also pathogenic for guinea pigs and rabbits. Found in snakes by Hinshaw and McNeill (Cornell Vet., *34*, 1944, 248). Also reported by Edwards (*loc. cit.*) from infants.

Habitat: Apparently widely distributed in lizards, snakes, and warm-blooded animals.

TRIBE II. ERWINEAE WINSLOW ET AL.

(Jour. Bact., *5*, 1920, 209.)

Motile rods which normally require organic nitrogen compounds for growth. Produce acid with or without visible gas from a variety of sugars. In some species, the number of carbon compounds attacked is limited and lactose may not be fermented. May or may not liquefy gelatin. May or may not produce nitrites from nitrates. Invade the tissues of living plants and produce dry necrosis, galls, wilts and soft rots. In the latter case, a protopectinase destroys the middle lamellar substance.

There is a single genus.

Genus I. **Erwinia** *Winslow et al.**

(Jour. Bact., *2*, 1917, 560.) Named for Erwin F. Smith, pioneer American plant pathologist.

Characters as for the tribe.

The type species is *Erwinia amylovora* (Burrill) Winslow et al.

Key to the species of genus **Erwinia.**

I. **Pathogens which cause dry necrosis, galls or wilts in plants but not a soft rot (*Erwinia* sensu stricto).
  A. Gas not produced in sugar media.
    1. Gelatin liquefied.
      a. Starch not hydrolyzed.
        b. Nitrites not produced from nitrates.
          1. *Erwinia amylovora.*
        bb. Nitrites produced from nitrates.
          2. *Erwinia milletiae.*
      aa. Starch hydrolyzed.
        b. Nitrites produced from nitrates.
          3. *Erwinia vitivora.*
      aaa. Action on starch not reported.
        b. Nitrites produced from nitrates.
          4. *Erwinia cassavae.*
    2. Gelatin not liquefied.
      a. Starch not hydrolyzed.
        b. Nitrites produced from nitrates.
          5. *Erwinia salicis.*
        bb. Nitrites not produced from nitrates.
          6. *Erwinia tracheiphila.*

---

* Completely revised by Prof. F. D. Chester, New York, N. Y., December, 1938; further revision by Prof. Walter H. Burkholder, Cornell University, Ithaca, New York, May, 1945.

** The genus *Erwinia* as defined here is heterogeneous in nature and is composed of at least two distinct groups. The first group constitutes *Erwinia* proper and does not produce visible gas from sugars. Waldee (Iowa State Coll. Jour. Sci., *19*, 1945, 435) in a paper that appeared as this manuscript was ready for the press has suggested that the species in this first group be placed in a separate family *Erwiniaceae*.

II. †Pathogens which normally cause a soft rot in plants (largely belong in the genus *Pectobacterium* Waldee).
- A. Gas produced in sugar media.
  - 1. Gelatin liquefied.
    - a. Nitrites produced from nitrates.
      - b. Hydrogen sulfide produced.
        - 7. *Erwinia betivora.*
        - 8. *Erwinia carnegieana.*
      - bb. Hydrogen sulfide not produced.
        - 9. *Erwinia atroseptica.*
        - 10. *Erwinia carotovora.*
    - aa. Nitrites not produced from nitrates.
      - 11. *Erwinia erivanensis.*
      - 12. *Erwinia flavida.*
  - 2. Gelatin not liquefied.
    - a. Starch hydrolyzed.
      - 13. *Erwinia dissolvens.*
    - aa. Starch not hydrolyzed.
      - 14. *Erwinia nimipressuralis.*
- B. Gas not produced in sugar media.
  - 1. Gelatin liquefied.
    - a. Nitrites produced from nitrates.
      - b. Starch hydrolyzed.
        - 15. *Erwinia ananas.*
        - 16. *Erwinia cytolytica.*
      - bb. Starch not hydrolyzed.
        - c. Acid from lactose.
          - 17. *Erwinia aroideae.*
          - 18. *Erwinia mangiferae.*
        - cc. No acid from lactose.
          - 19. *Erwinia citrimaculans.*
  - 2. Gelatin not liquefied.
    - 20. *Erwinia rhapontici.*
  - 3. Very slow gelatin liquefaction.
    - a. Nitrites not produced from nitrates.
      - 21. *Erwinia lathyri.*
- C. Gas production not reported.
  - 1. Gelatin liquefied.
    - a. Nitrites produced from nitrates.
      - 22. *Erwinia lilii.*

---

† The second group of species usually causes soft rots, but includes a few not very typical species. Waldee (*loc. cit.*) has proposed that the species that cause typical soft rot be placed in a new genus, *Pectobacterium*, with *Pectobacterium carotovorum* as the type species. The new genus is retained in the family *Enterobacteriaceae*. Waldee would place the atypical species in other genera, *Erwinia dissolvens* for example being placed in the genus *Aerobacter*. As further comparative studies are needed before such changes can be made with confidence, the older arrangement is allowed to stand in this edition of the MANUAL.

1. **Erwinia amylovora** (Burrill) Winslow et al. (*Micrococcus amylovorus* Burrill, Illinois Indust. Univ., 11th Rept., 1882, 142; American Naturalist, *17*, 1883, 319; *Bacillus amylovorus* Trevisan, I generi e le specie delle Batteriacee, 1889, 19; *Bacterium amylovorus* Chester, Del. Col. Agr. Exp. Sta., 9th Ann. Rept., 1897, 127; *Bacterium amylovorum* Chester, Manual Determ. Bact., 1901, 176; Winslow et al., Jour. Bact., *5*, 1920, 209.) From Latin, starch devouring.

Description mainly from Ark, Phytopath., *27*, 1937, 1.

Rods: 0.7 to 1.0 by 0.9 to 1.5 microns, occurring singly, in pairs and sometimes in short chains. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, whitish, amorphous, entire.

Gelatin stab: Slow crateriform liquefaction confined to the upper layer.

Agar colonies: Circular, grayish-white, moist, glistening, irregular margins.

Broth: Turbid, with a thin granular pellicle.

Potato: Growth white, moist, glistening. Medium not softened. No odor. No pigment.

Litmus milk: Coagulated after 3 to 4 days to a pasty condition, with a separation of whey. At first acid, becoming alkaline. Litmus reduced. There is a gradual digestion of the casein.

Blood serum: Growth similar to that on agar. No liquefaction.

Dunham's solution: Rapid growth, but clouding not dense.

Indole not produced.

Nitrites not produced from nitrates.

Most of the strains gave a positive test for ammonia in broth, a few showed only a slight positive test.

Acetylmethylcarbinol produced.

Growth in synthetic media with $(NH_4)_2HPO_4$ as a source of nitrogen and containing different carbohydrates.

Acid without gas from glucose, sucrose, arabinose, mannose, fructose, maltose, cellobiose, raffinose, salicin and amygdalin. Xylose, rhamnose, dulcitol and starch not fermented. Acid production from lactose and galactose variable. Utilizes salts of citric, malic, and hippuric acid. Action on salts of lactic and succinic acids variable. Salts of benzoic, maleic, malonic, oxalic, tartaric and valeric acid are not utilized.

Asparagine fermented with production of alkali. Glycine, valine, isoleucine, glutamic acid, cystine, tyrosine, tryptophane and urea not fermented.

Minimum temperature between 3° and 8°C. Maximum below 37°C.

Optimum pH 6.8. Minimum pH 4.0 to 4.4. Maximum pH 8.8.

Source: From the blossoms, leaves and twigs of the pear and apple.

Habitat: Attacks a large number of species in several tribes of the family *Rosaceae* (Elliott, Manual Bact. Plant Pathogens, 1930, 19).

2. **Erwinia milletiae** (Kawkami and Yoshida) Magrou. (*Bacillus milletiae* Kawkami and Yoshida, Bot. Mag., Tokyo, *34*, 1920, 110; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 213.) From *Milletia*, a genus named for A. J. Millett.

Rods: 0.4 to 0.6 by 0.9 to 2.5 microns. Motile with peritrichous flagella. Capsules. Gram-negative.

Gelatin: Liquefaction begins after 8 days.

Agar colonies: Circular, flat, smooth, shiny, opaque, waxy yellow. Margins entire.

Broth: Turbid. Heavy precipitate.

Milk: No coagulation. Clears with alkaline reaction.

Conjac: No liquefaction.

Nitrites produced from nitrates.

Acid but no gas from galactose, fructose, lactose, maltose, sucrose and mannitol. No acid from glycerol.

Starch not hydrolyzed.

Growth in 0.2 per cent but not in 0.3 per cent of the following acids in sucrose

peptone broth: Acetic, citric, oxalic and tartaric.

Aerobic.

Grows well at 32°C. Thermal death point, 53°C for 10 min.

Source: From galls on the Japanese wisteria in various localities in Japan.

Habitat: Causes galls on the Japanese wisteria, *Milletia floribunda*.

3. **Erwinia vitivora** (Baccarini) du Plessis. (*Bacillus vitivorus* Baccarini, Bull. della Soc. Bot. Ital., 1894, 235; du Plessis, Dept. Agr. and Forestry Union of S. Africa, Science Bul. 214, 1940, 58.) From Latin, devouring the vine.

Note: Macchiati (Bol. della Soc. Bot., 1897, 156) uses the name *Bacillus baccarinii* for *Bacillus vitivorus*. The description Macchiati gives is not of *Erwinia vitivora* but is evidently that of a saprophyte occurring with the pathogen. He conducted no inoculation experiments. Migula (System der Bakterien, *2*, 1900, 778) gives *Bacillus vitivorus* Bacc. (Malpighia, *6*, 1892, 229) which is an incorrect citation and *Bacillus baccarinii* Macch. 1897, as synonyms of *Bacillus gummis* Comes 1884. It is impossible to determine what this latter species is. Du Plessis (*loc. cit.*) does not believe *Bacillus gummis* is the same as *Erwinia vitivora*.

Rods: 0.74 (0.44 to 1.10) by 1.46 (0.95 to 2.19) microns. Cells sometimes dumbbell-shaped. Motile with peritrichous flagella. Gram-negative. Capsules present.

Gelatin: Liquefaction.

Agar colonies: First punctiform, irregularly circular or lenticular, ultimately circular, raised to pulvinate, glistening, spreading, light to orange-yellow. Agar becomes brown.

Broth: Turbid in 24 hrs. Whitish to lemon yellow pellicle.

Milk: Litmus reduced. Thread-like to spongy curd formed. Yellow whey about curd. Yellow growth on top of plain milk. Medium acid.

Uschinsky's solution: Slowly becomes turbid. Pellicle. Sediment whitish-yellow.

Nitrites produced from nitrates.

Hydrogen sulfide produced.

Acid produced from glucose, fructose, xylose, lactose, sucrose, mannitol and salicin. No acid from raffinose or inulin.

Starch hydrolyzed.

Facultative anaerobe.

Temperature relations: Optimum 25°C. Maximum 35° to 40°C. Minimum 5° to 10°C.

Optimum pH 6.0. Minimum 4.2.

Source: Du Plessis used 5 isolates from various localities in South Africa.

Habitat: Causes a disease of grape vines in South Africa, Italy and France.

4. **Erwinia cassavae** (Handsford) *comb. nov.* (*Bacterium cassavae* Handsford, Ann. Rept. Dept. Agric. Uganda for 1937, II, 1938, 48.) From cassava, the host plant.

Rods: Motile with a few peritrichous flagella. No capsules. Gram-negative.

Gelatin is slowly liquefied.

Agar colonies: Smooth, lens-shaped, edges entire, translucent and of uniform structure. Yellow.

Broth: Turbid with a ring. A yellow precipitate in old cultures.

Milk becomes alkaline. Not cleared.

Nitrates are rapidly reduced to nitrites.

Methyl red test negative. Acetylmethylcarbinol produced (Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 183).

Acid but no gas from glucose, sucrose, maltose and glycerol, but not from lactose.

Facultative anaerobe.

Source: From necrotic lesions on cassava leaves in Uganda.

Habitat: Pathogenic on cassava, *Manihot sp.*

5. **Erwinia salicis** (Day) Chester. (*Bacterium salicis* Day, Oxford For. Mem., *3*, 1924, 14; *Phytomonas salicis*

Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 408; Chester, in Bergey et al., Manual, 5th ed., 1939, 406.) From Latin *salix*, willow; M. L. generic name, *Salix*.

Description from Dowson, Ann. Appl. Biol., *24*, 1937, 542.

Rods: 0.5 to 0.7 by 0.8 to 2.2 microns, occurring singly or in pairs, rarely in chains, with rounded ends. Motile with 5 to 7 long peritrichous flagella. Gram-negative.

Gelatin stab: Beaded growth. No liquefaction.

Infusion agar: Colonies appear slowly, circular, with slightly uneven margins, pale brown by transmitted light, pale gray by reflected.

Infusion agar slants: Growth thin, nearly transparent.

Broth: Moderate, uniform turbidity. No pellicle.

Litmus milk: No change.

Potato: Bright yellow, later fading to pale brown, spreading, abundant, glistening, slimy growth.

Indole not formed.

Nitrites produced from nitrates (Dowson).

Hydrogen sulfide not produced.

Ammonia not produced.

Acetylmethylcarbinol produced. Methyl red test negative (Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 183).

Acid, but no gas, from glucose, galactose, mannose, xylose, maltose, sucrose, raffinose, glycerol, mannitol and salicin. No growth in arabinose, fructose, rhamnose, inulin or dextrin.

No growth in Cohn's solution.

Starch not hydrolyzed.

Temperature relations: Optimum 29° to 30°C. Minimum 5° to 10°C. Maximum 33° to 37°C. Thermal death point 50° to 52°C.

Aerobic, facultative anaerobic.

Source: From the cricket-bat willow (*Salix caerulea*) and from the white willow (*Salix alba*).

Habitat: Causes a water-mark disease of willow in England.

6. **Erwinia tracheiphila** (Erw. Smith) Holland. (*Bacillus tracheiphilus* Erw. Smith, Cent. f. Bakt., II Abt., *1*, 1895, 364; *Bacterium tracheiphilus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 72; Smith, see Bacteria in Relation to Plant Diseases, *2*, 1911, 286; Holland, Jour. Bact., *5*, 1920, 215.) From Greek, trachea-loving, i.e., live in fibrovascular bundles.

Rods: 0.5 to 0.7 by 1.2 to 2.5 microns, with rounded ends, occurring singly and in pairs, more rarely in fours. Motile with peritrichous flagella. Capsulated. Gram-negative.

Gelatin colonies: Small, circular, grayish-white, smooth, glistening. Show internal striae by transmitted light.

Gelatin stab: Surface growth thin, spreading, grayish-white. Slight filiform growth in depth. No liquefaction.

Agar colonies: Small, circular, grayish-white, smooth, glistening.

Agar slant: Growth gray, smooth, filiform, moist, glistening.

Broth: Slight turbidity. No ring or pellicle.

Potato: Growth white or color of substratum, smooth, moist, glistening. No action on the starch. Does not soften the middle lamella of potato cells.

Litmus milk: Not coagulated. Reaction unchanged. Litmus not reduced. Not peptonized.

Egg albumen: Not digested.

Blood serum: No liquefaction.

Cohn's solution: No growth.

Uschinsky's solution: Weak growth.

Fermi's solution: Weak growth.

Indole not formed in Dunham's solution.

Nitrites not produced from nitrates.

Ammonia production moderate.

Cannot utilize asparagine, ammonium lactate or tartarate as sources of nitrogen.

Acid without gas from glucose, sucrose and fructose; growth in closed arm. Acid from glycerol. No growth in closed arm with lactose, maltose, dextrin, glycerol or mannitol. No acid from lactose.

Starch not hydrolyzed.

Hydrogen sulfide production feeble.

Growth in broth with 1.0 per cent NaCl retarded; inhibited with 2.0 per cent.

Very sensitive to acid (phenolphthalein).

Temperature relations: Optimum 25° to 30°C. Minimum about 8°C. Maximum 34° to 35°C. Thermal death point 43°C for one hour.

Aerobe and facultative anaerobe.

Source: From various curcurbits.

Habitat: Causes the wilt of cucumber, also affects cantaloupes, muskmelons, pumpkins and squashes.

6a. *Bacillus tracheiphilus* var. *cucumis* E. F. Smith. (An Introduction to Bact. Dis. of Plants, 1920, 135.) Smith states that squash is immune to this variety of *Erwinia tracheiphila*.

7. **Erwinia betivora** (Takimoto) Magrou. (*Bacillus betivorus* Takimoto, Ann. Phyt. Soc. Japan, *2*, 1931, 356; Magrou, in Hauduroy et al., Dict. d. Bact. Path., Paris, 1937, 200). From Latin, devouring the beet.

Rod: Short rods, sometimes filaments. Motile with 2 to 6 peritrichous flagella. Gram-negative.

Gelatin: Liquefaction.

Agar colonies: Circular or amoeboid, homogenous, thin, edges smooth and entire.

Broth: Turbid with pellicle.

Milk: Acid, coagulated.

Nitrites produced from nitrates.

Indole produced.

Hydrogen sulfide produced.

Gas from glucose and sucrose.

Facultative anaerobic.

Optimum temperature 35°C. Minimum 12°C. Maximum 45°C. Thermal death point 50°C for 10 min.

Source: From rot of sugar beets in Korea.

Habitat: Pathogenic on roots of beets. Artificial inoculation of carrots, radishes, potato tubers and tomato fruits gave positive results.

8. **Erwinia carnegieana** Lightle, Standring and Brown. (Phytopath., *32*, 1942, 310.) From the genus *Carnegiea*.

Rods: 1.12 to 1.79 by 1.56 to 2.90 microns. Motile with peritrichous flagella. Capsules. Gram-positive (Lightle et al.). Gram-negative; old cultures show Gram-positive granules in cells (Burkholder).

Gelatin: Slow liquefaction.

Agar colonies: Round, slightly raised, smooth, gray-white, wet-shining, margins entire.

Broth: Abundant growth.

Uschinsky's solution: Turbid, slight ring and sediment.

Milk: Litmus pink to reduced. No curdling.

Nitrites are produced from nitrates.

Hydrogen sulfide is formed (Burkholder).

Acid and gas from glucose, galactose, fructose, maltose, sucrose, raffinose, mannitol and salicin. Acid and gas from lactose and xylose and alkali from sodium tartrate (Burkholder).

Starch not hydrolyzed (Burkholder).

No odor.

Aerobic.

Thermal death point 59°C.

Source: From rotting tissue of the giant cactus (*Carnegiea gigantia*).

Habitat: Pathogenic on the giant cactus, but not on carrots.

9. **Erwinia atroseptica** (van Hall) Jennison. (*Bacillus atrosepticus* van Hall, Inaug. Diss., Amsterdam, 1902, 134; Jennison, Ann. Missouri Bot. Gard., *10*, 1923, 43.) From Latin *ater*, black and *septicus*, putrefying.

Synonyms: Morse (Jour. Agr. Res., *8*, 1917, 79) lists the following synonyms: *Bacillus solanisaprus* Harrison, Cent. f. Bakt., II Abt., *17*, 1906, 34 (*Erwinia solanisapra* Holland, Jour. Bact., *5*, 1920, 222) and *Bacillus melanogenes* Pethybridge and Murphy, Roy. Irish Acad. Proc., *29*, B, No. 1, 1911, 31.

Paine (Jour. Agr. Sci., *8*, pt. 4, 1917,

492) agrees and points out that *Bacillus phytophthorus* Appel is very similar to *Bacillus melanogenes* Pethybridge and Murphy.

Jennison (Ann. Missouri Bot. Gard., *10*, 1923, 1) concurs and adds *Bacillus phytophthorus* Appel, Ber. d. Deut. Bot. Gesell., *20*, 1902, 128 (*nomen nudum*) and K. Biol. Anst. f. Land. u. Forst. Arb., *3*, 1903, 364. (This last reference contains Appel's description which is antedated by van Hall's description of the black leg pathogen.)

Stapp (Arb. d. Biol. Reichs. f. Land- u. Forst., *16*, 1928, 702) besides the above species adds *Bacillus carotovorus* Jones but uses the name *Bacillus phytophthorus* and states that the species contains 5 serological groups.

Description from Jennison (*loc. cit.*).

Rods: 0.6 by 1.5 microns. Motile with a few peritrichous flagella. No capsules. Gram-negative.

Gelatin liquefied.

Agar colonies: Small, round to somewhat irregular and whitish. Surface smooth with a glistening luster.

Broth: Turbid after a few days. Ring and sometimes a light pellicle.

Ammonia production feeble to moderate (Jennison). Ammonia production absent (Morse, *loc. cit.*).

Milk coagulated and acid. A slow peptonization. Litmus reduced.

Indole not formed.

Hydrogen sulfide not produced.

Nitrites are produced from nitrates.

Acid and gas from glucose, galactose, sucrose, lactose, maltose and mannitol. No acid and gas from dextrin and glycerol. Volume of gas is small.

Starch not hydrolyzed.

Cohn's solution: No growth.

Uschinsky's solution: Good growth.

Facultative anerobe (Morse, *loc. cit.*).

Optimum temperature 26°C. Maximum 33°C. Minimum below 5°C (Morse).

Slight growth with 3 per cent salt. None with 4 per cent salt.

Source: From stems of potatoes affected with black-leg.

Habitat: Causes a black rot on stem and tuber of potatoes and other vegetables.

NOTE: Smith (Science, *31*, 1910, 748) regarded *Erwinia solanisapra* and *Erwinia phytophthora* as very closely related. Brooks, Nain and Rhodes (Jour. Path. and Bact., *28*, 1925, 203) held that *Erwinia phytophthora*, *Erwinia solanisapra* and *Erwinia carotovora* are distinct serologically, although identical in cultural characteristics. Berridge (Ann. Appl. Biol., *13*, 1926, 12) claimed from serological tests that *Erwinia phytophthora* and *Erwinia solanisapra* are different yet closely related organisms. Lacey (Ann. Appl. Biol., *13*, 1926, 1) from cultural and serological tests considered *Erwinia phytophthora*, *Erwinia solanisapra* and *Erwinia carotovora* distinct species. Stapp (Arb. a. d. Biol. Reichanstalt f. Landw. u. Forstwirtsch., *16*, 1928, 643) from serological tests places *Erwinia phytophthora* in one serological group and *Erwinia carotovora* in another. Leach (Phytopath., *20*, 1930, 743) found that *Erwinia phytophthora* and *Erwinia carotovora* were indistinguishable in cultural and physiological characteristics, the most consistent difference being the inky black coloration of the tissues infected with the former.

Stapp (in Sorauer, Handb. d. Pflanzenk., 5 Aufl., *2*, 1928, 229) states that it is generally believed that the disease caused by *Bacillus solanincola* Delacroix (Compt. rend. Acad. Sci., Paris, *133*, 1901, 417 and 1030) is the same as stem rot of potato (blackleg).

10. **Erwinia carotovora** (Jones) Holland. (*Bacillus carotovorus* Jones, Cent. f. Bakt., II Abt., 7, 1901, 12; Holland, Jour. Bact., *5*, 1920, 222; *Bacterium carotovorum* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 446; *Pectobac-*

terium carotovorum Waldee, Iowa State Coll. Jour. Sci., *19*, 1945, 469.) From Latin, carrot destroying.

Synonyms: Leach (Minnesota Agr. Exp. Sta. Tech. Bull. 76, 1931, 18) lists the following as synonyms:

Bacillus atrosepticus van Hall. (Van Hall, Inaug. Diss., Univ. Amsterdam, 1902, 134; *Erwinia atroseptica* Jennison, Ann. Missouri Bot. Gard., *10*, 1923, 43.)

Bacillus phytophthorus Appel. (Ber. d. deut. Bot. Ges., *20*, 1902, 128; *Erwinia phytophthora* Holland, Jour. Bact., *5*, 1920, 222; *Bacterium phytophthorum* Burgwitz, Phytopath. Bacteria, Leningrad, 1935, 141; *Pectobacterium phytophthorum* Waldee, Iowa State Coll. Jour. Sci., *19*, 1945, 471).

Bacillus solanisaprus Harrison. (Harrison, Cent. f. Bakt., II Abt., *17*, 1907, 34; *Erwinia solanisapra* Holland, Jour. Bact., *5*, 1920, 222.)

Bacillus melanogenes Pethybridge and Murphy. (Roy. Irish Acad., *29*, B, No. 1, 1911, 31.)

Bacillus oleraceae Harrison. (Harrison, Science, *16*, 1902, 152; *Erwinia oleraceae* Holland, Jour. Bact., *5*, 1920, 222.)

Bacillus omnivorus van Hall. (Inaug. Diss., Univ. Amsterdam, 1902, 176.)

Bacillus apivorus Wormald. (Jour. Sci., *6*, 1914, 203.)

Elrod (Bot. Gaz., *103*, 1941, 270) holds that *Erwinia aroideae* is a synonym of *Erwinia carotovora*.

The following also have been considered as possible synonyms of *Erwinia carotovora*:

Bacillus cepivorus Delacroix. (Delacroix, Ann. Inst. Nat. Agron., Sér 2, *5*, 1905, 368; *Bacterium cepivorum* Stapp, in Sorauer, Handb. d. Pflanzenkrankheiten, 5 Aufl., *2*, 1928, 49; *Aplanobacter cepivorus* Elliott, Man. Bact. Plant Path., 1930, 4; *Phytomonas cepivora* Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 344.) Causes a rot of onion bulbs.

Bacillus cypripedii Hori. (Hori, Cent. f. Bakt., II Abt., *31*, 1911, 85; *Erwinia cypripedii* Bergey et al., Manual, 1st ed., 1923, 171.)

Bacillus dahliae Hori and Bokura (Hori and Bokura, Imp. Agr. Expt. Sta. Nishigahara, *38*, 1911, 69; *Erwinia dahliae* Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 205.)

Pseudomonas destructans Potter. (Potter, Proc. Univ. Durham Philos. Soc., 1899, 165 and Proc. Roy. Soc., *67*, 1900, 449; *Bacterium destructans* Nakata, Nakajima and Takimoto, Tech. Rept. Korea Ind. Farm, 1922; *Phytomonas destructans* Bergey et al., Manual, 3rd ed., 1930, 264.) See Paine (Ann. Appl. Biol., *5*, 1918, 64) for a discussion of this species.

Bacillus hyacinthi septicus Heinz. (Heinz, Cent. f. Bakt., *5*, 1889, 539; *Bacillus hyacinthi-septicus* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 449; *Bacterium hyacinthi septicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 127; *Bacillus hyacinthi* Migula, Syst. d. Bakt., *2*, 1900, 874; not *Bacillus hyacinthi* Trevisan, I generi e le specie delle Batteriacee, 1899, 19; *Erwinia hyacinthi septica* Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 208.)

Rods: Usually 0.7 to 0.8 by 1.5 to 5.0 microns, occasionally in chains. Stain rather slowly with aniline colors, well with Löffler's methylene blue. No capsules observed. Actively motile with peritrichous flagella. Gram-negative.

Gelatin stab: Rapid surface liquefaction, slower in depth (Jones). Some strains very slow liquefiers.

Agar colonies: After 2 days, circular, convex, smooth, grayish-white, moist, glistening. Margins sharp, entire.

Agar slant: Growth thin, grayish-white, moist, glistening, butyrous. Medium not discolored.

Broth: Turbid, with pellicle and white flocculent sediment. Slow alkaline production.

Litmus milk: After 4 days, coagulated, acid, with separation of whey. Cheesy odor. Litmus reduced. Slightly peptonized.

Potato: Growth thick, creamy-white; medium softened.

Dunham's solution: Feeble persistent turbidity.

Blood serum: Growth much as on agar. Not liquefied.

Uschinsky's solution: Strong turbidity.

Indole production none.

Nitrites produced from nitrates.

Diastase negative.

No H_2S produced or only a trace.

No ammonia produced.

Methyl red positive, Voges-Proskauer negative (Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 183).

Acid and gas from glucose, lactose, sucrose, fructose, raffinose, mannitol, arabinose, xylose, salicin and rhamnose. Acid without gas from glycerol and ethyl alcohol. Butyl alcohol, inulin and starch not fermented.

Facultative anerobe.

Temperature relations: Optimum 25° to 30°C. Minimum 4°C. Maximum 38° to 39°C. Thermal death point 41° to 51°C.

Pathogenesis: Causes a rapid soft rot of roots, rhizomes, fruits and the fleshy stems of a variety of plants.

Source: From rotted carrots.

Habitat: Causes a soft rot in carrot, cabbage, celery, cucumber, egg-plant, iris, muskmelon, hyacinth, onion, parsnip, pepper, potato, radish, tomato, turnip, and other plants.

11. **Erwinia erivanensis** (Kalantarian) Bergey et al. (*Bacterium erivanense* Kalantarian, Cent. f. Bakt., II Abt., *65*, 1925, 298; *Bacillus erivanensis* Stapp, in Sorauer, Handb. d. Pflanzenkr., 5 Aufl., *2*, 1928, 202; Bergey et al., Manual, 3rd ed., 1930, 239.) Derived from Erivan, a city in Armenia.

Whether this organism is to be considered a chromogenic strain or a distinct species is impossible to determine; therefore, it occupies its present position tentatively. It cannot be separated from *Erwinia carotovora* on the basis of chromogenesis since the latter occasionally shows a tendency to the formation of a faint yellowish pigment.

Rods: 0.5 to 0.7 by 1.25 to 2.5 microns. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: After 3 days at 20°C, circular, 1 to 1.5 mm in diameter, yellowish-white, convex, entire. Microscopically gray with opaque borders and darker patches.

Gelatin stab: Surface growth somewhat umbonate. In 10 to 12 days a slow liquefaction. Intense yellow growth.

Agar colonies: Grayish-white, fatty lustre, turning yellow after several days.

Agar slant: Growth grayish-white, fatty lustre, becoming yellow.

Broth: Strong more or less flocculent turbidity. No surface growth. Little sediment.

Potato: Growth somewhat raised, becoming yellowish.

Milk: Coagulated in 14 days, becoming alkaline, slowly clearing.

Indole is formed.

Nitrites not produced from nitrates.

Acid and gas from glucose, sucrose and mannitol. No gas from lactose and glycerol.

Optimum temperature 20°C.

Source: From cotton plants.

Habitat: Causes a root-rot of cotton (*Gossypium sp.*).

12. **Erwinia flavida** (Fawcett) Magrou. (*Bacillus flavidus* Fawcett, Rev. Indust. y Agrico. de Tucuman, *13*, 1922, 5; Rev. App. Mycology, *2*, 1923, 338; not *Bacillus flavidus* Morse, Jour. Inf. Dis., *11*, 1912, 284; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 207.) From Latin *flavus*, yellow.

Morphology: Motile with peritrichous flagella. Gram-negative.

Gelatin: Yellow growth. Liquefaction.

Milk: Coagulated.

Potato: Yellow growth.

Indole is formed.

Nitrites not produced from nitrates.

Acid and gas from glucose, lactose and sucrose.

Diastase not formed.

Source: From sugar cane.

Habitat: Causes a soft rot of sugar cane (*Saccharum officinarum*).

NOTE: If this decay is due to a simple organism as stated above, it is probable that it should be considered merely a chromogenic strain of *Erwinia carotovora*.

13. **Erwinia dissolvens** (Rosen) *comb. nov.* (*Pseudomonas dissolvens* Rosen, Phytopath., *12*, 1922, 497; *Phytomonas dissolvens* Rosen, Phytopath., *16*, 1926, 264; *Bacterium dissolvens* Rosen, *ibid.*; *Aplanobacter dissolvens* Rosen, *ibid.*; *Aerobacter dissolvens* Waldee, Iowa State Coll. Jour. Sci., *19*, 1945, 473.) From Latin, dissolving.

Rods: 0.5 to 0.9 by 0.7 to 1.2 microns. Pairs, rarely in chains. Capsules present. First described as motile with a single flagellum; later as non-motile. Gram-negative.

Gelatin: Not liquefied.

Agar colonies: Round, margins entire, white, opaque, glistening, butyrous, emitting a strong odor of decaying vegetables.

Broth: Turbid with heavy surface growth consisting of ring, and floccules or compact slimy masses and streamers. Abundant sediment.

Uschinsky's solution: Good growth, but not viscid.

Litmus milk: Acid, coagulated.

Indole produced.

Nitrites produced from nitrates.

Hydrogen sulfide not produced.

Acid and gas from glucose, galactose, mannitol, sucrose, maltose, lactose and glycerol.

Starch hydrolyzed.

Optimum temperature 30°C.

Good growth in 3 per cent salt. Retarded at 4 per cent.

Source: From rotting corn stalks.

Habitat: Pathogenic in corn plants.

14. **Erwinia nimipressuralis** Carter. (Illinois Nat. Hist. Survey Bull. 23, 1945, 423.) From Latin *nimis*, too much and *pressuralis*, pertaining to pressure.

Rods: Mostly 0.34 to 0.68 by 0.68 to 1.35 microns. Motile with as many as 6 peritrichous flagella. Capsules not observed. Gram-negative.

Gelatin: Not liquefied.

Potato glucose agar: Colonies circular, smooth, whitish-cream, entire, flat to slightly raised and usually opaque. Gas produced when medium is stabbed.

Broth: Abundant with thin pellicle or flocculent surface growth. Sediment scant and viscid. Gas produced in nutrient broth plus glucose was 47 per cent CO_2 and 2.4 per cent hydrogen. CO_2 varied with age of culture, more being produced in young cultures.

Milk: Acid, coagulated. Litmus and bromocresol purple are reduced. Not peptonized.

Nitrites produced from nitrates.

Hydrogen sulfide produced.

Indole not produced.

Acid and gas produced from arabinose, rhamnose, xylose, glucose, fructose, galactose, mannose, lactose, maltose, trehalose, melibiose, cellobiose, mannitol, sorbitol and salicin; no acid or gas from inulin, dextrin or filterpaper; variable results from sucrose, raffinose, melezitose, dulcitol, glycerol and elm sawdust. Pectin is not fermented.

Starch not hydrolyzed.

Methyl red test positive. Acetylmethylcarbinol produced.

Facultative anaerobe.

Optimum temperature 24° to 30°C. Maximum 37°C. Minimum 5°C or lower. Thermal death point 45° to 55°C.

Optimum pH for growth 6.8 to 7.5. Maximum 10.0+. Minimum 4.6.

Source: Five cultures from 5 different trees affected with wet wood.

Habitat: Pathogenic in trunk wood of elms, *Ulmus americana*, *U. pumila*, *U. fulva* and *U. procera*.

15. Erwinia ananas Serrano. (Philippine Jour. Sci., *36*, 1928, 271; *Bacillus ananas* Serrano, *ibid.*; *Bacterium ananas* Burgwitz, Phytopathogenic Bacteria, Leningrad, 1935, 44.) Named for the genus, *Ananas*.

NOTE: Not to be confused with *Pseudomonas* (*Phytomonas*) *ananas* Serrano, Philippine Jour. Sci., *36*, 1928, 271.

Short rods: 0.6 by 0.9 micron, with rounded ends, occurring singly, in pairs and in short chains. Encapsulated. Motile with peritrichous flagella. Gram-negative.

Gelatin stab: Stratiform liquefaction, with a deep chrome-yellow sediment.

Potato glucose agar: After 24 hours, circular, 3 mm in diameter, convex, dense, homogeneous, entire, moist, straw-yellow, mottled, becoming primuline yellow. Plates have a molasses odor. Show two types of colonies, rough and smooth. Rough colonies have crenate margins.

Potato glucose agar slant: Growth straw-yellow, raised, becoming primuline yellow, moist, glistening.

Broth: Turbid, with a straw-colored pellicle and ring.

Glucose broth: Growth sulfur yellow.

Litmus milk: Coagulated, faintly acid, becoming alkaline.

Potato: Copious growth, moist, glistening, spreading, becoming primuline yellow.

Indole not formed.

Blood serum: Moderate growth, slightly raised, mustard yellow to primuline yellow. No liquefaction after 3 months.

Cohn's solution: No growth.

Phenol negative.

Diastase produced.

Nitrites produced from nitrates.

Slight amount of ammonia produced.

Slight amount of H_2S produced.

Small amount of alcohol and aldehyde produced.

No gas from carbohydrates. Acid from glucose, lactose, sucrose, mannitol, raffinose, glycerol, salicin, dextrin, maltose, fructose and mannose. No acid from arabinose, xylose, amygdalin, rhamnose, inositol, inulin, dulcitol, adonitol, asparagine or starch.

Source: From the pineapple (*Ananas sativus*) and sugar-cane (*Saccharum officinarum*).

Habitat: Causes a brown rot of the fruitlets of pineapple.

16. Erwinia cytolytica Chester. (Phytopath., *28*, 1938, 431.) From Latin, cell dissolving.

Rods: 0.6 to 0.7 by 2.5 to 3.5 microns. Singly or in pairs. Gram-negative. Motile with peritrichous flagella.

Gelatin: Slow liquefaction.

Agar colonies: 2 to 3 mm in diameter, round, convex, moist, glistening, grayish-white, watery, translucent. Light brownish-yellow by transmitted light.

Broth: Turbid.

Milk: Coagulated in 5 to 7 days. Slightly acid. Not digested.

Nitrites produced from nitrates.

Indole not formed.

Hydrogen sulfide not formed.

Acetylmethylcarbinol: A slight reaction.

Acid without gas from glucose, lactose, sucrose, raffinose, mannitol, salicin and isodulcitol. No acid from fructose, arabinose, xylose, glycerol and inulin.

Starch hydrolyzed.

Pectin dissolved.

Asparagine, peptone, and ammonia used as nitrogen sources in synthetic medium plus glucose. Potassium nitrate not used.

Optimum temperature 28° to 30°C. Growth at 37°C. Slow growth at 20°C and no growth at 8° to 10°C.

Good growth at pH 6.8 to 7.3. Feeble growth at 5.0. No growth at 4.4.

Aerobic and facultative anaerobic.

Source: Several isolates from diseased dahlias in New York Botanical Garden.

Habitat: Causes a rot of the tuber and stems of dahlias.

17. **Erwinia aroideae** (Townsend) Holland. (*Bacillus aroideae* Townsend, U. S. Dept. Agr., Bur. Plant Ind. Bull. 60, 1904, 40; Holland, Jour. Bact., *5*, 1920, 222; *Bacterium aroideae* Stapp, in Sorauer, Handb. d. Pflanzenkr., 5 Aufl., *2*, 1928, 41; *Pectobacterium aroideae* Waldee, Iowa State Coll. Jour. Sci., *19*, 1945, 472.) From Greek, pertaining to the family *Araceae*.

Probable synonyms: *Erwinia croci* (Mizusawa) Magrou. (*Bacillus croci* Mizusawa, Kanag. Agr. Exp. Sta. Bull. 51, 1921, 1; Ann. Phytopath. Soc. Japan, *1*, 1923, 1; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 204.) Attacks *Crocus sativus*, also onion.

Erwinia melonis (Giddings) Holland. (*Bacillus melonis* Giddings, Vermont Agr. Exp. Sta. Bull. 148, 1910, 413; Holland, Jour. Bact., *5*, 1920, 222; *Pectobacterium melonis* Waldee, Iowa State Coll. Jour. Sci., *19*, 1945, 473.) E. F. Smith (An Introduction to Bact. Dis. of Plants, 1920, 240) considered *Erwinia melonis* and *Erwinia aroideae* identical. Causes a soft rot of muskmelon.

Erwinia papaveris (Ayyar) Magrou. (*Bacillus papaveris* Ayyar, Mem. Dept. Agr. India, Bact. Ser. 2, 1927, 29; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 214.) The cause of a soft rot of the garden poppy.

Rods: 0.5 by 2 to 3 microns, with rounded ends, occurring singly, in pairs and in fours, also in chains under certain conditions. Motile with peritrichous flagella. No capsules. Gram-negative.

Gelatin stab: Narrow infundibuliform liquefaction.

Agar colonies: Circular to amoeboid, white, glistening. Borders sharp. Granular structure.

Agar slant: Growth white to grayish-white, moist, glistening. Medium not discolored.

Broth: Turbid.

Potato: Growth whitish, with tinge of yellow. Medium grayed.

Litmus milk: Coagulated, acid, with separation of whey, not peptonized. Litmus reduced.

Indole not formed.

Nitrites produced from nitrates.

Acetylmethylcarbinol produced. Methyl red negative (Dowson, Cent. f. Bakt., II Abt., *100*, 1939, 183).

Acid without gas from glucose, lactose, sucrose, maltose, mannitol, glycerol, fructose, raffinose, arabinose and xylose. Growth in closed arm.

Diastase slight.

Hydrogen sulfide produced.

Uschinsky's solution: Good growth.

No growth in nitrogen. Growth feeble in H_2 and CO_2.

Temperature relations: Optimum 35°C. Minimum 6°C. Maximum 41°C. Thermal death point 50°C for 10 minutes.

Facultative anaerobe.

Differential characters: See *Erwinia carotovora*. Massey (Phytopath., *14*, 1924, 460) considered *Erwinia aroideae* and *Erwinia carotovora* distinct species, though closely related. Link and Taliaferro (Bot. Gazette, *85*, 1928, 198) found them distinct serologically. Dowson (Ann. Appl. Biol., *28*, 1941, 102) differentiated them on their action on maltose and xylose.

Source: From rotted calla lily.

Habitat: Causes a soft rot of calla. Affects raw potato, egg-plant, cauliflower, radish, cucumber, cabbage, parsnip, turnip, salsify, tomato (ripe and green).

18. **Erwinia mangiferae** (Doidge) Bergey et al. (*Bacillus mangiferae* Doidge, Ann. Appl. Biol., *2*, 1915, 1; Bergey et al., Manual, 1st ed., 1923, 173.) Named for the genus, *Mangifera*.

Rods: 0.6 by 1.5 microns, occurring singly and in chains, with rounded ends. Encapsulated. Motile with peritrichous flagella. Gram-negative.

Gelatin stab: Medium liquefied in 10 to 17 days. Growth yellow.

Agar colonies: Glistening, yellowish, undulate borders.

Agar slant: Growth yellow, glistening.

Broth: Turbid, with yellow ring.

Litmus milk: Slow coagulation at 37°C. Slight acidity. Casein slowly dissolved. Litmus reduced.

Potato: Growth spreading, glistening, yellowish. Medium not discolored.

Indole formed in peptone solution. Phenol negative.

Nitrites produced from nitrates.

No H_2S produced.

No ammonia in broth.

Feeble acid production without gas from glucose, lactose, sucrose, fructose and glycerol. No growth in closed arm with lactose and glycerol; more or less growth in closed arm with glucose, sucrose, fructose, maltose, raffinose and mannitol.

Diastase not formed.

Produces an enzyme capable of dissolving the middle lamella but without action on cellulose.

Cohn's solution: Slight turbidity.

Uschinsky's solution: No growth.

Fermis' solution with starch jelly: No growth.

Pigment insoluble in water, alcohol, ether, chloroform or dilute acids.

Temperature relations: Optimum 30°C. Minimum 5° to 6°C. Maximum 45°C. Thermal death point 60°C.

Source: From the mango in Africa.

Habitat: Causes a disease of the mango (*Mangifera indica*).

19. **Erwinia citrimaculans** (Doidge) Magrou. (*Bacillus citrimaculans* Doidge, Ann. Appl. Biol., *3*, 1917, 53; *Bacterium citrimaculans* Burgwitz, Phytopath. Bacteria, Leningrad, 1935, 154; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 203.) From the genus *Citrus* and Latin *maculans*, spotting.

Rods: 0.45 to 0.7 by 0.8 to 3.2 microns. Motile with peritrichous flagella. Conspicuous capsule present. Gram-positive. Dowson thinks this species Gram-negative (Cent. f. Bakt., II Abt., *100*, 1939, 184).

Gelatin: Liquefied.

Agar colonies: Subcircular, yellow, with dense grumose centers.

Broth: Turbid, with pellicle and sediment.

Milk: Coagulated, with precipitation of casein and extrusion of whey. Not peptonized. Litmus gradually reduced.

Blood serum: Not liquefied.

Indole is formed.

Nitrites produced from nitrates with evolution of gas.

Ammonia produced in broth.

Acid without visible gas from glucose, sucrose, fructose, galactose, maltose and mannitol. No acid from lactose, glycerol, dextrin or starch.

Diastase not produced.

Cohn's solution: No growth.

Uschinsky's solution: Growth present.

No growth in broth over chloroform.

Methylene blue and neutral red reduced.

Pigment insoluble in water, alcohol, ether, chloroform, carbon bisulfide, dilute acid or alkalis.

A turbid growth is produced in 10 per cent salt.

Temperature relations: Optimum 35°C. Maximum 43°C. Thermal death point 62°C for 10 minutes.

Facultative anaerobe.

Source: From diseased lemons and oranges.

Habitat: Causes a spot disease of citrus. In nature attacks lemons, oranges, naartjes and has also been successfully inoculated into limes, shaddock, grapefruit and citron. Seville oranges are resistant.

20. **Erwinia rhapontici** (Millard) *comb. nov.* (*Phytomonas rhapontica* Millard, Univ. Leeds and Yorkshire Council for Agr. Ed. Bul. 134, 1924, 111; *Bacterium rhaponticum* Millard, *ibid.*; *Aplanobacter rhaponticum* Elliott, Man. Bact. Plant Path., 1930, 12.) From Greek *Rha pontic*, rhubarb of Pontus, a province of Asia Minor; M. L. *Rheum rhaponticum*.

Description from Metcalfe, Ann. of Appl. Biol., 27, 1940, 502, where he suggests it belongs in *Erwinia*.

Rods: 0.5 to 0.8 by 1.2 to 1.5 microns. Motile with 3 to 7 peritrichous flagella. Gram-negative.

Gelatin stab: Beaded growth. No liquefaction.

Infusion agar: Colonies circular, convex, smooth, glistening, translucent, with margins entire, 2 to 3 mm in diameter in 48 hours at 25°C.

Rhubarb agar: Colonies slightly larger, often with a yellowish tinge.

Tryptophane broth: Turbid with fragile pellicle, a slight rim and slight flocculent deposit.

Milk: Acid in 3 to 4 days with or without slight curd separation. No clotting.

Indole not produced.

Nitrites formed from nitrates.

Acetylmethylcarbinol produced.

No hydrogen sulfide produced.

Cohn's solution: Moderate growth.

Acid but no gas from arabinose, xylose, glucose, galactose, fructose, mannose, lactose, maltose, sucrose, mannitol, glycerol and salicin.

Growth in citrate solution.

Starch not hydrolyzed.

Chromogenesis: Water-soluble pinkish pigment in various media.

Growth from 0°C to 37°C and possibly higher.

Distinctive characters: Differs from *Erwinia aroideae* in that it does not liquify gelatin nor clot milk and is chromogenic. It also has a limited host range.

Source: From rotting rhubarb crowns. Metcalfe used 6 isolates from various sources in describing the pathogen.

Habitat: Causes a crown-rot of rhubarb.

21. **Erwinia lathyri** (Manns and Taubenhaus) Holland. (*Bacillus lathyri* Manns and Taubenhaus, Gardener's Chronicle, *53*, 1913, 215; Manns, Delaware Agr. Exp. Sta., Bul. 108, 1915, 23; Holland, Jour. Bact., *5*, 1920 218; *Bacterium lathyri* Burgwitz, Phytopath. Bacteria, Leningrad, 1935, 76.) From the genus *Lathyrus*.

Rods: After 24 hours at 25° to 28°C, 0.6 to 0.85 by 0.75 to 1.5 microns, with rounded ends. No capsules. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: After 8 days, circular, slightly convex, edges smooth. Liquefaction too slow to show on plate.

Gelatin stab: Growth best at surface. Line of stab filiform. Liquefaction slow, fairly well begun in four weeks, complete in three months.

Agar colonies: After 24 hours, yellow, stellate to amoeboid, smooth, glistening, slightly raised, entire. Centers granular, yellow.

Agar slant: Growth filiform, slightly convex, smooth, glistening, opaque, butyrous, light to deep yellow. Odor absent.

Broth: Strong turbidity in 24 hours, little or no pellicle. Sediment scant.

Litmus milk: Slow increase of acidity, not always sufficient to cause coagulation. Digestion of casein slow and variable.

Potato: Growth rapid, filiform, slightly convex, smooth, glistening, butyrous to slightly viscid. Light to deep yellow. Medium not discolored.

Indole is formed.

Cohn's solution: No growth.

Uschinsky's solution: Rapid growth, sometimes a pellicle. Fluid viscid.

Asparagine solution: Good growth.

Nitrites are not produced from nitrates.

Ammonia produced in broth and asparagine solution.

No gas from carbohydrates. Acid from glucose, lactose, sucrose, mannitol and glycerol. No growth in closed arm.

Diastase not formed or extremely weak.

Growth in broth over chloroform absent.

Growth inhibited by 4 per cent NaCl.

Temperature relations: Optimum 28°

to 30°C. Thermal death point 46° to 48°C for 10 minutes.

Aerobic.

Source: From sweet peas.

Habitat: Stated to be pathogenic for sweet pea (*Lathyrus odoratus*) and other legumes. Considered by many to be a saprophyte.

22. **Erwinia lilii** (Uyeda) Magrou. (*Bacillus lilii* Uyeda, by Bokura, Ann. Phytopath. Soc. Japan, *1* (2), 1919, 36; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 210.) From Latin *lilium*, a name taken from the Greek but derived from the Celtic word *li* meaning white; M. L., generic name, *Lilium*.

Translated by Marion Okimoto.

Rods: 0.6 to 0.7 by 0.8 to 1.0 micron. No capsules. Motile with 6 to 8 peritrichous flagella. Gram-positive(?).

Gelatin: Liquefaction.

Gelatin plate: Colonies after 2 days, round and smooth with grayish surface.

Broth: Alkaline, ammonia produced.

Milk: Curd formation.

Indole produced.

Nitrites produced from nitrates.

Hydrogen sulfide produced.

Sugar medium changes to a brown color.

Conjac not utilized.

Aerobic, facultative.

Optimum temperature 32° to 34°C. Killed in 3 min. at 50°C. Resists—20°C for 30 min.

Source: From brown spots on lily bulbs in Japan.

Habitat: Causes a disease of lily bulbs and leaves.

Appendix: The following additional species are found in the literature. Many are incompletely described.

Bacillus brassicaevorus Delacroix. (Compt. rend. Acad. Sci., Paris, *140*, 1905, 1356.) Presumably causes a rot of cabbage.

Bacillus farnetianus Pavarino. (Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis., Mat. e Nat., *20*, 1911, 233.)

Bacillus putrefaciens putridus Delacroix. (Ann. Inst. Nat. Agron., *5*, 1906, 154.) Pathogenic for tobacco.

Bacillus solaniperda Migula. (Syst. d. Bakt., *2*, 1900, 573; *Bacillus krameri* Chester, Man. Determ. Bact., 1901, 282.) Causes a soft rot of potato.

Bacillus spieckermanni Jaczewski. (Elliott, Bacterial Plant Diseases, 1935, 67.) Name applied to a species described by Spieckermann (Landw. Jahrb., *31*, 1902, 155) but left unnamed.

Bacillus tabacivorus Delacroix. (Ann. Inst. Nat. Agron., *5*, 1906, 266.) Said to cause collar rot of tobacco.

Bacillus tabificans Delacroix. (Compt. rend. Acad. Sci., Paris, *137*, 1903, 871.) Said to cause spotting of tobacco leaves.

Bacterium loehnisi Kalantarian. (Kalantarian, Cent. f. Bakt., II Abt., *65*, 1925, 301; *Phytomonas loehnisii* Bergey et al., Manual, 3rd ed., 1930, 276.) From diseased cotton plants. Peritrichous.

Bacterium lycopersici Burgwitz. (Ztschr. f. Pflanzenkr., *34*, 1924, 304.) From a blossom end rot of tomato.

Erwinia alliariae (Omori) Magrou. (*Bacillus alliariae* Omori, Official Gaz. of Japan, *11*, 1896, No. 3758; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 195.) Causes a root rot of horseradish.

Erwinia araliavora (Uyeda) Magrou. (*Bacillus araliavorus* Uyeda, Bull. Imp. Agr. Exp. Sta. Tokyo, *35*, 1909, 61; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 197.) Causes a root rot of ginseng.

Erwinia asteracearum (Pavarino) Magrou. (*Bacillus asteracearum* Paravino, Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis., Mat. e Nat., Ser. 5, *21*, 1912, 544; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 199.) Pathogenic for the aster (*Aster chinensis*).

Erwinia bussei (Migula) Magrou. (Bacillus B, Busse, Ztschr. f. Pflanzenkr., 7, 1897, 74; *Bacillus bussei* Migula, Syst. d. Bakt., *2*, 1900, 779; *Bacillus betae* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 599; not *Bacillus betae* Migula, Syst. d. Bakt., *2*, 1900, 779; Magrou, in

Hauduroy et al., Dict. d. Bact. Path., 1937, 200.) Pathogenic for the sugar beet.

Erwinia cacticida (Johnston and Hitchcock) Magrou. (*B. cacticidus* Johnston and Hitchcock, Trans. and Proc. Roy. Soc. South Australia, *47*, 1923, 162; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 201.) Causes a rot of cactus.

Erwinia edgeworthiae (Hori and Bokura) Magrou. (*Bacillus edgeworthiae* Hori and Bokura, Ideta Arata, Supplement to Handbook of the Plant Diseases of Japan, *1*, 1925, 32; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 206.) Pathogenic on *Edgeworthia chrysantha*, an oriental shrub.

Erwinia ixiae (Severini) Magrou. (*Bacillus ixiae* Severini, Annali di Botanica, Rome, *11*, 1913, 413; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 208.) Pathogenic on gladiolus and other bulbs.

Erwinia nelliae (Welles) Magrou. (*Bacillus nelliae* Welles, Philippine Jour. Sci., *20*, 1922, 279; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 213.)

Erwinia papayae (Rant) Magrou. (*Bacillus papayae* Rant, Cent. f. Bakt., II Abt., *84*, 1931, 483; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 214.) Pathogenic on papaya.

Erwinia sacchari Roldan. (Philippine Agric., *20*, 1931, 256; *Bacillus saccharum* Roldan, *idem*; not *Bacillus sacchari* Janse, Mededeel. uit's Lands. Plantentuin, *9*, 1891, 1.)

Erwinia scabiegena (von Faber) Magrou. (*Bacterium scabiegenum* von Faber, Arb. Kais. Biol. Anst. f. Land. u. Forstw., *5*, 1907, 347; *Bacillus scabiegenus* Stapp, in Sorauer, Handb. d. Pflanzenkr., 5 Aufl., *2*, 1928, 103; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 217.) Pathogenic for the beet (*Beta vulgaris*).

Erwinia serbinowi (Potebnia) Magrou. (*Bacterium beticola* Serbinow, Zhurnal Bolezni Rastenii, *7*, 1913, 237; not *Bacterium beticola* Smith, Brown and Townsend, Bur. Plant Ind., U. S. Dept. Agr., Bul. 213, 1911, 194; *Bacterium serbinowi* Potebnia, Kharkov Prov. Agr. Exp. Sta., *1*, 1915, 1; *Bacillus beticola* Stapp, in Sorauer, Handb. d. Pflanzenkr., 5 Aufl., *2*, 1928, 93; *Bacillus serbinowi* Elliott, Man. of Bact. Plant Pathogens, 1930, 75; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 217.) Pathogenic for the sugar beet.

Erwinia uvae (Kruse) Magrou. (Bacillo della bacterosidei grappoli della vite, Cugini and Macchiati, Le Stazione sperimentali ital., *20*, 1891, 579; *Bacillus uvae* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 329; *Bacterium uvae* Chester, Ann. Rept. Del. Agr. Exp. Sta., *9*, 1897, 53 and 127; Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 220.) Pathogenic for the grape.

Erwinia vitavora du Plessis syn. *Clostridium baccarinii* Bergey et al., Manual, 1st ed., 1923, 328.

TRIBE III. SERRATEAE BERGEY, BREED AND MURRAY

(Preprint, Manual, 5th ed., October, 1938, vi.)

Small, aerobic rods, usually producing a bright red or pink pigment on agar and gelatin. There is a single genus.

Genus I. Serratia *Bizio* emend. *Breed and Breed.**

(Bizio, Biblioteca italiana o sia Giornale de lettera, scienze e arti, *30*, 1823, 288; *Zaogalactina* Sette, Sull'arrossimento straordinario di alcune sostanze alimentose osservato nella provincia di Padova l'anno 1819. Venezia, 1824, 51; *Coccobacterium* Schmidt and Weis, Die Bakterien, 1902, 10; *Erythrobacillus* Fortineau, Compt. rend. Soc. Biol., Paris, *58*, 1905, 104; *Dicrobactrum* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 309; Breed and Breed, Cent. f. Bakt., II Abt., *71*, 1927, 435.) Named for Serafino Serrati, the Italian physicist who invented a steam boat at Florence before 1787.

Small, aerobic, rapidly liquefying, nitrate reducing, Gram-negative, peritrichous rods which produce characteristic red pigments. White to rose-red strains that lack brilliant colors are common. Coagulate and digest milk. Liquefy blood serum. Typical species produce CO_2 and frequently H_2 from glucose and other sugars; also acetic, formic, succinic and lactic acids, acetylmethylcarbinol and 2,3 butylene glycol. Saprophytic on decaying plant or even animal materials.

The type species is *Serratia marcescens* Bizio.

Key to the species of genus Serratia.

I. Pigment not especially water-soluble, readily soluble in alcohol.
  A. No visible gas from glucose.
    1. Inconspicuous pellicle, if any, on plain gelatin.
      1. *Serratia marcescens.*
    2. Brilliant orange-red pellicle on plain gelatin.
      2. *Serratia indica.*
  B. Produce enough H_2 with the CO_2 from glucose to show gas in fermentation tubes.
    1. Acetylmethylcarbinol produced.
      3. *Serratia plymuthicum.*
    2. Acetylmethylcarbinol not produced.
      4. *Serratia kilensis.*
II. Pigment soluble in water and alcohol.
      5. *Serratia piscatorum.*

1. **Serratia marcescens** Bizio. (Polenta porporina, Biblioteca italiana, *30*, 1823, 288.) From Latin, dissolving into a fluid or viscous matter.

Synonyms: *Zoagalactina imetrofa* Sette, Memoria storico-naturale sull' arrossimento straordinario di alcune sostanze alimentose. Venezia, 8°, 1824, 51; *Protococcus imetrophus* Meneghini, 1838, see Trevisan, Rend. R. Inst. Lomb.

---

* Revised by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, Nov., 1937; further revision by Prof. Robert S. Breed, Nov., 1945.

Diag., 1 Aufl., *2*, 1896, 259; *Liquidobacterium prodigiosum* Orla-Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 339; *Erythrobacillus prodigiosus* Winslow et al., Jour. Bact., *5*, 1920, 209; *Dicrobactrum prodigiosum* Enderlein, Bakterien Cyclogenie, 1925, 279; *Salmonella marcescens* and *Salmonella prodigiosa* Pribram, Jour. Bact., *18*, 1929, 384; *Chromobacterium prodigiosum* Topley and Wilson, Principles of Bacteriology, *1*, 1931, 402.

Description largely taken from Breed and Breed, Jour. Bact., *9*, 1924, 545.

Short rods, sometimes almost spherical: 0.5 by 0.5 to 1.0 micron, occurring singly and occasionally in chains of 5 or 6 elements. Motile, with four peritrichous flagella. Eight to ten flagella on cells grown at 20° to 25°C (De Rossi, Rivista d'Igiene, *14*, 1903, 000). Gram-negative.

Gelatin colonies: Thin, slightly granular, gray becoming red, circular, with slightly undulate margin. Liquefy the medium rather quickly.

Gelatin stab: Infundibuliform liquefaction. Sediment in liquefied medium usually red on top, white in the depth.

Agar colonies: Circular, thin, granular, white becoming red. R and S colonies with mucoid variants (Reed, Jour. Bact., *34*, 1937, 255).

Agar slant: White, smooth, moist layer, taking on an orange-red to fuchsin color in three or four days, sometimes with metallic luster.

Broth: Turbid, may form a red ring at surface or slight pellicle, and gray sediment.

Litmus milk: Acid reaction with soft coagulum. A red surface growth develops. Little or no digestion takes place.

Potato: At first a white line appears, which rapidly turns red. The growth is luxuriant and frequently shows a metallic luster.

Produces acetic, formic, succinic and levolactic acid, ethyl alcohol, acetylmethylcarbinol, 2,3 butylene glycol, CO_2 and a trace of H_2 from glucose (Pederson and Breed, Jour. Bact., *16*, 1928, 183).

Grows poorly or not at all in distilled water containing urea, potassium chloride and glucose.

Indole not produced.

Nitrites produced from nitrates.

Formation of H_2S: Produced from cysteine, cystine or organic sulfur compounds containing either of these molecules. Produced from sulfur but not from sulfites, sulfates or thiosulfates (Tarr, Biochem. Jour., *27*, 1933, 1869; *28*, 1934, 192).

Acetylmethylcarbinol is produced (Breed).

Pigment soluble in alcohol, ether, chloroform, benzol and carbon bisulfide (Schneider, Arb. Bakt. Hochsch. Karlsruhe, *1*, 1894, 210). Pigment may diffuse through the agar, i.e., shows solubility in water where strains are very deeply pigmented (Breed). Pigment not formed at 35°C.

Sodium formate broth (Stark and England, Jour. Bact., *29*, 1935, 26): Cultures do not produce visible gas (Breed).

Odor of trimethylamine is produced.

Aerobic, facultative.

Optimum temperature 25° to 30°C. No growth at 37°C.

Source: Described by Bizio (*loc. cit.*) and Sette (*loc. cit.*) from growth on corn meal mush (polenta).

Habitat: Water, soil, milk, foods, silk worms and other insects.

2. **Serratia indica** (Eisenberg) Bergey et al. (*Bacillus indicus* Eisenberg, Bakt. Diag., 1 Aufl., 1886, 1; *Bacillus indicus ruber* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 285; *Micrococcus indicus* Koch, Berichte ueber die Reise zur Erforschung der Cholera, 1887; *Bacillus ruber indicus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 302; *Bacterium ruber indicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 112; *Erythrobacillus indicus* Holland, Jour. Bact., *5*, 1920, 218; Bergey et al., Manual, 1st ed., 1923, 88; Breed and Breed, Jour. of Bact., *11*, 1926, 76; *Chromobacterium indicum* Topley and Wilson, Princ. Bact. and Immun., *1*, 1931, 402.) From Latin *indicus*, of India.

Small rods: 0.5 by 1.0 to 1.5 microns. Motile with four peritrichous flagella. Gram-negative.

Gelatin colonies: Resemble those of *Serratia marcescens*.

Gelatin stab: Liquefied rather quickly. Brilliant orange-red pellicle on plain gelatin.

Agar colonies: Pink, with slightly serrate margin, spreading, with green irridescence.

Agar slant: Luxuriant, dirty-white layer. Pigment produced best in alkaline media.

Broth: Turbid, with white sediment.

Litmus milk: Acid and coagulated. Digestion complete in 10 days.

Potato: Luxuriant growth with or without pigment formation.

Produces same products (except H_2) from glucose as does *Serratia marcescens* (Pederson and Breed, Jour. Bact., *16*, 1928, 183).

Indole not produced.

Nitrites produced from nitrates.

Growth with pigment production in distilled water containing urea, potassium chloride and glucose.

Blood serum liquefied.

Odor of trimethylamine.

Sodium formate broth: Cultures do not produce visible gas (Breed).

Pathogenic for laboratory animals.

Acetylmethylcarbinol is produced (Breed).

Aerobic, facultative.

Optimum temperature 25° to 35°C. No growth at 37°C.

Cultures of this organism lose their ability to produce the orange-red pellicle on gelatin and then become practically indistinguishable from cultures of *Serratia marcescens*. This would indicate that this so-called species is a rough strain of the former species (Breed). See Reed (Jour. Bact., *34*, 1937, 255) for a discussion of dissociation phenomena in this genus.

Source: Isolated from alimentary tract of a Java ape in India; also from milk can from Ithaca, N. Y.

Habitat: Presumably widely distributed.

Apparently the following non-gelatin liquefying strain belongs with this species. Subcultures that are claimed to be derived from the original now liquefy gelatin.

2a. *Serratia miquelii* Bergey et al. (Named *Bacillus ruber* by Miquel and described in a letter to Hefferan, Cent. f. Bakt., II Abt., *11*, 1903, 402; *Erythrobacillus ruber* Holland, Jour. Bact., *5*, 1920, 223; Bergey et al., Manual, 1st ed., 1923, 95.)

Isolated from water by Miquel.

3. **Serratia plymuthicum** (Lehmann and Neumann) Bergey et al. (Roter

Bacillus aus Plymouth, Fischer, Zeitschr. f. Hyg., *2*, 1887, 74; *Bacterium plymuthicum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 264; *Bacillus plymouthensis* Migula, Syst. d. Bakt., *2*, 1900, 849; *Erythrobacillus plymouthensis* Holland, Jour. Bact., *5*, 1920, 220; Bergey et al., Manual, 1st ed., 1923, 88.) Latinized from Plymouth, England.

Distinct rods: 0.6 by 1.5 to 2.0 microns with rounded ends, occurring singly and in short chains. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Like *Serratia marcescens*. Original culture mucoid.

Gelatin stab: Crateriform liquefaction. Liquefaction as in *Serratia marcescens*.

Agar colonies: Like mucoid varieties of *Serratia marcescens*.

Agar slant: Sometimes show metallic luster. Pigment as in *Serratia marcescens*.

Broth: Like *Serratia marcescens*.

Litmus milk: Acid and coagulated.

Potato: Growth violet pink, with or without metallic luster.

Gas from glucose, lactose and sucrose, 70 to 80 per cent of it CO_2. Remainder is H_2. Gas is also produced in asparagine solutions.

Strong fecal odor produced.

Blood serum liquefied.

Acetylmethylcarbinol is produced (Breed).

Sodium formate broth: Cultures produce abundant gas (Breed).

Pigment soluble in alcohol, ether and sometimes water.

Aerobic, facultative.

Optimum temperature 30°C.

Source: From water supply of Plymouth, England.

Habitat: Water and various foods.

4. **Serratia kilensis** (Lehmann and Neumann) Bergey et al. (Bacterium h, Breunig, Inaug. Diss., Kiel, 1888; *Bacillus ruber balticus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 303; *Bacterium kiliense* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 263; *Bacterium ruber balticus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 142; *Bacillus kiliensis* Migula, Syst. d. Bakt., *2*, 1900, 847; *Erythrobacillus kiliensis* Holland, Jour. Bact., *5*, 1920, 218; Bergey et al., Manual, 1st ed., 1923, 90; *Chromobacterium kielense* Topley and Wilson, Princip. Bact. and Immun., *1*, 1931, 400.) From Kiel, a city on the Baltic Sea.

Description taken from Kruse (*loc. cit.*) and Bergey et al. (*loc. cit.*).

Slender rods: 0.7 to 0.8 by 2.5 to 5.0 microns, occurring singly. Motile with four peritrichous flagella. Gram-negative.

Deep gelatin colonies: Bright yellow. Gelatin liquefied slowly, usually becoming rose-red.

Glucose gelatin stab: Rapid liquefaction. Occasional gas bubbles (Breed).

Agar colonies: Small, red becoming magenta, smooth.

Agar slant: Bright red becoming darker in old cultures.

Agar stab: Turbid strongly pigmented water of condensation.

Broth: Turbid. Usually reddened.

Litmus milk: Acid; at 20°C, coagulated slowly and pigment produced; at 35°C, coagulated rapidly and no pigment produced.

Potato: Slight red growth, becoming luxuriant and darker.

Indole not formed.

Nitrites and free nitrogen produced from nitrates.

Blood serum liquefied.

Acid and gas from carbohydrates (Lehmann and Neumann, *loc. cit.*). Gas from glucose, lactose and sucrose, 20 to 30 per cent of it CO_2 (Bergey). Inactive lactic acid produced and not more than a trace of acetylmethylcarbinol or 2, 3 butylene glycol (Pederson and Breed, Jour. Bact., *16*, 1928, 183).

Sodium formate broth: Gas produced (Breed).

Acetylmethylcarbinol not produced by the Král culture (Breed).

Pigment formed at 37°C. Pigment especially soluble in alcohol.

Optimum temperature 30°C.

Aerobic.

Distinctive characters: It is not certain whether Breunig's original culture was a heavily pigmented strain of *Serratia marcescens*, or whether it was of the type described above. Cultures of both types have been widely distributed as the Kiel bacillus. Descriptions drawn up by Kruse (*loc. cit.*) and Lehmann and Neumann (*loc. cit.*) in 1896 state that this bacterium produces visible gas, while Migula in 1900 gives a description which fits *Serratia marcescens*. Moreover, cultures obtained under this name from various laboratories in Europe and America are sometimes of one type and sometimes of the other. As the Král culture distributed as *Bacillus ruber balticus* is widely known and has now been shown to differ from *Serratia marcescens* in that it is a distinct rod in ordinary media, forms visible gas from carbohydrates and even more abundant gas from sodium formate media, the name *Serratia kilensis* is used here for the Král culture. *Serratia kilensis* is a distinct rod like *Serratia plymuthicum*, but fails to produce acetylmethylcarbinol. This use of the name *Serratia kilensis* given here also accords with the description drawn up by Bergey for the first edition of the Manual based on the study of a culture which he obtained many years previously from Europe (Breed).

Source: From water at Kiel, Germany.

Habitat: Presumably widely distributed.

5. Serratia piscatorum (Lehmann and Neumann) Breed. (Microbe rouge de la sardine, Du Bois Saint-Sévrin, Ann. Inst. Past., *8*, 1894, 155; *Bacterium piscatorum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 263; *Bacillus ruber sardinae* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 302; *Bacterium ruber sardinae* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 112; *Bacillus sardinae* Migula, Syst. d. Bakt., *2*, 1900, 852; *Bacillus piscatorus* Chester, Man. Determ. Bact., 1901, 257.) From Latin *piscatorum*, of fishermen.

Short rods: 0.5 by 0.6 micron, occurring in pairs, sometimes in fours or (in broth) in long filaments. Actively motile. Gram-negative.

Gelatin colonies: Small, yellowish-gray becoming pink, very slimy. Carmine-red pellicle. Liquefaction.

Gelatin stab: Rapid liquefaction. Grayish pellicle which becomes red after 24 hours and later precipitates. Slimy.

Agar colonies: Dull, white to pinkish growth.

Broth: Rapid turbidity. Thick, slimy, white pellicle which later turns red. Purplish sediment. Liquid becomes pink and syrupy. In old cultures the broth is brown.

Potato: At 37° to 39°C, red pigment visible after 8 hours. At room temperatures growth is first white, slimy, later red.

Strong odor of trimethylamine.

Distinctive characters: Pigment soluble in alcohol, more soluble in water. Good pigment production at 37°C. Sliminess.

Source: Isolated in 1893 from a box of oil-packed sardines at a canning-factory in France. Also found in the red pus from fishermen and sardine-factory-workers suffering from felons. In these lesions, this organism is associated with an anaerobe, but by itself it is not pathogenic.

Habitat: Presumably widely distributed.

Appendix: *Serratia marcescens* has frequently been described under other names, particularly where brilliantly pigmented cultures have been found. Some of these and other related species are listed below. It is known that white

strains of these organisms occur in nature but these strains when found have probably been placed in non-chromogenic genera of the family *Enterobacteriaceae*.

Bacillus ruber Frank. (Frank, in Cohn, Beitr. z. Biol. d. Pflanz., *1*, Heft 3, 1875, 181; not *Bacillus ruber* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 24; not *Bacillus ruber* Miquel, see Cent. f. Bakt., II Abt., *11*, 1903, 402; *Bacterium ruber* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 113.) Grew in a warm place on rice cooked in chicken broth.

Bacillus subkiliensis Petrow. (Arb. bakt. Inst. Karlsruhe, *2*, Heft 3, 1902, 273.) Dust contamination from air. Reported to resemble *Bacillus kiliensis*.

Bacterium aurescens Parr. (Proc. Soc. Exp. Biol. and Med., *35*, 1937, 563). A reddish-brown organism. This and the reddish-orange organism described by Tittsler (Jour. Bact., *33*, 1937, 450), which are regarded as pigmented variants of *Escherichia coli*, resemble the organisms in *Serratia* closely but do not liquefy gelatin. From water.

Serratia amylorubra (Hefferan) Bergey et al. (*Bacillus amyloruber* Hefferan, Cent. f. Bakt., II Abt., *11*, 1903, 313; *Erythrobacillus amyloruber* Holland, Jour. Bact., *5*, 1920, 217; Bergey et al., Manual, 1st ed., 1923, 90.) From Mississippi River water and buttermilk.

Serratia esseyana Combe. (Thèse, École de Méd. Univ. Besançon, 1934, 1.) From well water at Essey. A study of an authentic culture shows this to be *Serratia marcescens* (Breed).

Serratia fuchsina (Boekhout and De Vries) Bergey et al. (*Bacillus fuchsinus* Boekhout and DeVries, Cent. f. Bakt., II Abt., *4*, 1898, 497; *Erythrobacillus fuchsinus* Holland, Jour. Bact., *5*, 1920, 218; Bergey et al., Manual, 1st ed., 1923, 91.) *Bacillus fuchsinus* Migula. (Der rote Bacillus, Lustig, Diag. d. Bakterien d. Wassers, 1893, 72; Migula, Syst. d. Bakt., *2*, 1900, 853.) Although these two organisms were named independently from different cultures, they were undoubtedly identical. The original cultures of these species appear to have been heavy pigmented strains of *Serratia marcescens* showing a metallic luster. No authentic cultures are available. From water.

Serratia gutturis Jan. (Bull. Soc. Sci. de Bretagne, *16*, 1939, 34.) From sputum. Claimed to be different from *Serratia marcescens* on the ground that it will grow on an asparagine medium and that it reduces molybdates actively.

Serratia marinorubra Zobell and Upham. (Bull. Scripps Inst. Oceanography, LaJolla, *5*, 1944, 255.) From sea water. Grew only on sea water media when first isolated but later a culture studied by Breed (1944) became adapted to growth on ordinary media and then showed the characteristics of *Serratia marcescens*.

Serratia miniacea (Zimmermann) Bergey et al. (*Bacillus miniaceus* Zimmermann, Die Bakterien unserer Trink- und Nutzwässer, Chemnitz, *1*, 1890, 46; *Erythrobacillus miniaceus* Holland, Jour. Bact., *5*, 1920, 219; Bergey et al., Manual, 1st ed., 1923, 90.) Probably a heavily pigmented strain of *Serratia marcescens* or *Serratia plymuthicum* showing metallic luster. From water.

Serratia pyoseptica (Fortineau) Bergey et al. (*Erythrobacillus pyosepticus* Fortineau, Thesis, Faculty of Medicine, Paris, 1904; abstract in Bull. Inst. Pasteur, *3*, 1905, 13; Bergey et al., Manual, 1st ed., 1923, 89.) No constant differences have been detected between *Serratia marcescens* and authentic cultures of *Serratia pyoseptica*. From the shirt of a hospital patient. Pathogenic for guinea pigs and birds. Forms a soluble toxin.

Serratia rubidaea Stapp. (*Bacterium rubidaeum* Stapp, Cent. f. Bakt., II Abt., *102*, 1940, 251; *ibid.*, 259.) From surface of plants and in composts. Characters much like those of *Serratia marcescens*.

Serratia rutilescens (Hefferan) Bergey et al. (*Bacillus rutilescens* Hefferan, Cent. f. Bakt., II Abt., *11*, 1903, 313; *Erythrobacillus rutilescens* Holland, Jour. Bact., *5*, 1920, 220; Bergey et al., Manual, 1st ed., 1923, 91.) The characters given do not distinguish this species from strains of *Serratia marcescens* that have nearly lost their power of pigment production except that it is reported to grow rapidly at 37°C. No authentic cultures appear to be available. From Mississippi River water.

Serratia rutilis (Hefferan) Bergey et al. (*Bacillus rutilis* Hefferan, Cent. f. Bakt., II Abt., *11*, 1903, 313; *Erythrobacillus rutilis* Holland, Jour. Bact., *5*, 1920, 220; Bergey et al., 1st ed., 1923, 94.) The original of this species appears to have been a heavily pigmented strain of *Serratia marcescens* or of *Serratia plymuthicum*. No characters are given that distinguish it from these species and no cultures appear to be available. From Illinois River water.

Serratia stercoraria Jan. (Bull. Soc. Sci. de Bretagne, *16*, 1939, 34.) From feces. Claimed to be different from *Serratia marcescens* because it attacks lactose, maltose and mannitol and reduces molybdates even more actively than *Serratia gutturis*.

TRIBE IV. PROTEAE CASTELLANI AND CHALMERS.

(Manual of Trop. Med., 3rd ed., 1919, 932.)

Ferments glucose but not lactose with formation of acid and usually visible gas. There is a single genus.

Genus I. **Proteus** *Hauser.**

(Hauser, Sitzber. d. phys.-med. Sozietät zu Erlangen, 1885, 156; *Liquidobacterium* Jensen, Cent. f. Bakt., II Abt., *22*, 1909, 337; *Spirilina* Hueppe, Wiesbaden, 1886, 146; *Eisenbergia* Enderlein, Sitzber. Ges. Naturf. Freunde, Berlin, 1917, 315.) From Latin, having a changeable form.

Straight rods. Gram-negative. Generally actively motile at 25°C, motility may be weak or absent at 37°C, peritrichous, occasionally very numerous flagella. Generally produce amoeboid colonies, swarming phenomenon, on moist medium. Marked pleomorphism characteristic only of very young, actively swarming cultures. Ferment glucose and usually sucrose but not lactose. Three species in fermentable carbohydrates produce small gas volumes even after prolonged incubation and an occasional culture does not produce gas. One species usually produces acid only. Urea decomposed and trimethylamine oxide reduced by all species.

The type species is *Proteus vulgaris* Hauser.

Key to the species of genus **Proteus.**

I. No action on mannitol.
  A. Acid and gas from sucrose.
    1. Acid and gas from maltose.
      a. Indole formed.
        1. *Proteus vulgaris.*
  B. Acid and gas from sucrose (delayed).
    1. No action on maltose.
      a. Indole not formed.
        2. *Proteus mirabilis.*
  C. No action on sucrose (ordinarily).
    1. No action on maltose.
      a. Indole formed.
        3. *Proteus morganii.*

II. Acid, occasionally a bubble of gas, from mannitol.
  A. Acid from sucrose (delayed).
    1. No action on maltose.
      a. Indole formed.
        4. *Proteus rettgeri.*

1. **Proteus vulgaris** Hauser. (Hauser, Sitzungsber. d. phys.-mediz. Sozietät zu Erlangen, 1885, 156; *Bacillus proteus* Trevisan, I generi e le specie delle Batteriacee, 1889, 17; *Bacterium vulgare* Lehmann and Neumann, Bakt. Diag.,

---

* Originally revised by Prof. M. W. Yale, New York State Experiment Station, Geneva, New York, Nov., 1938; revised by Prof. C. A. Stuart and Dr. Robert Rustigian, Brown University, Providence, Rhode Island, May, 1943.

1 Aufl., *2*, 1896, 243; *Bacillus proteus vulgaris* Kruse, in Flügge, Die Mikroorganismen, *2*, 1896, 272; *Bacterium* (*Proteus*) *vulgaris* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 101; *Bacillus vulgaris* Migula, Syst. d. Bakt., *2*, 1900, 707; *Bacterium proteus anindologenes* van Loghem, Ann. Inst. Past., *32*, 1918, 295; *Bacillus proteus-vulgaris* Holland, Jour. Bact., *5*, 1920, 220.) From Latin, common.

Hauser described *Proteus vulgaris* as a rapid gelatin liquefier and *Proteus mirabilis* as a slow liquefier. Wenner and Rettger (Jour. Bact., *4*, 1919, 332) found the property of liquefying gelatin too variable to serve as a basis for separation of species. They suggested that this differentiating character be set aside and the two species differentiated on the basis of maltose fermentation, the species fermenting the sugar receiving the name *Proteus vulgaris* and the species failing to attack it, *Proteus mirabilis*. This suggestion was accepted by Bergey et al., Manual, 1st ed., 1923 and Weldin, Iowa Jour. Sci., *1*, 1927, 147; and their work was confirmed by Rustigian and Stuart (Jour. Bact., *45*, 1943, 198) and by Thornton (Jour. Bact., *48*, 1944, 123). Also see Moltke (Contributions to the Characterization and Systematic Classification of *Bac. proteus vulgaris* (Hauser), Levin and Munksgaard, Copenhagen, 1927, 156).

Rods: 0.5 to 1.0 by 1.0 to 3.0 microns, occurring singly, in pairs and frequently in long chains. Actively motile, with peritrichous flagella. Gram-negative.

Gelatin colonies: Irregular, spreading, rapidly liquefying.

Gelatin stab: Rapid, stratiform liquefaction.

Agar colonies: Opaque, gray, spreading.

Agar slant: Thin, bluish-gray, spreading over entire surface.

Broth: Marked turbidity, usually with a thin pellicle.

Litmus milk: Slightly acid, becoming markedly alkaline. Quick peptonization.

Potato: Abundant, creamy to yellowish-gray growth, becoming brown.

Indole formed.

Nitrites produced from nitrates.

Acetylmethylcarbinol not formed.

Acid and gas from glucose, fructose, galactose, maltose and sucrose. No acid or gas from dextrin, lactose or mannitol. See Moltke (*loc. cit.*) for other fermentation characters. Ratio H_2 to CO_2 is 1:1 (Speck and Stark, Jour. Bact., *44*, 1942, 687).

Putrefactive odor produced.

Sodium citrate usually utilized as sole source of carbon.

Formation of H_2S: Produced from cysteine, cystine or organic sulfur compounds containing either of these molecules. Produced from sulfur and thiosulfates (Tarr, Biochem. Jour., *27*, 1933, 1869; *28*, 1934, 192). Lead acetate turned brown.

Aerobic, facultative.

Optimum temperature 37°C.

Distinctive characters: X-Strains of Weil and Felix. Lehmann-Neumann-Breed, Determinative Bact., Eng. Trans., 7th ed., *2*, 1931, 493: "The discovery of proteus strains which may be agglutinated by typhus serum is of very great importance. These are the so-called X-strains from typhus patients found by Weil and Felix. They first cultivated strains X and X_2 from the urine of typhus patients and later the famous X_{19}. The two former were agglutinated weakly, the latter strongly (up to 1:50,000). The diagnosis of typhus by agglutination with strain X_{19} proved to be excellent and the reaction took place in the serum of almost 100 per cent of those suffering from the disease. . . . The typhus strains of proteus have recently been divided into the two types of Felix and Weil, the H forms and the O forms. The former grows as a thin opaque film, the latter lacks this character and grows as non-spreading slimy colonies; frequently without dis-

tinct flagella. . . ." (For further description of H and O forms see Moltke, *loc. cit.*)

The X_2 and X_{19} strains mostly ferment maltose.

Source: From putrid meat infusions and abscesses.

Habitat: Putrefying materials.

2. **Proteus mirabilis** Hauser. (Hauser, Sitzungsber. d. phys.-mediz. Sozietät zu Erlangen, 1885, 156; *Bacillus mirabilis* Trevisan, I generi e le specie delle Batteriacee, 1889, 17; *Bacillus proteus mirabilis* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 276; *Bacterium mirabilis* Chester, Del. Coll. Agr. Exp. Sta., 9th Ann. Rept., 1897, 101; *Bacillus pseudoramosus* Migula, Syst. d. Bakt., *2*, 1900, 817; not *Bacillus pseudoramosus* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 441; *Bacillus proteus-mirabilis* Holland, Jour. Bact., *5*, 1920, 220.) From Latin *mirabilis*, wonderful.

Short rods: 0.5 to 0.6 by 1.0 to 3.0 microns, occurring singly, in pairs and frequently in long chains. Motile, possessing peritrichous flagella. Gram-negative.

Gelatin colonies: Irregular, spreading.

Gelatin stab: Slow, stratiform liquefaction.

Agar colonies: Gray, irregular, spreading.

Agar slant: Thin, bluish-gray, spreading over surface.

Broth: Turbid, with thin gray pellicle and sediment.

Litmus milk: Slightly acid, becoming alkaline, peptonized.

Potato: Dirty-gray, spreading growth.

Indole not formed.

Acetylmethylcarbinol frequently produced weakly.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose and galactose. Acid and gas usually produced slowly from sucrose. No acid or gas from lactose, maltose, dextrin or mannitol.

The XK strains are mostly maltose negative.

Putrefactive odor produced.

Hydrogen sulfide is produced.

Sodium citrate usually utilized as a sole source of carbon.

Aerobic, facultative.

Optimum temperature 37°C.

Source: From putrid meat, infusions and abscesses. Also reported as a cause of gastroenteritis (Cherry and Barnes, Amer. Jour. Pub. Health, *36*, 1946, 484).

Habitat: Putrefying materials.

3. **Proteus morganii** (Winslow et al.) Rauss. (Organism No. 1, Morgan, Brit. Med. Jour., *1*, 1906, 908; *Bacillus morgani* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 481; *Bacterium morgani* Holland, Jour. Bact., *5*, 1920, 215; *Bacterium metacoli* or *Escherichia morgani* Thjøtta, Jour. Inf. Dis., *43*, 1928, 349; *Salmonella morgani* Castellani and Chalmers, Man. Trop. Med., 1919, 939; Rauss, Jour. Path. and Bact., *42*, 1936, 183; *Morganella morganii* Fulton, Jour. Bact., *46*, 1943, 81; regarded by Fulton as the type species of the genus *Morganella*.) Named for Morgan, who first isolated this organism.

Common name: Morgan's bacillus, type 1.

Rods: 0.4 to 0.6 by 1.0 to 2.0 microns, occurring singly. Motile with peritrichous flagella. See Rauss, *loc. cit.*, for discussion of flagellation and relation to the swarming characteristic. Gram-negative.

Gelatin colonies: Bluish-gray, homogeneous, smooth, entire.

Gelatin stab: No liquefaction.

Agar colonies: Grayish or bluish-white, circular, entire.

Agar slant: Grayish-white, smooth, glistening growth.

Broth: Turbid.

Litmus milk: Neutral, or becoming alkaline.

Potato: Dirty-white, limited growth.

Indole is formed.

Nitrites are produced from nitrates.

Acetylmethylcarbinol not formed.

Acid and a small amount of gas from glucose, fructose, galactose and mannose. Rarely from xylose. Does not attack lactose, sucrose, maltose, arabinose, raffinose, dextrin, salicin, mannitol, dulcitol, sorbitol, adonitol or inositol.

Hydrogen sulfide not produced.

Sodium citrate not utilized as sole source of carbon.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Isolated from the feces of infants with summer diarrhea.

Habitat: In intestinal canal in normal or diarrheal stools.

4. **Proteus rettgeri** (Hadley et al.) Rustigian and Stuart. (*Bacterium rettgeri* Hadley, Elkins and Caldwell, Rhode Island Agr. Exp. Sta. Bull. 174, 1918, 169; *Bacillus rettgeri* St. John-Brooks and Rhodes, Jour. Path. and Bact., *26*, 1923, 434; *Eberthella rettgeri* Bergey et al., Manual, 1st ed., 1923, 232; *Shigella rettgeri* Weldin, Iowa State College Jour. Sci., *1*, 1927, 181; Atypical enteric organisms of the *Shigella* group, Cope and Kilander, Amer. Jour. Pub. Health, *32*, 1942, 352; *Proteus entericus* Rustigian and Stuart, Jour. Bact., *45*, 1943, 198; Rustigian and Stuart, Proc. Soc. Exp. Biol. and Med., *53*, 1943, 241.) Named for L. F. Rettger, the American bacteriologist, who isolated this species in 1904.

Rods: 0.5 to 0.8 micron long, occurring singly, in pairs and occasionally in chains. Usually non-motile at 37°C, but actively motile variants possessing peritrichous flagella can be obtained at 25°C. Gram-negative.

Gelatin colonies: Small, grayish, translucent, entire.

Gelatin stab: No liquefaction.

Agar colonies: Small, grayish, translucent, entire; under suitable conditions some strains show marked spreading.

Agar slant: Filiform to echinulate, grayish, thin, moist, translucent.

Broth: Turbid with flocculent to viscid sediment.

Litmus milk: Alkaline in eight days, becoming translucent.

Potato: Luxuriant, grayish growth.

Acid and occasionally slight gas from glucose, fructose, galactose and mannitol. Salicin may or may not be fermented. Slow and sometimes weak acid in sucrose. Lactose and maltose not fermented.

Indole is formed.

Nitrites are produced from nitrates.

Acetylmethylcarbinol not formed.

Hydrogen sulfide not produced.

Sodium citrate utilized as sole source of carbon.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Originally isolated from cholera-like epidemic among chickens; recently isolated from sporadic and epidemic gastroenteritis patients.

Habitat: Fowl typhoid and some cholera-like diseases of birds.

Appendix: Acceptance of gelatin liquefaction and fermentation of glucose and sucrose but not lactose as the cardinal characteristics of *Proteus* without reference to urease production and small gas volumes has resulted in some cultures of *Paracolobactrum* (Borman et al., Jour. Bact., *48*, 1944, 361) being described as *Proteus* (Rustigian and Stuart, Jour. Bact., *49*, 1945, 419). Included in the appendix are species of *Proteus* whose taxonomic position is not clear. Where descriptions permit, the probable taxonomic position of the organism is indicated. For purposes of reference, organisms are also included which do not now merit species rank in the genus *Proteus* and organisms which will now be found in another genus.

Bacillus agglomerans Beijerinck. (Botan. Zeitung, *46*, 1888, 740 or 749.) From nodules on the roots of red clover. Colonies like those of *Proteus*.

Bacillus murisepticus pleomorphus Karlinski. (Karlinski, Cent. f. Bakt., *5*, 1889, 193; *Proteus* of Karlinski, Sternberg, Man. of Bact., 1893, 460.) From a urine discharge and from abscesses in the uterus. Sternberg regards this species as probably identical with *Proteus vulgaris* Hauser.

Flavobacterium meningitidis Hauduroy et al. (*Bacillus luteus liquefaciens* Hauduroy, Duhamel, Ehringer and Mondin, Compt. rend. Soc. Biol., Paris, *110*, 1932, 362; Hauduroy et al., Dict. d. Bact. Path., 1937, 236.) Related to this species but differing in that it ferments lactose is the following: *Bacterium coli* var. *luteoliquefaciens* Lehmann and Levy, in Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 314 (*Bacillus coli* var. *luteoliquefaciens* Hauduroy, Duhamel, Ehringer and Mondin, *loc. cit.*, 1932, 363).

Proteus alveicola Serbinow. (Jour. Microbiol., Petrograd, *2*, 1915, 19.) From an infectious diarrhoea of honey bees (*Apis mellifera*).

Proteus americanus Pacheco. (Sciencia Medica, *6*, 1928.) From the blood of patients with liver abscesses. Assis (Brasil Medico, No. 42-45, 1934, 35), St. John-Brooks and Rhodes (3rd Internat. Cong. for Microbiology, Rept. of Proc., 1939, 167), Rustigian and Stuart (Jour. Bact., *45*, 1943, 198) and Thornton (Jour. Bact., *48*, 1944, 123) agree that *Proteus americanus* is *Proteus mirabilis*. See Manual, 5th ed., 1939, 434 for a description of this species.

Proteus ammoniae Magath. (Magath, Jour. Inf. Dis., *43*, 1928, 181; *Salmonella ammoniae* Hager and Magath, Jour. Amer. Med. Assn., *85*, 1925, 1352.) From urine in cystitis. St. John-Brooks and Rhodes (3rd Internat. Congr. for Microbiology, Rept. of Proc., 1939, 167), Levine (Jour. Bact., *43*, 1942, 33), Rustigian and Stuart (Jour. Bact., *45*, 1943, 198) and Thornton (Jour. Bact., *48*, 1944, 123) agree that *Proteus ammoniae* is *Proteus mirabilis*. See Manual, 5th ed., 1939, 434 for a description of this species. See Fulton, Jour. Bact., *51*, 1946, 685 for the view that *Proteus ammoniae* is a valid species.

Proteus bombycis Bergey et al. (A Gram-negative bacillus, Glaser, Jour. Bact., *9*, 1924, 344; *Bacterium bombycivorum* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 445; *Aerobacter bombycis* Bergey et al., Manual, 3rd ed., 1930, 334; Bergey et al., Manual, 4th ed., 1934, 365.) From diseased silk worms (*Bombyx mori*). *Proteus bombycis* appears to be a strain of *Paracolobactrum aerogenoides* Borman et al. See Manual, 5th ed., 1939, 436 for a description of this species.

Proteus diffluens (Castellani) Castellani and Chalmers. (*Bacillus diffluens* Castellani, 1915; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 943.) From gastroenteritis patients. This may be a biochemical variant of *Proteus mirabilis*.

Proteus henricensis Shaw. (Sci., *65*, 1927, 477.) From putrefying materials. Said to be related to *Proteus diffluens*.

Proteus infantum (Weldin and Levine) Weldin. (Dean, Med. Jour. Australia, *1*, 1920, 27; *Bacterium infantum* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Weldin, Iowa State Coll. Jour. Sci., *1*, 1926, 148.) From urine and feces of an infant.

Proteus insecticolens Steinhaus. (Jour. Bact., *42*, 1941, 763.) From the stomach of the milkweed bug (*Oncopeltus fasciatus*). This appears to be a strain of *Paracolobactrum intermedium* Borman et al.

Proteus melanovogenes Miles and Halnan. (Jour. Hyg., *37*, 1937, 79.) From eggs showing black rot. This does not appear to be a member of the genus *Proteus*.

Proteus metadiffluens (Castellani) Castellani and Chalmers. (*Bacillus metadiffluens* Castellani, 1915; Castellani and Chalmers, Manual Trop. Med., 1919, 943.) From gastroenteritis patients.

This does not appear to be a member of the genus *Proteus.*

Proteus nadsonii Lobik. (Diseases of Plants, St. Petersburg, *9*, 1915, 67.) From decomposed potatoes and tomatoes. This does not appear to be a member of the genus *Proteus.*

Proteus noctuarum (White) Bergey et al. (*Bacillus noctuarum* White, Jour. Agr. Res., *26*, 1923, 488; *Escherichia noctuarii* Bergey et al., Manual, 3rd ed., 1930, 327; Bergey et al., Manual, 4th ed., 1934, 363.) A cause of cutworm (Fam. *Noctuidae*) septicemia. Culturally identical with but serologically different from *Proteus sphingidis.*

Proteus odorans Pribram. (*Bacterium aquatile odorans* von Rigler, Hyg. Rund., *12*, 1902, 479; Pribram, Klassifikation der Schizomyceten, Leipzig and Wien, 1933, 73.) From bottled mineral waters. Aromatic odor in milk.

Proteus paraamericanus Magalhães and Aragão. (Brasil Medico, *47*, 1933, 815.) From urine. Assis (Brasil Medico, No. 42-45, 1934, 35) states that this is *Proteus mirabilis.*

Proteus paradiffluens (Castellani) Castellani and Chalmers. (*Bacillus paradiffluens* Castellani; Castellani and Chalmers, Manual Trop. Med., 3rd ed., 1919, 943.) This appears to be identical with *Proteus mirabilis.*

Proteus paramorganii Castellani and Chalmers. (Man. Trop. Med., 3rd ed., 1919, 943.) This is an H form of *Proteus morganii.*

Proteus photuris Brown. (Amer. Museum Nov., No. 251, 1927, 9.) From luminous organ of the firefly (*Photuris pennsylvanicus*). This does not appear to be a member of the genus *Proteus.*

Proteus piscicidus versicolor Babes and Riegler. (Babes and Riegler, Cent. f. Bakt., I Abt., Orig., *33*, 1902–03, 449; *Bacillus piscicidus versicolor* Nepveux, Thèse, Fac. Pharm., Paris, 1920, 114.) From diseased carp (*Cyprinus carpio*). Resembles *Proteus vulgaris.*

Proteus pseudovaleriei Assis. (Jour. Hyg., *27*, 1927, 108.) Rustigian and Stuart (Proc. Soc. Exper. Biol. and Med., *53*, 1943, 241) state that this is a paracolon organism, presumably *Paracolobactrum coliforme* Borman et al. See Manual, 5th ed., 1939, 435 for a description of this species.

Proteus recticolens Steinhaus. (Jour. Bact., *42*, 1941, 763.) From pylorus and rectum of the milkweed bug (*Oncopeltus fasciatus*). This appears to be a strain of *Paracolobactrum intermedium* Borman et al.

Proteus sphingidis (White) Bergey et al. (*Bacillus sphingidis* White, Jour. Agr. Res., *26*, 1923, 49; *Escherichia sphingidis* Bergey et al., Manual, 3rd ed., 1930, 327; Bergey et al., Manual, 4th ed., 1934, 366.) A cause of hornworm septicemia (*Protoparce sexta* Johan. and *P. quinquemaculata* Haw.). See Manual, 5th ed., 1939, 605 for a description of this species. White (*loc. cit.*) regards this species as possibly identical with *Coccobacillus acridiorum* d'Herelle.

Proteus sulfureus Holschewnikoff. (Holschewnikoff, Fortschr. d. Med., *7*, 1889, 201 and Ann. de Microgr., *1*, 1888–1889, 257; *Bacillus lindenborni* Trevisan, I generi e le specie delle Batteriacee, 1889, 17; *Bacillus sulfureus* Migula, Syst. d. Bakt., *2*, 1900, 698; not *Bacillus sulfureus* Trevisan, I generi e le specie delle Batteriacee, 1889, 17.) From water. Similar to or perhaps identical with *Proteus vulgaris* Hauser. Produces H_2S.

Proteus sp. Steinhaus. (Jour. Bact., *42*, 1941, 764.) This organism appears to be a strain of *Paracolobactrum intermedium* Borman et al.

Proteus sp. Warren and Lamb. (Jour. Med. Res., *44*, 1924, 375.) From feces and blood of patient with a fatal infection. This organism does not appear to be a member of the genus *Proteus.*

Urobacillus liquefaciens septicus Krogius. (Compt. rend. Soc. Biol., Paris, *2*, 1890, 65.) Regarded by Lehmann and Neumann (Bakt. Diag., 1 Aufl., *2*, 1896, 243) as a synonym of *Proteus vulgaris.*

TRIBE V. SALMONELLEAE BERGEY, BREED AND MURRAY.

(Preprint, Manual, 5th ed., October, 1938, vi.)

Rods that are either motile with peritrichous flagella or non-motile. Attack numerous carbohydrates with the formation of acid, or acid and gas. Lactose, sucrose and salicin are not ordinarily attacked. Do not produce acetylmethylcarbinol. Gelatin not liquefied (exceptions have been noted, but are rare). Urea not hydrolyzed. Milk not peptonized. No spreading growth on ordinary 2 to 3 per cent agar. Live in the bodies of warm-blooded animals, including man, occasionally in reptiles, and frequently in food eaten by these animals.

Key to the genera of tribe Salmonelleae.

I. Ferments glucose with the formation of acid and, with few exceptions, gas.
Genus I. *Salmonella*, p. 492.

II. Ferments glucose with the formation of acid but, with rare exceptions, no gas.
Genus II. *Shigella*, p. 535.

Genus I. Salmonella *Lignières.**

(Rec. de méd. vét., Sér. 8, 7, 1900, 389.)

Usually motile, but non-motile forms occur. Produce acid and gas from glucose, maltose, mannitol and sorbitol (except that in *Salmonella typhosa* and *S. gallinarum* no gas is produced). Lactose, sucrose and salicin not attacked. Do not clot milk, form indole or liquefy gelatin. Reduce trimethylamine oxide to trimethylamine.† All of the known species are pathogenic for warm-blooded animals, including man, causing food infections and enteric fevers. A few are found in reptiles. Some or all may also live in decomposing foods.

Although fermentation of lactose, sucrose and salicin, formation of indole, gelatin liquefaction and failure to produce gas have been described for organisms serologically belonging to *Salmonella*, the practical recognition of this genus and studies of its constituent species suggest that these be looked upon as exceptions which do not invalidate the biochemical definition of the genus. Serological definition of the limits of the genus is fraught with many practical and theoretical difficulties. Indeed, there is increasing evidence of antigenic affinities of varying degree between *Escherichia*, *Salmonella* and *Shigella*. This is well reviewed by Bornstein (Jour. Immunol., *46*, 1943, 439). Within the limits of the genus *Salmonella*, serological rela-

---

* Completely revised by Prof. Frederick Smith, McGill Univ., Montreal, P. Q., Canada, December, 1938; further revision, 1946. Manuscript read by Dr. F. Kauffmann, State Serum Institute, Copenhagen, Denmark and by Dr. Philip Edwards and Dr. D. W. Bruner, Agri. Exper. Sta., Lexington, Kentucky, May, 1946. These specialists have also assisted in completing references and in compiling records of the distribution of types.

† Wood and Baird, Jour. Fish. Res. Board Canada, *6*, 1943, 194.

tionships are the chief means of identifying new strains. There is general dissatisfaction with the granting of species rank to each one of the rapidly mounting number of types. The purposes of the greater number of bacteriologists, however, will be best served for the present by listing the known types.

There is a wide difference between the viewpoint of those who think of the serological types recognized in this genus as species, e.g., Schütze et al. (Jour. Hyg., *34*, 1934, 333) and the more recently expressed viewpoint of Borman, Stuart and Wheeler (Jour. Bact., *48*, 1944, 351). The latter authors recognize only three species in the genus, *Salmonella choleraesuis*, *S. typhosa* and *S. kauffmannii*. In the second report by Schütze et al. (Proc. 3rd Internat. Cong. Microbiol., New York, 1940, 832) the so-called species listed in the first report by this Sub-committee are designated as types.

Kauffmann, who recognizes nearly 150 serotypes in the group, nevertheless notes in a recent paper (Acta Path. et Microbiol. Scand., *22*, 1945, 144) that five types are of special interest in the field of human medicine, *Salmonella paratyphi A*, *Salmonella paratyphi B*, *Salmonella paratyphi C*, *Salmonella typhi* and *Salmonella sendai;* and that six types are of special interest in the field of veterinary medicine, *Salmonella typhimurium*, *Salmonella abortusequi*, *Salmonella abortusovis*, *Salmonella choleraesuis*, *Salmonella enteritidis* and *Salmonella gallinarum-pullorum*.

The 150 or more serotypes are, in a way, comparable to the 50 or more serotypes of *Diplococcus pneumoniae* that are recognized on the basis of agglutination with immune serums. The serological methods used have proved to be of fundamental value as they provide useful diagnostic procedures by means of which unknown cultures can be accurately and quickly identified.

As the morphology, staining properties and physiology of the bacteria belonging to the various types are practically identical, only the antigenic structure, source and habitat (so far as the latter is known) have been recorded for the majority of the types listed. Even though there is much duplication, descriptions similar to those used elsewhere in the MANUAL are given for the eleven types that are of greatest interest. Special mention has also been made of unusual characters such as failure to produce gas from glucose, lactose fermentation, indole production and gelatin liquefaction.

The nomenclature used for this group presents a special problem. It developed from labelings used for cultures. These were designated by the name of a patient, e.g., Thompson; by the name of the hospital where the patient was placed, e.g., Virchow, Bispebjerg; or more frequently by the name of the village, locality or city where the outbreak occurred or was studied, e.g., Borbeck, Altendorf, Tel Aviv. The names of states and larger areas have also been used, e.g., Kentucky, Italia, etc. Recently several types have been named in honor of well-known bacteriologists, e.g., Berta, Gaminara, Arechavaleta. As this useful laboratory labeling is not in the form ordinarily used by taxonomists, various suggestions have been made regarding the development of a binomial nomenclature comparable to that more generally used. None of these suggestions has been generally accepted as yet. For example, Haupt (Ergebnisse d. Hyg., *13*, 1932, 673) and others who have thought of the serotypes as species have added Latin endings to the place and other proper names that have been used, e.g., *Salmonella readingensis*, *S. rostockensis*. Schütze et al. (Jour. Hyg., *34*, 1934, 333) accepted the view that the place and other names should be used in binomials without adding Latin endings. Kauffmann (Ztschr. f. Hyg., *120*, 1938, 193), on the other hand, has suggested that letters and numbers, e.g., *Salmonella* B2, or even (Acta Path. et Microbiol. Scand., *22*, 1945, 147) the antigenic formula be used with the generic name, e.g., *Salmonella* IV, V, XII . . . b ↔ 1, 2 . . . instead of *Salmonella paratyphi B*.

The nomenclature used in the present edition of the MANUAL is slightly modified from that used in the fifth edition. The form adopted is in accordance with the view that the recognition of similar antigenic structures really identifies serotypes rather than species. In a way, serotypes are varieties in a taxonomic sense, though like horticultural varieties in higher plants, they do not exactly correspond with varieties as usually defined by taxonomists. Where cultural differences rather than antigenic structure have been used to subdivide species, these subdivisions are designated as varieties.

As it is not clear as yet how many and what species will eventually be recognized, the form *Salmonella sp.* has been used as before to indicate that the serotypes belong to species in the genus *Salmonella* which are not yet definitely defined. Geographic and other proper names are used to designate types as these have been used extensively in the literature. They have an historic significance and are not as easily confused as are letters and numbers. No Latin endings have been used for these place names as this might indicate that the serotype names are accepted as species names.

The genus *Eberthella* has been combined with the genus *Salmonella* as recommended by Schütze et al. (*loc. cit.*). With the exception of the typhoid organism, other species previously listed in *Eberthella* appear not to exist in type culture collections. As cultures are not available for study, these species are merely listed in an appendix to the genus *Salmonella*.

The type species is *Salmonella choleraesuis* (Smith) Weldin.

The table on pages 495 to 500 is used in place of the usual key.

Med., 3rd ed., 1919, 938 and 939; *Bacterium paratyphosum A* Holland, Jour. Bact., *5*, 1920, 219.) From Latin *para*, like and *typhus*, typhoid.

Rods: 0.6 by 3.0 to 4.0 microns, occurring singly. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Bluish-gray, homogeneous, smooth, glistening, entire to slightly undulate.

Gelatin stab: Fair surface growth. No liquefaction.

Agar colonies: Grayish, homogeneous, smooth, glistening, entire to slightly undulate.

Agar slant: Filiform, grayish, smooth, glistening growth.

Broth: Turbid, with slight grayish sediment.

Litmus milk: Slightly acid.

Potato: Limited, dirty-white streak.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, galactose, mannose, arabinose, maltose, trehalose, dextrin, glycerol, mannitol, dulcitol, rhamnose and sorbitol. No acid or gas from lactose, sucrose, raffinose, xylose, salicin, inulin, adonitol or inositol.

Reduces trimethylamine oxide (Wood and Baird, Jour. Fish. Res. Bd. Canada, *6*, 1943, 198).

No hydrogen sulfide formed.

Aerobic, facultative.

Optimum temperature 37°C.

Antigenic structure: [I], II, XII: a:—. (Type Durazzo lacks I).

Source: Isolated from enteric fever in man. Not known to be a natural pathogen of animals.

Habitat: A natural pathogen of man causing enteric fever.

2. **Salmonella schottmuelleri** (Winslow et al.) Bergey et al. (Bacilli paratyphique, Achard and Bensaude, Soc. Méd. des Hôp. de Paris, *13*, 1896, 679; *Bacillus paratyphi alcaligenes* Schottmüller, Deutsche med. Wchnschr., *32*, 1900, 511; *Bacterium paratyphi* Typus B, Brion and Kayser, Münch. med. Wchnschr., *49*, 1902, 611; *Bacillus paratyphosus B* Boycott, Jour. Hyg., *6*, 1906, 33; *Bacterium paratyphosum B* Le Blaye and Guggenheim, Manuel Pratique de Diag. Bact., 1914; *Bacillus schottmülleri* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 479; *Salmonella paratyphi B* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 939; *Bacterium schottmülleri* Holland, Jour. Bact., *5*, 1920, 222; included in Group IV of Hecht-Johansen, Copenhagen, 1923; Bergey et al., Manual, 1st ed., 1923, 213.) Named for Prof. Schottmüller who isolated this organism in 1899.

Rods: 0.6 to 0.7 by 2.0 to 3.0 microns, occurring singly and in pairs. Motile with peritrichous flagella. Gram-negative.

Gelatin stab: No liquefaction.

Agar colonies: Small, circular, bluish-gray, transparent, homogeneous, entire to undulate.

Broth: Turbid with thin gray pellicle and sediment. Fecal odor.

Litmus milk: Slightly acid, becoming alkaline.

Potato: Grayish-white, viscous growth.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, galactose, mannose, arabinose, xylose, maltose, dextrin, trehalose, glycerol,

mannitol, dulcitol, sorbitol, rhamnose and inositol. No acid or gas from lactose, sucrose, inulin, salicin or adonitol and usually not from raffinose.

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Hydrogen sulfide produced.

Optimum temperature 37°C.

Aerobic, facultative.

Antigenic structure: [I], IV, [V], XII: b: [1,2]. . . . Some strains lack antigen V and some have I.

Source: Isolated from cases of enteric fever in man. Not a natural pathogen of animals.

Habitat: A natural pathogen of man causing enteric fever. Also found rarely in cattle, sheep, swine, lower primates and chickens.

3. **Salmonella sp.** (Type Abony). (*Salmonella abony* Kauffmann, Acta Path. et Microbiol. Scand., *17*, 1940, 1.)

Antigenic structure: [I], IV, V, XII: b: e, n, x. . . .

Source: Isolated by Kauffmann from a mixed culture of *Salmonella abortus bovis* sent to him by Dr. K. Rauss, Budapest. Later three additional cultures were received from Dr. Rauss. Original culture from the feces of a normal person.

Habitat: All cultures thus far recognized have been from human sources.

4. **Salmonella typhimurium** (Loeffler) Castellani and Chalmers. (*Bacillus typhi murium* Loeffler, Cent. f. Bakt., *11*, 1892, 192; *Bacterium typhi murium* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 70; *Bacillus murium* Migula, Syst. d. Bakt., *2*, 1900, 761; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 939; *Bacillus typhi-murium* Holland, Jour. Bact., *5*, 1920, 221; *Bacterium typhi-murium* Holland, *idem*; *Bacillus enteritidis B, Typ. murium* Januschke, Ztschr. f. Infektionskr. d. Haustiere, *27*, 1924, 182.)

The following are regarded as synonyms of this organism: *Salmonella psittacosis* Castellani and Chalmers (Man. Trop. Med., 3rd ed., 1919, 939; *Bacillus psittacosis* Nocard, Conseil d. Hyg. Publique et Salubrité du Dept. du Seine, Séance, March 24, 1893; *Bacterium psittacosis* Le Blaye and Guggenheim, Manuel Pratique de Diagnostic Bactériologique, 1914); *Salmonella aertrycke* Castellani and Chalmers (Man. Trop. Med., 3rd ed., 1919, 939; *Bacillus aertrycke* De Nobele, Ann. Soc. Méd. Gand., *72*, 1898, 281; *Bacillus para-aertrycke* Castellani, Ann. di Med. Nav. e Colon., *11*, 1914, 453; *Bacterium aertrycke* Weldin and Levine, Abst. Bact., *7*, 1923, 13); Kaensche's *Bacillus* and Basenau's *Bacillus*, Kaensche, Ztschr. f. Hyg., *22*, 1896, 53; *Bacillus pestis-caviae* Wherry (Jour. Inf. Dis., *5*, 1908, 519; *Bacillus cholera-caviae* Wherry, Pub. Health Repts., November, 1908; *Pasturella pestis-caviae* Holland, Jour. Bact., *5*, 1920, 219); *Bacillus paratyphosus B*, Mutton type, Schütze, Lancet, *1*, 1920, 93; Group VII of Hecht-Johansen, Copenhagen, 1923; *Salmonella aertrycke* Ibrahim and Schütze, Brit. Jour. Exp. Path., *9*, 1928, 353; *Bacterium enteritidis Breslau* and *Salmonella breslau* of German literature; Mouse-typhoid of many authors. Some strains are confused with *Salmonella anatis* because of their origin in ducklings, e.g., see *Salmonella anatum* var. *aertrycke* Olsen and Goetchins, Cornell Vet., *27*, 1937, 354.

Hauduroy et al. (Dict. d. Bact. Path., Paris, 1937, 449) regard the following as synonyms of *Salmonella aertrycke: Bacillus breslaviensis* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 377; *Bacterium breslaviensis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 69; *B. enteritidis breslaviense* Berge, Deut. tierärztl. Wchnschr., 1926, 473; *Salmonella meleagridis* Rettger, Plastridge and Cameron, Jour. Inf. Dis., *53*, 1933, 279; *Salmonella aertrycke* var. *meleagridis* Cameron and Rettger, Jour. Bact., *27*, 1934, 86.

See Edwards and Bruner, Kentucky

Agr. Exp. Sta. Bull. 400, 1940, 43-70, for a discussion of this species.

Rods: 0.5 by 1.0 to 1.5 microns, occurring singly. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Small, circular, grayish, granular, becoming yellowish-brown.

Gelatin stab: Flat surface growth. No liquefaction.

Agar colonies: Small, circular, grayish, entire to undulate.

Agar slant: Filiform, grayish, moist, entire growth.

Broth: Turbid.

Litmus milk: Slightly acid, becoming alkaline.

Potato: Grayish-white streak.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, galactose, arabinose, maltose, dextrin, mannitol, sorbitol and inositol. Acid from glycerol. No action on lactose, sucrose, raffinose, inulin, salicin or adonitol.

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Hydrogen sulfide produced.

Optimum temperature 37°C.

Aerobic, facultative.

Antigenic structure: [I], IV, [V], XII: i: 1, 2, 3 . . .

Source: Isolated during a mouse typhoid epidemic in the Hygienic Institute of Greifswald, Germany.

Habitat: Causes food-poisoning in man. A natural pathogen for all warm-blooded animals. This type occurs more frequently than any other type not confined to a specific host. Also found in snakes by Hinshaw and McNeil (Amer. Jour. Vet. Res., *6*, 1945, 264).

4a. *Salmonella typhimurium* (Type Binns). (*Bacillus paratyphosus B* Binns type, Schütze, Lancet, *1*, 1920, 93; Group VI of Hecht-Johansen, Copenhagen, 1923; Typus-Binns, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella typhimurium* var. *Copenhagen*, Kauffmann, Ztschr. f. Hyg., *116*, 1934, 368; *Salmonella typhi-murium* var. *Binns*, Schütze et al., Jour. Hyg., *34*, 1934, 339; *Salmonella aertrycke* var. *Storrs*, Edwards, Jour. Bact., *30*, 1935, 471.)

Morphology and cultural characters indistinguishable from those of *Salmonella typhimurium*, except some strains ferment maltose late or are anaerogenic.

Antigenic structure: [I], IV, XII: i: 1, 2, 3 . . . (Edwards, Jour. Hyg., *36*, 1936, 348). Many colonies may be examined before the specific phase flagellar antigen is demonstrated. Differs from *Salmonella typhimurium* in lacking antigen V.

Source: Isolated by Dr. McNee from a case of food poisoning in man, France, 1919.

Habitat: Natural host the pigeon, and may infect other animals, including man.

5. **Salmonella sp.** (Type Köln). (*Salmonella köln* Sievers, Cent. f. Bakt., I Abt., Orig., *150*, 1943, 52; *Salmonella coeln* Kauffmann, Acta Path. et Microbiol. Scand., Suppl. 54, 1944, 33.)

Antigenic structure: IV, V, XII: y: 1, 2, 3 . . .

Source: A single culture isolated from a human case of enteritis.

Habitat: Not reported from other sources as yet.

6. **Salmonella sp.** (Type Stanley). (*Bacillus paratyphosus B*, Stanley type, Schütze, Lancet, *1*, 1920, 93; *Salmonella stanleyi* Haupt, Ergebnisse d. Hyg., *13*, 1932, 673; *Salmonella* Stanley type, White, Med. Res. Council, Spec. Rept. Ser. 103, 1926, 19; *Salmonella stanley* Warren and Scott, Jour. Hyg., *29*, 1929, 415; Typus Stanley, Kauffmann, Ztschr. Hyg., *111*, 1930, 210.)

Antigenic structure: IV, V, XII: d: 1, 2 . . .

Source: Isolated from cases of human food poisoning in Stanley, England by Hutchens (1917).

Habitat: Not known as a natural pathogen of animals.

7. **Salmonella sp.** (Type Heidelberg). (*Bacterium enteritidis*, Typus Heidelberg, Habs, Cent. f. Bakt., I Abt., Orig., *130*, 1933, 367; *Salmonella heidelberg* Schutze et al., Jour. Hyg., *34*, 1934, 340.)

Antigenic structure: IV, V, XII: r: 1, 2, 3 . . .

Source: Isolated from cases of human food poisoning in Heidelberg, Germany.

Habitat: Not known as a natural pathogen of animals.

8. **Salmonella sp.** (Type Chester). (*Salmonella chester* Kauffmann and Tesdal, Ztschr. f. Hyg., *120*, 1937, 168.)

Antigenic structure: IV, [V], XII: e, h: e, n, x . . .

Source: Isolated by W. H. Grace, Chester, England, from gastroenteritis in man. Typed by Kauffmann and Tesdal (*loc. cit.*).

Habitat: Has usually been found in human feces.

9. **Salmonella sp.** (Type San Diego). (*Salmonella san diego* Kauffmann, Acta Path. et Microbiol. Scand., *17*, 1940, 429.)

Antigenic structure: IV, [V], XII: e, h: e, n, z_{15} . . .

Source: Originally isolated from cultures sent to Dr. Kauffmann by Dr. K. F. Meyer who obtained them from an outbreak of food poisoning near San Diego, California. Also reported from Denmark, Uruguay and Kentucky.

Habitat: Usually has been isolated from human feces, but has been found in birds and other animals.

10. **Salmonella sp.** (Type Salinas). (*Salmonella salinatis* Edwards and Bruner, Jour. Bact., *44*, 1942, 289.)

Antigenic structure: IV, XII: d, e, h: d, e, n, z_{15} . . .

By cultivation in semi-solid agar containing agglutinating serum for *Salmonella typhosa*, an organism having the antigenic formula for *Salmonella sp.* (Type San Diego) was isolated.

Source: From rat feces collected by Dr. Henry Welch near Salinas, California.

Habitat: Also found in normal human carriers.

11. **Salmonella sp.** (Type Saint Paul). (*Salmonella saint paul* Edwards and Bruner, Jour. Inf. Dis., *66*, 1940, 220.)

Antigenic structure: I, IV, V, XII: e, h: 1, 2, 3 . . .

Source: A single culture isolated from the liver of a turkey poult by Dr. B. S. Pomeroy, St. Paul, Minnesota. Two cases in man.

Habitat: Also reported from hogs.

11a. *Salmonella sp.* (Type Zagreb). (*Salmonella zagreb* Kauffmann, Acta Path. et Microbiol. Scand., *17*, 1940, 351.)

Antigenic structure: IV, V, XII: e, h: 1, 2. . . . This is a minor type of No. 11.

Source: Culture received by Dr. Kauffmann under the label *S. reading* from Dr. N. Cernozubov of Zagreb, Jugoslavia.

Habitat: Not reported from other sources as yet.

12. **Salmonella sp.** (Type Reading). (*Bacillus paratyphosus* B, Reading type, Schütze, Lancet, *1*, 1920, 93; *Salmonella reading* Schutze, Brit. Jour. Exp. Path., *11*, 1930, 34; Typus Reading, Kauffmann, Zentbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella readingensis* Haupt, Ergebnisse d. Hyg., *13*, 1932, 673.)

Antigenic structure: IV, XII: e, h: 1, 5. . . .

Source: Isolated from the Reading, England water supply by Dr. H. Schütze. Also found in hogs (Edwards and Bruner, Jour. Inf. Dis., *72*, 1943, 64).

Habitat: A cause of gastroenteritis in man.

12a. *Salmonella sp.* (Type Kaposvar). (*Salmonella kaposvar* Rauss, Cent. f. Bakt., I Abt., Orig., *147*, 1941, 253; also see Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 212.)

Antigenic structure: IV, V, XII: e, (h) 1, 5. . . . This is a minor type of No. 12.

Source: From the feces of three members of a family suffering from gastroenteritis.

Habitat: Not reported from other sources as yet.

13. **Salmonella sp.** (Type Kaapstad). (*Salmonella reading* var. *kaapstad* Henning, Rhodes and Gordon-Johnstone, Onderstepoort Jour. Vet. Sci. Animal Ind., *16*, 1941, 103; *Salmonella kaapstad* Kauffmann, Acta Path. et Microbiol. Scand., *19*, 1942, 523.)

Antigenic structure: IV, XII: e, h: 1, 7. . . .

Source: From a child with meningitis.

Habitat: Not known from other sources as yet.

14. **Salmonella sp.** (Type Derby). (*Bacillus enteritidis* Peckham, Jour. Hyg., *22*, 1923, 69; Derby type, Savage and White, Med. Res. Council Spec. Rept. Ser. 91, 1925, 19; *Salmonella derby* Warren and Scott, Jour. Hyg., *29*, 1929, 415; *Salmonella derbyensis* Haupt, Ergebnisse d. Hyg., *13*, 1932, 673.)

Antigenic structure: [I], IV, XII: f, g:—.

Source: Isolated from tank water at Derby, England.

Habitat: Widely distributed. Found in human feces, lymph glands of hogs, chickens, etc.

15. **Salmonella sp.** (Type Essen). (*Salmonella essen 173* Hohn and Herrmann, Cent. f. Bakt., I Abt., Orig., *135*, 1936, 505.)

Antigenic structure: IV, XII: g, m: —.

Source: Isolated from the feces of an infant, Essen, Germany.

Habitat: Known only from human sources.

16. **Salmonella sp.** (Type Budapest). (*Salmonella budapest* Rauss, Ztschr. f. Immunitätsf., *95*, 1929, 489.)

Antigenic structure: I, IV, XII: g, t:—.

Source: Originally isolated in Budapest from 3 normal persons and from 3 persons with enteric fever.

Habitat: Known only from human sources.

17. **Salmonella sp.** (Type California). (*Salmonella california* Edwards, Bruner and Hinshaw, Jour. Inf. Dis., *66*, 1940, 127; Hinshaw, Hilgardia, *13*, 1941, 583.)

Antigenic structure: IV, XII, g, m, t:—.

Source: Six cultures isolated from infected turkey poults from California. The seventh culture was isolated from a turkey in a second outbreak of the infection. Reported by Pomeroy and Fenstermacher (Jour. Amer. Vet. Med. Assoc., *94*, 1936, 90). Also found in hogs and man (Edwards and Bruner, Jour. Inf. Dis., *72*, 1943, 64).

Habitat: Also reported from chickens and ducks. Widely distributed.

18. **Salmonella sp.** (Type Brandenburg). (Typus-Brandenburg, Kauffmann and Mitsui, Ztschr. f. Hyg., *111*, 1930, 740; Kauffmann, Zentbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella brandenburgensis* Haupt, Ergebnisse d. Hyg., *13*, 1932, 673; *Salmonella brandenburg* Schütze et al., Jour. Hyg., *34*, 1934, 540.)

Antigenic structure: IV, XII: l, v: e, n, z_{15}. . . . See Kauffmann, Ztschr. f. Hyg., *118*, 1936, 540.

Source: Isolated from a case of gastroenteritis at the Virchow Hospital of Berlin.

Habitat: Known only from human sources.

19. **Salmonella sp.** (Type Bispebjerg). (*Salmonella bispebjerg* Typus, Kauffmann, Ztschr. f. Hyg., *118*, 1936, 540.)

Antigenic structure: I, IV, XII: a: e, n, x. . . .

Source: Isolated from a case of gastroenteritis at the Bispebjerg Hospital in Copenhagen.

Habitat: Not reported from other sources as yet.

20. **Salmonella abortivoequina** (Good and Corbett) Bergey et al. (*Bacillus abortivus equinus* Good and Corbett, Jour. Inf. Dis., *13*, 1913, 53; *Bacillus abortus equi* Meyer and Boerner, Jour. Med. Res., *29*, 1913, 330; *Bacillus abortivo-equinus* Good and Corbett, Jour. Inf. Dis., *18*, 1916, 586; *Bacillus abortus equinus* Weiss and Rice, Jour. Med. Res., *35*, 1907, 403; *Bacillus abortivus* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 477; *Bacillus abortus-equi* Holland, Jour. Bact., *5*, 1929, 216; *Bacterium abortum-equi* Holland, *ibid.*; Bergey et al., Manual, 1st ed., 1923, 217; *Bacillus enteritidis B*, *Typ. equinus* Januschke, Ztschr. f. Infektionskr. d. Haustiere, *29*, 1924, 182; *Salmonella abortus-equi* Bergey et al., Manual, 2nd ed., 1925, 236.) From Latin, aborting and equine.

Antigenic structure: IV, XII: —: e, n, x. . . .

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Source: Isolated from afterbirth of mares that had aborted.

Habitat: A natural pathogen of mares, causing abortion. Infectious for guinea pigs, rabbits, goats, cows, producing abortion.

21. **Salmonella sp.** (Type Arechavaleta). (*Salmonella arechavaleta* Hormaeche and Peluffo, quoted from Hormaeche et al., Jour. Bact., *47*, 1944, 323.) Named in honor of Prof. Arechavaleta of Uruguay.

Antigenic structure: IV, [V], XII: a: 1, 7. . . .

Source: From a human case of gastroenteritis. Also found by Dr. P. R. Edwards among cultures sent to him from the Canal Zone for identification.

Habitat: Known only from human sources.

22. **Salmonella abortusovis** (Lovell) Schütze et al. (*Bacillus paratyphi abortus ovis* Schermer and Ehrlich, Cent. f. Bakt., I Abt., Ref., *73*, 1922, 252; *Bacillus enteritidis C*, *Typ. ovis* Januschke, Ztsch. f. Infektionskr. d. Haustiere, *27*, 1924, 182; *Bacterium abortus ovis* Lovell, Jour. Path. and Bact., *34*, 1931, 13; Typus-Abortus ovis, Kauffmann, Zentlbl. f. d. ges. Hyg., *25*, 1931, 273; Schütze et al., Jour. Hyg., *34*, 1934, 340.)

Antigenic structure: IV, XII: c: 1, 6. . . .

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Source: Isolated from cases of abortion in sheep.

Habitat: Not known to infect any other animal.

23. **Salmonella sp.** (Type Altendorf). (*Salmonella altendorf* Hohn, Cent. f. Bakt., I Abt., Orig., *146*, 1940, 218.)

Antigenic structure: IV, XII: c: 1, 7. . . .

Source: Isolated from a case of acute gastroenteritis from Altendorf, Germany.

Habitat: Not reported from other sources as yet.

24. **Salmonella sp.** (Type Texas). (*Salmonella texas* Watt, De Capito and Moran, U. S. Public Health Repts., *62*, 1947, 808.)

Antigenic structure: IV, V, XII: k: e, n, z_{15}. . . .

Source: Isolated by Dr. James Watt from the feces of a boy convalescing from diarrhoea.

Habitat: Not reported from other sources as yet.

25. **Salmonella abortusbovis** Kauffmann. (Kauffmann, Ztschr. f. Hyg., *120*, 1937, 194.)

Antigenic structure: [I], IV, XXVII, XII: b: e, n, x. . . .

Liquefies gelatin (Kauffmann, Ztschr. f. Hyg., *117*, 1936, 778).

Source: Isolated and incompletely typed by H. Bernard, Ztschr. f. Hyg., *117*, 1935, 352.

Habitat: Normally found in cattle, causing abortion. Occasionally occurs in man.

26. **Salmonella sp.** (Type Bredeney). (*Salmonella bredeney* Kauffmann, Ztschr. f. Hyg., *119*, 1937, 356.)

Antigenic structure: I, IV, [XXVII], XII: l, v: 1, 7. . . .

Source: Found by Hohn and Herrmann in Bredeney, Germany. Typed by Kauffmann (*loc. cit.*). From cases of human gastroenteritis and an abscess of lower jaw.

Habitat: Isolated from human sources. Also found in normal hogs and chickens.

27. **Salmonella sp.** (Type Schleissheim). (*Salmonella schleissheim* Kauffmann and Tesdal, Ztschr. f. Hyg., *120*, 1937, 171.)

Antigenic structure: IV, XXVII, XII: b, z_{12}: —.

Liquefies gelatin (Kauffmann and Tesdal, *loc. cit.*).

Source: Isolated by Hopfengärtner (Münchener tierärz. Wchnschr., *1*, 1929, 185) in Schleissheim. From cattle. Typed by Kauffmann and Tesdal (*loc. cit.*). Also found by Tillmanns in the liver of a horse (Ztschr. f. Fleisch. u. Milch Hyg., *50*, 1940, 109). Caused an outbreak of gastroenteritis in 30 persons (Kauffmann, Acta Path. et Microbiol. Scand., *17*, 1940, 1).

Habitat: Apparently widely distributed.

28. **Salmonella sp.** (Type Schwarzengrund). (*Salmonella schwarzengrund* Kauffmann, Acta Path. et Microbiol. Scand., Suppl. 44, 1944, 34.)

Antigenic structure: I, IV, XXVII, XII: d: 1, 7.

Source: A single culture isolated by Dr. J. Hohn from a human case of enteritis that occurred in Schwarzengrund, near Breslau, Germany.

Habitat: Not reported from other sources as yet.

29. **Salmonella hirschfeldii** Weldin. (*Bacillus paratyphosus* β_5 Weil, Wien. klin. Wchnschr., *30*, 1917, 1061; *Bacillus erzinjan* Neukirch, Ztschr. f. Hyg., *85*, 1918, 103; Paratyphoid C bacillus, Hirschfeld, Lancet, *1*, 1919, 296; "Para-C", Mackie and Bowen, Jour. Roy. Army Med. Corps, *33*, 1919, 154; *Bacillus paratyphosus C* Andrewes and Neave, Brit. Jour. Exp. Path., *2*, 1921, 157; Paratyphus N_1, Iwaschenzoff, Arch. f. Schiffs- u. Trop. Hyg., *30*, 1926, 1; Weldin, Iowa Sta. Coll. Jour. Sci., *1*, 1927, 161; *Bacterium hirschfeldii* Weldin, *ibid.*, 161; Typus-Orient, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella paratyphi C* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 939; *Salmonella paratyphosus C* Castellani and Chalmers, *ibid.*, 952.) Named for Hirschfeld who worked with this organism.

Rods: 0.3 to 0.5 by 1.0 to 2.5 microns, occurring singly. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Grayish, smooth, flat, glistening, margin irregular.

Gelatin stab: Flat, grayish surface growth. No liquefaction.

Agar colonies: Grayish, moist, smooth, translucent.

Broth: Turbid.

Litmus milk: Slightly acid, becoming alkaline.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, maltose, arabinose, xylose, dextrin, trehalose, mannitol, dulcitol and sorbitol. No action on lactose, sucrose,

salicin, adonitol or inositol. Rarely may fail to form gas from sugars (Nabih, Jour. Hyg., *41*, 1941, 39).

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Hydrogen sulfide produced.

Optimum temperature 37°C.

Aerobic, facultative.

Antigenic structure: VI, VII, [Vi]: c: 1, 5. . . .

Source: Isolated from cases of enteric fever in man.

Habitat: A natural pathogen of man causing enteric fever.

30. **Salmonella choleraesuis** (Smith) Weldin. (Probably not the *Bacillus* of swine plague, Klein, Report of the Medical Officer of the Local Gov. Bd., England, 1877–78, Supplement, p. 168; *Bacterium* of swine plague, Salmon, U. S. Dept. Agr. Bur. An. Ind. Ann. Rep., 1885, 212; *Bacterium* of hog cholera, Salmon, *ibid.*, 1886, 20; Bakterium der Schweinepest, Selander, Cent. f. Bakt., *3*, 1888, 361; *Pasteurella salmoni* Trevisan, I generi e le specie delle Batteriacee, 1889, 21; *Bacterium cholerae suis* Th. Smith, U. S. Dept. Agr. Bur. An. Ind., Bull. 6, 1894, 9; Swine-feverbacillus, Klein, Cent. f. Bakt., I Abt., *18*, 1895, 105; *Bacillus suipestifer* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 401; *Bacterium cholerae suum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 233; *Bacterium suipestifer* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 70; *Bacillus cholerae suum* Migula, Syst. d. Bakt., *2*, 1900, 759; Le microbe du hog-cholera, Lignières, Bull. Soc. Cent. Méd. Vet., see Rec. de méd. vét., Paris, Sér. 8, *7*, 1900, 389; *Bacillus salmoni* Chester, Manual Determ. Bact., 1901, 210; *Bacterium intestinale suis* Le Blaye and Guggenheim, Manuel Pratique de Diagnostic Bacteriologique, 1914; *Bacillus suis* Krumwiede, Kohn and Valentine, Jour. Med. Res., *38*, 1918, 89; *Bacterium (Salmonella) cholera suis* Buchanan, Jour. Bact., *3*, 1918, 53; *Salmonella suipestifer* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 939; *Bacillus cholerae-suis* Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 476; *Bacterium cholerae-suis* Holland, Jour. Bact., *5*, 1920, 217; *Bacillus paratyphosus B* (Arkansas type), Schütze, Lancet, *2*, 1920, 93; included in Group I *suipestifer*, Andrewes and Neave, Brit. Jour. Exp. Path., *2*, 1921, 157; Weldin, Iowa Sta. Coll. Jour. Sci., *1*, 1927, 155; Typus suipestifer Amerika, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; the American *Salmonella suipestifer* of many authors.) From Latin, hog cholera.

Salmonella choleraesuis (Smith) Weldin is the type species of the genus *Salmonella*.

Rods: 0.6 to 0.7 by 2.0 to 3.0 microns, occurring singly. Motile with four to five peritrichous flagella. Gram-negative.

Gelatin colonies: Grayish, smooth, flat, glistening; margin irregular.

Gelatin stab: Flat, grayish surface growth. No liquefaction.

Agar colonies: Grayish, moist, smooth, translucent.

Agar slant: Grayish, moist, smooth, translucent growth.

Broth: Turbid, with thin pellicle and grayish-white sediment.

Litmus milk: Slightly acid, becoming alkaline, opalescent, translucent to yellowish-gray.

Potato: Grayish-white streak becoming brownish.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, galactose, mannose, xylose, maltose, glycerol, mannitol, dulcitol, rhamnose, sorbitol and dextrin. Arabinose, inositol, lactose, sucrose, salicin, inulin, raffinose and trehalose not attacked.

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Hydrogen sulfide not produced.

Optimum temperature 37°C.

Aerobic, facultative.

Antigenic structure: VI, VII: c: 1,

5 . . . Serologically identical with *Salmonella typhisuis*, and cross-agglutinates to a varying degree with a number of other serotypes.

Habitat and source: Natural host the pig as an important secondary invader in the virus disease, hog cholera. Does not occur as a natural pathogen in other animals, although lethal for mice and rabbits on subcutaneous injection. Occasionally gives rise to acute gastroenteritis and enteric fever in man.

30a. *Salmonella choleraesuis* var. *Kunzendorf* Schütze et al.

The synonyms up to and including Weldin, 1927 for *Salmonella choleraesuis* apply equally well to the var. Kunzendorf, for these were not separated with certainty until 1926 (White, Med. Res. Council, London, Spec. Rep. Ser. 103, 27). Re-examined serologically a number of previously described strains agree with this variety. (Paratyphus C Bacillus, Heimann, Cent. f. Bakt., I Abt., Orig., *66*, 1912, 211; Paratyphosus C, Weil and Saxl, Wien. klin. Wchnschr., *30*, 1917, 519; Typus-suipestifer Kunzendorf, Pfeiler, Ztschr. f. Infektskr. d. Haust., *20*, 1920, 218; *Bacillus paratyphosus* B, G. type, Schütze, Lancet, *1*, 1920, 93; *Bacillus paratyphosus C*, Dudgeon and Urquart, Lancet, *2*, 1920, 15; included in Group II suipestifer, Andrewes and Neave, Brit. Jour. Exp. Path., *2*, 1921, 157 and Group V of Hecht-Johansen, Copenhagen, 1923; *Salmonella suipestifer* (European variety) Schütze, Brit. Jour. Exp. Path., *11*, 1930 34; *Typus-suipestifer* Kunzendorf, Kauffmann, Zbl. f. d. gen. Hyg., *25*, 1931, 273; *Salmonella choleraesuis* var. *kunzendorf* Schütze et al., Jour. Hyg., *34*, 1934, 341; the European *Salmonella suipestifer* of many authors.)

Indistinguishable from *Salmonella choleraesuis* in morphology and cultural characters, except that the Kunzendorf variety forms hydrogen sulfide.

Antigenic structure: VI, VII: [c]: 1, 5. Differs from *Salmonella choleraesuis* in lacking the specific flagellar phase; serologically identical with *Salmonella typhisuis* var. *voldagsen*.

Source: From pigs with swine fever and once from a monkey in captivity.

Habitat: Causes acute gastro enteritis and enteric fever in man. Also found in cattle, sheep, carnivora and chickens.

31. **Salmonella typhisuis** (Glässer) Schütze et al. (*Bacillus typhisuis* Glässer, Deutsche tierärztl. Wchnschr., *17*, 1909, 513; included in the Ferkeltyphus bacilli of German literature, Dammann and Stedefeder, Arch. f. wiss. u. prakt. Tierheilk., *36*, 1910, 432; *Bacillus glässer* Neukirch, Ztschr. f. Hyg., *85*, 1918, 103; *Bacterium typhi-suis* Holland, Jour. Bact., *5*, 1920, 221; included in Group I suipestifer, Andrewes and Neave, Brit. Jour. Exp. Path., *2*, 1921, 157; Typus-Glässer, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; Schütze et al., Jour. Hyg., *34*, 1934, 342.) From Greek, typhus and Latin, pig.

Rods: 0.6 to 0.7 by 2.0 to 3.0 microns, occurring singly. Motile with four to five peritrichous flagella. Gram-negative.

Gelatin colonies: Grayish, smooth, flat, glistening, edge entire. No liquefaction.

Agar colonies: Grayish, moist, smooth, translucent.

Broth: Turbid.

Litmus milk: Slightly acid or neutral.

Indole not formed.

Nitrites produced from nitrates.

Forms gas slowly and sparsely from all substances. Growth poor on all ordinary media.

Acid from arabinose, xylose and trehalose. Delayed or variable fermentation from dextrin, maltose, rhamnose, dulcitol, sorbitol. Mannitol not fermented or very slowly. Inositol not fermented.

No H_2S produced.

Optimum temperature 37°C.

Aerobic, facultative.

Antigenic structure: Identical with *Salmonella choleraesuis*, from which the

organism differs in respect to arabinose and trehalose. Antigenic structure VI, VII: c: 1, 5. . . .

Habitat: Infects only the pig.

31a. *Salmonella typhisuis* var. *voldagsen* Schütze et al. (Included in Ferkeltyphus bacilli, Dammann and Stedefeder, Arch. f. wiss. u. prakt. Tierheilk., *36*, 1910, 432; *Bacillus voldagsen* Neukirch, Ztschr. f. Hyg., *85*, 1918, 103; included in Group II suipestifer, Andrewes and Neave, Brit. Jour. Exp. Path., *2*, 1921, 157; Typus-voldagsen, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella typhisuis* var. *voldagsen*, Schütze et al., Jour. Hyg., *34*, 1934, 342.)

Morphology and cultural characters identical with those of *Salmonella typhisuis*.

Antigenic structure: VI, VII: [c]: 1, 5. . . . Identical with that of *Salmonella choleraesuis* var. *Kunzendorf* from which species the organism differs culturally.

Habitat: Infects only the pig.

32. **Salmonella sp.** (Type Thompson). (Thompson type of *Salmonella*, Scott, Jour. Hyg., *25*, 1925, 398; Typus-Thompson-Berlin, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella thompson* Schütze et al., Jour. Hyg., *34*, 1934, 343.) Named after the family involved in the outbreak.

Antigenic structure, VI, VII: k: 1, 5. . . .

Source: Isolated from food poisoning in man. Also found in chickens and turkeys (Edwards and Bruner, Jour. Inf. Dis., *72*, 1943, 64).

Habitat: Widely distributed in warm-blooded animals.

32a. *Salmonella sp.* (Type Berlin) (Type Thompson). (Typus-Berlin, Kauffmann, Cent. f. Bakt., I Abt., Ref., *94*, 1929, 282; Typus C Berlin, Boecker and Kauffmann, Cent. f. Bakt., I Abt., Orig., *116*, 1930, 458; Typus-Thompson-Berlin, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella thompson* var. *berlin* Schütze et al., Jour. Hyg., *34*, 1934, 343.)

Antigenic structure: VI, VII: [k]: 1, 5. . . .

Source: Isolated from food poisoning in man. Not known to be a natural pathogen of animals.

Habitat: A natural pathogen of man causing food poisoning.

33. **Salmonella sp.** (Type Montevideo). (*Salmonella montevideo* Hormaeche and Peluffo, Arch. Urug. de Med., Cirug. y Espec., *9*, 1936, 673.)

Antigenic structure: VI, VII: g, m, s: —.

Source: Originally isolated from human sources in Montevideo from an ape that died of an enterocolitis, and mesenteric glands of healthy hogs; also reported from chickens and powdered eggs (Schneider, Food Research, *11*, 1946, 313).

Habitat: Apparently widely distributed.

34. **Salmonella sp.** (Type Oranienburg). (Typus-Oranienburg, Kauffmann, Ztschr. f. Hyg., *111*, 1930, 223; *Salmonella oranienburgensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673; *Salmonella oranienburg* Schütze et al., Jour. Hyg., *34*, 1934, 343.)

Antigenic structure: VI, VII: m, t: —.

Source: From the feces of a child in a children's home near Oranienburg. Later isolated from gastroenteritis in man. Also from quail, chickens and powdered eggs (Schneider, *loc. cit.*).

Habitat: Reported from human sources, from hogs and from birds.

35. **Salmonella sp.** (Type Virchow). (Typus-Virchow, Kauffmann, Ztschr. f. Hyg., *111*, 1930, 221; *Salmonella virchowii* Haupt, Ergebnisse der Hyg., *13*, 1932, 673; *Salmonella virchow* Schütze et al., Jour. Hyg., *34*, 1934, 343.)

Antigenic structure: VI, VII: r: 1, 2, 3. . . .

Source: Isolated from food poisoning in a man at the Rudolf Virchow Hospital in Berlin.

Habitat: A natural pathogen of man causing food poisoning.

36. **Salmonella sp.** (Type Oslo). (*Salmonella oslo* Tesdal, Ztschr. f. Hyg., *119*, 1937, 451.)

Antigenic structure: VI, VII: a: e, n, x. . . .

Source: Isolated in Oslo, Norway from cases of gastroenteritis in man.

Habitat: Not reported from other sources as yet.

37. **Salmonella sp.** (Type Amersfoort). (*Salmonella amersfoort* Henning, Jour. Hyg., *37*, 1937, 561.)

Antigenic structure: VI, VII: d: e, n, x. . . .

Source: Originally isolated from chickens from Amersfoort, Transvaal. Later found in a human mixed infection with *Salmonella typhi murium*.

Habitat: Not reported from other sources as yet.

38. **Salmonella sp.** (Type Braenderup). (*Salmonella braenderup* Kauffmann and Henningsen, Ztschr. f. Hyg., *120*, 1937, 640.)

Antigenic structure: VI, VII: e, h: e, n, z_{15}. . . .

Source: Isolated from a case of human gastroenteritis in Braenderup, Denmark. Also from a cat in the same home that had died from a diarrhoea. Reported later from So. Africa (see Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 237).

Habitat: Apparently widely distributed.

39. **Salmonella sp.** (Type Potsdam). (Typus-Potsdam, Kauffmann and Mitsui, Ztschr. f. Hyg., *111*, 1930, 740; *Salmonella potsdamensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673; *Salmonella potsdam* Schütze et al., Jour. Hyg., *34*, 1934, 343.)

Antigenic structure: VI, VII: l, v: e, n. z_{15}. . . .

Source: Isolated from food poisoning in man at Potsdam, Germany.

Habitat: A natural pathogen of man causing food poisoning.

40. **Salmonella sp.** (Type Bareilly). (*Salmonella*, Type Bareilly, Bridges and Scott, Jour. Roy. Army Med. Corps, *56*, 1931, 241; *Salmonella bareilly* Schütze et al., Jour. Hyg., *34*, 1934, 343.)

Antigenic structure: VI, VII: y: 1, 5. . . .

Source: Isolated in 1928 from cases of mild enteric fever that occurred in Bareilly, India. Also reported from chickens (Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1942, 235).

Habitat: A natural pathogen of man causing gastroenteritis and enteric fever. Widely distributed in fowls.

41. **Salmonella sp.** (Type Hartford). (*Salmonella hartford* Edwards and Bruner, Jour. Inf. Dis., *69*, 1941, 223.)

Antigenic structure: VI, VII: y: e, n, x. . . .

Source: One culture isolated from the stool of a man with persistent diarrhoea by Dr. E. K. Borman, Hartford, Conn.

Habitat: Not reported from other sources as yet.

42. **Salmonella sp.** (Type Mikawasima*). (*Salmonella bareilly* var. *mikawasima* Hatta, Japan Jour. Exper. Med., *16*, 1938, 201; *Salmonella mikawasima* Hormaeche, quoted from Schütze et al., Proc. 3rd Internat. Cong. Microbiol., 1940, 337; also see Kauffmann, Acta Path. et Microbiol. Scand., *16*, 1939, 347 and *ibid.*, *17*, 1940, 429.)

Antigenic structures: VI, VII: y: e, n, z_{15}. . . .

---

*Correct spelling according to Prof. Kojima.

Source: Isolated from a rat by Prof. Kojima and Prof. Hatta, 1937.

Habitat: Not reported from other sources as yet.

43. **Salmonella sp.** (Type Tennessee). (*Salmonella tennessee* Bruner and Edwards, Proc. Soc. Exp. Biol. and Med., *50*, 1942, 174.)

Antigenic structure: VI, VII: z_{29}: —.

Source: Culture isolated from feces of normal carrier by Dr. W. C. Williams, State Dept. of Health, Nashville, Tennessee.

Habitat: Also reported from turkeys and powdered eggs.

44. **Salmonella sp.** (Type Concord). (*Salmonella* var. *concord* Edwards and Hughes, Jour. Bact., *47*, 1944, 574.)

Antigenic structure: VI, VII: l, v: 1, 2, 3. . . .

Source: Two cultures isolated by Dr. J. R. Beach and one by Dr. C. U. Duckworth from fatal infections in chicks (U. S. A.) and one by Dr. Joan Taylor from the stool of a person affected with gastroenteritis (England).

Habitat: Also reported from turkeys.

45. **Salmonella sp.** (Type Infantis). (*Salmonella infantis* Wheeler and Borman, Jour. Bact., *46*, 1943, 481.)

Antigenic structure: VI, VII: r: 1, 5. . . .

Source: Isolated at Hartford, Connecticut from the blood of an infant. Subsequently also from stools.

Habitat: Not reported from other sources as yet.

46. **Salmonella sp.** (Type Georgia). (*Salmonella georgia* Morris, Brim and Sellers, Amer. Jour. Pub. Health, *34*, 1944, 1279; Seligmann, Saphra and Wassermann, Amer. Jour. Hyg., *40*, 1944, 227.)

Antigenic structure: VI, VII: b: e, n, z_{15}. . . .

Source: Isolated by Miss Jane Morris from the feces of a 16-year-old boy during routine examination of food handlers, State Dept. of Health, Atlanta, Georgia.

Habitat: Not reported from other sources as yet.

47. **Salmonella sp.** (Type Papua). (*Salmonella papuana* Wilcox, Edwards and Coates, Jour. Bact., *49*, 1945, 514.)

Antigenic structure: VI, VII: r: e, n, z_{15}. . . .

Source: Isolated by Lt. Goldwasser from human feces from Port Moresby in Papua, New Guinea.

Habitat: Not reported from other sources as yet.

48. **Salmonella sp.** (Type Richmond). (*Salmonella richmond* Moran and Edwards, Proc. Soc. Exp. Biol. and Med., *62*, 1946, 294.)

Antigenic structure: VI, VII: y: 1, 2, 3. . . .

Source: Isolated by Mr. Forest Spindle in Richmond, Virginia from the feces of a child affected with gastroenteritis.

Habitat: Isolated as yet from human sources only.

49. **Salmonella sp.** (Type Cardiff). (*Salmonella cardiff* Taylor, Edward and Edwards, Brit. Med. Jour., 1945, i, 368.)

Antigenic structure: VI, VII: k: 1, 10. . . .

Source: Isolated from human case of gastroenteritis from Cardiff, Wales.

Habitat: Isolated as yet from human sources only.

50. **Salmonella sp.** (Type Daytona). (*Salmonella daytona* Moran and Edwards, Proc. Soc. Exp. Biol. and Med., *62*, 1946, 294.)

Antigenic structure: VI, VII: k: 1, 6. . . .

Source: Isolated by Mrs. Mildred Galton from human feces from Daytona, Florida.

Habitat: Not known from other sources as yet.

51. **Salmonella sp.** (Type Newport). (Paratyphus β_2, Weil and Saxl, Wien. klin. Wchnschr., *30*, 1917, 519; *Bacillus paratyphosus B*, Newport type, Schütze, Lancet, *1*, 1920, 93; Paratyphus Newport Bacillus, Kauffmann, Cent. f. Bakt., I Abt., Ref., *94*, 1929, 282; *Salmonella newport* Schütze, Brit. Jour. Exp. Path., *11*, 1930, 34; *Salmonella newportensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673.)

Antigenic structure: VI, VIII: e, h: 1, 2, 3. . . .

Source: Isolated from food poisoning in man, Newport, England.

Habitat: Widely distributed in man, cattle, hogs, chickens, etc. Also in snakes (Hinshaw and McNeil, Amer. Jour. Vet. Res., *6*, 1945, 264).

51a. *Salmonella sp.* (Type Puerto Rico) Kauffmann. (Jordan, Amer. Jour. Trop. Dis., *14*, 1934, 27; Kauffmann, Cent. f. Bakt., I Abt., Orig., *132*, 1934, 162; Schütze et al., Jour. Hyg., *34*, 1934, 344.)

Antigenic structure: VI, VIII: [e, h]: 1, 2, 3. . . .

This is regarded as a non-specific variant of *Salmonella sp.* (Type Newport) by Schütze et al. (Proc. 3rd Internat. Cong. Microbiol., New York, 1940, 833).

52. **Salmonella sp.** (Type Pueris). (*Salmonella pueris* Wheeler and Borman, Jour. Bact., *46*, 1943, 481.)

Antigenic structure: VI, VIII: e, h: 1, 2. . . .

Source: Isolated at Hartford, Connecticut from anal swabbings of a 14-year-old boy during an attack of gastroenteritis complicating measles.

Habitat: Not reported from other sources as yet.

53. **Salmonella sp.** (Type Kottbus). (*Salmonella newport* var. *kottbus* Kauffmann, Cent. f. Bakt., I Abt., Orig., *132*, 1934, 162; *Salmonella kottbus* Schütze et al., Proc. 3rd Internat. Microbiol. Cong., New York, 1940, 834.)

Antigenic structure: VI, VIII: e, h: 1, 5. . . .

Source: From an acute case of gastroenteritis in Kottbus, Denmark.

Habitat: Not reported from other sources as yet.

54. **Salmonella sp.** (Type Muenchen). (Typus München, Mandelbaum, Cent. f. Bakt., I Abt., Ref., *105*, 1932, 377; *Salmonella muenchen* Schütze et al., Jour. Hyg., *34*, 1934, 344.)

Antigenic structure: VI, VIII: d: 1, 2. . . .

Source: Isolated from a fatal case of enteric fever.

Habitat: Widely distributed. Reported from man, rabbits, hogs, camels and chickens (Kauffmann, Die Bakteriologie der Salmonella Gruppe, 1941, 244).

54a. *Salmonella sp.* (Type Oregon). (*Salmonella oregon* Edwards and Bruner, Amer. Jour. Hyg., *34*, 1941, 21.)

Antigenic structure: VI, VIII: d: 1, 2, 3. . . .

Source: Six cultures, one isolated from a turkey by Dr. E. M. Dickinson and five from the mesenteric glands of apparently normal hogs by Dr. H. L. Rubin. This is a minor type of No. 54.

Habitat: Also reported from reptiles, chickens and man. Also powdered eggs.

55. **Salmonella sp.** (Type Manhattan). (*Salmonella manhattan* Edwards and Bruner, Amer. Jour. Hyg., *34*, 1941, 21.)

Antigenic structure: VI, VIII: d:, 1, 5. . . .

Source: Two cultures, one isolated from a chicken by Dr. L. D. Bushnell, Manhattan, Kansas, and the other from a turkey by Dr. W. R. Hinshaw. Also

from reptiles, hogs and human sources (Edwards and Bruner, Jour. Inf. Dis., *72*, 1942, 64).

Habitat: Apparently widely distributed.

56. **Salmonella sp.** (Type Litchfield). (*Salmonella litchfield* Edwards and Bruner, Jour. Inf. Dis., *66*, 1940, 220.)

Antigenic structure: VI, VIII: l, v: 1, 2, 3. . . .

Source: Isolated from the liver of a young turkey poult from Litchfield, Minnesota by Dr. B. S. Pomeroy. Also isolated from a case of food poisoning in man by Miss Georgia Cooper.

Habitat: Not reported from any other source, as yet.

57. **Salmonella morbificans** (Migula) Haupt. (*Bacillus bovis morbificans* Basenau, Arch. f. Hyg., *20*, 1894, 257; *Bacillus morbificans bovis* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 380; *Bacterium morbificans bovis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 70; *Bacillus morbificans* Migula, Syst. d. Bakt., *2*, 1900, 747; *Flavobacterium morbificans* Bergey et al., Manual, 3rd ed., 1930, 147; Haupt, Ergebnisse der Hyg., *13*, 1930, 673; *Salmonella bovis-morbificans* Schütze et al., Jour. Hyg., *34*, 1934, 344.)

Antigenic structure: VI, VIII: r: 1, 5. . . .

Source: Originally isolated from a septicemia in a cow.

Habitat: Also found in rabbits and in gastroenteritis in man.

58. **Salmonella sp.** (Type Narashino). (*Salmonella narashino* Nakaguro and Yamashita, quoted from Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 246.)

Antigenic structure: VI, VIII: a: e, n, x. . . .

Source: From the blood and feces of a person suffering from enteric fever. Found in Japan.

Habitat: Not reported from other sources as yet.

59. **Salmonella sp.** (Type Buenos Aires). (*Salmonella bonariensis* Monteverde, Nature, *149*, 1942, 472.)

Antigenic structure: VI, VIII: i: e, n, x. . . .

Source: Isolated by Dr. Monteverde, Buenos Aires from a mesenteric gland of a normal hog.

Habitat: Also reported from normal human carriers and from cases of gastroenteritis.

60. **Salmonella sp.** (Type Glostrup). (*Salmonella glostrup* Kauffmann and Henningsen, Acta Path. et Microb. Scand., *16*, 1939, 99.)

Antigenic structure: VI, VIII: z_{10}: e, n, z_{15}. . . .

Source: Isolated from cases of gastroenteritis in a family in Denmark. Also affected their dog. Later isolated in Jugoslavia and in Palestine.

Habitat: Evidently widely distributed.

61. **Salmonella sp.** (Type Duesseldorf). (*Salmonella duesseldorf* Hohn, Cent. f. Bakt., I Abt., Orig., *146*, 1940, 218.)

Antigenic structure: VI, VIII: z_4, z_{24}: —.

Source: Isolated from two patients, one of whom died. Found in Duesseldorf, Germany.

Habitat: Not reported from other sources as yet.

62. **Salmonella sp.** (Type Tallahassee). (*Salmonella tallahassee* Moran and Edwards, Proc. Soc. Exp. Biol. and Med., *62*, 1946, 294.)

Antigenic structure: VI, VIII: z_4, z_{32}: —.

Source: Isolated by Mrs. Mildred Gal-

ton from feces of gastroenteritis patients and from normal human carriers, Tallahassee, Florida.

Habitat: Not known from other sources.

63. **Salmonella sp.** (Type Gatun). (*Salmonella gatuni* Wilcox and Coates, Jour. Bact., *51*, 1946, 561.)

Antigenic structure: VI, VIII: b: e, n, x. . . .

Source: Isolated from human feces from Gatun, Canal Zone.

Habitat: Not known from other sources as yet.

64. **Salmonella sp.** (Type Amherst). (*Salmonella amherstiana* Edwards and Bruner, Jour. Immunol., *44*, 1942, 319.)

Antigenic structure: (VIII): l, v: 1, 6. . . .

Source: Isolated by Dr. H. Van Roekel from one of a group of poults affected with a fatal disease.

Habitat: Not reported from other sources as yet.

65. **Salmonella sp.** (Type Virginia). (*Salmonella virginia* Saphra and Seligmann, Proc. Soc. Exper. Biol. and Med., *58*, 1945, 50.)

Antigenic structure: (VIII): d: —.

Source: Isolated by F. Spindle, Richmond, Virginia from the feces of an adult person suffering from a diarrhoea.

Habitat: Not known from other sources as yet.

66. **Salmonella typhosa** (Zopf) White. (Bacillus des Abdominal-Typhus, Eberth, Arch. f. path. Anat., *81*, 1880 and *83*, 1881; Typhus bacillen, Gaffky, Mitteil. a. d. kaiserl. Gesundheitsamte, *2*, 1884, 372; *Bacillus typhosus* Zopf, Die Spaltpilze, 3 Aufl., 1885, 126; not *Bacillus typhosus* Klebs, Handbuch d. path. Anat., 1880; *Bacillus typhi* Schroeter, in Cohn, Kryptogamen Flora v. Schlesien, *3*, 1886, 165; *Bacillus typhi abdominalis* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 198; *Vibrio typhosus* Trevisan, I generi e le specie delle Batteriacee, 1889, 23; *Bacterium typhi* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 73; *Bacterium typhosum* Twort, Proc. Royal Soc., London, *79*, B, 1907, 329; *Acystia typhi* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 517; *Bacterium (Eberthella) typhi* Buchanan, Jour. Bact., *3*, 1918, 53; *Eberthus typhosus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 936; *Eberthella typhi* Bergey et al., Manual, 1st ed., 1923, 223; *Eberthella typhosa* Weldin, Iowa State College Jour. Sci., *1*, 1927, 170; *Salmonella typhi* Warren and Scott, Jour. Hyg., *29*, 1930, 416; White, Jour. Hyg., *29*, 1930, 443.) Named from the disease, typhoid fever.

The species name *typhosa* should be used for the typhoid organism when it is placed in any genus other than *Bacillus* in spite of the earlier use of this species name by Klebs for a different organism. There are two reasons for this: (a) This appears to be the proper course to follow under International Rules of Nomenclature (See Art. 54, p. 54) and (b) there is less chance for confusion regarding the nature of this organism among English-speaking persons who may carelessly interpret *typhi* as the name of a typhus rather than a typhoid bacillus.

Rods: 0.6 to 0.7 by 2.0 to 3.0 microns, occurring singly, in pairs, occasionally short chains. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Grayish, transparent to opaque, with leaf-like surface markings.

Gelatin stab: Thin, white, opalescent growth. No liquefaction.

Agar colonies: Grayish, transparent to opaque.

Agar slant: Whitish-gray, glistening, echinulate, entire to undulate growth

Broth: Turbid, moderate sediment and delicate pellicle in old cultures.

Litmus milk: Slight, transient acidity, followed by a return to neutral or to slight alkalinity.

Potato: Delicate, moist, slightly spreading, barely visible growth.

Acid but no gas from glucose, fructose, galactose, xylose, maltose, raffinose, dextrin, glycerol, mannitol and sorbitol. No action on lactose, sucrose, inulin, rhamnose, inositcl, salicin and usually arabinose and dulcitol.

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Indole not formed.

No characteristic odor.

Nitrites produced from nitrates.

Hydrogen sulfide produced.

Aerobic, facultative.

Optimum temperature 37°C.

Antigenic structure: IX, XII, [Vi]: d: —. The somatic antigens are related to those of *Salmonella enteritidis* and a number of other species of *Salmonella*. V and W forms are present (Felix and Pitt, Jour. Path. and Bact., *38*, 1934, 409; Craigie and Brandon, Jour. Path. and Bact., *43*, 1936, 233 and 239). Craigie and Yen (Canadian Public Health Journal, *29*, 1938, 448 and 484) by the action of selected Vi phages recognize eleven distinct stable types of *Salmonella typhosa* which have been found to be of epidemiological importance.

Source: From the human intestine.

Habitat: The cause of typhoid fever. Pathogenic for laboratory animals on parenteral injection. Isolated once from a chicken by Henning, Onderstepoort, So. Africa.

Note: This species has previously been regarded as the type species of the genus *Eberthella* Buchanan (*Acystia* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 317; Buchanan, Jour. Bact., *3*, 1918, 53; *Eberthus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 934; *Lankoides* Castellani and Chalmers, *ibid.*, 938; *Wesenbergus* Castellani and Chalmers, *ibid.*, 940.)

67. **Salmonella enteritidis** (Gaertner) Castellani and Chalmers. (*Bacillus enteritidis* Gaertner, Correspond. d. Allgemein. Artzl. Verein Thuringen, *17*, 1888, 573; *Klebsiella enteritidis* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 923; *Bacterium enteritidis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 68; *Bacillus gaertner* Morgan, Brit. Med. Jour., *1*, 1905, 1257; Castellani and Chalmers, Manual Trop. Med., 3rd ed., 1919, 930.) Named for the disease, enteritis.

Rods: 0.6 to 0.7 by 2.0 to 3.0 microns, occurring singly, in pairs and occasionally in short chains. Motile with peritrichous flagella. Gram-negative.

Gelatin colonies: Circular, gray, translucent, granular, entire.

Gelatin stab: Abundant surface growth. No liquefaction.

Agar colonies: Circular, gray, translucent, moist, smooth, entire. Deskowitz and Buchbinder (Jour. Bact., *29*, 1935, 294) describe a variant that produces a soluble yellow pigment where certain peptone is present in the agar. Antigenic structure not determined.

Agar slant: Grayish-white, opalescent, smooth, moist, undulate growth.

Broth: Turbid, with thin pellicle and grayish-white sediment.

Litmus milk: Slightly acid, becoming alkaline, opalescent, translucent to yellowish-gray.

Potato: Abundant, moist, yellowish-brown to brown growth.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, galactose, mannose, arabinose, xylose, maltose, trehalose, dextrin, glycerol, mannitol, dulcitol and sorbitol. No acid or gas from lactose, sucrose, inulin, salicin, raffinose, adonitol and inositol.

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Hydrogen sulfide produced.

No characteristic odor.

Aerobic, facultative.

Optimum temperature 37°C.

Antigenic structure: [I], IX, XII: g, m: —.

Source: First isolated from feces in an epidemic of meat poisoning at Frankenhausen, Germany.

Habitat: Widely distributed, occurring in man. Also in domestic and wild animals, particularly rodents.

67a. *Salmonella enteritidis* var. *Danysz.* (Bahr, Deutsche tierärztl. Wchnschr., 1928, 786 and 1930, 145; Typus-Gärtner Ratin, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella enteritidis* var. *danysz*, Schütze et al., Jour. Hyg., *34*, 1934, 345; *Salmonella danysii* Gay et al., Agents of Disease and Host Resistance, 1935, 650.)

Differs from *Salmonella enteritidis* only in its negative action on glycerol in Stern's medium.

Source: Isolated by Danysz in 1900.

Habitat: A natural pathogen of rodents and man.

67b. *Salmonella enteritidis* var. *Chaco.* (Savino and Menendez, Rev. Inst. Bact., *6*, 1934, 347; Kauffmann, Ztschr. f. Hyg., *117*, 1935, 401.)

Differs from *Salmonella enteritidis* in its action on dulcitol when tested by the method of Bitter, Weigmann and Habs (Münch. med. Wchnschr., *73*, 1926, 940.)

Habitat and source: Isolated from cases of fever during the Chaco war, South America.

67c. *Salmonella enteritidis* var. *Essen.* (Hohn and Herrmann, Cent. f. Bakt., I Abt., Orig., *133*, 1935, 183; *ibid.*, *134*, 1935, 277; Kauffmann, Ztschr. f. Hyg., *117*, 1935, 401.)

Differs from *Salmonella enteritidis* when tested by the method of Bitter, Weigmann and Habs (Münch. med. Wchnschr., *73*, 1926, 940), giving a negative reaction with arabinose and dulcitol.

Habitat and source: Isolated from human gastroenteritis, ducks and duck eggs.

NOTE: Jansen (Cent. f. Bakt., I Abt., Orig., *135*, 1935, 421) states that the organism named by him *Salmonella enteritidis* var. *Mulheim* is in reality *Salmonella enteritidis* var. *Essen.*

67d. *Salmonella enteritidis* var. *Jena.* (Fournier, Rev. Immunolog., Paris, *6*, 1940–41, 264.)

Source: Isolated from purulent pleural fluid.

Habitat: Not reported from other sources as yet.

68. **Salmonella sp.** (Type Dublin). (*Bacillus enteritidis* Pesch, Cent. f. Bakt., I Abt., Orig., *98*, 1926, 22; Dublin Type, White, Med. Res. Counc., Syst. of Bact., *4*, 1929, 86 and White, Jour. Hyg., *29*, 1930, 443; *Salmonella dublin* Warren and Scott, Jour. Hyg., *29*, 1930, 415; Typus-Dublin-Kiel, Kauffmann, Zbl. f. d. ges. Hyg., *25*, 1931, 273; *Salmonella enteritidis* var. *dublin* Schütze et al., Jour. Hyg., *34*, 1934, 345.)

Antigenic structure: I, IX, XII: g, p: —.

Source: From meningitis in children (Pesch, *loc. cit.*). Also isolated by Dr. J. W. Bigger in Dublin, Eire from a fatal fever following a kidney operation. Typed by Dr. Bruce White (*loc. cit.*).

Habitat: Found in man. A natural pathogen of cattle. Widely distributed in cattle and foxes.

Two special fermentative types belong here: (1) *Salmonella dublin 2* = *Salmonella dublin* var. *accra* Kauffmann, (2) *Salmonella dublin 3* = *Salmonella dublin* var. *koeln* Kauffmann (Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 252).

69. **Salmonella sp.** (Type Rostock). (Gärtner-Poppe Typus, Bahr, Dtsch. Tierärzt. Wchnschr., 1930, 145; Typus

Gärtner-Rostock, Kauffmann, Ztschr. f. Hyg., *111*, 1930, 221; *Salmonella enteritidis* var. *rostock* Schütze et al., *34*, 1934, 345; *Salmonella rostockensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673.)

Antigenic structure: I, IX, XII: g, p, u: —.

Source: Originally isolated from cattle by Dr. Poppe in Rostock, Germany.

Habitat: Not known to infect man.

70. **Salmonella sp.** (Type Moscow). (Paratypus C_1, Weigmann, Cent. f. Bakt., I Abt., Orig., *97*, 1925, Beiheft, 299; *Salmonella* Type Moscow, Hicks, Jour. Hyg., *29*, 1929, 446; *Salmonella moscow* Warren and Scott, Jour. Hyg., *29*, 1929, 446; Typus Gärtner-Moskow, Kauffmann, Ztschr. f. Hyg., *111*, 1930, 229; *Salmonella moscowaensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673; *Salmonella enteritidis* var. *moscow*, Schütze et al., *34*, 1934, 345).

Antigenic structure: IX, XII: g, q: —.

Source: From patients with enteric fever. Isolated in Moscow, Russia.

Habitat: Infects man, horses, cattle.

71. **Salmonella sp.** (Type Blegdam). (*Salmonella blegdam* Kauffmann, Ztschr. f. Hyg., *117*, 1935, 431.)

Antigenic structure: IX, XII: g, m, q: —.

Source: Isolated in 1929, at State Serum Institute, Copenhagen from the blood of a pneumonia patient. Also found in the blood of a patient by Dr. Fournier, in Shanghai, China (Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 264).

Habitat: Not reported from other sources as yet.

72. **Salmonella sp.** (Type Berta). (*Salmonella berta* Hormaeche, Peluffo and Salsamendi, Arch. Urug. de Med., Cirug. y Espec., *12*, 1938, 277.) Named in honor of Prof. Arnoldo Berta, Uruguay.

Antigenic structure: IX, XII: f, g, t: —.

Source: Isolated from the mesenteric glands of normal hogs.

Habitat: Causes gastroenteritis in man. Also found in chickens.

73. **Salmonella sp.** (Type Pensacola). (*Salmonella pensacola* Moran and Edwards, Proc. Soc. Exper. Biol. and Med., *59*, 1945, 52.)

Antigenic structure: IX, XII: g, m, t: —.

Source: From a severe case of gastroenteritis in man.

Habitat: Not reported from other sources as yet.

74. **Salmonella sp.** (Type Claiborne). (*Salmonella claibornei* Wilcox and Lennox, Jour. Immunol., *49*, 1944, 71.)

Antigenic structure: I, IX, XII: k: 1, 5. . . .

Source: Culture isolated from human feces at Camp Claiborne, Louisiana.

Habitat: Not known from other sources as yet.

75. **Salmonella sp.** (Type Sendai). (K type, Shimojo, quoted from Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 265; Atypical Paratyphosus A, Aoki and Sakai, Cent. f. Bakt., I Abt., Orig., *95*, 1925, 152; Sendai type, White, Med. Res. Council, Spec. Rept. Ser. No. 103, 1926, 118; *Salmonella sendaiensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673; *Salmonella sendai* Schütze et al., Jour. Hyg., *34*, 1934, 345; *Eberthella sp.* (Sendai Type) F. Smith, in Manual, 5th ed., 1939, 464.)

Antigenic structure: [I], IX, XII: a: 1, 5. . . .

Source: Isolated in 1922 by K. Shimojo in Japan from a case of paratyphoid. Later isolated by Aoki and Sakoi from feces, urine and blood of typhoid patients.

Habitat: A natural pathogen of man causing enteric fever.

76. **Salmonella sp.** (Type Miami). (*Salmonella miami* Edwards and Moran, Jour. Bact., *50*, 1945, 259.)

Antigenic structure: IX, XII: a: 1, 5. . . .

Differ culturally and biochemically from organisms of Sendai Type (Edwards and Moran, Jour. Bact., *50*, 1945, 257).

Source: Twenty-four cultures isolated by Mrs. Mildred Galton in Florida. Fourteen cultures were from cases of acute gastroenteritis, one from a patient with chronic diarrhoea, 4 from food handlers, 4 from chimpanzees thought to be affected with bacillary dysentery and one from pickles which caused an outbreak of food poisoning. One culture was from Borman, Wheeler, West and Mickle (Amer. Jour. Pub. Health, *33*, 1943, 127) and was isolated from a case of gastroenteritis in Connecticut. Another culture was from Seligmann, Saphra and Wassermann (Amer. Jour. Hyg., *38*, 1943, 225) and was isolated from a case of enteric fever.

Habitat: Apparently widely distributed as a natural pathogen of man and apes.

77. **Salmonella sp.** (Type Durban). (*Salmonella durban* Henning, Rhodes and Gordon-Johnstone, Onderstepoort Jour. Vet. Sci. An. Ind., *16*, 1941, 103; also see Kauffmann, Acta Path. et Microbiol. Scand., *19*, 1942, 523.)

Antigenic structure: IX, XII: a: e, n, z_{15}. . . .

Source: Isolated by Dr. J. Gordon-Johnstone in Durban, So. Africa from feces of a woman affected with gastroenteritis.

Habitat: Not reported from other sources as yet.

78. **Salmonella sp.** (Type Onarimon). (*Salmonella onarimon* Kisida, Kitasato Arch. of Exper. Med., *17*, 1940, 1.)

Antigenic formula: I, IX, XII: b: 1, 2. . . .

Source: From the feces of a paratyphoid B carrier. Later found in other cases of enteric fever resembling typhoid.

Habitat: Cause of a typhoid-like disease in man.

79. **Salmonella sp.** (Type Eastbourne). (*Salmonella eastbourne* Leslie and Shera, Jour. Path. and Bact., *34*, 1931, 533.)

Antigenic structure: [I], IX, XII: e, h: 1, 5. . . .

May or may not produce indole (Kauffmann, Die Bakteriologie der Salmonella-Gruppe, 1941, 12.)

Source: From human enteric fever at Eastbourne, England.

Habitat: A natural pathogen for man. Also found in turkeys.

80. **Salmonella sp.** (Type Panama). (Jordan, Amer. Jour. Trop. Med., *14*, 1934, 27; *Salmonella panama* Kauffmann, Cent. f. Bakt., I Abt., Orig., *132*, 1934, 160.)

Antigenic structure: I, IX, XII: l, v: 1, 5. . . .

Source: From human food poisoning at Fort Amador, in Panama, Canal Zone. Also isolated in New York City, Germany and Uruguay. Also in reptiles, hogs and chickens (Edwards and Bruner, Jour. Inf. Dis., *72*, 1943, 64).

Habitat: Apparently widely distributed.

81. **Salmonella sp.** (Type Dar es Salaam). (Brown, Duncan and Henry, Lancet, *1*, 1926, 117; Dar-es-Salaam Typus, Schütze, Arch. f. Hyg., *100*, 1928, 192; *Salmonella daressalaamensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673; *Salmonella dar-es-salaam* Schütze et al., Jour. Hyg., *34*, 1934, 346.)

Antigenic structure: I, IX, XII: l, w: e, n. . . .

Liquefies gelatin (Jordan, Jour. Inf. Dis., *58*, 1936, 126).

Source: Isolated by Butler in 1922 from a case of pyrexia at Dar es Salaam, East Africa. Cultures have also been reported from Zanzibar.

Habitat: Known thus far from human sources only.

82. **Salmonella sp.** (Type Goettingen). (*Salmonella goettingen* Hohn, Cent. f. Bakt., I Abt., Orig., *146*, 1940, 218.)

Antigenic structure: IX, XII: l, v: e, n, z_{15}. . . .

The complete formula was developed by Kauffmann (Acta Path. et Microbiol. Scand., *17*, 1940, 429.)

Source: Not given. Presumably from a human source.

Habitat: Not reported.

83. **Salmonella sp.** (Type Java). (*Salmonella javiana* Alley and Pijoan, Yale Jour. Biol. and Med., *15*, 1942, 229; Edwards and Bruner, Jour. Immunol., *44*, 1942, 319.)

Antigenic structure: [I], IX, XII: l, z_{28}: 1, 5. . . .

Source: From Eijkman Institute in Java. Isolated from feces of a child. Subsequently two cultures labeled N112 and N140, isolated in Panama from human carriers, were received from Col. Chas. G. Sinclair.

Habitat: Reported as yet from human sources only.

84. **Salmonella gallinarum** (Klein) Bergey et al. (*Bacillus gallinarum* Klein, Cent. f. Bakt., *5*, 1889, 689; Pheasant bacillus, Klein, Jour. Path. & Bact., *2*, 1893, 214; *Bacillus phasiani septicus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 410; *Bacterium sanguinarium* Moore, 12th and 13th Ann. Rpt. for 1895–96, U. S. Dept. Agr. Bur. An. Ind., 1897, 188; see Moore, U. S. Dept. Agr. Bur. An. Ind., Bull. 8, 1895, 63; *Bacillus phasiani* Migula, Syst. der Bakt., *2*, 1900, 769; *Bacterium phasiani septicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 74; *Bacterium gallinarum* Chester, *ibid.*, 80; *Bacterium pyogenes sanguinarium* Berry and Ernst, Jour. Med. Res., *10* (N. S. *5*), 1903–04, 402; *Bacillus pseudo-cholerae gallinarum* Trincas, Giorn. della R. Soc. Ital. d'Igiene, 1908, 385; *Bacillus typhi gallinarum alcalifaciens* and *Bacillus typhi gallinarum* Pfeiler and Rehse, Mitt. K. Inst. f. Landw. Bromberg, *5*, 1913, 306; *Eberthella sanguinaria* Bergey et al., Manual, 1st ed., 1923, 231; Bergey et al., Manual, 2nd ed., 1925, 236; *Shigella gallinarum* Weldin, Iowa State Coll. Jour. Sci., *1*, 1927, 179.) From Latin, of chickens.

Bacterium jeffersonii Hadley, Elkins and Caldwell, Rhode Island Agr. Exp. Sta. Bull. 174, 1918, 169 (*Eberthella jeffersonii* Bergey et al., Manual, 1st ed., 1923, 230; *Shigella jeffersonii* Bergey et al., Manual, 4th ed., 1934, 394). *Shigella jeffersonii* is identical serologically with *Salmonella gallinarum* (St. John-Brooks and Rhodes, Jour. Path. and Bact., *26*, 1923, 433).

Rods: 0.4 to 0.6 by 0.8 to 1.6 microns, with rounded ends, occurring singly or (in blood) in short chains. Non-motile. Gram-negative.

Gelatin colonies: Small, grayish-white, finely granular, circular, entire.

Gelatin stab: Slight, grayish-white surface growth with slight grayish, filiform growth in stab. No liquefaction.

Agar colonies: Moist, grayish, circular, entire.

Agar slant: Thin, gray streak, with irregular margin, moist, glistening.

Broth: Turbid with heavy, flocculent sediment.

Litmus milk: Reaction unchanged, becoming translucent. No coagulation.

Potato: Slight grayish growth.

Indole not formed.

Nitrites produced from nitrates.

Acid but no gas from glucose, fructose, galactose, mannose, xylose, arabinose, maltose, dextrin, mannitol, dulcitol and isodulcitol. Lactose, sucrose, glycerol, salicin and sorbitol are not attacked.

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Hydrogen sulfide is sometimes formed.

Aerobic, facultative.

Optimum temperature 37°C.

Antigenic structure: [I], IX, XII: —: —. Identical with *Salmonella pullorum*,

and related to *Salmonella typhosa*. [I] antigen noted by Kauffmann (Acta Path. et Microbiol. Scand., Suppl. 54, 1944, 36).

Source and habitat: The causative agent of fowl typhoid (clearly to be distinguished from fowl cholera), and identical with Moore's infectious leukemia of fowls. Infectious for rabbits and all poultry, canaries and certain wild birds (quail, grouse, pheasant) by feeding or by injection. Found once in a normal human carrier.

85. **Salmonella pullorum** (Rettger) Bergey et al. (*Bacterium pullorum* Rettger, Jour. Med. Res., *21* (N.S. *16*), 1909, 117; also see Rettger, N. Y. Med. Jour., *71*, 1900, 803; *ibid.*, *73*, 1901, 267; Rettger and Harvey, Jour. Med. Res., *18* (N.S. *13*), 1908, 277; *Bacillus pullorum* Smith and Ten Broeck, Jour. Med. Res., *31* (N. S. *26*), 1915, 547; Bergey et al., Manual, 1st ed., 1923, 218; Typus pullorum, Kauffmann, Zentbl. f. d. ges. Hyg., *25*, 1931, 273.) From Latin, of chickens.

Rods: 0.3 to 0.5 by 1.0 to 2.5 microns, occurring singly. Non-motile. Gram-negative.

Gelatin colonies: Grayish-white, moist, lobate, with grape-leaf surface.

Gelatin stab: Slight, grayish surface growth. No liquefaction.

Agar colonies: Grayish-white, smooth, glistening, entire to undulate.

Agar slant: Develops as discrete, translucent colonies.

Broth: Turbid.

Litmus milk: Acid, becoming alkaline. No coagulation.

Potato: Slow development, grayish.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas from glucose, fructose, galactose, mannose, arabinose, xylose, mannitol and rhamnose. Does not attack lactose, sucrose, maltose, dextrin, salicin, raffinose, sorbitol, adonitol, dulcitol or inositol. Gas may be slight or absent (cf. *Salmonella gallinarum*). Xylose may be fermented late (see Weldin, Iowa State Coll. Jour. Sci., *1*, 1927, 165). Maltose fermenting strains may occur (Hinshaw, Browne and Taylor, Jour. Inf. Dis., *73*, 1943, 197).

Reduces trimethylamine oxide (Wood and Baird, *loc. cit.*).

Hydrogen sulfide is formed.

Aerobic, facultative.

Optimum temperature 37°C.

Antigenic structure, IX, XII: —: The complete antigenic formula of *S. pullorum* is IX, XII_1, XII_2, XII_3, while that of *S. gallinarum* seems to be IX, XII_1, XII_3. Antigen XII_2 is variable in *S. pullorum* (Edwards and Bruner, Cornell Vet., *36*, 1946, 318) and $XII_2{}^{++}$ and $XII_2{}^{+}$ forms occur. The $XII_2{}^{++}$ forms are synonymous with the X strains of Younie (Can. Jour. Comp. Med., *5*, 1941, 164).

Source: Isolated from chickens and other birds, as well as calves, hogs, rabbits and man. Occasionally produces food poisoning or gastroenteritis in man (Mitchell, Garlock and Broh-Kahn, Jour. Inf. Dis., *79*, 1946, 57).

Habitat: The cause of white diarrhoea in young chicks. Infects the ovaries and eggs of adult birds.

85a. *Salmonella gallinarum* var. *Duisburg*. (Müller, Münch. med. Wchnschr., *80*, 1933, 1771; Kauffmann, Cent. f. Bakt., I Abt., Orig., *132*, 1934, 337.)

Antigenically identical with *Salmonella gallinarum* and *Salmonella pullorum*. Differs from *Salmonella gallinarum* in its slow fermentation of maltose, failure to ferment d-tartrate and in not forming H_2S.

Source and habitat: Isolated from acute gastroenteritis in man.

86. **Salmonella sp.** (Type Canastel). (*Salmonella canastel* Randall and Bruner, Jour. Bact., *49*, 1945, 511.) Source of name not given.

Liquefies gelatin.

Antigenic structure: IX, XII: z_{29}: 1, 5. . . .

Source: Isolated in North Africa from American soldiers acting as food handlers.

Habitat: Not reported from other sources as yet.

87. **Salmonella sp.** (Type Italia). (*Salmonella italiana* Bruner and Edwards, Proc. Soc. Exp. Biol. and Med., *58*, 1945, 289.)

Antigenic structure: IX, XII: l, v: 1, 11. . . .

Source: Two cultures, one isolated from a case of bloody diarrhoea and the other from a case of gastroenteritis in man. Found in Italy by Lt. Col. Robert Hebble and by Capt. Ira C. Evans.

Habitat: Not reported from other sources as yet.

88. **Salmonella sp.** (Type Napoli). (*Salmonella napoli* Bruner and Edwards, Proc. Soc. Exper. Biol. and Med., *58*, 1945, 289.)

Antigenic structure: [I], IX, XII: l, z_{13}: e, n, x. . . .

Source: Ten cultures isolated from normal feces and from cases of gastroenteritis in Naples, Italy. The first culture was isolated by Capt. W. H. Ewing.

Habitat: Not reported from other sources as yet.

89. **Salmonella sp.** (Type Loma Linda). (*Salmonella loma linda* Edwards, Proc. Soc. Exper. Biol. and Med., *57*, 1944, 104.)

Antigenic structure: IX, XII: a: e, n, x. . . .

Source: Single culture isolated by Dr. T. F. Judefind, Loma Linda, California from the spinal fluid of a baby that died of meningitis.

Habitat: Not reported from other sources as yet.

90. **Salmonella sp.** (Type New York). (*Salmonella new york* Kauffmann, Acta Path. et Microbiol. Scand., Suppl. 54, 1944, 35.)

Antigenic structure: IX, XII: l, v: 1, 5. . . .

Source: Found by Dr. F. Schiff, New York in a study of a culture received under the label *S. panama* Strain No. 431. Regarded at the present time as a strain of *Salmonella javiana* by Dr. Kauffman (personal communication, March, 1947).

Habitat: Not reported from other sources as yet.

91. **Salmonella sp.** (Type London). (*Salmonella* Type L, White, Med. Res. Council Spec. Rept. Ser. 103, 1926, 37; *Salmonella londonensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 675; *Salmonella london* Schütze et al., Jour. Hyg., *34*, 1934, 346.)

Antigenic structure: III, X, XXVI: l, v: 1, 6. . . .

Source: Isolated in London from the feces of a gastroenteritis patient from Reading, England.

Habitat: Found in human infections, in hogs and in chickens.

92. **Salmonella sp.** (Type Give). (*Salmonella give* Kauffmann, Ztschr. f. Hyg., *120*, 1937, 177.)

Antigenic structure: III, X, XXVI: l, v; l, 7. . . .

Source: From feces of a patient with pernicious anemia. Also found in the U. S. A. and Germany. Occurs in fowls and hogs (Edwards and Bruner, Jour. Inf. Dis., *72*, 1943, 64).

Habitat: Apparently widely distributed.

93. **Salmonella sp.** (Type Uganda). (*Salmonella uganda* Kauffmann, Acta Path. et Microbiol. Scand., *17*, 1940, 189.)

Antigenic structure: III, X, XXVI: l, z_{13}: 1, 5. . . .

Source: Isolated in Uganda by Dr. H. G. Wiltshire from a human spleen on autopsy. Typed by Dr. F. Kauffmann.

Habitat: Not reported from other sources as yet.

94. **Salmonella anatis** (Rettger and Scoville) Bergey et al. (*Bacterium anatis* Rettger and Scoville, Abst. Bact., *3*, 1910, 8; not *Bacterium anatis* Migula, Syst. d. Bakt., *2*, 1900, 364; *Bacterium anatum* Rettger and Scoville, Jour. Inf. Dis., *26*, 1920, 217; *Escherichia anata* Bergey et al., Manual, 1st ed., 1923, 198; Bergey et al., Manual, 2nd ed., 1925, 238; *Salmonella anatum* Bergey et al., Manual, 3rd ed., 1930, 344.) From Latin, of the duck.

With the transfer of this organism to the genus *Salmonella*, the original species name *anatis* again becomes available in spite of the earlier use of this species name by Migula for Cornil and Toupet's Bacillus der Enten-cholera (Compt. rend. Acad. Sci., Paris, *106*, 1888, 1737). The latter organism is stated by Rettger and Scoville (1920, *loc. cit.*, 220) to be indistinguishable from *Pasteurella avi-septica*.

Morphology and cultural characters like those of *Salmonella enteritidis*.

Kauffmann (Ztschr. f. Hyg., *119*, 1937, 352) describes a lactose-splitting variant of this species.

Antigenic structure: III, X, XXVI: e, h: 1, 6. . . .

Reduces trimethylamine oxide (Wood and Baird (*loc. cit.*).

Source: Isolated from an epizootic of keel in ducklings. Also found in intestinal infections in chickens and man. Frequently occurs in association with *Salmonella typhimurium*.

Habitat: Widely distributed in man and domestic animals.

95. **Salmonella sp.** (Type Muenster). (*Salmonella anatum* var. *muenster*, Kauffmann and Silberstein, Cent. f. Bakt., I Abt., Orig., *132*, 1934, 431; *Salmonella muenster* Kauffmann, Ztschr. f. Hyg., *140*, 1937, 177.)

Antigenic structure: III, X, XXVI: e, h: 1, 5. . . .

Source: Isolated by Dr. Besserer in Muenster from food poisoning. Also isolated in Uruguay from human sources.

Habitat: Not known from any but human sources as yet.

96. **Salmonella sp.** (Type Nyborg). (*Salmonella anatum* var. *nyborg*, Kristensen and Bojlén, Cent. f. Bakt., I Abt., Orig., *136*, 1936, 294; *Salmonella nyborg* Kauffmann, Ztschr. f. Hyg., *120*, 1937, 189.)

Antigenic structure: III, X, XXVI: e, h: 1, 7. . . .

Source: From a case of acute enteritis in a young girl in Nyborg, Denmark.

Habitat: Known only from human sources as yet.

97. **Salmonella sp.** (Type Vejle). (*Salmonella vejle* Harhoff, quoted from Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 274.)

Antigenic structure: III, X, XXVI: e, h: 1, 2, 3. . . .

Source: Isolated by E. Møller, Copenhagen, from a case of acute gastroenteritis.

Habitat: Not reported from other sources as yet.

98. **Salmonella sp.** (Type Meleagris). (*Salmonella meleagridis* Bruner and Edwards, Amer. Jour. Hyg., *34*, 1941, 82; not *Salmonella meleagridis* Rettger, Plastridge and Cameron, Jour. Inf. Dis., *53*, 1933, 279.)

Antigenic structure: III, X, XXVI: e, h: l, w. . . .

Source: Original cultures isolated by Dr. B. S. Pomeroy, Univ. of Minnesota, from two distinct outbreaks of infection in turkey poults. Stated to be the same as *Salmonella bantam* from Batavia, Java (Kauffmann, Acta Path. et Microbiol. Scand., *19*, 1942, 529).

Habitat: In addition to the two strains isolated in Minnesota (Bruner and Edwards, Kentucky Agr. Exp. Sta., Bull. 434, 1942), the same type was recognized among cultures received from Massachusetts, Michigan, Pennsylvania, Maryland, South America and Japan. Also isolated from German soldiers in

Norway by Tesdal (Kauffmann, Die Bakteriologie der Salmonella-Gruppe, 1941, 295) and from snakes by Hinshaw and McNeil (Amer. Jour. Vet. Res., *6*, 1945, 264).

99. **Salmonella sp.** (Type Shangani). (*Salmonella shangani* Kauffmann, Acta Path. et Microbiol. Scand., *16*, 1939, 347.)

Antigenic structure: III, X, XXVI: d: 1, 5. . . .

Source: Isolated in Zanzibar by Dr. J. D. Robertson from a woman with enteric fever.

Habitat: Known only from human sources as yet.

100. **Salmonella sp.** (Type Zanzibar). (*Salmonella zanzibar* Kauffmann, Acta Path. et Microbiol. Scand., *16*, 1939, 347.)

Antigenic structure: III, X, XXVI: k: 1, 5. . . .

Source: Isolated in Zanzibar by Dr. J. D. Robertson from a typhoid carrier.

Habitat: Also found in chickens (Edwards).

101. **Salmonella sp.** (Type Amager). (*Salmonella amager* Kauffmann, Acta Path. et Microbiol. Scand., *16*, 1939, 347.)

Antigenic structure: III, X, XXVI: y: 1, 2, 3. . . .

Source: Isolated in Copenhagen from the feces of a person suffering from gastroenteritis.

Habitat: Known only from human sources as yet.

102. **Salmonella sp.** (Type Lexington). (*Salmonella lexington* Rubin, Jour. Bact., *40*, 1940, 463; Edwards, Bruner and Rubin, Proc. Soc. Exper. Biol. and Med., *44*, 1940, 395.)

Antigenic structure: III, X, XXVI: z_{10}: 1, 5. . . .

According to Kauffmann (Die Bakteriologie der Salmonella-Gruppe, 1941, 276), Dr. Erber of Java has found a *Salmonella* type with the same antigenic structure and has given it the name *Salmonella batavia*.

Source: Isolated from mesenteric lymph glands of apparently normal hogs by Dr. H. L. Rubin, Univ. of Kentucky, Lexington, Ky.

Habitat: Also reported from turkeys.

103. **Salmonella sp.** (Type Weltevreden). (*Salmonella weltevreden* Mertens, quoted from Kauffmann, Acta Path. et Microbiol. Scand., *19*, 1942, 529.)

Antigenic structure: III, X, XXVI: r: z_6. . . .

Source: Isolated by Dr. W. K. Mertens, Batavia, Java, according to Kauffmann (*loc. cit.*).

Habitat: Not recorded in available literature.

104. **Salmonella sp.** (Type Orion). (*Salmonella* type, var. *orion* and *Salmonella orion* Barnes, Cherry and Myers, Jour. Bact. *50*, 1945, 578.) From a seaman on the S. S. Orion.

Antigenic structure: III, X, XXVI: y: 1, 5. . . .

Source: From rectal swab specimen from a normal food handler.

Habitat: Not reported from other sources as yet.

105. **Salmonella sp.** (Type Butantan). (*Salmonella butantan* Peluffo, Bier, Amaral, and Biocca, Mem. Inst. Butantan, *19*, 1946, 211.)

Antigenic structure: III, X, XXVI: b: 1, 5. . . .

Source: Isolated by Dr. C. A. Peluffo from a case of diarrhoea in a child.

Habitat: Not reported from other sources as yet.

106. **Salmonella sp.** (Type Newington). (Anatum C_1 No. 3071, N.C.T.C., London, Kauffmann and Silberstein, Cent. f. Bakt., I Abt., Orig., *132*, 1934, 434; *Salmonella newington* Edwards, Jour. Hyg., *37*, 1937, 384.)

Antigenic structure: III, XV: e, h: 1, 6. . . .

Source: Isolated from ducks from Newington, Connecticut by Dr. L. F.

Rettger. Also found in hogs, silver foxes and man. Kauffmann (Ztschr. f. Hyg., *120*, 1937, 177) has described a related type (*Salmonella tim*) from a case of enteritis in Tim, Denmark.

Habitat: Widely distributed.

107. **Salmonella sp.** (Type Selandia). (*Salmonella selandia* Kauffmann, Ztschr. f. Hyg., *120*, 1937, 189.)

Antigenic structure: III, XV: e, h: 1, 7. . . .

Source: Isolated from the feces of a sailor on the S. S. Selandia after a voyage to Asia and Australia. Was patient in Bispebjerg Hospital with pleuropneumonia at the time.

Habitat: Known only from human sources as yet.

108. **Salmonella sp.** (Type New Brunswick). (*Salmonella new brunswick* Edwards, Jour. Hyg., *37*, 1937, 384; also see Kauffmann, Ztschr. f. Hyg., *120*, 1937, 189.)

Antigenic structure: III, XV: l, v: 1, 7. . . .

Source: Isolated by Dr. F. R. Beaudette, New Brunswick, New Jersey from a chicken. Also isolated from gastroenteritis in man.

Habitat: Apparently widely distributed.

109. **Salmonella sp.** (Type Illinois). (*Salmonella illinois* Edwards and Bruner, Proc. Soc. Exper. Biol. and Med., *48*, 1941, 240.)

Antigenic structure: (III), (XV), XXXIV: z_{10}: 1, 5. . . .

Source: Isolated from hogs in Illinois by Dr. Robert Graham, from Hungarian partridges in Michigan by Miss Virginia Stoney and from turkeys in Minnesota by Dr. B. S. Pomeroy.

Habitat: Also reported from hogs and man (Edwards).

110. **Salmonella sp.** (Type Senftenberg). (Typus Senftenberg, Kauffmann, Ztschr. f. Hyg., *111*, 1930, 221; *Salmonella senftenberg* Schütze et al., Jour. Hyg., *34*, 1934, 339; *Salmonella senftenbergensis* Haupt, Ergebnisse der Hyg., *13*, 1932, 673.)

Antigenic structure: I, III, XIX: g, s, t: —.

Source: From a case of acute gastroenteritis in a boy in Senftenberg, Denmark. Cultures have frequently been found from persons and also from young turkeys.

Habitat: Apparently widely distributed.

111. **Salmonella sp.** (Type Niloese). (*Salmonella niloese* Kauffmann, Acta path. et Microbiol. Scand., *16*, 1939, 347.)

Antigenic structure: I, III, XIX: d: z_6. . . .

Source: Isolated in Copenhagen from a case of acute gastroenteritis in Niloese, Denmark. Later found frequently in gastroenteritis in Denmark.

Habitat: Known only from human sources as yet.

112. **Salmonella sp.** (Type Simsbury). (*Salmonella simsbury* Bruner and Edwards, Proc. Soc. Exper. Biol. and Med., *50*, 1942, 174.)

Antigenic structure: I, III, XIX: z_{27}: —.

Source: Original culture isolated by Dr. E. K. Borman, State Dept. Health Lab., Hartford, Conn., from a normal human carrier from Simsbury, Conn. Edwards states (1946) that this may be a variant of *Salmonella sp.* (Type Senftenberg).

Habitat: Also found in turkeys (Bruner and Edwards, Kentucky Agr. Exp. Sta., Bull. 434, 1942, 9).

113. **Salmonella sp.** (Type Taksony). (*Salmonella taksony* Rauss, Ztschr. f. Immunitätsforsch., *103*, 1943, 220.)

Antigenic structure: I, III, XIX: i: z_6. . . .

Source: Isolated from a healthy carrier (Hungary).

Habitat: Not reported from other sources as yet.

114. **Salmonella sp.** (Type Kentucky). (*Salmonella kentucky* Edwards, Jour. Hyg., *38*, 1938, 306.)

Antigenic structure: (VIII), XX: i: z_6. . . .

Source: Isolated from the intestinal tract of a chick affected with coccidiosis and ulcerative enteritis. Found at Lexington, Kentucky.

Habitat: Also reported from many species of fowls, from hogs and from man (Edwards).

115. **Salmonella sp.** (Type Aberdeen). (*Salmonella aberdeen* J. Smith, Jour. Hyg., *34*, 1934, 357.)

Antigenic structure: XI: i: 1, 2, 3. . . .

Source: Isolated in Aberdeen, Scotland, from the stool of a child suffering from acute enteritis. Also isolated by Timmerman in Utrecht from Ovomaltine, and by Edwards in Kentucky from birds. See Kauffmann, Die Bakteriologie der Salmonella-Gruppe, Kopenhagen, 1941, 279.

Habitat: Apparently widely distributed.

116. **Salmonella sp.** (Type Rubislaw). (*Salmonella rubislaw* Smith and Kauffmann, Jour. Hyg., *40*, 1940, 122.)

Antigenic structure: IX: r: e, n, x. . . .

Source: Isolated in Aberdeen, Scotland from the feces of a child suffering from enteritis. Also found by Tesdal in Oslo, Norway. Reported by Hinshaw and McNeil from snakes (Amer. Jour. Vet. Res., *6*, 1945, 264).

Habitat: Apparently widely distributed.

117. **Salmonella sp.** (Type Pretoria). (*Salmonella pretoria* Henning, Rhodes and Gordon-Johnstone, Onderstepoort Jour. Vet. Sci. An. Ind., *16*, 1941, 103.)

Antigenic structure: XI: k: 1, 2, 3. . . .

Source: Isolated by Dr. M. W. Henning in Pretoria, South Africa from an infection in garbage-fed hogs.

Habitat: Not reported from other sources as yet.

118. **Salmonella sp.** (Type Venezia). (*Salmonella veneziana* Bruner and Joyce, Jour. Bact., *50*, 1945, 371.)

Antigenic structure: XI: i: e, n, x. . . .

Source: Culture received from Capt. J. K. Hill. Isolated from an apparently normal Italian civilian food handler in Venice, Italy.

Habitat: Not known from other sources as yet.

119. **Salmonella sp.** (Type Solt). (*Salmonella solt* Rauss, Ztschr. f. Immunitätsforsch., *103*, 1943, 220.)

Antigenic structure: XI: y: 1, 5. . . .

Source: Isolated from a healthy carrier (Hungary).

Habitat: Not reported from other sources as yet.

120. **Salmonella sp.** (Type St. Lucie). (*Salmonella luciana* Moran, Edwards and Bruner, Proc. Soc. Exp. Biol. and Med., *64*, 1947, 89.) From St. Lucie, Florida.

Antigenic structure: XI: a: e, n, z_{15}. . . .

Source: Single culture isolated by Mrs. Mildred Galton from feces of a normal human carrier.

Habitat: Not known from other sources as yet.

121. **Salmonella sp.** (Type Senegal). (*Salmonella senegal* Hinshaw and McNeil, Jour. Bact., *52*, 1946, 349.)

Antigenic structure: XI: r: 1, 5. . . .

Source: Isolated by Dr. W. L. Hinshaw from a green mamba snake.

Habitat: Not known from other sources as yet.

122. **Salmonella sp.** (Type Marseille). (*Salmonella marseille* Moran, Edwards and Bruner, Proc. Soc. Exp. Biol. and Med., *64*, 1947, 89.)

Antigenic structure: XI: a: 1, 5. . . .

Source: Isolated in Marseilles, France by Capt. Wm. Sutton from feces.

Habitat: Not known from other sources as yet.

123. **Salmonella sp.** (Type Grumpy). (*Salmonella grumpensis* Hormaeche and Peluffo, quoted from Hormaeche et al., Jour. Bact., *47*, 1944, 323.) Named for a person called grumpy.

Antigenic structure: XIII, XXIII, XXXVI: d: 1, 7 . . . as given by Kauffmann (Acta Path. et Microbiol. Scand., Suppl. 54, 1944, 37).

Source: Isolated in Uruguay from a guinea pig. Also studied by Kauffmann (*loc. cit.*).

Habitat: Not reported from other sources as yet.

124. **Salmonella sp.** (Type Poona). (*Salmonella poona* Bridges and Scott, Jour. Roy. Army Med. Corps, *55*, 1935, 221.)

Antigenic structure: XIII, XXII: z: 1, 6. . . .

Source: Isolated by Dr. L. Dunbar in Poona from the stool of a child suffering from enteritis.

Habitat: Also reported from hogs (Edwards).

125. **Salmonella sp.** (Type Borbeck). (*Salmonella borbeck* Hohn and Herrimann, Cent. f. Bakt., I Abt., Orig., *145*, 1940, 219.)

Antigenic structure: XIII, XXII: l, v: 1, 6. . . .

Source: Isolated from the feces of a child with typhoid. Found in the Borbeck section of Essen, Germany.

Habitat: Not reported from other sources as yet.

126. **Salmonella sp.** (Type Mississippi). (*Salmonella mississippi* Edwards, Cherry and Bruner, Proc. Soc. Exp. Biol. and Med., *54*, 1943, 263.)

Antigenic structure: I, XIII, XXIII, b: 1, 5. . . .

Source: Isolated by the State Dept. of Health of Mississippi from the stool of a normal food handler.

Habitat: Also reported from hogs (Edwards).

127. **Salmonella sp.** (Type Wichita). (*Salmonella wichita* Schiff and Strauss, Jour. Inf. Dis., *65*, 1939, 125.)

Antigenic structure: I, XIII, XXIII: d: —.

Source: Isolated by Miss B. McKinlay in an epidemic of enteritis affecting babies, Wichita, Kansas. Also in fowls, turkeys and hogs (Edwards and Bruner, Jour. Inf. Dis., *72*, 1942, 64).

Habitat: Apparently widely distributed.

128. **Salmonella sp.** (Type Havana). (*Salmonella havana* Schiff and Saphra, Jour. Inf. Dis., *68*, 1941, 125.)

Antigenic structure: I, XIII, XXIII: f, g: —.

Source: Isolated during an outbreak of 21 cases of meningitis in children in a maternity hospital in Havana, Cuba.

Habitat: Not reported from other sources as yet.

129. **Salmonella sp.** (Type Worthington). (*Salmonella worthington* Edwards and Bruner, Jour. Hyg., *38*, 1938, 716.)

Antigenic structure: I, XIII, XXIII: l, w: z. . . .

Source: Isolated by Dr. B. S. Pomeroy from a turkey poult from Worthington, Minnesota. Also found in a hen. Later additional cultures were found in other birds, in rodents, cattle, hogs and man. (Edwards and Bruner, Jour. Inf. Dis., *72*, 1943, 64).

Habitat: Apparently widely distributed.

130. **Salmonella sp.** (Type Cuba). (*Salmonella cubana* Seligmann, Wasserman and Saphra, Jour. Bact., *51*, 1946, 123.)

Antigenic structure: I, XIII, XXIII: z_{29}: —.

Source: Isolated in Havana, Cuba by Dr. Arturo Curbelo from diseased baby chicks.

Habitat: Not reported from other sources as yet.

131. **Salmonella sp.** (Type Heves). (*Salmonella heves* Rauss, Ztschr. f. Immunitätsforsch., *103*, 1943, 220.)

Antigenic structure: VI, XIV, XXIV: d: 1, 5. . . .

Source: Isolated from a healthy carrier (Hungary).

Habitat: Not reported from other sources as yet.

132. **Salmonella sp.** (Type Carrau). (*Salmonella carrau* Hormaeche, Peluffo and Salsamendi, Arch. Urug. de Med., Cirug. y Espec., *12*, 1938, 377; Hormaeche, Peluffo and Pereyra, Jour. Bact., *47*, 1944, 323.)

Antigenic structure: VI, XIV, XXIV: y: 1, 7. . . .

Source: Isolated in Uruguay from mesenteric glands of normal hogs.

Habitat: Also reported from feces and blood in man, once from flies and one culture from human blood from Mexico.

133. **Salmonella sp.** (Type Onderstepoort). (*Salmonella onderstepoort* Henning, Jour. Hyg., *36*, 1936, 525.)

Antigenic structure: (I), VI, XIV, XXV: e, (h): 1, 5. . . .

Source: Isolated in So. Africa by Dr. J. H. Mason from sheep in Onderstepoort. Also isolated from man by Dr. Hormaeche (Uruguay) and from turkeys (Edwards, Kentucky).

Habitat: Apparently widely distributed in warm-blooded animals.

134. **Salmonella sp.** (Type Florida). (*Salmonella florida* Cherry, Edwards and Bruner, Proc. Soc. Exp. Biol. and Med., *52*, 1943, 125; Galton and Quan, Amer. Jour. Hyg., *38*, 1943, 173.)

Antigenic structure: (I), VI, XIV, XXV: d: 1, 7. . . .

Source: Isolated by Mrs. Mildred Galton from feces of a patient with a febrile disease and diarrhoea.

Habitat: Also reported from reptiles (Edwards).

135. **Salmonella sp.** (Type Madelia). (*Salmonella madelia* Cherry, Edwards and Bruner, Proc. Soc. Exp. Biol. and Med., *52*, 1943, 125.)

Antigenic structure: (I), VI, XIV, XXV: y: 1, 7. . . .

Source: A single culture isolated by Dr. B. S. Pomeroy from the liver of a poult that died of septicemia. Found in Madelia, Minnesota.

Habitat: Also reported from man (Edwards).

136. **Salmonella sp.** (Type Sundsvall). (*Salmonella sundsvall* Olin and Alin, Acta Path. et Microbiol. Scand., *20*, 1943, 607.)

Antigenic structure: (I), VI, XIV, XXV: z: e, n, x. . . .

Source: Isolated from a person suffering from gastroenteritis.

Habitat: Not reported from other sources as yet.

137. **Salmonella sp.** (Type Orient). (*Salmonella orientalis* Carlquist and Conte, Bull. U. S. Army Med. Dept., *6*, 1946, 343.)

Antigenic structure: XVI: k: e, n, z_{15}. . . .

Source: Isolated from U. S. Army personnel who had been prisoners of the Japanese Army in the Orient.

Habitat: Not known from other sources as yet.

138. **Salmonella sp.** (Type Hvittingfoss). (*Salmonella hvittingfoss* Tesdal, Ztschr. f. Hyg., *118*, 1936, 533.)

Antigenic structure: XVI: b: e, n, x. . . .

Source: Isolated during a food poisoning outbreak in Hvittingfoss, a small town in Norway. Caused by eating

pultoste, a kind of soft cheese. Cultures secured from the cheese, from the persons who were poisoned, from sewage and from a foal.

Habitat: Evidently rather widely distributed.

139. **Salmonella sp.** (Type Gaminara). (*Salmonella gaminara* Hormaeche, Peluffo and Salsamendi, Arch. Urug. de Med., Cirug. y Espec., *12*, 1938, 377; *ibid.*, *14*, 1939, 217.) Named in honor of Prof. Gaminara of Uruguay.

Antigenic structure: XVI: d: 1, 7. . . .

Source: Isolated from the feces of a child suffering from enteritis.

Habitat: Not known from other sources as yet.

140. **Salmonella sp.** (Type Szentes). (*Salmonella szentes* Rauss, Ztschr. f. Immunitätsforsch., *103*, 1943, 220.)

Antigenic structure: XVI: k: 1, 2, 3. . . .

Source: Isolated by Dr. K. Rauss from a healthy carrier (Hungary).

Habitat: Not reported from other sources as yet.

141. **Salmonella sp.** (Type Kirkee). (*Salmonella kirkee* Bridges and Dunbar, Jour. Roy. Army Med. Corps, *67*, 1936, 289.)

Antigenic structure: XVII: b: 1, 2. . . .

Source: Isolated in Kirkee, India from the feces of a child suffering from acute enteritis. The source of the infection was thought to be a dog.

Habitat: Not reported from other sources as yet.

142. **Salmonella sp.** (Type Cerro). (*Bacterium cerro* Hormaeche, Peluffo and Salsamendi, Arch. Urug. Med., Cirug. y Espec., *12*, 1938, 377; *Salmonella cerro* Hormaeche, Peluffo and Aleppo, *ibid.*, *19*, 1941, 125.)

Antigenic structure: XVIII: z_4, z_{23}, z_{25}: —.

Source: Isolated from the mesenteric glands of normal hogs from Cerro, Uruguay.

Habitat: Also isolated by the authors in 13 cases of infantile infections. Found also in chickens (Edwards).

143. **Salmonella sp.** (Type Minnesota). (*Salmonella minnesota* Edwards and Bruner, Jour. Hyg., *38*, 1938, 716.)

Antigenic structure: XXI, XXVI: b: e, n, x. . . .

Source: Isolated in Minnesota by Dr. B. S. Pomeroy from a young turkey.

Habitat: Also reported from cattle and man.

144. **Salmonella sp.** (Type Tel Aviv). (*Salmonella tel-aviv* Kauffmann, Acta Path. et Microbiol. Scand., *17*, 1940, 1.)

Antigenic structure: XXVIII: y: e, n, z_{15}. . . .

Source: Isolated in Tel Aviv, Palestine by Dr. G. B. Simmins during an epizootic affecting young chickens during which 50 per cent died.

Habitat: Not known from other sources as yet.

145. **Salmonella sp.** (Type Pomona). (*Salmonella pomona* Edwards, Proc. Soc. Exp. Biol. and Med., *58*, 1945, 291.)

Antigenic structure: XXVIII: y: 1, 7. . . .

Source: Single culture isolated from the intestine of a poult in 1941 by Dr. W. R. Hinshaw.

Habitat: Also reported from man (Edwards).

146. **Salmonella sp.** (Type Ballerup). (*Salmonella ballerup* Kauffmann and Møller, Jour. Hyg., *40*, 1940, 246.)

Antigenic structure: XXIX, [Vi]: z_{14}: —.

Source: From the feces of a woman from the town of Ballerup, Denmark. A cause of gastroenteritis.

Habitat: Not known from other sources as yet.

147. **Salmonella sp.** (Type Hormaeche). (*Salmonella hormaechei* Monteverde, Nature, *154*, 1944, 676.) Named in honor of Dr. Hormaeche of Uruguay.

Antigenic structure: XXIX, [Vi]*: z_{30}, [z_{31}]: —.

Source: From the ovary of a hen whose blood gave a positive reaction with the *S. pullorum* antigen. Found in Buenos Aires by Dr. Monteverde.

Habitat: Also reported from hogs and man (Edwards).

*Reported by Dr. P. R. Edwards (personal communication).

148. **Salmonella sp.** (Type Urbana). (*Salmonella urbana* Edwards and Bruner, Jour. Inf. Dis., *69*, 1941, 223.)

Antigenic structure: XXX: b: e, n, x. . . .

Source: One culture was received from Dr. Robert Graham, Urbana, Illinois and was isolated from the contents of the colon of a hog affected with hemorrhagic enteritis. The second culture was isolated from the intestinal tract of a chicken by Dr. W. L. Mallmann, East Lansing, Michigan.

Habitat: Also reported from man (Edwards).

149. **Salmonella sp.** (Type Adelaide). (*Salmonella adelaide* Cleland, Med. Jour. Australia, *31*, 1944, 59.)

Antigenic structure: XXXV: f, g: —.

Source: Isolated in Adelaide, Australia by Miss Nancy Atkinson from two fatal cases resembling typhoid fever.

Habitat: Not reported from other sources as yet.

150. **Salmonella sp.** (Type Inverness). (*Salmonella inverness* Edwards and Hughes, Proc. Soc. Exp. Biol. and Med., *56*, 1944, 33.)

Antigenic structure: XXXVIII: k: 1, 6. . . .

Source: Isolated by Mrs. Mildred Galton and Mr. M. S. Quan of the Florida State Department of Health, from the stool of a normal food handler, Inverness, Florida.

Habitat: Not reported from other sources as yet.

151. **Salmonella sp.** (Type Champaign). (*Salmonella champaign* Edwards, Proc. Soc. Exp. Biol. and Med., *58*, 1945, 291.)

Antigenic structure: XXXIX: k: 1, 5. . . .

Source: Single culture isolated from the liver of an adult hen by Dr. Robert Graham, Champaign, Illinois.

Habitat: Not reported from other sources as yet.

Appendix I: The following species and varieties are largely taken from Hauduroy, Ehringer, Urbain, Guillot and Magrou, Dictionnaire des Bactéries Pathogènes, Paris, 1937, 446–472. The relationships of many of these are not clear.

Bacillus canariensis Migula. (Bacillus der Kanarienvögelseptikämie, Rieck, Deutsche Ztschr. f. Thiermed., *15*, 1889, 69; Migula, Syst. d. Bakt., *2*, 1900, 770; *Bacillus avisepticus* Chester, Man. Determ. Bact., 1901, 220; not *Bacillus avisepticus* Kitt, in Kolle and Wassermann, Handb. d. path. Mikroorg., 1 Aufl., *2*, 1903, 544.) Associated with intestinal catarrh and liver changes in canaries. Hadley, Elkins and Caldwell (Rhode Island Agr. Exp. Sta., Bull. 174, 1918, 178) regard this as probably *Bacillus gallinarum* Klein.

Bacillus friedebergensis Kruse. (Bacillus der Friedeberger Fleischvergiftung, Gaffky and Paak, Mitt. a. d. kaiserl. Gesundheitsamte, *6*, 1890, 159; Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 378; *Bacterium friedebergensis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 73.) From sausage in meat poisoning.

Salmonella abortus canis Gard. (Ztschr. f. Hyg., *121*, 1938, 139.) From the feces of four persons with paratyphoid apparently spread from an infected dog. Kauffmann regards this as identical with *Salmonella schottmuelleri*.

Salmonella annamensis Hauduroy et al. (Un bacille du groupe des *Salmonella*, Normet, Urbain and Chaillot, Compt. rend. Soc. Biol., Paris, *101*, 1929, 752; Hauduroy et al., Dict. d. Bact. Path.,

1937, 450.) Isolated during an epidemic of dysentery at Hué (Annam) in 1925.

Salmonella archibaldii Castellani and Chalmers. (Man. Trop. Med., 3rd ed., 1919, 940.)

Salmonella carolina (Castellani) Castellani and Chalmers. (*Bacillus carolinus* Castellani, Ann. di Med. Nav. e Colon., *1*, 1918; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 940.)

Salmonella coagulans (Castellani) Hauduroy et al. (*Bacillus coagulans* Castellani, 1916; *Balkanella coagulans* Castellani, 1916; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 935; Hauduroy et al., Dict. d. Bact. Path., 1937, 453.)

Salmonella columbensis (Castellani) Castellani and Chalmers. (*Bacterium columbense* Castellani, Proc. Meeting Ceylon Branch British Assoc., 1905, quoted from Castellani, Cent. f. Bakt., I Abt., Orig., *74*, 1914, 197; *Bacillus columbensis* Castellani, Jour. Trop. Med. and Hyg., *20*, 1917, 181; Castellani and Chalmers, Ann. Inst. Past., *34*, 1920, 609; *Morganella columbensis* Fulton, Jour. Bact., *46*, 1943, 81.) The cause of columbensis fever. Isolated from feces, urine and blood.

Salmonella enteritidis var. v, Hauduroy et al. (Bacille para-Gärtner V, Rochaix and Couture, Revue de Microbiologie appliquée, *2*, 1936; Hauduroy et al., Dict. d. Bact. Path., 1937, 454.) Found associated with *Salmonella enteritidis* in meat pies and in the feces of individuals with food poisoning.

Salmonella enteritidis-yellow, a variety of *Salmonella enteritidis* Deskowitz and Buchbinder (Jour. Bact., *29*, 1935, 293). Cultures differ from typical *Salmonella enteritidis* in producing a yellow, water-soluble pigment. From the feces of a rat with enteric infection.

Salmonella foetida Bergey et al. (*Coccobacillus foetidus ozenae* Perez, Ann. Inst. Past., *13*, 1899, 937; *Coccobacillus (foetidus) ozaenae* Ward, Jour. Bact., *2*, 1917, 619; Bergey et al., Manual, 1st ed., 1923, 220; *Bacterium foetida* Weldin and Levine, Abst. Bact., *7*, 1923, 13; *Escherichia foetida* Bergey et al., Manual, 2nd ed., 1925, 222.) From chronic rhinitis, ozena. See Manual, 4th ed., 1934, 380 for a description of this species.

Salmonella holsatiensis Roelcke. (Also *Salmonella* Typ Holstein, Roelcke, Cent. f. Bakt., I Abt., Orig., *137*, 1936, 464.) According to Kauffmann (Ztschr. f. Hyg., *119*, 1937, 352) the O-antigens of this rapid fermenter of salicin and weak indole-former are identical with those of *Salmonella poona*. The H-antigens have not been compared as yet.

Salmonella icteroides (Sanarelli) Bergey et al. (Bacillo icteroide, Sanarelli, Il Policlinico, *4*, 1897, 412; *Bacillus icteroides* Sanarelli, British Med. Jour., July 3, 1897, 7; *Bacterium icteroides* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 241; Bergey et al., Manual, 1st ed., 1923, 218.) From yellow fever cadavers. See Manual, 5th ed., 1939, 604 for a description of this species.

Salmonella iwo-jima Lindberg and Bayliss. (Jour. Inf. Dis., *79*, 1946, 92.) Isolated from a soldier on Iwo-Jima during a routine examination of food handlers. Belongs to Group C. Antigenic structure: VI, VIII: i: 1, 5 . . . Described too recently to be included in the main body of the text.

Salmonella liceagi Leon. (Rev. Inst. Salubridad y Enferm. Trop., *3*, 1942, 273.) From feces. This probably belongs in the coliform group.

Salmonella macfadyeanii (Weldin and Levine) Weldin. (*Bacterium macfadyeanii* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Weldin, Iowa State Jour. Sci., *1*, 1927, 168.) Associated with hog cholera.

Salmonella mexicana Varela and Olarte. (Rev. Inst. Salubridad y Enferm. Trop., *4*, 1943, 313.) From feces.

Salmonella monshaui Carlquist and Coates. (Jour. Bact., *53*, 1947, 249.) Isolated from stump of a soldier who suffered traumatic amputation of a leg in the fighting around Monshau, Ger-

many. Belongs to Group F. Antigenic structure: XXXV: m. t.:—Described too recently to be included in the main body of the text.

Salmonella nocardi Pacheco. (Compt. rend. Soc. Biol., Paris, *106*, 1931, 372 and 1018.) Pathogenic for parrots and pigeons.

Salmonella oahu Lindberg and Bayliss. (Jour. Inf. Dis., *79*, 1946, 92.) Isolated from a case of gastroenteritis in a soldier hospitalized on Oahu. Belongs to Group B. Antigenic structure: IV, V, XII: 1, v: 1, 2, 3 . . . Described too recently to be included in the main body of the text.

Salmonella ostrei (Besson and Ehringer) Hauduroy et al. (*Bacillus ostrei* Besson and Ehringer, Compt. rend. Soc. Biol., Paris, *87*, 1922, 1017; Hauduroy et al., Dict. d. Bact. Path., 1937, 460.) Isolated from oysters. Not pathogenic for laboratory animals.

Salmonella para-asiatica (Castellani) Hauduroy et al. (*Bacillus paraasiaticus* Castellani, 1916; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 950; Hauduroy et al., Dict. d. Bact. Path., 1937, 461.)

Salmonella para-coagulans (Castellani) Hauduroy et al. (*Bacillus para-coagulans* Castellani, 1914; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 950; Hauduroy et al., Dict. d. Bact. Path., 1937, 461.)

Salmonella pauloensis Gomes. (Rev. Inst. Adolfo Lutz, *2*, 1942, 231.) May be the same as *Salmonella columbensis*.

Salmonella pseudo-asiatica (Castellani) Castellani and Chalmers. (*Bacillus pseudo-asiaticus* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 266; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 940.)

Salmonella pseudo-asiatica var. *mobilis* Hauduroy et al. (*Bacillus pseudo-asiaticus mobilis* Castellani, see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 952; Hauduroy et al., Dict. d. Bact. Path., 1937, 463.)

Salmonella (?) *pseudo-carolina* (Castellani) Hauduroy et al. (*Bacillus pseudocarolinus* Castellani, 1917; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 952; Hauduroy et al., Dict. d. Bact. Path., 1937, 463.)

Salmonella (?) *pseudo-columbensis* (Castellani) Hauduroy et al. (*Bacillus pseudo-columbensis* Castellani, see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 954; Hauduroy et al., Dict. d. Bact. Path., 1937, 464.)

Salmonella pseudo-morganii (Castellani) Hauduroy et al. (*Bacillus pseudomorgani* Castellani, see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 954; Hauduroy et al., Dict. d. Bact. Path., 1937, 464.)

Salmonella ranicida Hauduroy et al. (Bacille pathogène isolé des grenouilles, Gheorghiu and Balmus, Compt. rend. Soc. Biol., Paris, *108*, 1931, 1002; Hauduroy et al., Dict. d. Bact. Path., 1937, 466.) Pathogenic for frogs.

Salmonella saipan Lindberg and Bayliss. (Jour. Inf. Dis., *79*, 1946, 92.) Isolated from a case of gastroenteritis in a soldier hospitalized on Saipan. Belongs to Group E. Antigenic structure: III, X, XXVI: z_6. . . . Described too recently to be included in the main body of the text.

Salmonella schottmülleri var. *alvei* Hauduroy et al. (*Bacillus paratyphi alvei* Bahr, Skand. Veterin. Tidsk., *9*, 1919; Hauduroy et al., Dict. d. Bact. Path., 1937, 469.) Pathogenic for bees and wasps.

Salmonella veboda (Castellani) Castellani and Chalmers. (*Bacillus veboda* Castellani, Jour. Trop. Med. and Hyg., *20*, 1917, 181; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 939; *Bacterium veboda* Weldin and Levine, Abst. Bact., *7*, 1923, 13.)

Salmonella watareka (Castellani) Bergey et al. (*Bacillus watareka* Castellani, Rept. Advisory Committee for Trop. Dis. Research Fund for 1912, London, 1913; *Bacterium watareka* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Bergey et al., Manual, 1st ed., 1923, 219.)

Salmonella werahensis (Castellani) Hauduroy et al. (*Bacillus werahensis* Castellani, see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 956; Hauduroy et al., Dict. d. Bact. Path., 1937, 471.)

Salmonella wesenbergoides (Castellani) Hauduroy et al. (*Bacillus wesenbergoides* Castellani, 1916; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 935; Hauduroy et al., Dict. d. Bact. Path., 1937, 471.)

Salmonella willegoda (Castellani) Castellani and Chalmers. (*Bacillus willegoda* Castellani; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 939.)

Salmonella woliniae (Castellani) Castellani and Chalmers. (*Bacillus woliniae* Castellani, Jour. Trop. Med. and Hyg., *20*, 1917, 181; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 939; *Bacterium woliniae* Weldin and Levine, Abst. Bact., *7*, 1923, 13.)

Appendix II: The following species have been thought to belong to the genus *Eberthella*, i.e., do not produce gas from glucose. Descriptions of nearly all of the species listed in the genus *Eberthella* will be found in the Manual, 5th ed., 1939, 464–469.

Bacillus subentericus Ford. (Studies from the Royal Victoria Hosp., Montreal, *1*, 1903, 40; also see Jour. Med. Res., *1*, 1901, 218.) From feces.

Bacterium typhi flavum Dresel and Stickl. (Deutsche med. Wchnschr., *54*, 1928, 517.) From feces of persons with typhoid fever. Cruickshank (Jour. Hyg., *35*, 1935, 354) reports that a variety of yellow chromogenic saprophytes have been identified as belonging to this species, none of which could be regarded as yellow variants of *Salmonella typhosa* (Zopf) White. They apparently belong in the genus *Flavobacterium* Bergey et al.

Eberthella alcalifaciens de Salles Gomes. (Rivista do Inst. Adolfo Lutz, *4*, 1944, 191.) From catarrhal feces of an infant.

Eberthella belfastiensis (Weldin and Levine) Bergey et al. (*Bacterium coli anaerogenes* Lembke, Arch. f. Hyg., *26*, 1896, 299; *Bacterium lembkei* Migula, Syst. d. Bakt., *2*, 1900, 417; *Bacterium anaerogenes* Chester, Man. Determ. Bact., 1901, 135; *Bacillus belfastiensis II*, Wilson, Jour. Hyg., *8*, 1908, 543; *Bacillus anaerogenes* Holland, Jour. Bact., *5*, 1920, 217; *Bacterium belfastiensis* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Bergey et al., Manual, 1st ed., 1923, 226; *Bacillus coli anaerogenes* Kerrin, Jour. Hyg., *28*, 1928, 4; *Escherichia anaerogenes* Bergey et al., Manual, 3rd ed., 1930, 321; *Castellanus colianaerogenes* Castellani, Cent. f. Bakt., I Abt., Orig., *125*, 1932, 42.) From feces.

Eberthella bentotensis (Castellani and Chalmers) Bergey et al. (*Bacillus bentotensis* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 262; *Bacterium bentotensis* Weldin and Levine, Abst. Bact., *7*, 1923, 15; Bergey et al., Manual, 1st ed., 1923, 227; *Castellanus bentotensis* Castellani, Cent. f. Bakt., I Abt., Orig., *125*, 1932, 42.) From the intestinal canal.

Eberthella chylogena (Ford) Bergey et al. (*Bacillus chylogenes* Ford, Studies from the Royal Victoria Hospital, Montreal, *1*, No. 5, 1903, 62; Bergey et al., Manual, 1st ed., 1923, 224.) From the intestinal canal.

Eberthella dubia (Chester) Bergey et al. (Meiner Bakterie, Bleisch, Ztschr. f. Hyg., *13*, 1893, 31; *Bacillus dubius* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 323; *Bacillus bleischii* Kruse, *ibid.*, 704; *Bacterium dubius* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 93; Bergey et al., Manual, 1st ed., 1923, 225.) From the intestinal canal.

Eberthella enterica (Ford) Bergey et al. (*Bacillus entericus* Ford, Studies from the Royal Victoria Hospital, Montreal, *1*, No. 5, 1903, 40; also see Jour. Med. Research, *1*, 1901, 211; not *Bacillus*

entericus Castellani, 1907 (*Enteroides entericus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 941); Bergey et al., Manual, 1st ed., 1923, 223.) From the intestinal canal.

Eberthella insecticola Steinhaus. (Jour. Bact., *42*, 1941, 762 and 769.) From the intestinal tracts of grasshoppers, milkweed bugs and stinkbugs.

Eberthella kandiensis (Castellani) Bergey et al. (*Bacillus kandiensis* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 262; *Eberthus kandiensis* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 936; *Bacterium kandiensis* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Bergey et al., Manual, 1st ed., 1923, 225.) From feces.

Eberthella lewisii Weldin. (Organism $B3_2$, Lewis, Local Gov. Board Rept. Med. Suppl. London, 1910–11, Appen. B, No. 2, 1911, 314; *Bacterium lewisii* Weldin and Levine, Bact. Abst., *7*, 1923, 13; Weldin, Iowa State Col. Jour. Sci., *1*, 1926, 172.) From feces of a normal child.

Eberthella oedematiens Assis. (Boletin do Inst. Vital, Brazil, *5*, 1928.) From the intestinal canal.

Eberthella oxyphila (Ford) Bergey et al. (*Bacterium oxyphilum* Ford, Studies from the Royal Victoria Hospital, Montreal, *1*, No. 5, 1903, 49; Bergey et al., Manual, 1st ed., 1923, 224.) From the intestinal canal.

Eberthella pauloensis Mello. (Jornal dos Clinicos, Rio de Janeiro, No. 18–30, Sept., 1937, 7 pp.) From feces of a dysentery patient.

Eberthella priztnitzi (Castellani and Chalmers) Hauduroy et al. (*Bacillus priztnitzi* Castellani, Jour. Trop. Med. and Hyg., *20*, 1917, 182; *Eberthus priztnitzi* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 936; *Bacterium priztnitzi* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Hauduroy et al., Dict. d. Bact. Path., 1937, 186.) From cases of paraenteric fever.

Eberthella proteosimilis Wassilien. (Cent. f. Bakt., I Abt., Orig., *151*, 1944, 423.) Colonies show motility on agar. From feces of a dysentery patient.

Eberthella pyogenes (Migula) Bergey et al. (*Bacillus pyogenes foetidus* Passet, Fortschr. der Med., 1885; *Bacillus foetidus* Trevisan, I generi e le specie delle Batteriacee, 1889, 16; *Bacterium pyogenes foetidus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 141; *Bacterium pyogenes* Migula, Syst. der Bakt., *2*, 1900, 381; *Lankoides pyogenes* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 938; *Bacillus pyogenes-foetidus* Holland, Jour. Bact., *5*, 1920, 220; Bergey et al., Manual, 1st ed., 1923, 226; *Castellanus pyogenes* Castellani, Cent. f. Bakt., I Abt., Orig., *125*, 1932, 42.) From a rectal abscess.

Eberthella talavensis (Castellani) Bergey et al. (*Bacillus talavensis* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 262; *Eberthus talavensis* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 936; *Bacterium talavensis* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Bergey et al., Manual, 1st ed., 1923, 225.) From the intestinal canal.

Eberthella tarda Assis. (Boletin do Inst. Vital, Brazil, *5*, 1928.) From the intestinal canal.

Eberthella wesenbergi (Castellani and Chalmers) Hauduroy et al. (*Bacillus wesenberg* Castellani, 1913; *Wesenbergus wesenbergi* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 940; Hauduroy et al., Dict. d. Bact. Path., 1937, 191.)

Eberthella wilsonii Weldin. (*Bacillus belfastiensis V*, Wilson, Jour. Hyg., *8*, 1908, 543; Weldin, Iowa State Col. Jour. Sci., *1*, 1926, 174.) From feces.

Eberthella xenopa Schrire. (Trans. Royal Soc. So. Africa, *17*, 1928, 43.) From wound infection in frogs.

Wesenbergus fermentosus Castellani and Chalmers. (Man. Trop. Med., 3rd ed., 1919, 940.) From blood. Isolated by Archibald in the Anglo-Egyptian Sudan.

Genus II. **Shigella** *Castellani and Chalmers.**

(Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 936; subgenera, *Flexnerella* and *Shigella*, Castellani and Chalmers, *ibid.*, 938; *Castellanus* Carruti, Jour. Trop. Med. and Hyg., July 15, 1930; *Proshigella* Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 363.) Named for Prof. I. Shiga, the Japanese bacteriologist who discovered the dysentery bacillus in 1898.

Non-motile rods, although cultures of some of the less well-known species have been reported as motile. Produce acid but no gas from carbohydrates except with some types of *Shigella paradysenteriae*. Do not liquefy gelatin. Some species produce acid from lactose and form indole. Some species reduce trimethylamine oxide to trimethylamine, others do not.† Some species will grow at 45.5°C (Eijkman test).‡ Pathogenic (causing dysenteries) or non-pathogenic species, all living in the bodies of warm-blooded animals. Carried by polluted water supplies and by flies.

The type species is *Shigella dysenteriae* (Shiga) Castellani and Chalmers.

Key to the species of genus **Shigella.****

I. No acid from mannitol.
  A. No acid from lactose. Milk not coagulated.
    1. Indole not produced.
      a. Acid but no gas from glucose.
        1. *Shigella dysenteriae.*
      aa. Acid and a small amount of gas from glucose.
        4a. See *Shigella paradysenteriae* (Type Newcastle).
    2. Indole produced.
        2. *Shigella ambigua.*
  B. Acid formed slowly from lactose.
    1. Indole not produced.
        3. *Shigella gintottensis.*

II. Acid from mannitol (one type produces a small amount of gas).
  A. No acid from lactose.
    1. No acid from rhamnose, xylose or dulcitol.
        4. *Shigella paradysenteriae.*
    2. Acid from rhamnose, xylose and dulcitol.
        5. *Shigella alkalescens.*
    3. Acid from xylose but not from dulcitol.
        6. *Shigella pfaffii.*
  B. Acid formed slowly from lactose.
    1. Indole not produced.
      a. Acid from rhamnose. None from xylose.
        7. *Shigella sonnei.*
      aa. No acid from rhamnose. Acid from xylose.
        8. *Shigella equirulis.*

---

* Completely revised by Dr. Frederick Smith, McGill University, Montreal, P. Q., Canada, December, 1938; further revision, April, 1946.

† Wood, Baird and Keeping, Jour. Bact., *46*, 1943, 106.

‡ Stuart and Rustigian, Jour. Bact., *46*, 1943, 105.

** See Weil, Jour. Immunology, *55*, 1947, 363–405.

2. Indole produced.
   a. Acid from dulcitol.
      9. *Shigella ceylonensis.*
   aa. No acid from dulcitol.
      10. *Shigella madampensis.*

III. Action on mannitol unknown.
   A. No acid from lactose.
      1. Indole is produced.
         11. *Shigella septicemiae.*

1. **Shigella dysenteriae** (Shiga) Castellani and Chalmers. (Bacillus of Japanese dysentery, Shiga, Cent. f. Bakt., I Abt., *23*, 1898, 599; *Bacillus dysenteriae* Shiga, Cent. f. Bakt., I Abt., *24*, 1898, 817; *Bacillus japanicus* Migula, Syst. d. Bakt., *2*, 1900, 755; *Bacillus shigae* Chester, Man. Determ. Bact., 1901, 228; *Bacillus dysentericus* Ruffer and Willmore, Brit. Med. Jour., *2*, 1909, 862; *Bacterium dysenteriae* Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 348; not *Bacterium dysenteriae* Chester, Man. Determ. Bact., 1901, 145; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 935; *Bacterium shigae* Holland, Jour. Bact., *5*, 1920, 220; *Eberthella dysenteriae* Bergey et al., Manual, 2nd ed., 1925, 250.) Latinized, of dysentery.

Rods: 0.4 to 0.6 by 1.0 to 3.0 microns, occurring singly. Non-motile. Gram-negative.

Gelatin colonies: Small, grayish, smooth, homogeneous, entire to slightly undulate.

Gelatin stab: Grayish surface growth. No liquefaction.

Agar slant: Grayish, filiform to echinulate, smooth, entire to undulate growth.

Broth: Slightly turbid, with grayish sediment.

Litmus milk: Slightly acid, then alkaline.

Potato: Delicate, grayish to slightly brownish streak.

Indole not produced.

Nitrites produced from nitrates.

Acid but no gas from glucose, fructose, raffinose, glycerol and adonitol. Does not attack arabinose, xylose, maltose, lactose, sucrose, salicin, mannitol, dulcitol or rhamnose.

Does not reduce trimethylamine oxide (Wood et al., Jour. Bact., *46*, 1943, 106).

Aerobic, facultative.

Optimum temperature 37°C. Does not grow at 45.5°C (Eijkman's reaction, Stuart et al., Jour. Bact., *46*, 1943, 105).

Serologically homogeneous and different from the other species of *Shigella*. Forms a potent exotoxin.

Source: From widespread epidemics of dysentery in Japan.

Habitat: A cause of dysentery in man and monkeys.

2. **Shigella ambigua** (Andrewes) Weldin. (Bazillus Schmitz, Schmitz, Ztschr. f. Hyg., *84*, 1917, 449; *Bacillus ambiguus* Andrewes, The Lancet, *194*, 1918, 560; *Bacillus dysenteriae* "Schmitz", Murray, Jour. Roy. Army Med. Corps, *31*, 1918, 257; *Bacterium ambiguum* Levine, Abst. Bact., *4*, 1920, 15; not *Bacterium ambiguum* Chester, Del. Col. Agr. Exp. Sta. Ann. Rept., *11*, 1900, 59; *Eberthella ambigua* Bergey et al., Manual, 1st ed., 1923, 229; *Bacillus paradysenteriae X*, Stutzer, Cent. f. Bakt., I Abt., Orig., *90*, 1923, 12; *Bacterium schmitzii* Weldin and Levine, Abst. Bact., *7*, 1923, 13; Weldin, Iowa State College Jour. Sci., *1*, 1927, 177; *Shigella schmitzii* Hauduroy et al., Dict. d. Bact. Path., 1937, 496.) From Latin, uncertain.

Morphology and colony characters indistinguishable from those of *Shigella dysenteriae*.

Acid from glucose and rhamnose.

Does not attack xylose, maltose, lactose, sucrose, dextrin, glycerol, mannitol or dulcitol.

Indole is produced.

Does not reduce trimethylamine oxide (Wood et al., Jour. Bact., *46*, 1943, 106).

Aerobic, facultative.

Optimum temperature 37°C. Does not grow at 45.5°C (Stuart et al., Jour. Bact., *46*, 1943, 105).

Serologically homogeneous and different from the other species of *Shigella*. Does not form an exotoxin.

Source: Found in feces in a dysentery epidemic in a prison in Germany.

Habitat: A cause of human dysentery.

3. **Shigella gintottensis** (Castellani) Hauduroy et al. (*Bacillus gintottensis* Castellani, 1910; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 948; *Lankoides gintottensis* Castellani and Chalmers, *ibid.*, 938; *Castellanus gintottensis* Castellani, 1930; Castellani, Jour. Trop. Med. and Hyg., *36*, 1933, 109; Hauduroy et al., Dict. d. Bact. Path., 1937, 488.)

Rods: Non-motile. Gram-negative.

Morphology and cultural characters indistinguishable from those of *Shigella dysenteriae*.

Litmus milk: Acid and coagulation; decolorized.

Indole not formed.

Acid, but no gas, from lactose, glucose, arabinose and galactose. No acid from sucrose, dulcitol, mannitol, maltose, dextrin, raffinose, adonitol, inulin, sorbitol, levulose, inositol, salicin and glycerol.

Antigenic structure not known.

Source: From feces in cases of dysentery.

Habitat: A cause of human dysentery.

4. **Shigella paradysenteriae** (Collins) Weldin. (*Bacillus dysenteriae* Flexner, Phil. Med. Jour., *6*, 1900, 414; *Bacillus dysenteriae* Hiss and Russell, Medical News, *82*, 1903, 289; *Bacillus dysenteriae* Strong, Jour. Amer. Med. Assoc., *35*, 1906, 498; *Bacillus paradysenteriae* Collins, Jour. Inf. Dis., *2*, 1905, 620; includes weakly toxic strains of dysentery bacilli, Groups I and II, Sonne, Cent. f. Bakt., I Abt., Orig., *75*, 1915, 408; *Shigella flexneri* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 937; *Shigella dysenteriae* (Hiss and Russell, and Strong types) Castellani and Chalmers, *ibid.*, 937; not *Shigella paradysenteriae* Castellani and Chalmers, *ibid.*, *937*; *Bacillus flexneri* Levine, Jour. Inf. Dis., *27*, 1920, 31; *Bacterium flexneri* Levine, Abst. Bact., *4*, 1920, 15; *Bacterium dysenteriae* (Flexner type) and *Bacterium paradysenteriae* Holland, Jour. Bact., *5*, 1920, 215; *Eberthella flexneri* Weldin and Levine, Abst. Bact., *7*, 1923, 13; *Eberthella paradysenteriae* Bergey et al., Manual, 1st ed., 1923, 230; Weldin, Iowa State College Jour. Sci., *1*, 1927, 178.) Latinized, like dysentery.

Rods: 0.5 by 1.0 to 1.5 microns. Non-motile. Gram-negative.

Morphologically these organisms are like *Shigella dysenteriae*.

Culturally these organisms differ from *Shigella dysenteriae* in that they ferment mannitol. No acid is produced from lactose, rhamnose, xylose or dulcitol.

Does not reduce trimethylamine oxide (Wood et al., Jour. Bact., *46*, 1943, 106).

Does not form a potent exotoxin.

Aerobic, facultative.

Optimum temperature 37°C. Does not grow at 45.5°C (Stuart et al., Jour. Bact., *46*, 1943, 105).

Antigenically the organisms of this species are not homogeneous.

Boyd (Trans. Roy. Soc. Trop. Med. and Hyg., *33*, 1940, 553) has shown that the mannitol-fermenting *Shigella* include many organisms previously unknown or unclassified because they did not agree with the classical types of Andrewes and Inman (Med. Res. Council, Special Rept. Ser. No. 42, London, 1919). With these, on grounds of antigenic structure, will be included the gas-forming Manchester bacillus of Downie, Wade and Young (Jour. Hyg., *33*, 1933, 196) and

both mannitol-fermenting and non-fermenting Newcastle bacilli (Clayton and Warren, Jour. Hyg., *28*, 1929, 355 and *29*, 1929, 191).

The following tables are taken from Boyd (*loc. cit.*).

TABLE 1.—Classification of *Shigella paradysenteriae*.

New Name	Old Name
Bacillus dysenteriae Flexner I	Andrewes and Inman V (Flexner)
Bacillus dysenteriae Flexner II	Andrewes and Inman W (Strong)
Bacillus dysenteriae Flexner III	Andrewes and Inman Z
Bacillus dysenteriae Flexner IV	Type 103
Bacillus dysenteriae Flexner V	Type P 119
Bacillus dysenteriae Flexner VI	88-Newcastle-Manchester group
Bacillus dysenteriae Boyd I	Type 170
Bacillus dysenteriae Boyd II	Type P 288
Bacillus dysenteriae Boyd III	Type D1

The six Flexner types possess a common group antigen and separate type-specific antigens. The three Boyd types are distinct antigenically from each other and from the Flexner types.

Two new Flexner types (Type 953 = provisional Type VII and Type 1296/7 = provisional Type VIII) have been described by Francis (Jour. Path. and Bact., *58*, 1946, 320) as this section goes to press. Also see Boyd (*ibid.*, 297).

TABLE 2.—Subclassification of *Bacillus dysenteriae* Flexner VI (including the Newcastle bacillus).

	Lactose	Glucose	Mannitol	Dulcitol	Sucrose	Indole
Type 88 (33 per cent of strains)	—	A	A	—	—	—
Type 88 (66 per cent of strains)	—	A	A	(late) A	—	—
Manchester bacillus..........	—	AG	AG	(late) AG		—
Newcastle bacillus............	—	AG	—	(late) AG		—

Source: From feces in cases of dysentery.

Habitat: A cause of dysentery in man. A cause of summer diarrhoea in children.

NOTE: The term *Bacillus paradysenteriae* is used by Kruse (Münch. med. Wchnschr., 1917, 1309) for the *Escherichia coli*-like motile and gas-forming Gram-negative rods that have been found to cause dysentery-like diseases. Kruse (Deut. med. Wchnschr., *27*, 1901, 388) uses the term pseudodysentery for the group that includes the Flexner, Strong, and Hiss and Russell types. See Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 456. Gardner (Med. Res. Council, System of Bacteriology, *4*, 1929, 170) states that "Kruse's terms *B. dysenteriae* for Shiga, and *Bacillus pseudodysenteriae* for the Flexner-Sonne-Schmitz groups have, however, never taken root outside the German-speaking world".

4a. *Shigella paradysenteriae* (Type Newcastle). (Clayton and Warren, Jour. Hyg., *28*, 1929, 355 and *29*, 1929, 191; *Bacillus dysenteriae* Flexner VI in part, Boyd, Trans. Roy. Soc. Trop. Med. and Hyg., *33*, 1940, 553.)

Rods: Non-motile. Gram-negative.

In peptone water solution, lactose, mannitol, and sucrose not fermented. Glucose, maltose and dulcitol fermented.

Peculiarities of the organism are: (1) Occasionally a slight bubble of gas is produced from glucose and dulcitol, (2) when the substrate is dissolved in beef extract broth, glucose, dulcitol and maltose are always fermented to gas and acid.

Does not reduce trimethylamine oxide (Wood et al., Jour. Bact., *46*, 1943, 106).

Optimum temperature 37°C. Does not grow at 45.5°C (Stuart et al., Jour. Bact., *46*, 1943, 105).

Aerobic, facultative.

Serologically related to the mannitol-fermenting strains of *Shigella paradysenteriae*.

Source: Isolated in 1925 from a case of diarrhoea in Newcastle-on-Tyne, England.

Habitat: A cause of human dysentery.

4b. *Shigella paradysenteriae* (Type Manchester). (Downie, Wade and Young, Jour. Hyg., *33*, 1933, 196; *Bacillus dysenteriae* Flexner VI in part, Boyd, Trans. Roy. Soc. Trop. Med. and Hyg., *33*, 1940, 553.)

Characters as for Type Newcastle except that acid and gas are produced from mannitol. Does not produce gas from maltose.

Serologically related to the non-mannitol-fermenting strains of *Shigella paradysenteriae*.

Source: Five strains were isolated from cases of dysentery at Denton near Manchester, England. One strain came from a case of dysentery in Nigeria.

Habitat: A cause of human dysentery.

5. **Shigella alkalescens** (Andrewes) Weldin. (*Bacillus alkalescens* Andrewes, The Lancet, London, *194*, 1918, 560; *Bacterium alkalescens* Levine, Jour. Inf. Dis., *27*, 1920, 31; *Eberthella alkalescens* Bergey et al., Manual, 1st ed., 1923, 231; Weldin, Iowa State College Jour. Sci., *1*, 1927, 179; *Proshigella alkalescens* Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 363.) From the chemical term, alkaline.

Rods: 0.5 by 1.0 to 1.5 microns, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin stab: No liquefaction.

Agar slant: Abundant, transparent, often iridescent growth.

Broth: Turbid.

Litmus milk: Acid, then alkaline.

Potato: Moderate, grayish growth.

Indole is formed.

Acid but no gas from glucose, xylose, rhamnose, maltose, mannitol and dulcitol. Sucrose is fermented by some strains. Does not attack lactose, dextrin or salicin.

Reduces trimethylamine oxide to trimethylamine (Wood et al., Jour. Bact., *46*, 1943, 106). In contrast to all other species of the genus, will also produce trimethylamine from choline (Wood and Keeping, Jour. Bact., *47*, 1944, 309).

Aerobic, facultative.

Optimum temperature 37°C. Grows at 45.5°C (Eijkman's reaction, Stuart et al., Jour. Bact., *46*, 1943, 105).

Not pathogenic. Not agglutinated by Shiga immune serum.

Source: From feces in cases of dysentery.

Habitat: Intestinal canal.

6. **Shigella pfaffii** (Hadley et al.) Weldin. (Bacillus der kanarienvögelseuche, Pfaff, Cent. f. Bakt., I Abt., Orig., *38*, 1905, 276; *Bacterium pfaffi* Hadley, Elkins and Caldwell, Rhode Island Agr. Exp. Sta. Bull. 174, 1918, 169; *Bacillus pfaffi* Hadley, Elkins and Caldwell, *ibid.*, 204; *Eberthella pfaffi* Bergey et al., Manual, 1st ed., 1923, 232; Weldin, Iowa State College Jour. Sci., *1*, 1927, 180.) Named for Dr. Franz Pfaff of Prague who isolated this species.

Description largely from Hadley et al. (*loc. cit.*, 180).

Rods: 0.5 by 1.0 to 2.0 microns, occurring singly. Non-motile. Gram-negative.

Gelatin colonies: Small, grayish, translucent.

Gelatin stab: No liquefaction.

Agar colonies: Small, yellowish-gray, homogeneous, translucent, entire. No odor.

Agar slant: Slight, yellowish-gray, translucent streak.

Broth: Turbid, with flocculent sediment (Pfaff, *loc. cit.*, 280).

Litmus milk: Unchanged.

Potato: Moderate, whitish streak.

Acid but no gas from glucose, fructose, arabinose, xylose, maltose, dextrin, salicin and mannitol. Does not attack lactose, sucrose, raffinose, inulin, adonitol or dulcitol.

Indole not formed.

No hydrogen sulfide produced.

Nitrites not produced from nitrates.

Pathogenic for canaries, sparrows, pigeons, white mice, guinea pigs and rabbits. Not pathogenic for chickens (Pfaff, *loc. cit.*, 280).

Aerobic, facultative.

Optimum temperature 37°C.

Source: First encountered in an epidemic of septicemia in canaries. Caused a necrotic enteritis.

Habitat: Not known from other sources.

7. **Shigella sonnei** (Levine) Weldin. (Duval's bacillus, Duval, Jour. Amer. Med. Assn., *43*, 1904, 381; Pseudodysentery bacillus E, Kruse, Deutsche med. Wchnschr., *23*, 1907, 292, 338; *Bacillus ceylonensis A*, Castellani, Jour. Hyg., 7, 1907, 1; Group III of Sonne, Sonne, Cent. f. Bakt., I Abt., Orig., *75*, 1915, 408; *Bacillus dispar* (in part) Andrewes, Lancet, *1*, 1918, 560 (see *Shigella ceylonensis* and *Shigella madampensis*); Bacillus of Sonne, Thjøtta, Jour. Bact., *4*, 1919, 355; *Bacterium sonnei* Levine, Jour. Inf. Dis., *27*, 1920, 31; *Bacillus dysenteriae* Sonne, Smith, Jour. Hyg., *23*, 1924, 94; Weldin, Iowa Sta. Coll. Jour. Sci., *1*, 1927, 182; *Castellanus krusecastellani* Cerruti, Jour. Trop. Med. and Hyg., *33*, 1930, 207; *Shigella paradysenteriae* var. *sonnei* Bergey et al., Manual, 4th ed., 1934, 393; *Proshigella sonnei* Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 363.) Named for Dr. Carl Sonne, who worked with this organism.

Rods: Non-motile. Gram-negative.

Gelatin: No liquefaction.

Agar colonies: Cultures dissociable into two types: (1) Glistening surface, 2 mm in diameter in 24 hours, soft, grayish, edge entire; (2) Granular surface, 3 to 4 mm in diameter in 24 hours, soft, grayish, edge tending to spread unevenly, surface developing, after some days, papillae (daughter colonies) which are lactose-fermenting. Some colonies of type 1 change to type 2 on continued incubation. The colony types do not breed true.

Broth: Many authors stress the flocculent growth, associated with spontaneous agglutination in saline solution. These appear to be dependent on growth conditions and time of incubation.

Litmus milk: Acid and with about 50 per cent of strains coagulation. Coagulation tends to occur later than the fermentation of lactose in peptone water.

Indole is not produced.

Acid, but no gas, from lactose (about 2 per cent of strains are lactose-negative after 2 months incubation), glucose, fructose, maltose, galactose, rhamnose, mannitol, arabinose, raffinose and sucrose. No acid from dulcitol, inulin, inositol, adonitol, xylose (xylose is occasionally fermented) and salicin.

Fermentation of substances other than the monosaccharides may require days or weeks.

Reduces trimethylamine oxide to trimethylamine (Wood et al., Jour. Bact., *46*, 1943, 106).

Serologically *Shigella sonnei* is divisible into two types, which do not correspond with the colony types described above. Most freshly isolated strains absorb agglutinins completely from all *Shigella sonnei* antisera, while most stock strains absorb only partially from other than antisera of the second serological type. There exist minor serological relationships between *Shigella sonnei* and *Shigella paradysenteriae*, *Shigella alkalescens* and *Shigella madampensis*.

Optimum temperature 37°C. Grows at 45.5°C (Stuart et al., Jour. Bact., *46*, 1943, 105).

Source: From feces in cases of dysentery.

Habitat: A cause of mild dysentery in man; summer diarrhoea in children.

8. **Shigella equirulis** (de Blieck and van Heelsbergen) Edwards. (*Bacillus nephritidis equi* Meyer, Transvaal Dept. Agr. Rept. Gov. Bac., 1908–1909, 122; *Bacterium viscosum equi* Magnusson,

Svensk. Veterinartijdskr., 1917, 81; also see Jour. Comp. Path. and Therap., *32*, 1919, 143; *Bacillus equuli* van Straaten, Verslag van den Werkzaamheden der Rijksseruminrichting voor 1916–1917, Rotterdam, 1918, 75; *Bacterium pyosepticus equi* de Blieck and van Heelsbergen, Tydschr. v. Diergeneesk., *46*, 1919, 492; *Bacillus equirulis* de Blieck and van Heelsbergen, *ibid.*, 496; *Bacterium pyosepticum viscosum* Meissner, Deut. tierärztl. Wchnschr., *29*, 1921, 185; *Bacterium pyosepticum* (*viscosum*) *equi* Lütje, Deut. tierärztl. Wchnschr., *29*, 1921, 463; *Bacterium pyosepticum* (*viscosum*) Meissner and Berge, Deut. tierärztl. Wchnschr., *30*, 1922, 473; *Bacterium pyosepticum* Meissner, Deut. tierärtzl. Wchnschr., *31*, 1923, 348; *Bacterium pyosepticum equi* Landien, Inaug. Diss., Hanover, 1923; *Bacillus pyosepticus* Clarenberg, Ztschr. f. Infektskr. u. Hyg. d. Haust., *27*, 1924, 193; *Bacterium equi* Weldin and Levine, Abst. Bact., *7*, 1923, 13; *Eberthella viscosa* Snyder, Jour. Amer. Vet. Med. Assoc., *66*, 1925, 481; *Shigella equi* Weldin, Iowa Sta. Col. Jour. Sci., *1*, 1927, 121; *Shigella viscosa* Bergey et al., Manual, 3rd ed., 1930, 363; Edwards, Kentucky Agr. Exp. Sta. Res. Bul. 320, 1931.)

While awaiting further information, the binomial introduced by Edwards is used for this species although Haupt of Leipzig points out in a personal communication to Edwards (1934) that van Straaten's original name was *Bacillus equuli*. The binomial *Bacillus equirulis* is stated to have appeared first in the article by de Blieck and van Heelsbergen, *loc. cit.*

Description from Edwards (*loc. cit.*).

Rods: 0.3 to 0.4 by 0.4 to 0.8 micron, occurring singly, in chains and filaments. Young cultures (8 to 10 hrs.) frequently show long filaments and streptococcus-like chains as well as large, yeast-like bodies with projections. Rough mucoid colonies consist of short, oval rods. Smooth colonies contain long filaments and streptococcus-like chains. Rough colonies are always mucoid. Non-mucoid colonies are always smooth. Capsules described but uncertain. Non-motile. Gram-negative.

Gelatin colonies: Grayish-white, circular, translucent.

Gelatin stab: Nail-head, moderate growth along line of stab. No liquefaction.

Agar colonies: 3 to 5 mm at 48 hours. Semi-solid, tough, adherent, circular, grayish-white, smooth, moist, glistening. Rough variants and dwarf colonies.

Agar slant: Grayish-white, viscid growth, covering the surface. Viable 8 to 10 days.

Broth: Masses form on side of tube. At times a thin grayish pellicle. Grayish, tough, ropy sediment. Eventually diffuse turbidity which is highly viscous. Viability 2 to 4 weeks.

Litmus milk: Slowly acidified; slimy, viscid. Sometimes coagulation and reduction.

Potato: No visible growth.

Indole not formed.

Nitrites produced from nitrates.

Voges-Proskauer test negative.

Acid but no gas from glucose, fructose, xylose, lactose, galactose, maltose, sucrose, mannitol and raffinose. Dextrin usually fermented. No action in rhamnose, dulcitol, sorbitol or inositol. Usually no action in salicin, adonitol and arabinose.

Does not reduce trimethylamine oxide (Wood et al., Jour. Bact., *46*, 1943, 106).

Does not grow at 45.5°C (Stuart et al., Jour. Bact., *46*, 1943, 105).

Optimum temperature 37°C.

Aerobic, facultative.

Not pathogenic for small experimental animals. Produces abscesses and stiffening of the joints when injected subcutaneously in horses.

Serologically heterogeneous. Nothing is known of its antigenic relations to other members of the genus. Haupt writes in a personal communication that comparative serological studies indicate

that this species should be placed in the genus *Actinobacillus*.

Distinctive characters: Differentiation from *Shigella sonnei* is made on cultural and morphological grounds and immediate fermentation of lactose.

Source: Isolated from cases of joint-ill in foals.

Habitat: Causes joint-ill in foals.

9. **Shigella ceylonensis** (Castellani) Weldin. (*Bacillus ceylonensis B*, Castellani, Jour. Hyg., *7*, 1907, 1; *Bacillus dispar* (in part) Andrewes, Lancet, *1*, 1918, 560 (see *Shigella madampensis* and *Shigella sonnei*. Andrewes included in *Bacillus dispar* all lactose-fermenting members of the dysentery group); *Lankoides ceylonensis B*, Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 938; *Eberthella dispar* Bergey et al., Manual, 1st ed., 1923, 232 (see *Shigella madampensis*); Weldin, Iowa Sta. Coll. Jour. Sci., *1*, 1927, 182; *Castallanus castellanii* Cerruti, Jour. Trop. Med. and Hyg., *33*, 1930, 207.) Latinized, pertaining to Ceylon.

Rods: Non-motile. Gram-negative.

Morphology and colony characters indistinguishable from those of *Shigella dysenteriae*.

Gelatin not liquefied.

Litmus milk: Acid with coagulation.

Indole is formed.

Acid, but no gas, from lactose, glucose, fructose, sucrose, mannitol, dulcitol, maltose, xylose, arabinose, rhamnose, sorbitol, raffinose, dextrin and glycerol. Inulin, inositol, adonitol and salicin not fermented (salicin differentiates *Shigella ceylonensis* from *Bacterium coli anaerogenes* Lembke, Arch. f. Hyg., *26*, 1896, 299).

Substances other than the monosaccharides are characteristically fermented slowly.

Reduces trimethylamine oxide to trimethylamine (Wood et al., Jour. Bact., *46*, 1943, 106).

Pathogenic for guinea pigs and rabbits.

Serologically the organism is stated by Castellani to be homogeneous and completely different from *Shigella madampensis* and *Shigella sonnei*. The relations to other members of the dysentery group have not been stated.

Optimum temperature 37°C. Grows at 45.5°C (Stuart et al., Jour. Bact., *46*, 1943, 105).

Source: Isolated from the stools and intestines of persons suffering from dysentery.

Habitat: A cause of dysentery in man.

10. **Shigella madampensis** (Castellani) Weldin. (*Bacillus madampensis* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 262; *Bacillus dispar* (in part) Andrewes, Lancet, *1*, 1918, 560 (see *Shigella ceylonensis* and *Shigella sonnei*); *Lankoides madampensis* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 938; *Bacterium dispar* Levine, Abst. Bact., *4*, 1920, 15; *Eberthella dispar* Bergey et al., Manual, 1st ed., 1923, 232 (see *Shigella ceylonensis*); Weldin, Iowa Sta. Coll. Jour. Sci., *1*, 1927, 181a; *Shigella dispar* Bergey et al., Manual, 3rd ed., 1930, 364; *Proshigella dispar* Borman, Stuart and Wheeler, Jour. Bact., *48*, 1944, 363.)

Neter (Bact. Rev., *6*, 1942, 26) combines *Shigella ceylonensis* and *S. madampensis* into a single species which he names *Shigella castellanii*.

Strains currently existing in various Type Collections as *Bacillus dispar* have biochemical properties indistinguishable from those described for *Shigella madampensis* (Glynn and Starkey, Jour. Bact., *37*, 1939, 315).

Rods: Non-motile. Gram-negative.

Morphology and colony characters indistinguishable from those of *Shigella dysenteriae*.

Gelatin not liquefied.

Indole is formed.

Litmus milk: Acid with coagulation.

Acid, but no gas, from lactose, maltose, sucrose, arabinose, xylose, glycerol, mannitol, rhamnose, glucose, fructose, galactose and dextrin. Dulcitol, salicin, inulin, inositol and adonitol not fermented.

Substances other than monosaccharides are characteristically fermented slowly.

Reduces trimethylamine oxide to trimethylamine (Wood et al., Jour. Bact., *46*, 1943, 106).

Serologically the organism is stated by Castellani to be homogeneous and completely different from *Shigella ceylonensis* and *Shigella sonnei*. According to Andrewes (*loc. cit.*), *Bacillus dispar* is serologically distinct from *Shigella alkalescens* and *Shigella paradysenteriae*. Fifteen strains (Glynn and Starkey, *loc. cit.*) from various sources, labelled *Bacillus dispar* and conforming to the above description, proved to be serologically heterogeneous.

Optimum temperature 37°C. Grows at 45.5°C (Stuart et al., Jour. Bact., *46*, 1943, 105).

Source: Isolated from human stools and intestines.

Habitat: Considered by Castellani to be a cause of colitis and cystitis.

11. Shigella septicaemiae (Bergey et al.) Bergey et al. (*Bacillus septicaemiae anserum exsudativae* Riemer, Cent. f. Bakt., I Abt., Orig., *37*, 1904, 648; *Eberthella septicaemiae* Bergey et al., Manual, 2nd ed., 1925, 250; Bergey et al., Manual, 3rd ed., 1930, 358.) Latinized, of septicemia.

Small rods: 0.5 by 1.5 to 2.0 microns, occurring singly, in pairs and in threads. Motile. Gram-negative.

Gelatin colonies: Small, white, circular.

Gelatin stab: Slight, infundibuliform liquefaction, becoming complete in several weeks.

Agar colonies: Circular, transparent, smooth, homogeneous, entire.

Agar slant: Soft, grayish-white streak, slightly viscid, becoming transparent.

Does not grow on Endo agar.

Broth: Slight, uniform turbidity, with slight pellicle formation.

Litmus milk: Unchanged.

Potato: No growth.

Blood serum: Yellowish-white streak, the medium becoming brownish and slowly liquefied.

Indole is formed after several days.

Slight acid and no gas from glucose. No acid from lactose.

Hydrogen sulfide is formed.

Not pathogenic for white mice, guinea pigs, chickens or pigeons. Mildly pathogenic for ducks.

Aerobic.

Optimum temperature 37°C.

Source: Isolated from blood, exudates and all of the internal organs of geese.

Habitat: Cause of a fatal septicemia in young geese.

Appendix: The following species are also found in the literature. Many are incompletely described.

Bacillus coli dysentericum Ciechanowski and Nowak. (Cent. f. Bakt., I Abt., Orig., *23*, 1898, 445.) From a case of dysentery.

Bacillus dysenteriae Migula. (Bacillus of Japanese dysentery, Ogata, Cent. f. Bakt., *11*, 1892, 264; *Bacillus dysenteriae liquefaciens* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 284; *Bacterium dysenteriae liquefaciens* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 102; Migula, Syst. d. Bakt., *2*, 1900, 641; not *Bacillus dysenteriae* Shiga, Cent. f. Bakt., I Abt., *24*, 1898, 817; not *Bacillus dysenteriae* Hiss and Russell, Medical News, *82*, 1903, 289; not *Bacillus dysenteriae* Strong, Jour. Amer. Med. Assoc., *35*, 1906, 498; not *Bacillus dysenteriae* Sonne, Smith, Jour. Hyg., *23*, 1924, 94.) From a case of Japanese dysentery. Motile. Gram-positive.

Bacillus dysentericus Trevisan. (Bacillus der Dysenterie, Klebs, Cent. f. Bakt., *2*, 1887, 248; Trevisan, I generi e le specie delle Batteriacee, 1889, 14; not *Bacillus dysentericus* Ruffer and Willmore, Brit. Med. Jour., *2*, 1909, 862.) From feces.

Bacterium pseudodysentericum Kruse. (Kruse, Deutsche med. Wchnschr., *27*, 1901, 370, 386; *Escherichia pseudodysenteriae* Bergey et al., Manual, 1st ed., 1923, 198.) From feces. Motile.

Bacterium wakefield Berger. (Jour.

Hyg., *44*, 1945, 116–119.) From feces. A non-mannitol-fermenting organism of the Flexner group. Wheeler and Stuart (Jour. Bact., *51*, 1946, 324) regard this as an anaerogenic paracolon.

Shigella albofaciens (Castellani) Hauduroy et al. (*Bacillus albofaciens* Castellani, Meetings of the Ceylon Branch of the British Medical Association, 1905; Hauduroy et al., Dict. d. Bact. Path., 1937, 482.)

Shigella arabinotarda, types A and B, Christensen and Gowen. (Jour. Bact., *47*, 1944, 171–176.) From cases of dysentery in U. S. Army in Tunisia. A lactose-negative, mannitol-negative *Shigella*.

Shigella bienstockii (Schroeter) Bergey et al. (Bacillus III, Bienstock, Ztschr. f. klin. Med., *8*, 1884; *Bacillus coprogenes parvus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 269; *Bacillus bienstockii* Schroeter, Kryptogamen Flora von Schlesien, *3*, 1, 1886, 163; *Bacillus parvus* Trevisan, I generi e le specie delle Batteriacee, 1889, 15; not *Bacillus parvus* Neide, Cent. f. Bakt., II Abt., *12*, 1904, 344; *Bacterium coprogenes parvus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 85; *Bacterium bienstockii* Chester, Man. Determ. Bact., 1901, 144; *Eberthella bienstockii* Bergey et al., Manual, 1st ed., 1923, 227; Bergey et al., Manual, 3rd ed., 1930, 360.) From feces.

Shigella douglasi (Castellani and Chalmers) Hauduroy et al. (*Bacillus douglasi* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 946; Hauduroy et al., Dict. d. Bact. Path., 1937, 484.)

Shigella etousae Heller and Wilson. (Jour. Path. and Bact., *58*, 1946, 98.) From dysentery outbreak in an army camp in England.

Shigella faecaloides (Castellani) Hauduroy et al. (*Bacillus faecaloides* Castellani, 1915; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 946; Hauduroy et al., Dict. d. Bact. Path., 1937, 488.)

Shigella giumai (Castellani) Hauduroy et al. (*Bacillus giumai* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 264; *Wesenbergus giumai* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 940; *Bacterium giumai* Weldin and Levine, Abst. Bact., *7*, 1923, 15; *Salmonella giumai* Bergey et al., Manual, 1st ed., 1923, 220; Hauduroy et al., Dict. d. Bact. Path., 1937, 488.)

Shigella lunavensis (Castellani) Hauduroy et al. (*Bacillus lunavensis* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 264; *Bacterium lunavensis* Weldin and Levine, Abst. Bact., *7*, 1923, 16; Hauduroy et al., Dict. d. Bact. Path., 1937, 489.) From feces.

Shigella metadysenterica var. *A*, *B*, *C*, and *D* (Castellani) Hauduroy et al. (*Bacillus metadysentericus* var. *A*, *B*, *C*, and *D*, Castellani, 1904; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 946; *Dysenteroides metadysentericus* var. *A*, *B*, *C*, and *D*, Castellani and Chalmers, Ann. Inst. Past., *34*, 1920, 607; *Castellanus metadysentericus* Castellani, 1930; Hauduroy et al., Dict. d. Bact. Path., 1937, 489.) From cases of dysentery.

Shigela negombensis (Castellani) Hauduroy et al. (*Bacillus negombensis* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 262; Hauduroy et al., Dict. d. Bact. Path., 1937, 490.)

Shigella oxygenes (Ford) Bergey et al. (*Bacterium oxygenes* Ford, Studies from the Royal Victoria Hospital, Montreal, *1*, No. 5, 1903, 47; *Eberthella oxygenes* Bergey et al., Manual, 1st ed., 1923, 228; Bergey et al., Manual, 3rd ed., 1930, 360.) From feces.

Shigella piscatora Bois and Roy. (Naturaliste Canadien, *71*, 1945, 259.) From the intestine of a codfish (*Gadus callarias L.*).

Shigella tangallensis (Castellani) Hauduroy et al. (*Bacillus tangallensis* Castellani, Cent. f. Bakt., I Abt., Orig., *65*, 1912, 266; Hauduroy et al., Dict. d. Bact. Path., 1937, 497.) From feces.

Shigella tarda (Castellani) Hauduroy et al. (*Bacillus tardus* Castellani, 1917; see Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 954; Hauduroy et al., Dict. d. Bact. Path., 1937, 497.)

FAMILY XI. PARVOBACTERIACEAE RAHN.*

(Cent. f. Bakt., II Abt., *96*, 1937, 281.)

Small, motile or non-motile rods. Gram-negative. Some will grow on ordinary media, but the majority either require or grow better on media containing body fluids or growth-promoting substances. Some invade living tissues. Usually do not liquefy gelatin. No visible gas formed in the fermention of carbohydrates. Infection in some cases may take place by penetration of organisms through mucous membranes or skin. Parasitic to pathogenic on warm-blooded animals, including man.

Key to the tribes of family **Parvobacteriaceae.**

I. Usually grow on ordinary media.
  A. Aerobic to facultative anaerobic.
    1. Show bipolar staining. Majority ferment carbohydrates.
      Tribe I. *Pasteurelleae*, p. 545.
    2. Do not show bipolar staining. None ferment carbohydrates.
      Tribe II. *Brucelleae*, p. 560.
  B. Anaerobic.
      Tribe III. *Bacteroideae*, p. 564.
II. On first isolation dependent on some factor or factors contained in blood or plant tissues. Aerobic to anaerobic.
      Tribe IV. *Hemophileae*, p. 584.

TRIBE I. PASTEURELLEAE CASTELLANI AND CHALMERS.

(Man. Trop. Med., 3rd ed., 1919, 943.)

Small, motile or non-motile, ellipsoidal to elongated rods showing bipolar staining.

Key to the genera of tribe **Pasteurelleae.**

I. Milk not coagulated.
  A. Causes hemorrhagic septicemia, pseudotuberculosis, tularemia or plague.
      Genus I. *Pasteurella*, p. 546.
II. Milk coagulated slowly and sometimes digested.
  A. Causes glanders or glanders-like infections.
      Genus II. *Malleomyces*, p. 554.
III. Milk unchanged to slightly acid.
  A. Associated with actinomycosis in cattle and in man.
      Genus III. *Actinobacillus*, p. 556.

---

* Revised by Prof. E. G. D. Murray, McGill University, Montreal, Canada with the collaboration of Prof. Karl F. Meyer, Hooper Foundation, San Francisco, California; Prof. W. A. Hagan, Cornell University, Ithaca, New York; Dr. Alice C. Evans and Dr. Margaret Pittman, National Institute of Health, Washington, D. C.; Prof. I. F. Huddleson, Michigan State College, East Lansing, Michigan; and others, December, 1938.

Genus I. **Pasteurella** *Trevisan.**

(*Octopsis* Trevisan, Atti della Accad. Fisio-Medico-Statistica, Milano, Ser. 4, *3*, 1885, 102; Trevisan, Rendiconti Reale Instituto Lombardo di Scienze e Lettere, 1887, 94; *Coccobacillus* Gamaleïa, Cent. f. Bakt., *4*, 1888, 167; *Eucystia* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 317.) Named for Louis Pasteur, the French scientist.

Small, Gram-negative, ellipsoidal to elongated rods showing bipolar staining by special methods; aerobic, facultative; may require low oxidation-reduction potential on primary isolation; majority ferment carbohydrates but produce only a small amount of acid; no or slight lactose fermentation; no gas production; gelatin not liquefied; milk not coagulated; parasitic on man, other mammals and birds.

The type species is *Pasteurella multocida* (Lehmann and Neumann) Rosenbusch and Merchant.

Key to the species of genus **Pasteurella.**

I. Growth on ordinary media. Growth in milk.
  A. Non-motile and non-flagellated at 18° to 26°C. No change or slight acid in milk without coagulation.
    1. Indole and H_2S produced. No growth in bile. Sorbitol fermented. No hemolysis on blood agar.
      1. *Pasteurella multocida.*
    2. Indole not formed. Hemolysis produced on blood agar.
      2. *Pasteurella hemolytica.*
    3. Neither indole nor H_2S produced. Growth in bile. Sorbitol not fermented. No hemolysis.
      3. *Pasteurella pestis.*
  B. Motile and flagellated at 18° to 26°C. Milk alkaline. Hydrogen sulfide produced. Indole not formed.
      4. *Pasteurella pseudotuberculosis.*
II. No growth on plain agar or in liquid medium without special enrichment. No growth in milk.
      5. *Pasteurella tularensis.*

1. **Pasteurella multocida** (Lehmann and Neumann) Rosenbusch and Merchant. (Virus der Wildseuche, Hueppe, Berlin. klin. Wochnschr., *23*, 1886, 797; Bactérie ovoide, Lignières, Recueil de Méd. Vétér., *75*, 1898, 836 (Bull. Soc. Centr. Méd. Vétér., N. S. *60*, 1898, 836); *Bacillus septicaemiae haemorrhagicae* Sternberg, Man. of Bact., 1893, 408; *Bacterium septicaemiae hemorrhagicae* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 194; *Bacterium multocidum* Lehmann and Neumann, *ibid.*, 196; *Bacillus plurisepticus* and *Bacterium avicidum* Kitt, in Kolle and Wassermann, Handb. d. path. Mikroorg., 1 Aufl., *2*, 1903, 562; *Bacillus pleurisepticus* Jordan, General Bact., 1st ed., 1908, 289; *Bacillus bipolaris septicus* Hutyra, in Kolle and Wassermann, Handb. d. path. Mikroorg., 2 Aufl., *6*, 1913, 67; *Bacillus bipolaris plurisepticus* Hutyra, *ibid.*; *Pasteurella septica* Topley and Wilson, Princip. Bact. and Immun., 1st ed., *1*, 1931, 488;

* Rearranged by Mrs. Eleanore Heist Clise, New York State Experiment Station, Geneva, New York, in accordance with the suggestions of Mr. Philip C. Harvey and Dr. Mark Welsh, Pearl River, New York, November, 1945.

Pasteurella pluriseptica Gay et al., Agents of Disease and Host Resistance, 1935, 730; Rosenbusch and Merchant, Jour. Bact., *37*, 1939, 85.) From Latin, killing many.

The following are regarded as identical with the above but are arranged here according to source:

Pasteurella bollingeri Trevisan. (Microparasiten bei eine neue Wild- und Rinderseuche, Bollinger, Über eine neue Wild- und Rinderseuche unsw., München, 1878; *Bacterium bipolare multocidum* Kitt, Sitz. Gesell. Morphol. u. Physiol., München, *1*, 1885, 24; Trevisan, I generi e le specie delle Batteriacee, 1889, 21; *Bacillus bovisepticus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 421; *Bacterium bovisepticus* Chester, Ann. Rept. Del. Coi. Agr. Exp. Sta., *9*, 1897, 81; *Bacterium multocidum* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 196; La Pasteurella bovine, Lignières, Recueil de Méd. Vétér., *77*, 1900, 537; *Bacillus bipolaris bovisepticus* Hutyra, in Kolle and Wassermann, Handb. d. path. Mikroorg., 2 Aufl., *6*, 1913, 67; *Pasteurella boviseptica* Holland, Jour. Bact., *5*, 1920, 224; *Pasteurella bovium* Hutyra, in Kolle, Kraus und Uhlenhuth, Handb. d. path. Mikroorg., 3 Aufl., *6*, 1927–1929, 487; *Pasteurella ferarum* Hauduroy et al., Dict. d. Bact. Path., 1937, 316.) From domestic cattle and deer.

Pasteurella avicida (Gamaleïa) Trevisan. (Microbe du cholera des poules, Pasteur, Compt. rend. Acad. Sci., Paris, *90*, 1880, 239, 952 and 1030; Granules of fowl cholera, Salmon and Th. Smith, U. S. Dept. Agr. Ann. Rept., 1880, 438; *Micrococcus cholerae gallinarum* Zopf, Die Spaltpilze, 3 Aufl., 1885, 57; *Octopsis cholerae gallinarum* Trevisan, Atti della Accad. Fisio-Medico-Statistica, Milano, Ser. 4, *3*, 1885, 102; *Bacillus cholerae gallinarum* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 253; *Bacterium cholerae gallinarum* Schroeter, Kryptogamen Flora von Schlesien, *3*, 1, 1886, 155; Hühnercholerabacterien, Kitt, Cent. f. Bakt., *1*, 1887, 305; *Pasteurella cholerae gallinarum* Trevisan, Rendiconti Reale Instituto Lombardo di Scienze e Lettere, 1887, 94; *Coccobacillus avicidus* Gamaleïa, Cent. f. Bakt., *4*, 1888, 167; Trevisan, I generi e le specie delle Batteriacee, 1889, 21; *Bacterium avicidum* Kitt, according to Chester, Man. Determ. Bact., 1901, 135; *Bacterium cholerae* Chester, *idem*; *Bacillus avisepticus* and *Bacterium avisepticum* Kitt, in Kolle and Wassermann, Handb. d. path. Mikroorg., 1 Aufl., *2*, 1903, 544; not *Bacillus avisepticus* Chester, *loc. cit.*, 220; *Pasteurella avium* Kitt, *loc. cit.*, 562; *Pasteurella gallinae* Besson, Practical Bacteriology, London and New York, 1913, 447; *Pasteurella cholerae-gallinarum* Winslow et al., Jour. Bact., *2*, 1917, 561; *Bacillus cholerae-gallinarum* Holland, Jour. Bact., *5*, 1920, 217; *Pasteurella aviseptica* Holland, *ibid.*, 224.) From fowls.

Pasteurella cuniculicida (Flügge) Trevisan. (Septicämiebacterien, Gaffky, Mit. kaiserl. Gesundheitsamte, *1*, 1881, 98; *Bacillus cuniculicida* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 251; Trevisan, I generi e le specie delle Batteriacee, 1889, 21; *Bacterium septichaemiae* Schroeter, Kryptogamen Flora von Schlesien, *3*, 1, 1889, 155; *Bacterium cuniculicida* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 80; not *Bacterium cuniculicida* Chester, Man. Determ. Bact., 1901, 140; *Bacillus cunicuIisepticus* Kitt, in Kolle and Wassermann, Handb. d. path. Mikroorg., 1 Aufl., *2*, 1903, 562; *Bacterium lepisepticum* Ferry and Hoskins, Jour. Lab. and Clin. Med., *5*, 1920, 311; *Bacillus bipolaris septicus* and *Bacillus lepisepticus* Ford, Textb. of Bact., 1927, 591; *Pasteurella lepiseptica* Holland, Jour. Bact., *5*, 1920, 221; *Pasteurella cuniculi* Schütze, Med. Res. Council, Syst. of Bact., London, *4*, 1929, 469; *Bacterium leporisepticum* Hauduroy et al., Dict. d. Bact. Path., 1937, 314.) From rabbits.

Pasteurella suilla Trevisan. (Rothlaufstabchen, Loeffler, Arb. kaiserl. Ge-

sundheitsamte, *1*, 1886, 51; Rothlaufbacillen, Schütz, *ibid.*, 74; Bacillus of swine plague, Salmon, Rept. U. S. Dept. Agr., Bur. An. Ind., 1886, 87; *Bacillus parvus ovatus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 273; Trevisan, Reale Instituto Lombardo d. Sci. e Let. Rend., Ser. 2, *20*, 1887, 94; *Bacterium suicida* Migula, in Engler and Prantl, Natürl. Pflanzenfam., *1*, 1a, 1895, 27; *Bacillus suisepticus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 419; *Bacterium suisepticus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 80; La Pasteurella porcine, Lignières, Recueil de Méd. Vétér., *77*, 1900, 391; *Pasteurella suiseptica* Holland, Jour. Bact., *5*, 1920, 220; *Pasteurella suum* Hutyra, in Kolle, Kraus and Uhlenhuth, Handb. d. path. Mikroorg., 3 Aufl., *6*, 1927–1929, 487.) From swine.

Bacterium bovicida Migula. (Microbo del barbone dei bufali, Oreste Armanni, Atti. d. R. Istit. d'incoragg. alle scienze natur. ecenom. e technol., 1887; Letta nella tornata Accad., Sept. 16, 1886; Cent. f. Bakt., *2*, 1887, 50; Atti della Commissione per le malattie degli animali, *121*, 1887; Migula, Syst. d. Bakt., *2*, 1900, 366; *Pasteurella bubalseptica* Kelser, Man. Vet. Bact., 1st ed., 1927, 195; *Bacillus bubalsepticus* Kelser, *ibid.*; *Bacillus bipolaris bubalisepticus* Hauduroy et al., Dict. d. Bact. Path., 1937, 312.) From buffaloes.

Pasteurella vituliseptica (Kitt) Ford. (*Bacillus vitulisepticus* Kitt, in Kolle and Wassermann, Handb. d. path. Mikroorg., 1 Aufl., *2*, 1903, 562; *Bacterium vitulisepticum* Lehmann and Neumann, Bakt. Diag., 5 Aufl., *2*, 1912, 282; Ford, Textb. of Bact., 1927, 597.) From calves.

Pasteurella muricida Meyer and Batchelder. (Meyer and Batchelder, Jour. Inf. Dis., *39*, 1926, 386; *Pasteurella muriseptica* Topley and Wilson, Princip. Bact. and Immun., 1st ed., *1*, 1931, 482; not *Pasteurella muriseptica* Bergey et al., 1st ed., 1923, 265 (*Bacillus murisepticus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 250; *Erysipelothrix muriseptica* Bergey et al., Manual, 2nd ed., 1925, 380).) From wild rats.

Bacillus bipolaris der malignen Meerschweinchen-Phlegmasie of Heymann and Kyriasides, Ztschr. f. Hyg., *114*, 1932, 119 (*Klebsiella caviae* Hauduroy et al., Dict. d. Bact. Path., 1937, 261) is stated by the original authors to be closely related to this organism.

Plasaj and Pribram (Cent. f. Bakt., I Abt., Orig., *87*, 1921, 1) also present a classification of the hemorrhagic septicemia bacteria.

Description from Schütze (Med. Res. Council, Syst. of Bact., London, *4*, 1929, 451) who prepared it from studies of 230 strains described by 17 authors during the years 1908–1926.

Short ellipsoidal rods: 0.3 to 1.25 microns in length, occurring singly, in pairs, rarely in chains. Show bipolar staining. Non-motile. Gram-negative.

Gelatin: No liquefaction.

Agar: Fine translucent growth. Characteristic odor.

Broth: Uniform turbidity. Characteristic odor.

Milk: No change in reaction. No coagulation.

Potato: No visible growth.

Indole is formed.

Nitrites are produced from nitrates.

Hydrogen sulfide is produced.

No hemolysis on blood agar.

Acid but no gas from glucose, mannitol (usually), sucrose, fructose, sorbitol, galactose, mannose, xylose (usually) and trehalose (usually). No acid from lactose, dulcitol, arabinose (usually), amygdalin, maltose (usually), raffinose, rhamnose, adonitol, dextrin, inulin, glycerol, salicin (usually) or erythritol.

Optimum temperature 37°C. Killed at temperatures above 45°C.

Aerobe to facultative anaerobe.

Three serological types have been found on the basis of agglutination tests (Little and Lyon, Amer. Jour. Vet. Res., *4*, 1943, 110).

Virulent for laboratory animals, especially mice and rabbits.

Distinctive characters: Grows on ordinary media. Bile salts inhibit growth.

Source: From numerous domestic animals and fowls, including cat, dog, cattle, horse, goat, sheep, pig, rabbit, chicken, and from reindeer, buffalo, rat, etc.

Habitat: The cause of hemorrhagic septicemia in birds and mammals.

2. **Pasteurella hemolytica** Newsom and Cross. (Jour. Amer. Vet. Med. Assoc., *80* (N.S. *33*), 1932, 715.) From M. L., hemolytic.

Bipolar staining.

Blood agar: Hemolysis.

Indole not formed.

Acid from dextrin, fructose, galactose, glucose, glycerol (usually), inositol, lactose (usually), maltose, mannitol, raffinose, sorbitol, sucrose and xylose. No acid from arabinose, dulcitol, inulin, mannose, rhamnose or salicin.

No cross-agglutination between *Pasteurella multocida* and this species.

Avirulent for rabbits.

Source: Twenty strains isolated from pneumonia in sheep and cattle.

Habitat: Occurs in pneumonia of sheep and cattle.

3. **Pasteurella pestis** (Lehmann and Neumann) Holland. (Bacille de la peste, Yersin, Ann. Inst. Past., *8*, 1894, 666; Pest Bacillus, Aoyama, Ztschr. f. Hyg., *21*, 1895, 165; *Bacterium pestis* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 194; *Bacillus pestis bubonicae* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 429; *Bacterium pestis bubonicae* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 81; *Bacillus pestis* Migula, Syst. d. Bakt., *2*, 1900, 749; *Eucystia pestis* Enderlein, Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 317; Holland, Jour. Bact., *5*, 1920, 219; *Coccobacillus yersini* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 20.) From Latin *pestis*, plague.

Rods: 1.0 by 2.0 microns, occurring singly. Non-motile. Polar staining. Characteristic bladder, safety-pin and ring involution forms. Gram-negative.

Gelatin colonies: Flat, gray, with granular margin.

Gelatin stab: Flat surface growth. Arborescent growth in stab. No liquefaction.

Agar colonies: Grayish-white, translucent, irridescent, undulate.

Agar slant: Growth grayish, viscid, thin, moist, translucent. Growth slow, favored by the addition of blood or sodium sulfite.

Broth: Turbid or clear with flocculi in the fluid. Old cultures show a pellicle with streamers into the fluid (stalactites). Becomes alkaline more slowly than *Pasteurella pseudotuberculosis*. See Bessonowa and Lenskaja, Cent. f. Bakt., I Abt., Orig., *119*, 1930, 430.

Litmus milk: Slightly acid or unchanged. No coagulation.

Potato: Scanty, grayish growth.

Indole not formed.

Lactose and rhamnose not attacked. Variable action on glycerol.

Nitrites are produced from nitrates.

Temperature relations: Optimum 25° to 30°C. Minimum 0°C. Maximum 43° to 45°C.

Aerobic, facultative.

Source: Buboes, blood, pleural effusion, spleen and liver of infected rodents and man. Sputum in pneumonic plague. Infected fleas.

Habitat: The causative organism of plague in man, rats, ground squirrels and other rodents. Infectious for mice, guinea pigs and rabbits. Transmitted from rat to rat and from rat to man by the infected rat flea.

Note: *Pasteurella pestis* and *Pasteurella pseudotuberculosis* are not definitely distinguishable by serological methods (Schütze, Med. Res. Council, Syst. of Bact., London, *4*, 1929, 478, and Wu Lien-teh, in Chun, Pollitzer and Wu, "Plague," National Quarantine Service, Shanghai, 1936). Malachite-green broth slowly decolorized by *Pasteurella pestis*

and quickly by *P. pseudotuberculosis*; same for methylene blue, Janus green and thionin. No growth on Bessonowa media (pH 5.9). See *Yersinia*, p. 703.

4. **Pasteurella pseudotuberculosis** (Eisenberg) Topley and Wilson. (Bacillus der pseudotuberculose, Pfeiffer, Ueber die bacilläre Pseudotuberculose bei Nagetieren, Leipzig, 1889; *Bacillus pseudotuberculosis* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 294; *Streptobacillus pseudotuberculosis rodentium* Preisz, Ann. Inst. Past., *8*, 1894, 231; *Bacterium pseudotuberculosis rodentium* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 362; *Bacillus pseudotuberculosis rodentium* Lehmann and Neumann, *ibid.*, 429; *Bacterium pseudotuberculosis* Migula, Syst. d. Bakt., *2*, 1900, 374; *Corynebacterium rodentium* Bergey et al., Manual, 1st ed., 1923, 386; *Corynebacterium pseudotuberculosis* Bergey et al., Manual, 2nd ed., 1925, 394; Topley and Wilson, Princip. Bact. and Immun., 1st ed., *2*, 1931, 825; *Corynebacterium pseudotuberculosis rodentium* Kelser, Man. Vet. Bact., 2nd ed., 1933, 319; *Malleomyces pseudotuberculosis rodentium* Pribram, Klassifikation d. Schizomyceten, 1933, 93.) Latinized, false tuberculosis.

Bacillus tuberculosis zoogloeicae Malassez and Vignal (Ann. de Physiol., 1883, 370) is considered identical with this species by Hauduroy et al. (Dict. d. Bact. Path., 1937, 162).

The original tabular description by Eisenberg, Bakt. Diag., 3 Aufl., 1891, 294 is very incomplete. Description taken from Topley and Wilson, Princip. Bact. and Immun., 2nd ed., 1936, 607 and Bessonowa, Lenskaja and Molodtzowa, Office Internat. d'Hyg. Publ., *29*, 1937, 2106.

Small rods: Variable in size and shape. Ellipsoidal or coccoid forms 0.8 by 0.8 to 2.0 microns, with rounded ends, occurring singly. Rod-shaped forms 0.6 by 1.5 to 5.0 microns, with rounded ends, occurring singly, in groups or in short chains. Occasionally long curved filaments. Motile (Weitzenberg, Cent. f. Bakt., I Abt., Orig., *133*, 1935, 343). Non-acid-fast. Gram-negative.

Gelatin stab: After 7 days at 22°C, good filiform growth extending to bottom of tube. No liquefaction.

Agar colonies: After 24 hours at 37°C, circular, 0.5 to 1.0 mm in diameter, umbonate, granular, translucent, grayish-yellow, butyrous; edge entire; dull, finely granular or beaten-copper surface; differentiated into a raised, more opaque center and a flat, clearer periphery with radial striation.

Agar slant: After 48 hours at 37°C, growth moderate, confluent, raised, grayish-yellow, translucent, with glistening, wavy or beaten-copper surface and an irregularly lobate edge.

Blood agar plate: Good growth. No hemolysis.

Broth: After 24 hours at 37°C, moderate growth with moderate turbidity which later clears. Viscous sediment. Incomplete surface and ring growth. Becomes alkaline more rapidly than *Pasteurella pestis*.

Potato: After 7 days at 22°C, a thin yellowish membrane which later turns brown.

Indole not formed.

Litmus milk: Usually slightly alkaline.

Nitrites produced from nitrates.

Ammonia is produced.

Acid but no gas from glucose, maltose, mannitol, salicin, arabinose, xylose, rhamnose and glycerol. Sometimes acid from sucrose.

Hydrogen sulfide produced.

Catalase positive.

Methyl red positive.

Methylene blue is reduced.

Voges-Proskauer test negative.

Temperature relations: Optimum 30°C. Minimum 5°C. Maximum 43°C. Thermal death point 60°C for ten minutes.

Pathogenicity: The cause of spontaneous disease in rabbits, rats and guinea pigs. Infectious for mice, rats, dogs, cats and horses.

Aerobic, facultative.

Source: From a guinea pig inoculated with material from a horse suspected of having glanders.

Habitat: Lesions in natural disease in animals. Causes pseudotuberculosis in rodents, especially guinea pigs.

5. **Pasteurella tularensis** (McCoy and Chapin) Bergey et al. (*Bacterium tularense* McCoy and Chapin, Jour. Inf. Dis., *10*, 1912, 61; McCoy and Chapin, Public Health Bull. 53, U. S. Treas. Dept., Public Health Service, 1912, 17; *Bacillus tularense* Vail, The Ophthalmic Record, 23, 1914, 487; also Francis, U. S. Hygienic Lab. Bull. 130, 1922; Bergey et al., Manual, 1st ed., 1923, 267; *Brucella tularensis* Topley and Wilson, Princip. Bact. and Immun., 1st ed., *1*, 1931, 509; *Coccobacterium tularense* Galli-Valerio, Schweiz. med. Wochnschr., *68*, 1938, 1206.) From Tulare, the county in California in which the disease was first observed.

Description taken from McCoy and Chapin (*loc. cit.*) and Francis (*loc. cit.*). Further revision by Francis, 1947.

Equal numbers of cocci and rods; 0.2 by 0.2 to 0.7 micron, occurring singly. Bipolar staining may occur. Capsules rare or absent. Extremely pleomorphic (Hesselbrock and Foshay, J. Bact. 49, 1945, 209) Non-motile. Gram-negative.

No growth on plain agar or in liquid media without special enrichment. (Tamura and Gibby, J. Bact. 45, 1943, 361) Filterable through Berkefeld filters.

Growth occurs on coagulated egg-yolk (McCoy and Chapin, *loc. cit.*), on blood-glucose-cystine agar (Francis, *loc. cit.*), on blood agar, glucose-blood agar and glucose serum agar. The addition of fresh sterile rabbit spleen to the surface of the last three media favors the growth of the organism.

Forms minute viscous colonies after 2 to 5 days which may attain a diameter of 4 mm if well separated. Growth readily emulsifiable.

Growth on blood media is gray. May cause green discoloration of the blood.

Rough, smooth and mucoid variants have not been reported.

Slight acid without gas may be produced from glucose, glycerol, maltose, mannose, fructose and dextrin.

Growth soluble in sodium ricinoleate.

Hydrogen sulfide produced in a cystine medium.

Aerobic. No growth anaerobically.

Optimum temperature 37°C. Thermal death point 56°C for ten minutes. Survives best at low temperatures, even −70°C.

Pathogenicity: Penetrates unbroken skin to cause infection. Buboes and areas of necrosis produced in human and animal tissue. Infectious for man and most rodents, including rabbits, guinea pigs, rats, mice, squirrels, ground hogs, muskrats, beavers, water rats and lemmings.

Source: Originally isolated from California ground squirrels and later from more than 30 other forms of wild life in the United States and elsewhere. Found in lesions in man and animals with natural or experimental infections. Especially the liver, blood, lymph nodes, and spleen of animals.

Habitat: The cause of tularemia in man and transmitted from wild animals to man by blood-sucking insects, by contact with infected animals, or by drinking water. Disease known in North America, Japan, Russia, Norway, Sweden, Austria, Turkey, Czechoslovakia and Central Germany. See Burroughs, Holdenreid, Longanecker and Meyer, Jour. Inf. Dis., *76*, 1945, 115 for a complete list of known vertebrate hosts.

Appendix: The following organisms may be identical with some of those listed above or related to them:

Bacillus coscoroba Trétrop. (Trétrop, Ann. Inst. Past., *14*, 1900, 224; not *Bacillus coscoroba* MacConkey, Jour. Hyg., *6*, 1906, 397.) The cause of swan cholera in the Antwerp Zoological Garden. Trétrop's description is that of a *Pasteurella* as is pointed out by Castellani

and Chalmers (Man. Trop. Med., 3rd ed., 1919, 941). The organism described by Trétrop clearly was not the same as that in the culture sent by Binot of the Pasteur Institute to MacConkey and described by him (*loc. cit.*) as a member of the coliform group. Because of MacConkey's studies, the Binot culture has been accepted as determining the nature of *Bacillus coscoroba* in many subsequent studies of the coliform group, e. g., Bergey and Deehan, Jour. Med. Res., *19*, 1908, 182; Levine, Amer. Jour. Pub. Health, *7*, 1917, 785; Winslow, Kligler and Rothberg, Jour. Bact., *4*, 1919, 485; Bergey et al., Manual, 1st ed., 1923, 204; etc.

Bacillus cuniculicida Migula. (Bacillus der Kaninchenseptikämie, Eberth and Mandry, Arch. f. path. Anat., *121*, 1890; *Bacillus cuniculicida mobilis* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 406; *Bacterium cuniculicida mobilis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 132; Migula, Syst. d. Bakt., *2*, 1900, 757; not *Bacillus cuniculicida* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 251.) From peritoneal exudate of a rabbit.

Bacillus mustelaecida Trevisan. (Bacillus der Frettchenseuche, Eberth and Schimmelbusch, Fortschr. d. Med., *6*, 1888, 295; also see Arch. f. path. Anat., *115*, 1889, 282; Trevisan, I generi e le specie delle Batteriacee, 1889, 13; *Pasteurella mustelaecida* DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 996; *Bacillus mustelae septicus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 405; *Bacterium mustelae septicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 138; *Bacillus mustelae* Migula, Syst. d. Bakt., *2*, 1900, v and 756.) From a disease of ferrets.

Bacterium anatis Migula. (Bactéries du choléra des canards, Cornil and Toupet, Compt. rend. Acad. Sci. Paris, *106*, 1888, 1747; *Bacillus cholerae anatum* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 417; Migula, Syst. d. Bakt., *2*, 1900, 364.) Regarded as the cause of duck cholera and very similar to, if not identical with, *Pasteurella avicida*. See Rettger and Scoville, Jour. Inf. Dis., *26*, 1920, 220. From the blood and other organs of infected ducks.

Bacterium cuniculi Migula. (Bacillus der Brustseuche des Kaninchens, Beck, Ztschr. f. Hyg., *15*, 1893, 363; *Bacillus cuniculi pneumonicus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 418; *Bacterium cuniculi pneumonicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 84; Migula, Syst. d. Bakt., *2*, 1900, 370; *Bacterium beckii* Chester, Man. Determ. Bact., 1901, 142.) Associated with a lung plague of rabbits.

Bacterium haemorrhagicum (Kruse) Lehmann and Neumann. (Kolb, Arb. kaiserl. Gesundheitsamte, *7*, 1892, 60; *Bacillus haemorrhagicus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 424; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 194.) From the mucous membranes of fever patients.

Bacterium palumbarium Migula. (La bactérie de la maladie des palombes, Leclainche, Ann. Inst. Past., *8*, 1894, 493; *Bacillus cholerae columbarum* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 417; *Bacterium cholerae columbarum* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 84; Migula, Syst. d. Bakt., *2*, 1900, 368; *Bacterium columbarum* Chester, Man. Determ. Bact., 1901, 141.) Associated with an epidemic in wild pigeons.

Bacterium phasianicida Klein. (Klein, Cent. f. Bakt., I Abt., Orig., *31*, 1902, 76; *Bacterium phasianidarum mobile* Enders, Berl. tierarztl. Wchnschr., No. 23, 1902; abst. in Cent. f. Bakt., I Abt., Ref., *34*, 1904, 384.) From an epidemic in pheasants (England). Hadley, Elkins and Caldwell (Rhode Island Agr. Exp. Sta., Bull. 174, 1918, 28) state that this species (which they call *B. phasianicida*) belongs in the group of paratyphoids (*Salmonella*).

Bacterium purpurum Chester. (Bacillus of purpura-haemorrhagica, Babes, Septiche Proz. Kindesalters, Leipzig. 1889; *Bacillus haemorrhagicus septicus*

Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 424; *Bacterium haemorrhagicus septicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 85; Chester, Man. Determ. Bact., 1901, 143.) From a case of septicemia in man.

Bacterium tizzonii Migula. (Bacillus der haemorrhagischen Infektion, Tizzoni and Giovannini, in Zeigler, Beiträge, *7*, 1889, 300; *Bacillus haemorrhagicus velenosus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 425; *Bacterium haemorrhagicus velenosus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 85; Migula, Syst. d. Bakt., *2*, 1900, 386; *Bacterium velenosum* Chester, Man. Determ. Bact., 1901, 144.) From the blood of a child having a hemorrhagic infection.

Bacterium vassalei Migula. (Tizzoni and Giovannini, in Zeigler, Beiträge, *7*, 1889; *Bacillus haemorrhagicus nephritidis* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 424; *Bacterium haemorrhagicus nephritidis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 85; Migula, Syst. d. Bakt., *2*, 1900, 387; *Bacterium nephritidis* Chester, Man. Determ. Bact., 1901, 145.) Isolated by Vassale from a case of hemorrhagic nephritis.

Pasteurella bouffardi Commes. (Commes, 1919; quoted from Neveu-Lemaire, Précis de Parasitol. Hum., 5th ed., 1921, 21.) The cause of a human pasteurellosis observed by Bouffard at Bamako in 1909.

Pasteurella caniseptica Hauduroy et al. (Pasteurella du chien, Lignières, Recueil de Méd. Vét., *77*, 1900, 469; *Bacterium canicida* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 277; Hauduroy et al., Dict. d. Bact. Path., 1937, 312.) From dogs.

Pasteurella capriseptica (Lanfranchi and Pacchioni) Hauduroy et al. (*Bacillus pneumoniae caprae* Nicolle and Refik-Bey, Ann. Inst. Past., *10*, 1896, 321; Pasteurella du chevre, Lignières, Recueil de Méd. Vétér., *77*, 1900, 536; *Bacillus caprisepticus* Lanfranchi and Pacchioni, 1926; *Bacillus bipolaris capristepticus* Chefik Kolayi and Raif, 1935; Hauduroy et al., Dict. d. Bact. Path., 1937, 313.) From hemorrhagic septicemia in goats.

Pasteurella caviae Hauduroy et al. (Gaté and Billa, Compt. rend. Soc. Biol., Paris, *99*, 1928, 814; Hauduroy et al., Dict. d. Bact. Path., 1937, 313.) From a guinea pig with a tuberculosis-like disease.

Pasteurella caviseptica (Schwer) Hauduroy et al. (Pasteurella du cobaye, Phisalix, Compt. rend. Soc. Biol., Paris, *1*, 1898, 761; *Bacterium cavisepticum* Schwer, Cent. f. Bakt., I Abt., Orig., *33*, 1902, 47; Hauduroy et al., Dict. d. Bact. Path., 1937, 314.) From hemorrhagic septicemia in guinea pigs.

Pasteurella desmodilli Pirie. (Pub. So. African Inst. Med. Res., *4*, 1929, 191.)

Pasteurella equiseptica Kelser. (Bacille de la septicémie hémorragique du cheval, Lignières, Bull. Soc. Centr. d. Méd. Vét., *15*, 1897, 437 and *16*, 1898, 849; La Pasteurella equine, Lignières, Recueil de Méd. Vét., *77*, 1900, 524; Kelser, Man. Vet. Bact., 1st ed., 1927, 191; *Bacillus equisepticus* Kelser, *ibid.*; *Bacillus pneumoniae equi* Poels.) From horses.

Pasteurella felis (Migula) Hauduroy et al. (*Bacillus salivarius septicus felis* Fiocca, Ann. d. Instit. d'igiene d. Univ. di Roma, *2*, 1892 and Cent. f. Bakt., *11*, 1892, 406; *Bacillus felis septicus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 423; *Bacterium felis septicus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 81; Pasteurella du chat, Lignières, Recueil de Méd. Vét., *77*, 1900, 493; *Bacterium felis* Migula, Syst. d. Bakt., *2*, 1900, 375; Hauduroy et al., Dict. d. Bact. Path., 1937, 316.) From the sputum of a cat.

Pasteurella mastidis (Miessner and Schoop) Hauduroy et al. (Stäbchenbakterium, Dammann and Freese, Deut. tierärztl. Wchnschr., *15*, 1907, 165; Bipolar organism of the Pasteurella group, Leyshon, Vet. Jour., *85*, 1929, 299; *Bacterium mastitidis* Miessner and Schoop, Deut. tierärztl. Wchnschr., *40*,

1932, 69; Pasteurella, Marsh, Jour. Amer. Vet. Med. Assoc., *81* (N.S. *34*), 1932, 376; *Bacterium ovinum* Haupt, Cent. f. Bakt., I Abt., Orig., *123*, 1932, 365; Hauduroy et al., Dict. d. Bact. Path., 1937, 316.) The cause of infectious mastitis of ewes.

Pasteurella necrophora Hauduroy et al. (Bacille de la nécrose infectieuse des Canaris, Cornell, The Vet. Record, *84*, 1928, 350; Hauduroy et al., Dict. d. Bact. Path., 1937, 318.) From domestic canaries.

Pasteurella oviseptica Hauduroy et al (Galtier, Jour. d. méd. vét. et d. zoot., 1889–1890, 58, 113 and 481; La Pasteurella ovine, Lignières, Recueil de Méd. Vétér., 77, 1900, 529; *Bacillus bipolaris ovisepticus* Hutyra, in Kolle and Wassermann, Hand. d. path. Mikroorg., 2 Aufl., *6*, 1913, 67; Hauduroy et al., Dict. d. Bact. Path., 1937, 319.) From sheep.

Pasteurella pericarditis Hauduroy et al. (*Bacterium cavarum pericarditis* Roth, Acta Pathol. et Microb. Scand., *11*, 1934, 335; Hauduroy et al., Dict. d. Bact. Path., 1937, 319.) From guinea pigs.

Pasteurella strasburgensis Hauduroy et al. (Coccobacille de Strasbourg, Debre, Compt. rend. Soc. Biol., Paris, *82*, 1919, 224; Hauduroy et al., Dict. d. Bact. Path., 1937, 323.) From a case of purulent pleurisy.

Pfeifferella anatipestifer Hendrickson and Hilbert. (Hendrickson and Hilbert, The Cornell Veterinarian, *22*, 1932, 239; *Hemophilus anatipestifer* Hauduroy et al., Dict. d. Bact. Path., 1937, 247.) From a septicemic disease of ducks.

Genus II. Malleomyces *Pribram.**

(*Cladascus* Enderlein (in part), Sitzber. Gesell. Naturf. Freunde, Berlin, 1917, 316; *Pfeifferella* Buchanan, Jour. Bact., *3*, 1918, 54; Pribram, Klassification der Schizomyceten, Leipzig, 1933, 11 and 93; *Loefflerella* Gay et al., Agents of Disease and Host Resistance, Indianapolis, 1935, 782.) From Latin *malleus*, glanders and *myces*, fungus.

Because *Pfeifferella* was proposed inadvertently (Buchanan, Gen. Syst. Bact., 1925, 420) and because of a general feeling that it is inappropriate, *Malleomyces* Pribram is used as the earliest suitable name for this genus. The indefinite description of an organism (*Malleomyces equestris*) by Hallier (Ztschr. f. Parasitenkunde, 1870, 119) as the cause of glanders has not previously caused confusion and need not do so in the future.

Short rods, with rounded ends, sometimes forming threads and showing a tendency toward branching. Motile or non-motile. Gram-negative. Tendency to bipolar staining. Milk slowly coagulated. Gelatin may be liquefied. Specialized for parasitic life. Grow well on blood serum and other body fluid media.

The type species is *Malleomyces mallei* (Flügge) Pribram.

Key to the species of genus Malleomyces.

I. Carbohydrates not fermented. Honey-like colonies on potato. Glycerol agar colonies slimy or tenacious, translucent. Non-motile.
   1. *Malleomyces mallei.*

II. Carbohydrates fermented. Profuse, creamy growth on potato. Glycerol agar colonies iridescent, becoming corrugated. Motile.
   2. *Malleomyces pseudomallei.*

---

* Revised by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, December, 1938; further revision, December, 1945.

1. **Malleomyces mallei** (Zopf) Pribram. (Rotzpilz, Löffler and Schütz, Deutsche med. Wchnschr., No. 52, 1882; *Bacillus mallei* Zopf, Die Spaltpilze, 3 Aufl., 1885, 89; Rotzbacillus, Löffler, Arb. kaiserl. Gesundheitsamte, *1*, 1886, 222; *Bacterium mallei* Migula, in Engler and Prantl, Die natürl. Pflanzenfam., *1*, 1a, 1895, 21; *Corynebacterium mallei* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 366; *Mycobacterium mallei* Chester, Man. Determ. Bact., 1901, 353; *Cladascus mallei* Enderlein, Sitzber. Gesell. Naturf. Freunde Berlin, 1917, 395; *Pfeifferella mallei* Buchanan, Jour. Bact., *3*, 1918, 54; *Sclerothrix mallei* Vuillemin, Encyclopédie Mycolog., Paris, *2*, Champignons Parasites, 1931, 135; *Brucella mallei* Pacheco, Revista da Sociedado paulista de Medicina veterinaria, *3*, 1933, 1; *Actinobacillus mallei* Thompson, Jour. Bact., *26*, 1933, 226; also Jour. Bact., *25*, 1933, 44; Pribram, Klassification der Schizomyceten. Leipzig and Vienna, 1933, 93; *Loefflerella mallei* Gay et al., Agents of Disease and Host Resistance, Indianapolis, 1935, 782.) From Latin *malleus*, glanders, a disease of horses.

Bacillus ozenae Trevisan (Corr. Ser., 1884, n. 222) is identical with this species according to Trevisan (I generi e le specie delle Batteriacee, 1889, 13).

Description largely from Kelser, Man. Vet. Bact., 2nd ed., 1933, 325.

Slender rods: 0.5 to 1.0 by 2.0 to 5.0 microns, with rounded ends, usually occurring singly, in pairs and in groups, but may grow into filaments. Branching involution forms on glycerol agar. Show irregular staining. Bipolar staining common. Non-motile. Gram-negative.

Gelatin: Poor growth. Usually no liquefaction. May be slowly liquefied (Jordan, General Bact., 11th ed., 1935, 491).

Agar colonies: Moist, grayish-white layer, translucent, ropy, with regular borders. Later become yellowish or yellowish-brown.

Agar slants: Glistening, moist, ropy, grayish-white growth.

Löffler's serum: Good growth. Moist, viscid, yellowish colonies develop after 36 to 48 hours.

Broth: Turbid, sometimes with thin pellicle. Slimy or ropy sediment.

Litmus milk: Coagulation usually occurs after a week with some acid production. Litmus may or may not be reduced.

Potato: After 36 to 48 hours, pale yellow, honey-drop-like colonies. Later becoming darker, reddish-yellow or chocolate color. The medium sometimes has a faint greenish tinge around the growth.

Indole not formed.

Nitrites not produced from nitrates.

Carbohydrates usually not fermented. Some strains produce small amounts of acid from glucose.

Optimum temperature 37°C. No growth below 20°C or above 44°C.

Aerobic, facultative anaerobic.

Common name: Glanders bacillus.

Distinctive characters: Culture media of slightly acid reaction best suited for growth; addition of glycerol favors growth; honey-like growth on potato.

Source: Isolated by Löffler and Schütz from the liver and spleen of a horse. Lesions in animals and man.

Habitat: The cause of glanders, affecting horses, man, sheep and goats. Transmissible to dogs, cats, rabbits and guinea pigs.

2. **Malleomyces pseudomallei** (Whitmore) Breed. (*Bacillus pseudomallei* Whitmore, Jour. Hyg., *13*, 1913, 1; *Bacillus whitmori* Stanton and Fletcher, Trans. 4th Cong. Far East Assn. Trop. Med., *2*, 1921, 196; also Jour. Hyg., *23*, 1925, 347; *Pfeifferella pseudomallei* Ford, Textb. of Bact., 1927, 294; *Flavobacterium pseudomallei* Bergey et al., Manual, 3rd ed., 1930, 146; *Sclerothrix whitmori* Vuillemin, Encyclopédie Mycolog., *2*, Champignons Parasites, 1931, 136; *Actinobacillus pseudomallei* Thompson, Jour. Bact., *26*, 1933, 226; also Jour. Bact.,

25, 1933, 44; *Loefflerella whitmori* Gay et al., Agents of Disease and Host Resistance, Indianapolis, 1935, 791; Breed, in Manual, 5th ed., 1939, 300.) Latinized, false glanders.

Short rods: With rounded ends, occurring singly and in short chains, showing bipolar staining. Motile. Gram-negative.

Gelatin stab: Moderate, crateriform liquefaction.

Agar colonies: Circular, slightly raised, thick, opaque, cream-colored with irregular margin.

Glycerol agar slant: Wrinkled, thick, rugose, cream-colored growth.

Broth: Turbid with pellicle.

Litmus milk: Curdling with slowly developed acidity, pink sediment; may be digested.

Potato: Vigorous, cream-colored growth.

Indole not formed.

Acid from glucose, maltose, lactose, sucrose and mannitol.

Blood serum slowly liquefied.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Lesions and blood in rats, guinea pigs, rabbits and man. Once from a transient nasal discharge in a horse (Stanton, Fletcher and Symonds) and once from a splenic abscess in a cow (Nicholls).

Habitat: Glanders-like infection (melioidosis) in rats, guinea pigs, rabbits and in man in India, Federated Malay States and Indo-China.

Appendix: The following may belong in this genus:

Flavobacterium orchitidis Sherwood, Irwin and Marts. (Sherwood, Irwin (not Edwin) and Marts, Amer. Jour. Diseases of Children, *45*, 1933, 446; Sherwood, Jour. Kansas Med. Soc., *34*, 1933, 220.) From a case of meningitis. Sherwood (personal communication, 1945) now considers this organism identical with *Bacillus whitmori* (*Malleomyces pseudomallei*). See Manual, 5th ed., 1939, 538 for a description of this species.

Malleomyces agliaceus Pribram. (Bacillo opale agliaceo, Vincenzi, Giorn. d. R. Accad. d. Med. Torino, 1890, No. 6; Pribram, Klassification der Schizomyceten, Leipzig, 1933, 93.) Cause of pseudotuberculosis in frogs.

Genus III. Actinobacillus *Brumpt.**

(Précis de Parasitologie, Paris, 1st ed., 1910, 849.)

Medium-sized, aerobic, Gram-negative rods which frequently show much pleomorphism. Coccus-like forms frequent. Tendency to bipolar staining. Acid but no gas produced from carbohydrates. Grow best, especially when freshly isolated, under increased CO_2 tension. Pathogenic for animals; some species attack man. The outstanding characteristic of the group is the tendency to form aggregates in tissues or culture which resemble the so-called sulfur granules of actinomycosis.

The type species is *Actinobacillus lignieresi* Brumpt.

1. **Actinobacillus lignieresi** Brumpt. (Actinobacilo, Lignières and Spitz, Boletin d. Agri. y Ganaderia, Buenos Aires, *11*, 1902, 169; *Actinobacillus*, Lignières and Spitz, Cent. f. Bakt., I Abt., Orig., *35*, 1903, 294; Brumpt, Précis de Parasitol., Paris, 1st ed., 1910, 849; *Bacillus lignieri* (sic) Macé, Traité de Bactériolo-

*** Revised by Prof. W. A. Hagan, New York State Veterinary College, Ithaca, New York, December, 1938; further revision, December, 1945.**

gie, 6th ed., *2*, 1913, 743; *Nocardia lignieresi* Chalmers and Christopherson, Ann. Trop. Med. and Parasit., *10*, 1916, 242; *Discomyces lignieresi* Brumpt, Précis de Parasitol., Paris, 3rd ed., 1922, 993; *Pasteurella lignieresi* Vuillemin, Encyclopédie Mycologique, Paris, *2*, Champignons Parasites, 1931, 136.) Named for Lignières, who first worked with this organism.

Bacterium purifaciens Christiansen (Maanedsskr. f. Drylaeger, *29*, 1917, 449; *Pasteurella purifaciens* Hauduroy et al., Dict. d. Bact. Path., 1937, 322) is regarded as identical with this organism by Tunnicliff (Jour. Inf. Dis., *69*, 1941, 52).

Rods: 0.4 by 1.0 to 15.0 microns. Cocco-bacillary forms frequent. Non-motile. Gram-negative.

Gelatin: Growth sparse or fails. No liquefaction.

Agar: Primary cultures usually succeed best when the inoculum is introduced by stab. Serum agar is more favorable than plain. Surface colonies are small, bluish, translucent at first, later becoming opaque.

Broth: Serum favors growth. Freshly isolated strains usually grow in form of small granules which adhere to sides of tube, leaving broth fairly clear. Later most strains grow diffusely, often forming a fragile pellicle.

Litmus milk: Most strains cause no change. Sometimes slight acid. No coagulation.

Potato: Little or no growth.

Acid but no gas within 48 hours from glucose, fructose, galactose, maltose, sucrose and mannitol. Acid after longer incubation from lactose, raffinose and glycerol.

Indole is formed in small amounts.

Nitrites not produced from nitrates.

Aerobic. Is favored by increased CO_2 tension. Will not grow anaerobically.

Optimum temperature 37°C.

Pathogenic for cattle and swine. A few cases reported in man. Rabbits and guinea pigs slightly susceptible to inoculation.

Source and habitat: Usually isolated from the lesions of actinobacillosis of cattle. This condition is often clinically diagnosed as actinomycosis. Lesions found in soft tissues, usually lymph nodes, where granulomatous tumors are formed. Eventually these break down to form abscesses.

2. **Actinobacillus actinomycetemcomitans** Topley and Wilson. (*Bacterium actinomycetem comitans* Klinger, Cent. f. Bakt., I Abt., Orig., 1912, 198; *Actinobacillus actinomycetem comitans* Topley and Wilson, Princip. of Bact. and Immun., *1*, 1931, 256; Topley and Wilson, *ibid.*, 2nd ed., 1936, 279.) From actinomycete, and Latin *comitans*, accompanying.

Description taken from Topley and Wilson (*loc. cit.*), Colebrook (Brit. Jour. Exp. Path., *1*, 1920, 197), and Bayne-Jones (Jour. Bact., *10*, 1925, 572).

Cocco-bacilli: Rods 1.0 to 1.5 microns long, cocci 0.6 to 0.8 micron in diameter. Occurring in densely-packed masses. Non-motile. Gram-negative.

Gelatin: No liquefaction.

Agar colonies: Small, tough, adherent.

Glucose agar: Growth thin, dry, granular, hard, slightly yellow, adherent.

Liquid gelatin or broth: At 37°C, numerous isolated, translucent granules, 0.5 to 1.0 mm in diameter, form along sides of tube. In a few days they fuse into a grayish-white mass, forming ring around tube and pellicle over surface. Later granules become opaque, grayish-white.

Glucose broth: Turbid. Yellowish flakes.

Milk: No growth.

Potato: No growth.

Acid but no gas from glucose and lactose.

Not pathogenic for laboratory animals.

No growth at 20°C.

Aerobic, facultative.

Distinctive character: Manner of growth in liquid gelatin.

Source: Found in lesions of actinomycosis.

Habitat: Presumably in actinomycotic lesions.

3. **Actinobacillus actinoides** (Smith) Topley and Wilson. (*Bacillus actinoides* Th. Smith, Jour. Exp. Med., *28*, 1918, 333; *Actinomyces actinoides* Bergey et al., Manual, 1st ed., 1923, 346; Topley and Wilson, Princip. of Bact. and Immun., 1st ed., *1*, 1931, 256.) From Greek, ray-like.

Slender rods in tissues. In cultures may be bacillary or coccoid in form. Grows only under increased CO_2 tension (so-called microaerophilic). Does not grow on ordinary agar or broth, except occasionally when transferred from more favorable media. Most characteristic growth on coagulated blood serum.

Gelatin: No growth.

Agar colonies: Very minute, pale, straw color.

Agar slant: Best growth seen in water of condensation. Serial transfers on this medium generally fail.

Broth: No growth.

Litmus milk: No growth.

Potato: No growth.

Coagulated blood serum (cow): Growth appears first in the condensation water. Appear as granules, consisting of capsular material in which bacillary forms are embedded. Surface mulberry-like because of club-like extensions of capsular material. In stained preparations, the capsular material appears amorphous.

Optimum temperature 37°C.

Microaerophilic.

Not pathogenic for laboratory animals, except possibly the white rat in which a spontaneous chronic pneumonia occurs caused by an organism indistinguishable from this one. Experiments with rats by artificial inoculation have not been reported.

Source: From lungs of calves suffering from chronic pneumonia.

Habitat: Has not been recognized in nature except in pathological processes.

* APPENDIX TO TRIBE PASTEURELLEAE.

While the authors who describe the following new genus with its single species do not indicate its general relationships, it would appear to be as closely related to the species placed in *Parvobacteriaceae* as to those in any other family. It is therefore placed in this appendix pending a clarification of the situation.

Genus A. **Donovania** *Anderson, De Monbreun and Goodpasture.*

(Jour. Exp. Med., *81*, 1945, 25.) Named for C. Donovan who first described the type species.

Pleomorphic non-motile rods, exhibiting single or bipolar condensations of chromatin. Occur singly and in clusters. May be capsulated or non-capsulated. Gram-negative. Growth outside human body occurs only in the yolk, yolk sac or amniotic fluid of developing chick embryo or in a medium containing embryonic yolk. Pathogenic for man causing granulomatous lesions, particularly in the inguinal region.

The type species is *Donovania granulomatis* Anderson, De Monbreun and Goodpasture.

1. **Donovania granulomatis** Anderson et al. (Epithelial cell parasites, Donovan, Indian Med. Gaz., *40*, 1905, 414; Donovan bodies, Dienst, Greenblatt and Sanderson, Jour. Inf. Dis., *62*, 1938, 112; Donovan organism, Anderson, Science, *97*, 1943, 560; Anderson, De Monbreun and Goodpasture, Jour. Exp. Med., *81*, 1945, 25.) From M. L. *granuloma*, of granuloma.

Pleomorphic rods 1 to 2 microns in length, with rounded ends, occurring singly and in clusters. Intracellular forms usually capsulated. Non-motile. Gram-negative.

No growth on ordinary culture media.

Chick embryo: Grows readily in yolk, yolk sac and feebly in amniotic fluid of developing chick embryo.

Embryonic yolk medium: Growth occurs.

Distinctive characters: Capsulated forms readily demonstrated by means of Wright's stain as blue bacillary bodies surrounded by well-defined dense pinkish capsules. Non-capsulated forms variable in morphology. Characteristic safety-pin forms may be demonstrated.

Not pathogenic for the common experimental animals.

Source: Granulomatous lesions of man.

Habitat: Human lesions. The cause of granuloma inguinale.

---

* Prepared by Dr. Orren D. Chapman, Syracuse Medical College, Syracuse, New York, March, 1946.

TRIBE II. BRUCELLEAE BERGEY, BREED AND MURRAY.

(Preprint, Manual, 5th ed., October, 1938, vi.)

Small, motile or non-motile rods or coccoids which grow on special media. There is a single genus *Brucella*.

Genus I. Brucella *Meyer and Shaw.**

(Jour. Inf. Dis., *27*, 1920, 173.) Named for Sir David Bruce, who first recognized the organism causing undulant fever.

Short rods with many coccoid cells, 0.5 by 0.5 to 2.0 microns; non-motile; capsulated; Gram-negative; gelatin not liquefied; neither acid nor gas from carbohydrates; urea utilized; parasitic, invading all animal tissues, producing infection of the genital organs, the mammary gland, the respiratory and intestinal tracts; pathogenic for various species of domestic animals and man.

The type species is *Brucella melitensis* (Hughes) Meyer and Shaw.

Key to the species of genus **Brucella.**

I. Non-motile.
 A. Grow in special media containing basic fuchsin.
  1. Grows in media containing thionin.
   1. *Brucella melitensis.*
  2. Does not grow in media containing thionin.
   2. *Brucella abortus.*
 B. Does not grow in media containing basic fuchsin.
  1. Grows in media containing thionin.
   3. *Brucella suis.*

II. Motile.
   4. *Brucella bronchiseptica.*

Differential characters of the three closely related species of genus *Brucella*.

Species	Infectivity for guinea pigs	Requires CO_2 for isolation	H_2S formation	*Glucose utilized	Amino-nitrogen utilized	Growth in the presence of	
						Thionin	Basic fuchsin
		10 per cent	*days*				
Brucella melitensis	++	0	±1	+++	+	+++	+++
Brucella abortus	++	++	2	+	++	0	+++
Brucella suis	++	0	4	+++	+	+++	0

* All utilize glucose in shake cultures.

1. **Brucella melitensis** (Hughes) Meyer and Shaw. (Bruce, Practitioner, *39*, 1887, 161; *ibid.*, *40*, 1888, 241; Rept. Army Med. Dept., London, *32*, 1890, Append. No. 4, 465; *streptococcus Miletensis* (sic) Hughes, The Mediterranean Naturalist, *2*, February 1, 1892, 325; *Micrococcus melitensis* Bruce, Ann. Inst.

* Revised by Prof. I. F. Huddleson, Michigan State College, East Lansing, Michigan, December, 1942.

Past., *7*, April, 1893, 289; Hughes, La Riforma Med., *3*, Aug. or Sept., 1893, 789 and Ann. Inst. Past., *7*, Aug., 1893, 630; *Bacterium melitense* Saisawa, Ztschr. f. Hyg., *70*, 1912, 181; Meyer and Shaw, Jour. Inf. Dis., *27*, 1920, 173; *Bacillus melitensis* Holland, Jour. Bact., *5*, 1920, 219; *Alcaligenes melitensis* Bergey et al., Manual, 1st ed., 1923, 235; *Brucella melitensis* var. *melitensis* Evans, U. S. Public Health Reports, *38*, 1923, 1947.) From Latin, of Malta.

Short ellipsoidal rods: 0.3 to 0.4 micron in length, occurring singly and in pairs, rarely in short chains. Non-motile. Non-acid-fast. Gram-negative.

Gelatin colonies: Small, clear, entire.

Gelatin stab: Slow growth. No liquefaction.

Agar colonies: Small, circular, convex, amorphous, smooth, glistening, entire, bluish-green, grayish if R type.

Agar slant: Growth slow, moist, honey-like, entire. After a week, the agar is turned brownish and crystals may appear.

Broth: After 10 days, moderate turbidity and grayish sediment. Reaction alkaline, pH 8.0 or higher.

Litmus milk: Unchanged at 24 hours. Later becomes alkaline.

Potato: Scant growth, grayish becoming brownish.

Indole not formed.

Nitrates reduced, often with complete disappearance of nitrite (Zobell and Meyer, Jour. Inf. Dis., *51*, 1932, 99). Because of the latter fact, reports in the literature are apparently contradictory.

Ammonia produced from urea.

Growth enhanced on beef liver or tryptose agar of pH 6.8.

Neither acid nor gas from carbohydrate media.

Optimum reaction pH 7.4.

Optimum temperature 37°C. No growth at 6° or at 45°C. Killed at 59°C.

Aerobic.

Distinctive characters: Requires no increased CO_2 tension.

Source: Isolated by Bruce (1887, *loc. cit.*) from the spleen in fatal cases of Malta fever.

Habitat: Chief host the milch goat. The cause of undulant fever (brucellosis) in man and abortion in goats. May infect cows and hogs and be excreted in their milk. Infectious for all domestic animals.

2. **Brucella abortus** (Schmidt and Weis) Meyer and Shaw. (Bacillus of abortion, Bang, Ztschr. f. Thiermed., *1*, 1897, 241; *Bacterium abortus* Schmidt and Weis, Bakterierne, 1901, 266; *Bacterium abortivum* Chester, Man. Determ. Bact., 1901, 121; *Corynebacterium abortus endemici* Preisz, Cent. f. Bakt., I Abt., Orig., *33*, 1902, 194; *Bacillus abortus* Evans, Jour. Wash. Acad. Sci., *5*, 1915, 122; Meyer and Shaw, Jour. Inf. Dis., *27*, 1920, 173; *Alcaligenes abortus* Bergey et al., Manual, 1st ed., 1923, 234; *Brucella melitensis* var. *abortus* Evans, Public Health Reports, *38*, 1923, 1947.) From Latin *abortus*, an untimely birth.

The morphological and cultural characters are similar to those of *Brucella melitensis* with the following exceptions: Requires 10 per cent CO_2 for isolation, becomes aerobic after several transfers; the browning of the medium in agar slant culture is less marked; S cultures can be differentiated from *Brucella melitensis*, but not from *Brucella suis*, by the agglutinin absorption test.

Source: From the genital organs and milk of infected cattle and from blood in human cases of undulant fever.

Habitat: Chief host the milch cow. The cause of infectious abortion in cattle. The same effects are produced in mares, sheep, rabbits and guinea pigs, and all domestic animals except hogs. Causes undulant fever (brucellosis) in man.

3. **Brucella suis** Huddleson. (Organism resembling *Bacillus abortus*, Anonymous, U. S. D. A. Ann. Rept. Secy. Dept., Rept. of Chief Bur. Animal Ind.,

1914, 86 (30); authorship established by Traum in North Amer. Vet., *1*, No. 2, 1920; described as *Bacillus abortus* by Good and Smith, Jour. Bact., *1*, 1916, 415; Huddleson, Undulant Fever Symposium, Amer. Pub. Health Assoc., (Oct., 1928) 1929, 24; also Mich. Agr. Exp. Sta. Tech. Bull. 100, 1929, 12; *Brucella melitensis* var. *suis* Hardy, Jordan, Borts and Hardy, Public Health Reports, *45*, 1930, 2433; *Bacillus abortus suis* Meyer, Amer. Jour. Pub. Health, *21*, 1931, 503.) From Latin, of swine.

The morphological and cultural characters are similar to those of *Brucella melitensis*.

S cultures of *Brucella suis* can be differentiated from S cultures of *Brucella melitensis*, but not from S cultures of *Brucella abortus*, by the agglutinin absorption test.

Source: From urinogenital and many other organs of swine.

Habitat: Chief host the hog. Causes abortion in swine and undulant fever (brucellosis) in man. Also infectious for horses, dogs, cows, monkeys and laboratory animals.

The differentiation of the above species of *Brucella* by the bacteriostatic action of dyes depends upon the medium used. When tryptose agar (Difco) is used, basic fuchsin and thionin should be used in a final dilution of 1:100,000.

There are several forms of the R and mucoid phases of *Brucella spp.* (Huddleson, Amer. Jour. Vet. Res., 7, 1946, 5). The true R type differs from the S type in its lack of pathogenicity, its antigenic properties, its susceptibility to agglutination by exposure of suspensions to heat and to basic dyes in concentration of 1:2000, and colonial appearance. The mucoid phases differ antigenically, morphologically and culturally. Colonies on agar are spherical or flat, regular in contour, grayish to mucoid in appearance. Suspensions are not agglutinated by heat or dyes, or always by special agglutinating serums. There is no change in their growth characteristics on media containing either basic fuchsin or thionin.

4. **Brucella bronchiseptica** (Ferry) Topley and Wilson. (Ferry, Amer. Vet. Rev., *37*, 1910, 499; also see McGowan, Jour. Path., *15*, 1911, 372; *Bacillus bronchicanis* Ferry, Jour. Inf. Dis., *8*, 1911, 402; *Bacillus bronchisepticus* Ferry, Amer. Vet. Rev., *41*, 1912, 79; *Bacterium bronchisepticus* Evans, Jour. Inf. Dis., *18*, 1916, 578; *Bacterium bronchicanis* Holland, Jour. Bact., *5*, 1920, 221; *Alcaligenes bronchisepticus* Bergey et al., Manual, 1st ed., 1923, 234; Topley and Wilson, Princip. Bact. and Immun., 1st ed., *1*, 1931, 508.) Latinized, disease of the bronchial tubes.

Evans (*loc. cit.*, 593) regards *Bacterium bronchisepticus* as related to *Bacterium abortus* morphologically, culturally, biochemically and serologically.

Short slender rods: 0.4 to 0.5 by 2.0 microns, usually occurring singly, sometimes in pairs and chains. Motile with 4 to 6 peritrichous flagella (Topley and Wilson). Gram-negative.

Gelatin colonies: Similar to those on agar.

Gelatin stab: Slow filiform growth. No liquefaction.

Agar colonies: Small, opaque, white, slightly raised, porcellaneous, entire.

Agar slant: Growth moderate but more luxuriant than in *Brucella melitensis*, filiform, slightly raised, smooth, opalescent, lustrous, moist, entire.

Broth: Turbid, with thin, gray pellicle and ropy sediment. Musty odor develops.

Litmus milk: Alkaline. No coagulation.

Potato: Growth fairly abundant, brownish, glistening, moist, sticky. Medium is darkened.

Indole not formed.

Nitrites often produced from nitrates (Topley and Wilson).

No acid or gas from glucose, sucrose, lactose, maltose or mannitol.

No H_2S produced (Topley and Wilson).

Catalase positive (Topley and Wilson).

Ammonia formed from urea and asparagine.

Optimum temperature 37°C. Killed in twenty minutes at 55°C.

Aerobic, facultative.

Source: From dogs affected with distemper.

Habitat: Causes acute, often fatal, pneumonia in dogs generally as a secondary invader in distemper. Also pathogenic for cats, rabbits, guinea pigs, ferrets, white rats and monkeys. Sometimes occurs in man.

Appendix: The following are recorded in the literature discussing this genus:

Brucella evansi Pacheco (Revista da Sociedade Paulista de Med. Vet., *3*, 1933, 9) is a name applied to a group of thirteen cultures referred to by Evans (Jour. Inf. Dis., *23*, 1918, 354) as abortus-like bacteria although she definitely indicates that these cultures do not agree with each other in their biochemical characteristics (*loc. cit.*, Table 4, p. 361).

The binomials *Brucella paramelitensis*, *Brucella paraabortus* and *Brucella parasuis* have been used for inagglutinable strains of these three species which are, according to Topley and Wilson (Princip. Bact. and Immun., 2nd ed., 1936, 632), now known to be merely rough variants, not deserving to be so named.

Micrococcus paramelitensis Negré and Raymond. (Compt. rend. Soc. Biol., Paris, *72*, 1912, 791 and 1052.)

Micrococcus pseudomelitensis Sergent and Zammitt, 1908. Exact reference not known.

TRIBE III. BACTEROIDEAE TRIB. NOV.

Motile or non-motile rods without endospores. May or may not require enriched culture media. Obligate anaerobes. Gram-negative.

Key to the genera of tribe **Bacteroideae.**

I. Cells with rounded ends.

Genus I. *Bacteroides*, p. 564.

II. Cells with pointed ends.

Genus II. *Fusobacterium*, p. 581.

Genus I. **Bacteroides** *Castellani and Chalmers.**

(Man. Trop. Med., 3rd ed., 1919, 959.)

Characters as for the tribe. From Greek, like a rod.

The type species is *Bacteroides fragilis* (Veillon and Zuber) Castellani and Chalmers.

NOTE: The descriptions have been taken largely from Weinberg et al. (Les Microbes Anaérobies, Paris, 1937, 658); Prévot (Ann. Inst. Past., *60*, 1938, 285); Hauduroy, Ehringer, Urbain, Guillot and Magrou (Dict. Bact. Path., Paris, 1937, 51); and Eggerth and Gagnon (Jour. Bact., *25*, 1933, 389). Because cultures of many of these organisms have not been subjected to critical study with identical tests and media, it is difficult to know how many should be considered as distinct species, and the present arrangement must be considered as tentative. The key, of necessity, has been drawn up from recorded characters which appeared useful for the purpose and these on further study may prove to be inadequate.

Key to the species of genus **Bacteroides.**

I. Not requiring enriched media.
  A. Gas formed from proteins.
    1. Hydrogen sulfide not produced.
      a. Non-motile.
        1. *Bacteroides fragilis.*
      aa. Motile.
        2. *Bacteroides serpens.*
    2. Hydrogen sulfide produced.
      a. Indole not formed.
        b. Very pleomorphic.
          3. *Bacteroides funduliformis.*
        bb. Not markedly pleomorphic.
          4. *Bacteroides siccus.*
      aa. Indole formed.
        b. Gelatin liquefied.
          5. *Bacteroides coagulans.*

---

* Completely revised by Dr. T. E. Roy, Bacteriologist to the Hospital for Sick Children, Toronto, Ontario, Canada and Dr. C. D. Kelly, Assistant Professor of Bacteriology, McGill University, Montreal, P. Q., Canada, December, 1938; rearranged, December, 1945.

bb. Gelatin not liquefied.
c. No acid from lactose and maltose.
6. *Bacteroides varius.*
cc. Acid from lactose and maltose.
d. Acid from sucrose. No acid from glycerol.
7. *Bacteroides inaequalis.*
dd. No acid from sucrose. Acid from glycerol.
8. *Bacteroides insolitus.*

B. No gas formed from proteins.
1. Indole not formed.
a. Hydrogen sulfide not formed.
b. No acid from lactose.
9. *Bacteroides vescus.*
bb. Acid from lactose.
c. No acid from salicin.
10. *Bacteroides exiguus.*
cc. Acid from salicin.
11. *Bacteroides uncatus.*
aa. Hydrogen sulfide formed.
b. No acid from salicin. Acid from arabinose.
c. Gelatin liquefied.
12. *Bacteroides vulgatus.*
cc. Gelatin not liquefied.
13. *Bacteroides incommunis.*
bb. Acid from salicin. No acid from arabinose.
14. *Bacteroides distasonis.*
bbb. No acid from salicin or arabinose.
c. Acid from sorbitol.
15. *Bacteroides tumidus.*
cc. No acid from sorbitol.
16. *Bacteroides convexus.*
2. Indole formed.
a. No acid from salicin or arabinose.
17. *Bacteroides ovatus.*
aa. Acid from salicin and arabinose.
b. No acid from mannitol.
c. No acid from rhamnose.
18. *Bacteroides uniformis.*
cc. Acid from rhamnose.
d. Not capsu ated.
19. *Bacteroides thetaiotaomicron.*
dd. Capsulated.
20. *Bacteroides variabilis.*
bb. Acid from mannitol.
21. *Bacteroides gulosus.*

II. Requiring an enriched medium.
A. Producing a black pigment.
22. *Bacteroides melaninogenicus.*
B. Not producing pigment.
23. *Bacteroides caviae.*

1. **Bacteroides fragilis** (Veillon and Zuber) Castellani and Chalmers. (*Bacillus fragilis* Veillon and Zuber, Arch. Méd. Exp. et Anat. Path., *10*, 1898, 870; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 959; *Fusiformis fragilis* Topley and Wilson, Princip. Bact. and Immun., 1st ed., *1*, 1931, 302; *Ristella fragilis* Prévot, Ann. Inst. Past., *60*, 1938, 290.) From Latin *fragilis*, fragile.

Rods with rounded ends, staining more deeply at the poles, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin: No liquefaction; small amount of gas.

Agar colonies: Small, gray, irregular.

Broth: Turbid.

Indole not formed.

Hydrogen sulfide not formed.

Litmus milk: No coagulation. Slight amount of gas.

Nitrites not produced from nitrates.

Acid from fructose, maltose, sucrose, galactose, glucose and arabinose. Some strains produce acid from lactose (Weinberg et al., Les Microbes Anaérobies, 1937, 720).

Anaerobic.

Optimum temperature 37°C.

Pathogenicity: Some strains produce subcutaneous abscesses in rabbits, guinea pigs or mice.

Source and habitat: From acute appendicitis, pulmonary gangrene, abscesses of the urinary tract, and septicaemias in man.

2. **Bacteroides serpens** (Veillon and Zuber) Hauduroy et al. (*Bacillus serpens* Veillon and Zuber, Arch. Méd. Exp. et Anat. Path., *10*, 1898, 870; *Bacillus radiiformis* Rist and Guillemot, Arch. Méd. Exp. et Anat. Path., 1904; Hauduroy et al., Dict. d. Bact. Path., 1937, 74; *Zuberella serpens* Prévot, Ann. Inst. Past., *60*, 1938, 293.) From Latin *serpens*, creeping.

Rods: Thick, with rounded ends, occurring singly, in pairs, or in short chains. Motile. Gram-negative.

Gelatin: Slow liquefaction, with gas.

Agar colonies: Punctiform.

Deep agar colonies: Small colonies in 48 hours, ray-like growth later. Gas produced.

Broth: Turbid, then flocculent growth; some gas with foul odor.

Hydrogen sulfide not formed.

Litmus milk: Acidified and coagulated in six days, with no digestion.

Acid from fructose, galactose, maltose and lactose.

Coagulated egg white and serum not liquefied.

Anaerobic.

Optimum temperature 37°C.

Experimental pathogenicity: Some strains produce abscesses in rabbits, guinea pigs and mice.

Source and habitat: Acute appendicitis, mastoiditis, pulmonary gangrene, bile tract of dog, and sea water.

3. **Bacteroides funduliformis** (Hallé) Bergey et al. (*Bacillus funduliformi* Hallé, Inaug. Diss., Paris, 1898; *Bacillus thetoides* Rist, Thèse de Paris, 1898; Bergey et al., Manual, 3rd ed., 1930, 373; *Spherophorus funduliformis* Prévot, Ann. Inst. Past., *60*, 1938, 298.) From Latin *funduliformis*, sausage-shaped.

Rods: 1.5 to 3.0 microns long in pus, often spindle-shaped. Extremely pleomorphic in culture media, showing irregular filamentous and branching forms. Non-motile. Gram-negative.

Gelatin: Not liquefied.

Deep agar colonies: Lenticular, with some gas and foul odor.

Broth: Flocculent growth.

Glucose broth: Rapid growth with gas and foul odor.

Indole not formed; although sometimes found in old cultures.

Hydrogen sulfide is formed in small amounts.

Litmus milk: Acid and coagulation by some strains.

Acid and gas from fructose, glucose and maltose. Some strains ferment mannitol, sucrose and lactose.

Anaerobic.

Optimum temperature 37°C.

Experimental pathogenicity: Some strains are pathogenic for rabbits and guinea pigs but not for white rats and mice.

Source and habitat: Female genitalia, urinary infections, puerperal infections, acute appendicitis, otitis, pulmonary gangrene, liver abscesses, septicaemias and intestinal tract.

4. **Bacteroides siccus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 410; *Spherophorus siccus* Prévot, Ann. Inst. Past., *60*, 1938, 299.) From Latin *siccus*, dry.

Short, thick rods: About 1.0 micron long. In glucose broth they are coccoid and often grow in short chains. Non-motile. Gram-negative.

Gelatin: Not liquefied.

Blood agar colonies: Elevated, dry, difficult to emulsify, 1.0 to 1.5 mm in diameter.

Broth: Growth occurs as a powdery sediment with a clear supernatant fluid.

Indole not formed.

Hydrogen sulfide is formed.

Milk: Unchanged.

Nitrites not produced from nitrates.

Acid but no gas from fructose. No acid or gas from glucose, glycerol, mannitol, sorbitol, arabinose, salicin, trehalose, amygdalin, cellobiose, glycogen, rhamnose, xylose or lactose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: Gas is formed in small amounts from peptone. Phenol red and brom cresol purple are decolorized in meat infusion broth.

Source: Two strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

5. **Bacteroides coagulans** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 409; *Pasteurella coagulans* Prévot, Ann. Inst. Past., *60*, 1938, 292.) From Latin *coagulans*, coagulating.

Rods: 0.5 to 2.0 microns long. Bipolar staining. Non-motile. Gram-negative.

Gelatin: Liquefied in 8 to 12 days.

Blood agar colonies: Soft, transparent, 0.5 mm in diameter.

Broth: Diffuse growth.

Indole is formed.

Hydrogen sulfide is formed.

Milk: Coagulated in 8 days without acid production. The coagulum partly redissolves after 3 to 4 weeks.

Nitrites not produced from nitrates.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: No acid or gas from carbohydrates. A small amount of gas is formed from peptone. Phenol red and brom cresol purple are decolorized in a meat infusion broth.

Source: One strain isolated from human feces.

Habitat: Probably intestinal canal of mammals.

6. **Bacteroides varius** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 409; *Spherophorus varius* Prévot, Ann. Inst. Past., *60*, 1938, 299.) From Latin *varius*, diverse.

Rods: 1.0 to 3.0 microns long. Staining uneven. Non-motile. Gram-negative.

Gelatin: Not liquefied in 45 days.

Blood agar colonies: Very flat cones, 2.0 to 3.0 mm in diameter.

Broth: Diffusely clouded.

Indole is formed.

Hydrogen sulfide produced.

Milk: Not acidified or coagulated.

Nitrites not produced from nitrates.

Acid and gas from fructose, galactose, glucose and mannose. No acid or gas from esculin, amygdalin, arabinose, cellobiose, dextrin, glycerol, glycogen, inulin, lactose, maltose, mannitol, melezitose,

raffinose, rhamnose, salicin, sorbitol, starch, sucrose, trehalose or xylose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: Gas is formed from peptone. Brom cresol purple and phenol red are decolorized in a meat infusion broth.

Source: Two strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

7. **Bacteroides inaequalis** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 407; *Spherophorus inaequalis* Prévot, Ann. Inst. Past., *60*, 1938, 298.) From Latin *inaequalis*, unequal.

Rods: Wide variation in size and form. Marked pleomorphism on blood agar. Non-motile. Gram-negative.

Gelatin: Not liquefied in 45 days.

Blood agar colonies: Pin-point in size.

Broth: Diffusely clouded.

Indole is formed.

Hydrogen sulfide is produced.

Milk: Acidified but not coagulated.

Nitrites not produced from nitrates.

Acid but no gas from esculin, amygdalin, arabinose, fructose, galactose, glucose, lactose, maltose, mannose, raffinose, salicin, sucrose and xylose. No acid or gas from cellobiose, dextrin, glycerol, glycogen, inulin, mannitol, melezitose, rhamnose, sorbitol, starch and trehalose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: Forms small amount (5 per cent in Smith tube) of gas from peptone water in the complete absence of carbohydrates. None of this gas is absorbed by alkali. Rapidly decolorizes brom cresol purple and phenol red in meat infusion broth; slowly or not at all in peptone water.

Source: One strain isolated from human feces.

Habitat: Probably intestinal canal of mammals.

8. **Bacteroides insolitus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 408; *Ristella insolita* Prévot, Ann. Inst. Past., *60*, 1938, 291.) From Latin *insolitus*, uncommon.

Short thick rods: 1.0 to 2.0 microns long. Often slender, curved, 2.0 to 3.0 microns long. Non-motile. Gram-negative.

Gelatin: Not liquefied in 45 days.

Blood agar colonies: Minute, transparent.

Broth: Heavy, diffuse growth.

Indole is formed.

Hydrogen sulfide is formed.

Milk: Acidified and coagulated in 30 to 35 days.

Nitrites not produced from nitrates.

Acid but no gas from fructose, galactose, glucose, glycerol, lactose, maltose and mannose. No acid or gas from esculin, amygdalin, arabinose, cellobiose, dextrin, glycogen, inulin, mannitol, melezitose, raffinose, rhamnose, salicin, sorbitol, starch, sucrose, trehalose and xylose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: Brom cresol purple and phenol red are rapidly decolorized in a meat infusion broth. A small amount of gas is formed from peptone.

Source: One strain isolated from human feces.

Habitat: Probably intestinal canal of mammals.

9. **Bacteroides vescus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 406; *Fusiformis vescus* Prévot, Ann. Inst. Past., *60*, 1938, 300.) From Latin *vescus*, small or weak.

Slender, pointed rods: 1.0 to 2.0 microns long, sometimes slightly curved.

Bipolar staining. Non-motile. Gram-negative.

Gelatin: Liquefied in 8 to 25 days.

Blood agar colonies: Very minute and transparent.

Broth: Diffusely clouded.

Indole not formed.

Hydrogen sulfide not produced.

Milk: Neither acidified nor coagulated.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid but no gas from cellobiose (in 30 days), dextrin, glucose, maltose, mannose and rhamnose. No acid or gas from esculin, amygdalin, arabinose, galactose, mannitol, melezitose, raffinose, salicin, sorbitol, starch, sucrose, trehalose, xylose, glycerol, glycogen, inulin, lactose or fructose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: One strain isolated from human feces.

Habitat: Probably intestinal canal of mammals.

10. **Bacteroides exiguus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 407; *Ristella exigua* Prévot, Ann. Inst. Past., *60*, 1938, 292.) From Latin *exiguus*, small and narrow.

Very small slender rods: 0.5 to 1.0 micron long, occurring singly and in pairs. Non-motile. Gram-negative.

Gelatin: Liquefied in 16 to 20 days.

Blood agar colonies: These are of two types. One is pin-point in size, the other is large, gray, moist, 1.0 to 1.5 mm in diameter.

Broth: Diffusely clouded.

Indole not formed.

Hydrogen sulfide not formed.

Milk: Acidified and may or may not be coagulated in 35 to 40 days.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid but no gas from fructose, galactose, glucose, lactose, maltose, mannose, sucrose and trehalose. One strain ferments raffinose. No acid or gas from esculin, amygdalin, arabinose, cellobiose, dextrin, glycerol, glycogen, inulin, mannitol, melezitose, rhamnose, salicin, sorbitol, starch or xylose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: Two strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

11. **Bacteroides uncatus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 404; *Ristella uncata* Prévot, Ann. Inst. Past., *60*, 1938, 291.) From Latin *uncatus*, hooked at the tip.

Rods: Extreme variations in size and form. The ordinary length is 5.0 to 8.0 microns. Curved and hooked forms common. Non-motile. Gram-negative.

Gelatin: Liquefied in 16 days.

Blood agar colonies: Very minute and transparent.

Broth: Turbid, growth is slow and light.

Indole not formed.

Hydrogen sulfide not formed.

Milk: Not acidified or coagulated.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid but no gas after 8 to 30 days of incubation from dextrin, fructose, galactose, glucose, lactose, maltose, raffinose, rhamnose, salicin, starch and sucrose. No acid from esculin, amygdalin, arabinose, cellobiose, glycerol, glycogen, inulin, mannitol, mannose, melezitose, sorbitol, trehalose or xylose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: One strain isolated from human feces.

Habitat: Probably intestinal canal of mammals.

12. **Bacteroides vulgatus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour.

Bact., *25*, 1933, 401; *Pasteurella vulgata* Prévot, Ann. Inst. Past., *60*, 1938, 292.) From Latin *vulgatus*, common.

Oval rods: 0.7 to 2.5 microns long, usually occurring singly, sometimes in pairs. One strain formed filaments 10 microns long. Stain solidly, some strains show bipolar staining. Morphology very variable in glucose broth. Non-motile. Gram-negative.

Gelatin: Liquefied in 4 to 20 days by all but one strain.

Blood agar colonies: Soft, translucent, grayish, elevated, 1.5 to 2.0 mm in diameter. Half of the strains are hemolytic.

Broth: Heavy and diffuse growth.

Indole not formed.

Hydrogen sulfide is formed.

Milk: Acidified. Coagulated by some strains in 5 to 25 days.

Nitrites not produced from nitrates.

Acid and a small amount of gas from arabinose, dextrin, fructose, galactose, glucose, glycogen, inulin, lactose, maltose, mannose, raffinose, rhamnose, starch, sucrose and xylose. Seven strains fermented esculin. No acid or gas from amygdalin, cellobiose, glycerol, mannitol, melezitose, salicin, sorbitol, trehalose, dulcitol, erythritol or inositol.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: Does not form indole; does not produce gas from peptone. This is the commonest species found in the feces of adults. Differs from *Bacteroides incommunis* in that it does not ferment amygdalin and cellobiose, but does ferment glycogen and starch. Liquefies gelatin.

Source: Thirty-eight strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

13. **Bacteroides incommunis** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 402; *Ristella incommunis* Prévot, Ann. Inst. Past., *60*, 1938, 291.) From Latin *incommunis*, not common.

Rods: 0.5 to 1.5 by 1.0 to 3.0 microns, occurring singly. Stain solidly. Non-motile. Gram-negative.

Gelatin: Not liquefied.

Blood agar colonies: Elevated, slightly yellowish, 1 mm in diameter. One strain formed soft colonies; the other was stringy when emulsified.

Broth: Growth is diffuse.

Indole not formed.

Hydrogen sulfide is formed.

Milk: Acidified but not coagulated; coagulates promptly on boiling.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid and a small amount of gas from amygdalin, arabinose, cellobiose, dextrin, fructose, galactose, glucose, inulin, lactose, maltose, mannose, raffinose, rhamnose, sucrose and xylose. One strain fermented glycogen and starch. No action on esculin, glycerol, mannitol, melezitose, salicin, sorbitol or trehalose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: Two strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

14. **Bacteroides distasonis** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 403; *Ristella distasonis* Prévot, Ann. Inst. Past., *60*, 1938, 291.) Named for Distaso, Roumanian bacteriologist.

Rods: 0.5 to 0.8 by 1.5 to 2.5 microns, occurring singly. Staining solidly and having rounded ends. Some strains show a few bacilli 5.0 to 8.0 microns long. Non-motile. Gram-negative.

Gelatin: Not liquefied by 16 strains. The remaining 4 liquefied gelatin in 35 to 50 days.

Blood agar colonies: Soft, grayish, elevated colonies, 1.0 to 1.5 mm in diameter. Two strains markedly hemolytic.

Broth: Growth is diffuse.

Indole not formed.

Hydrogen sulfide is produced.

Milk: Acidified. All but 4 strains coagulate milk.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid but no gas from amygdalin, cellobiose, dextrin, fructose, galactose, glucose, inulin, lactose, maltose, mannose, melezitose, raffinose, rhamnose, salicin, sucrose, trehalose and xylose. Fifteen strains ferment esculin. Fifteen strains slowly ferment starch. No acid or gas from arabinose, glycogen, glycerol, mannitol or sorbitol.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: Usually fails to liquefy gelatin. Fails to ferment arabinose.

Source: Twenty strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

15. **Bacteroides tumidus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 405; *Ristella tumida* Prévot, Ann. Inst. Past., *60*, 1938, 292.) From Latin *tumidus*, swollen.

Small, thick oval rods: 1.0 to 1.5 microns long and occurring singly. The staining is solid. On glucose broth many swollen forms with irregular staining from 1.0 to 4.0 by 1.5 to 10 microns. The bodies of these swollen forms are usually very pale, with only the ends staining. Non-motile. Gram-negative.

Gelatin: Liquefied in 12 to 20 days.

Blood agar colonies: Soft, grayish, elevated colonies, 1 mm in diameter.

Broth: Heavy, diffuse growth.

Indole not formed.

Hydrogen sulfide is produced.

Milk: Acidified but not coagulated.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid but no gas from dextrin, fructose, galactose, glucose, glycogen, inulin, lactose, maltose, mannose, raffinose, sorbitol, starch and sucrose. No acid or gas from esculin, amygdalin, arabinose, cellobiose, glycerol, mannitol, melezitose, rhamnose, salicin, trehalose or xylose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: Four strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

16. **Bacteroides convexus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 406; *Pasteurella convexa* Prévot, Ann. Inst. Past., *60*, 1938, 292.) From Latin *convexus*, convex.

Thick, oval rods: 0.8 to 1.5 microns long, occurring singly or in pairs. In glucose broth, the rods are usually 2.0 to 3.0 microns long. Non-motile. Gram-negative.

Gelatin: Liquefied in 20 to 30 days.

Blood agar colonies: Elevated, grayish, somewhat opaque colonies, 1.0 to 1.5 mm in diameter.

Broth: Heavy diffuse growth.

Indole not formed.

Hydrogen sulfide is produced.

Milk: Acidified and coagulated in 4 days.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid and a small amount of gas from esculin, amygdalin, cellobiose, dextrin, fructose, galactose, glucose, glycogen, inulin, lactose, maltose, mannose, raffinose, starch, sucrose and xylose. No acid or gas from arabinose, glycerol, mannitol, melezitose, rhamnose, salicin, sorbitol or trehalose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: Five strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

17. **Bacteroides ovatus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 405; *Pasteurella ovata* Prévot, Ann. Inst. Past., *60*, 1938, 292.) From Latin *ovatus*, egg-shaped.

Small oval rods: 0.5 to 1.0 by 1.0 to 2.0 microns, occurring singly. Stains solidly. Non-motile. Gram-negative.

Gelatin: Liquefied in 4 days.

Blood agar colonies: Soft, grayish, elevated colonies, 1.0 to 1.5 mm in diameter.

Broth: Diffuse, heavy growth.

Indole is formed.

Hydrogen sulfide is produced.

Milk: Acidified and coagulated in 4 days.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid and a small amount of gas from esculin, amygdalin, cellobiose, dextrin, fructose, galactose, glucose, glycogen, inulin, lactose, maltose, mannose, raffinose, rhamnose, starch, sucrose and xylose. No acid or gas from arabinose, glycerol, mannitol, melezitose, salicin, sorbitol or trehalose.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: One strain isolated from human feces.

Habitat: Probably intestinal canal of mammals.

18. **Bacteroides uniformis** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 400; *Ristella uniformis* Prévot, Ann. Inst. Past., *60*, 1938, 291.) From Latin *uniformis*, of a single form.

Small rods: 0.8 to 1.5 microns long, occurring singly, with rounded ends. Stain heavier at poles and around periphery. Non-motile. Gram-negative.

Gelatin: Liquefied by two strains in 15 to 40 days. Six strains did not liquefy.

Blood agar colonies: Transparent, soft, elevated, 0.5 to 0.75 mm in diameter.

Broth: Diffuse growth.

Indole formed.

Hydrogen sulfide produced slowly or not at all.

Milk: Acidified and coagulated in 8 to 12 days.

Nitrites not produced from nitrates.

Peptone: No gas.

Acid but no gas from esculin, amygdalin, arabinose, cellobiose, dextrin, fructose, galactose, glucose, glycogen, inulin, lactose, maltose, mannose, melezitose, raffinose, salicin, starch, sucrose, trehalose and xylose. No acid or gas from glycerol, mannitol, rhamnose, sorbitol, dulcitol, erythritol or inositol.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Distinctive characters: Forms indole. Resembles *Bacteroides vulgatus*.

Source: Eight strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

19. **Bacteroides thetaiotaomicron** (Distaso) Castellani and Chalmers. (*Bacillus thetaiotaomicron* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 444; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 960; *Spherocillus thetaiotaomicron* Prévot, Ann. Inst. Past., *60*, 1938, 300.) The combination theta, iota and omicron is used because the pleomorphic rods have the shape of these Greek letters.

Description taken from Distaso (*loc. cit.*). More complete description will be found in Eggerth and Gagnon (Jour. Bact., *25*, 1933, 399).

Short, plump to oval rods. Stain solidly or only at poles. Sometimes with bar causing organism to resemble Greek letter theta. Motile (Distaso). Non-motile (Eggerth and Gagnon). Gram-negative.

Gelatin: No liquefaction.

Glucose agar colonies: Large, transparent, entire. Sometimes form gas bubbles.

Broth: Turbid.

Egg albumen broth: Albumen not attacked.

Indole is formed.

Hydrogen sulfide produced (Eggerth and Gagnon).

Litmus milk: Acid, coagulated. Curd shrinks with expulsion of turbid whey.

Nitrates not recorded (Distaso). Nitrites not produced from nitrates (Eggerth and Gagnon).

Peptone: No gas (Eggerth and Gagnon).

Acid and gas from esculin, amygdalin, arabinose, fructose, inulin, lactose, cellobiose, dextrin, galactose, glucose, glycogen, maltose, mannose, melezitose, raffinose, rhamnose, salicin, starch, sucrose, trehalose and xylose. Four strains fail to produce gas from any sugar. No acid or gas from glycerol, mannitol or sorbitol (Eggerth and Gagnon).

Anaerobic.

Distinctive characters: Resembles *Bacteroides variabilis* but is not capsulated, does not liquefy gelatin, usually forms gas from sugars, and ferments melezitose and trehalose. Differs from *Bacteroides uniformis* in morphology, forming gas from sugars and in fermenting rhamnose (Eggerth and Gagnon).

Source: Isolated frequently from human feces.

Habitat: Intestinal canal of mammals (common).

20. **Bacteroides variabilis** (Distaso) Castellani and Chalmers. (*Bacillus variabilis* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 441; Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 960; *Capsularis variabilis* Prévot, Ann. Inst. Past., *60*, 1938, 293.) From Latin *variabilis*, variable.

Short rods, with rounded ends, occurring singly. Some long flexuous rods. Capsulated. Non-motile. Gram-negative.

Gelatin: No growth on plain gelatin (Distaso); liquefaction (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 400).

Blood agar colonies: Smooth, glistening, elevated and very mucoid, about 1.0 mm in diameter.

Broth: Diffuse growth.

Indole is formed.

Hydrogen sulfide is formed.

Litmus milk: Unchanged (Distaso); acidified and some strains coagulating in 25 to 35 days (Eggerth and Gagnon).

Nitrites not produced from nitrates (Eggerth and Gagnon).

Peptone: No gas.

Acid and gas from glucose, lactose and sucrose (Distaso). Acid and no gas from esculin, amygdalin, arabinose, cellobiose, dextrin, fructose, galactose, glycogen, inulin, lactose, glucose, maltose, mannose, raffinose, rhamnose, salacin, starch, sucrose and xylose. No acid or gas from glycerol, mannitol, melezitose, sorbitol or trehalose (Eggerth and Gagnon).

Non-pathogenic for white mice and rabbits.

Anaerobic.

Optimum temperature 37°C.

Distinctive characters: Capsulated.

Source: Isolated from human feces by Distaso, and by Eggerth and Gagnon (8 strains).

Habitat: Probably intestinal canal of mammals.

21. **Bacteroides gulosus** Eggerth and Gagnon. (Eggerth and Gagnon, Jour. Bact., *25*, 1933, 398; *Spherophorus gulosus* Prévot, Ann. Inst. Past., *60*, 1938, 298.) From Latin *gulosus*, gluttonous.

Small oval rods: 0.8 to 1.0 by 1.0 to 2.0 microns, staining deeper around periphery. Non-motile. Gram-negative.

Gelatin: Liquefied in 2 to 3 weeks.

Blood agar colonies: Soft, gray, entire, elevated, 2 mm in diameter.

Broth: Heavy and diffuse growth.

Indole formed.

Hydrogen sulfide is formed.

Milk: Acidified and coagulated in 4 to 20 days.

Nitrites not produced from nitrates.

Acid and a very small amount of gas from esculin, amygdalin, arabinose, cellobiose, dextrin, fructose, galactose, glycogen, inulin, lactose, glucose, maltose, mannitol, mannose, melezitose, raffinose, rhamnose, salicin, sorbitol, starch, sucrose, trehalose and xylose. Sorbitol and mannitol require 2 to 3 weeks for fermentation. Neither acid nor gas from glycerol, dulcitol, erythritol or inositol.

Peptone: No gas.

Non-pathogenic for white mice and rabbits.

Anaerobic.

Source: Seven strains isolated from human feces.

Habitat: Probably intestinal canal of mammals.

22. **Bacteroides melaninogenicus** (Oliver and Wherry) Roy and Kelly. (*Bacterium melaninogenicum* Oliver and Wherry, Jour. Inf. Dis., *28*, 1921, 341; *Hemophilus melaninogenicus* Bergey et al., Manual, 3rd ed., 1930, 314; *Ristella melaninogenica* Prévot, Ann. Inst. Past., *60*, 1939, 290; Roy and Kelly, in Manual, 5th ed., 1939, 569.) From Greek, black-producing.

Description taken from Oliver and Wherry (*loc. cit.*) and Burdon (Jour. Inf. Dis., *42*, 1928, 161).

Rods: 0.8 by 1.0 to 3.0 microns. Non-motile. Gram-negative.

Serum gelatin stab: Dense flocculent growth at 37°C. No liquefaction.

Blood agar slant: Confluent, black, dry layer. The blood is disintegrated in one to two weeks forming melanin. The medium becomes colorless.

Sodium phosphate broth: Turbid.

Litmus milk: Slow acidification but no coagulation.

Blood serum slant: Fairly luxuriant, white, moist layer.

Acid from fructose, glucose, lactose, maltose, sucrose and mannitol. No acid from galactose.

Non-pathogenic for rabbits, guinea pigs and white mice (Burdon). Anaerobic.

Optimum temperature 37°C.

Distinctive characters: Growth very poor unless fresh body fluids are added to the medium. Grows more readily in mixed culture. When grown on a medium containing haemoglobin, a black pigment is produced (melanin).

Source: Oral cavity, external genitalia, infected surgical wound, urine and feces (Oliver and Wherry).

Habitat: Inhabits healthy mucous membranes of mammals, but may take a part in various pathological processes (Burdon).

23. **Bacteroides caviae** (Vinzent) Hauduroy et al. (*Streptobacillus caviae* Vinzent, Ann. Inst. Past., *42*, 1928, 533; Hauduroy et al., Dict. d. Bact. Path., 1937, 53; *Spherophorus caviae* Prévot, Ann. Inst. Past., *60*, 1938, 299.) From *Cavia*, a genus of rodents.

Rods: Small, sometimes curved. Usually 0.3 to 0.5 by 1.0 to 1.5 microns. Occurring singly and in chains. Pleomorphic in old cultures with long filamentous forms. Non-motile. Gram-negative.

Serum gelatin: No liquefaction.

Serum agar: Surface colonies, small, translucent, slightly raised, adherent to medium in 48 hours. Deep colonies, lenticular, 2 mm in size in 48 hours. Colonies difficult to break up. No gas.

Serum broth: Supernatant fluid clear, with small, stellate colonies, which tend to adhere to walls of the tube. No gas.

Indole not formed in serum peptone water.

Hydrogen sulfide not formed.

Milk: Unchanged.

Coagulated egg white and serum not liquefied.

No acid or gas from carbohydrates.

Pathogenic for guinea pigs, rabbits and mice.

Anaerobic.

Optimum temperature 37°C.

Distinctive characters: No growth unless serum is added to the medium.

Source: From epidemic benign cervical adenitis of guinea pigs.

Habitat: Infected guinea pigs so far as known.

Appendix I: Additional species which may belong here.

Bacteroides laevis (Distaso) Bergey et al. (*Bacillus laevis* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 444; Bergey et al., Manual, 1st ed., 1923, 259; not *Bacillus laevis* Frankland and Frankland, Phil. Trans. Roy. Soc. London, *178*, B, 1887, 278.) From feces.

Bacteroides liquefaciens (Distaso) Bergey et al. (*Coccobacillus liquefaciens* Distaso, Cent. f. Bakt., I Abt., Orig., *59*, 1911, 102; Bergey et al., Manual, 1st ed., 1923, 262.) From feces.

Bacteroides rigidus (Distaso) Bergey et al. (*Bacillus rigidus* Distaso, Cent. f. Bakt., I Abt., Orig., *59*, 1911, 103; Bergey et al., Manual, 1st ed., 1923, 263.)

Appendix II*: Prévot (Ann. Inst. Past., *60*, 1938, 285 and Man. de Class. et de Déterm. des Bact. Anaérobies, 1940, 38) has arranged some of the anaerobic, non-spore-forming, Gram-negative, largely parasitic rods in two families, *Ristellaceae* and *Spherophoraceae*, as follows:

Family Ristellaceae Prévot.

(Ann. Inst. Past., *60*, 1938, 288.)

Genus I. Ristella *Prévot.*

(*Loc. cit.*, 289.)

Straight or slightly bent, non-motile rods. Not capsulated. Gram-negative. Anaerobic.

1. *Ristella fragilis.* See *Bacteroides fragilis.*

2. *Ristella melaninogenica.* See *Bacteroides melaninogenicus.*

3. *Ristella haloseptica* (Wyss) Prévot. (*Bacterium halosepticum* Wyss, Mitt. Grenz. Med. u. Chir., *13*, 1904, 199; Prévot, *loc. cit.*, 291.) From a fatal case of osteomyelitis in man. For a description of this species, see Manual, 5th ed., 1939, 570.

4. *Ristella putredinis* (Weinberg et al.) Prévot. (Bacillus A, Heyde, Beitr. z. klin. Chirurg., *76*, 1911, 1; *Bacillus putredinis* Weinberg et al., Les Microbes Anaérobies, 1937, 755; Prévot, *loc. cit.*, 291.) Fifteen strains isolated from acute appendicitis. For a description of this species, see Manual, 5th ed., 1939, 571.

5. *Ristella terebrans* (Brocard and Pham) Prévot. (*Bacillus terebrans* Brocard and Pham, Compt. rend. Soc. Biol., Paris, *117*, 1934, 997; Prévot, *loc. cit.*, 291.) Two strains isolated from cases of gangrenous erysipelas, associated with a streptococcus. For a description of this species, see Manual, 5th ed., 1939, 571.

6. *Ristella furcosa* (Veillon and Zuber) Prévot. (*Bacillus furcosus* Veillon and Zuber, Arch. Méd. Exp. et Anat. Path., *10*, 1898; *Fusiformis furcosus* Topley and Wilson, Princip. Bact. and Immun., 1st ed., *1*, 1931, 302; *Bacteroides furcosus* Hauduroy et al., Dict. d. Bact. Path., 1937, 61; Prévot, *loc. cit.*, 291.) From cases of appendicitis and from lung abscesses. For a description of this species, see Manual, 5th ed., 1939, 572.

7. *Ristella putida* (Weinberg et al.) Prévot. (*Bacillus gracilis putidus* Tissier and Martelly, Ann. Inst. Past., *16*, 1902, 865; *Bacillus putidus* Weinberg et al., Les Microbes Anaérobies, 1937, 790; not *Bacillus putidus* Kern, Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1896,

* Rearranged by Mrs. Eleanore Heist Clise, New York State Experiment Station, Geneva, New York, December, 1945.

400; Prévot, *loc. cit.*, 291.) From putrefying meat. For a description of this species, see Manual, 5th ed., 1939, 573.

8. *Ristella clostridiiformis* (Ankersmit) Prévot. (*Bacterium clostridiiformis* Ankersmit, Cent. f. Bakt., I Abt., Orig., *40*, 1906, 115; Prévot, *loc. cit.*, 291.) From the normal intestines of cattle. For a description of this species, see Manual, 5th ed., 1939, 574.

9. *Ristella perfoetens* (Weinberg et al.) Prévot. (*Coccobacillus anaerobius perfoetens* Tissier, Thèse Méd., Paris, 1900; *Bacterium perfoetens* Weinberg et al., Les Microbes Anaérobies, 1937, 790; *Bacteroides perfoetens* Hauduroy et al., Dict. d. Bact. Path., 1937, 67; Prévot, *loc. cit.*, 291.) From the intestines of infants with diarrhoea. For a description of this species, see Manual, 5th ed., 1939, 575.

10. *Ristella thermophila β* (Weinberg et al.) Prévot. (Thermo β, Veillon, Ann. Inst. Past., *36*, 1922, 430; *Bacillus thermophilus β* Weinberg et al., Les Microbes Anaérobies, 1937, 800; Prévot, *loc. cit.*, 291.) From manure. Non-pathogenic.

11. *Ristella thermophila γ* (Weinberg et al.) Prévot. (Thermo γ, Veillon, Ann. Inst. Past., *36*, 1922, 432; *Bacillus thermophilus γ* Weinberg et al., Les Microbes Anaérobies, 1937, 800; Prévot, *loc. cit.*, 291.) From manure. For a description of this species, see Manual, 5th ed., 1939, 575.

12. *Ristella incommunis*. See *Bacteroides incommunis*.

13. *Ristella insolita*. See *Bacteroides insolitus*.

14. *Ristella halosmophila* (Baumgartner) Prévot. (*Bacteroides halosmophilus* Baumgartner, Food Research, *2*, 1937, 321; Prévot, Man. de Class. et de Déterm. des Bact. Anaérobies, 1940, 47.) From salted Mediterranean anchovies. Frequently found in the fish muscle and in the solar salt (the probable infecting agent) in which the fish is packed. For a description of this species, see Manual, 5th ed., 1939, 584.

15. *Ristella naviformis* (Jungano) Prévot. (*Bacillus naviformis* Jungano, Compt. rend. Soc. Biol., Paris, *66*, 1909, 122; Prévot, Ann. Inst. Past., *60*, 1938, 291.) From the large intestine of the rat. For a description of this species, see Manual, 5th ed., 1939, 573.

16. *Ristella lichenis-plani* Prévot. (Bacillus of lichen planus, Jacob and Helmbold, Arch. Derm. Syph., *3*, 1933, 28; Prévot, *loc. cit.*, 291.) From the lesions of an inflammatory skin disease, lichen planus.

17. *Ristella destillationis* (Weinberg et al.) Prévot. (Bacterium, Tunnicliff, Jour. Inf. Dis., *13*, 1913, 283; *Bacterium destillationis* Weinberg et al., Les Microbes Anaérobies, 1937, 762; Prévot, *loc. cit.*, 291.) From a case of chronic bronchitis.

18. *Ristella uniformis*. See *Bacteroides uniformis*.

19. *Ristella distasonis*. See *Bacteroides distasonis*.

20. *Ristella uncata*. See *Bacteroides uncatus*.

21. *Ristella tumida*. See *Bacteroides tumidus*.

22. *Ristella exigua*. See *Bacteroides exiguus*.

23. *Ristella trichoides* (Potez and Compagnon) Prévot. (*Bacillus trichoides* Potez and Compagnon, Compt. rend. Soc. Biol., Paris, *87*, 1922, 339; *Bac-*

teroides trichoides Hauduroy et al., Dict. d. Bact. Path., 1937, 78; Prévot, *loc. cit.*, 292.) From a case of choleocystitis. For a description of this species, see Manual, 5th ed., 1939, 572.

24. *Ristella glutinosa* (Guillemot and Hallé) Prévot. (*Bacillus glutinosus* Guillemot and Hallé, Arch. Méd. Exp. et Anat. Path., *16*, 1904, 599; *Bacteroides glutinosus* Hauduroy et al., Dict. d. Bact. Path., 1937, 61; Prévot, *loc. cit.*, 292.) From purulent pleurisies.

25. *Ristella capillosa* (Tissier) Prévot. (*Bacillus capillosus* Tissier, Ann. Inst. Past., *22*, 1908, 189; Prévot, *loc. cit.*, 292.) From the intestines of infants. For a description of this species, see Manual, 5th ed., 1939, 573.

26. *Ristella cylindroides* (Rocchi) Prévot. (*Bacterium cylindroides* Rocchi, Lo stato actuale delle nostre cognizioni sui germi anaerobi Gamberine e Parmezziani, Bologna, 1908; Prévot, *loc. cit.*, 292.) From the human intestine. For a description of this species, see Manual, 5th ed., 1939, 574.

Genus II. Pasteurella *Trevisan.*

Four species. *See Bacteroides vulgatus*, *Bacteroides ovatus*, *Bacteroides convexus*, and *Bacteroides coagulans*.

Genus III. Dialister *Bergey et al.*

Two species. See *Dialister*.

Genus IV. Capsularis *Prévot.*

(*Loc. cit.*, 290.)

Characters as for the genus *Ristella*, but capsulated.

1. *Capsularis zoogleiformans* (Weinberg et al.) Prévot. (*Bacillus mucosus anaerobius* Prausnitz, Cent. f. Bakt., I Abt., Orig., *89*, 1922, 126; *Bacterium zoogleiformans* Weinberg et al., Les Microbes Anaérobies, 1937, 725; *Bacteroides praussnitzii* Hauduroy et al., Dict. d. Bact. Path., 1937, 68; Prévot, *loc. cit.*, 293.) From a purulent empyema in man. For a description of this species, see Manual, 5th ed., 1939, 576.

2. *Capsularis mucosus* (Weinberg et al.) Prévot. (*Coccobacterium mucosum anaerobicum* Klinger, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 186; *Bacterium mucosum* Weinberg et al., Les Microbes Anaérobies, 1937, 727; *Bacteroides viscosus* Hauduroy et al., Dict. d. Bact. Path., 1937, 81; Prévot, *loc. cit.*, 293.) From a brain abscess following bronchiectasis in man. For a description of this species, see Manual, 5th ed., 1939, 575.

3. *Capsularis variabilis*. See *Bacteroides variabilis*.

Genus V. Zuberella *Prevot.*

(*Loc. cit.*, 290.)

Characters as for the genus *Ristella*, but motile with peritrichous flagella.

1. *Zuberella serpens*. See *Bacteroides serpens*.

2. *Zuberella praeacuta* (Tissier) Prévot. (*Coccobacillus praeacutus* Tissier, Ann. Inst. Past., *22*, 1908, 189; Prévot, *loc. cit.*, 293.) From the intestines of infants. For a description of this species, see Manual, 5th ed., 1939, 577.

3. *Zuberella clostridiiformis mobilis* Prévot. (*Bacterium clostridiiformis* Choukévitch, Ann. Inst. Past., *25*, 1911, 345; Prévot, *loc. cit.*, 293.) From the intestines of a horse. Choukévitch considered his organism the same as Ankersmit's *Bacterium clostridiiformis*, although the former was motile.

4. *Zuberella aquatilis* Prévot. (Spray and Laux, Amer. Water Works Assoc.

22, 1930, 235; Prévot, *loc. cit.*, 293.) From river water. For a description of this organism, see Manual, 5th ed., 1939, 577.

5. *Zuberella variegata* (Distaso) Prévot. (*Bacillus variegatus* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 445; *Bacteroides variegatus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 960; Prévot, *loc. cit.*, 293.) From the intestines. For a description of this species, see Manual, 5th ed., 1939, 578.

6. *Zuberella rhinitis* (Tunnicliff) Prévot. (*Bacillus rhinitis* Tunnicliff, Jour. Inf. Dis., *16*, 1915, 493; Prévot, *loc. cit.*, 293.) Thirty-two strains isolated from the nasopharynx in human beings suffering from pharyngitis, tonsilitis, bronchitis and rhinitis, as well as from the nasal mucosa of normal human beings, rabbits, guinea pigs and dogs. For a description of this species, see Manual, 5th ed., 1939, 576.

Family Spherophoraceae Prévot.

(*Loc. cit.*, 289.)

Genus I. Spherophorus *Prévot.*

(*Loc. cit.*, 297.)

Very pleomorphic rods. Metachromatic granules common in elongated forms. Non-motile. Non-spore-forming. Gram-negative.

1. *Spherophorus necrophorus* (Flügge) Prévot. (Bacillus der Kälberdiphtherie, Loeffler, Mitteil. kaiserl. Gesundheitsamte, *2*, 1884, 493; *Bacillus diphtheriae vitulorum* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 265; *Bacillus necrophorus* Flügge, *ibid.*, 273; *Bacillus diphtheriae-vitulorum* Trevisan, I generi e le specie delle Batteriacee, 1889, 13; *Bacillus filiformis* Shütz; not *Bacillus filiformis* Tils, Ztschr. f. Hyg., *9*, 1890, 294; not *Bacillus filiformis* Migula, Syst. d. Bakt., *2*, 1900, 587; Nekrosebacillen, Bang, Maanedskrift f. Dyrleager, *2*, 1890, 235; *Streptothrix cuniculi* Schmorl, Deut. Ztschr. f. Tiermed., *17*, 1891, 376; *Actinomyces cuniculi* Gasperini, Mittheil. 11 Internat. Med. Congr. Rome, see Cent. f. Bakt., *15*, 1894, 684; not *Actinomyces cuniculi* Erikson, Med. Res. Council Spec. Rept. Ser. 203, 1935, 32; *Oospora diphtheriae vitulorum* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 393; *Actinomyces necrophorus* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 434; *Streptothrix necrophora* Kitt, Bakterienkunde, 1899; *Corynebacterium necrophorum* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 531; *Bacillus necroseos* Salomonsen, quoted from Lehmann and Neumann, *ibid.*, 532; *Cladothrix cuniculi* Macé, Traité de Bact., 6th ed., *2*, 1913, 753; *Bacterium necrophorum* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 504; *Fusiformis necrophorus* Topley and Wilson, Princip. Bact. and Immun., 1st ed., *1*, 1931, 299; Prévot, Ann. Inst. Past., *60*, 1938, 298.) Because of the importance of this organism, a description is included here:

Rods: 0.5 to 1.5 microns wide, forming long filaments, up to 80 to 100 microns long. Some authors report branching, others deny this. Short forms are reported by Schmorl to be motile. Gram-negative.

Gelatin stab: No liquefaction.

Agar colonies: Small, dirty-white, circular, opaque, with yellowish center under low power lens. Margin floccose.

Agar stab: Yellowish colonies along needle track. Gas bubbles produced.

Coagulated blood serum: Small, whitish colonies, becoming opaque, fimbriate.

Broth: Turbid, with gas. Cheese-like odor.

Indole is formed.

Litmus milk: Cheese-like odor. Acidified and generally coagulated.

Nitrites not produced from nitrates.

Anaerobic.

Optimum temperature 37°C.

Produces a soluble exotoxin.

Source and habitat: Causes diphtheria in cattle with multiple sclerotic abscesses; gangrenous dermatitis in horses and mules; multiple necrotic foci in liver of cattle and hogs. One case of human infection reported. Transmissible to mice and rabbits.

2. *Spherophorus funduliformis*. See *Bacteroides funduliformis*.

3. *Spherophorus necrogenes* (Weinberg et al.) Prévot. (Bacillus, Kawamura, Jour. Jap. Soc. Vet. Sci., *5*, 1926, 22; *Bacillus necrogenes* Weinberg et al., Les Microbes Anaérobies, 1937, 381; Prévot, *loc. cit.*, 298.) From epidemic abscesses in hens.

4. *Spherophorus necroticus* (Nativelle) Prévot. (*Bacillus necroticus* Nativelle, 1936, see Weinberg et al., Les Microbes Anaérobies, 1937, 693; Prévot, *loc. cit.*, 298.) From a case of gangrenous appendicitis. For a description of this species, see Manual, 5th ed., 1939, 580.

5. *Spherophorus peritonitis* Prévot. (Bacillus, Ghon and Sachs, Cent. f. Bakt., I Abt., Orig., *38*, 1905, 1 and 131; Prévot, *loc. cit.*, 298.) From peritoneal exudate.

6. *Spherophorus gulosus*. See *Bacteroides gulosus*.

7. *Spherophorus inaequalis*. See *Bacteroides inaequalis*.

8. *Spherophorus varius*. See *Bacteroides varius*.

9. *Spherophorus siccus*. See *Bacteroides siccus*.

10. *Spherophorus mortiferus* (Harris) Prévot. (*Bacillus mortiferus* Harris, Jour. Exp. Med., *6*, 1901, 519; Prévot, *loc. cit.*, 299.) From a liver abscess in man. For a description of this species, see Manual, 5th ed., 1939, 581.

11. *Spherophorus freundi* (Hauduroy et al.) Prévot. (Freund, Cent. f. Bakt., I Abt., Orig., *88*, 1922, 9; Bacterium of Freund, Weinberg et al., Les Microbes Anaérobies, 1937, 706; *Bacteroides freundii* Hauduroy et al., Dict. d. Bact. Path., 1937, 57; Prévot, *loc. cit.*, 299.) From a purulent meningitis following otitis in man. For a description of this species, see Manual, 5th ed., 1939, 581.

12. *Spherophorus pyogenes* (Hauduroy et al.) Prévot. (Buday, Cent. f. Bakt., I Abt., Orig., *77*, 1916, 453; *Bacillus pyogenes anaerobius* Bela-Johan, Cent. f. Bakt., I Abt., Orig., *87*, 1922, 290; *Bacteroides pyogenes* Hauduroy et al., Dict. d. Bact. Path., 1937, 69; Prévot, *loc. cit.*, 299.) From abscesses of the liver and lungs following septic war wounds. Also from the blood stream following tonsillectomies. For a description of this species, see Manual, 5th ed., 1939, 582.

13. *Spherophorus gonidiaformans* (Tunnicliff and Jackson) Prévot. (*Bacillus gonidiaformans* Tunnicliff and Jackson, Jour. Inf. Dis., *36*, 1925, 430; *Actinomyces gonadiformis* (sic) Bergey et al., Manual, 3rd ed., 1930, 469; *Bacteroides gonidiaformans* Hauduroy et al., Dict. d. Bact. Path., 1937, 62; Prévot, *loc. cit.*, 299.) From a tonsil. For a description of this species, see Manual, 5th ed., 1939, 582.

14. *Spherophorus floccosus* (Weinberg et al.) Prévot. (*Streptobacillus pyogenes floccosus* Couromont and Cade, Arch. Med. Exp., *12*, 1900, 393; *Bacillus floccosus* Weinberg et al., Les Microbes Anaérobies, 1937, 698; not *Bacillus floccosus* Kern, Arb. bakt. Inst. Karlsruhe, *1*, Heft 4, 1896, 424; *Bacteroides floccosus* Hauduroy et al., Dict. d. Bact.

Path., 1937, 55; Prévot, *loc. cit.*, 299.) From blood in pyemia of man. For a description of this species, see Manual, 5th ed., 1939, 580.

15. *Spherophorus influenzaeformis* (Russ) Prévot. (*Bacillus influenzaeformis* Russ, Cent. f. Bakt., I Abt., Orig., *39*, 1905, 357; *Bacteroides russii* Hauduroy et al., Dict. d. Bact. Path., 1937, 73; Prévot, *loc. cit.*, 299.) One strain isolated from a perianal abscess and two strains from purulent meningitis in man. For a description of this species, see Manual, 5th ed., 1939, 583.

16. *Spherophorus caviae*. See *Bacteroides caviae*.

Genus II. **Spherocillus** *Prévot.*

(*Loc. cit.*, 297.)

Characters as for the genus *Spherophorus*, but motile with peritrichous flagella.

1. *Spherocillus bullosus* (Distaso) Prévot. (*Bacillus bullosus* Distaso, Cent. f. Bakt., I Abt., Orig., *62*, 1912, 443; *Bacteroides bullosus* Castellani and Chalmers, Man. Trop. Med., 3rd ed., 1919, 960; Prévot, *loc. cit.*, 300.) From the intestinal canal. For a description of this species, see Manual, 5th ed., 1939, 583.

2. *Spherocillus thetaiotaomicron*. See *Bacteroides thetaiotaomicron*.

3. *Spherocillus wirthi* Prévot. (Bacillus, Wirth, Cent. f. Bakt., I Abt., Orig., *105*, 1928, 201; Prévot, *loc. cit.*, 300.) From a case of acute otitis.

Appendix III: The following additional species have been found in the literature.

Actinomyces pseudonecrophorus Harris and Brown. (Bull. Johns Hopkins Hosp., *40*, 1927, 203.) From the uterus in cases of puerperal infection. Probably should be classified near *Spherophorus necrophorus*. For a description of this species, see Manual, 5th ed., 1939, 579.

Bacillus anaerobius gracilis Lewkowicz. (Arch. Méd. Exp., *13*, 1901, 633.) From the mouths of infants.

Bacillus angulosus Garnier and Simon. (Presse Méd., 1909, 473.) From the blood of an infant with typhoid fever.

Bacillus annuliformans Massini. (Ztschr. f. gesam. Exp. Med., 1913, 81.) From a tuberculous cavity of man. Pathogenic.

Bacillus circularis major Heurlin. (Bakt. Unters. d. Keimgehaltes im Genitalkanale d. fiebernden Wöchnerinnen. Helsingfors, 1910, 168.) From the genital canal. Anaerobic. Gram-negative.

Bacillus limitans Heurlin. (*Ibid.*, 165.) From the genital canal. Anaerobic. Gram-negative.

Bacillus nebulosus Hallé. (Hallé, Thèse de Paris, 1898; not *Bacillus nebulosus* Vincent, Ann. Inst. Past., *21*, 1907, 69.) From the human vagina.

Bacillus stellatus Vincent. (Vincent, Ann. Inst. Past., *21*, 1907, 62; not *Bacillus stellatus* Chester, Man. Determ. Bact., 1901, 274.) From water.

Bacillus symbiophiles Shottmuller. (Leitfaden f. d. klin. bakt. Kultur., Berlin, 1923.) From the blood in a case of puerperal fever.

Bacterium albarrani Jungano. (Compt. rend. Soc. Biol., Paris, *63*, 1907, 302.) From a case of cystitis.

Bacterium minutissimum Le Blaye and Guggenheim. (*Cocco-bacillus minutissimum gazogenes* Jacobson, Ann. Inst. Past., *22*, 1908, 300; Le Blaye and Guggenheim, Manuel Pratique de Diagnostic Bact., Viget Frères, 1914.) From intestines of infants.

Bacteroides splenomegaliae (Pinoy) Hauduroy et al. (*Synbacterium splenomegaliae* Pinoy, Compt. rend. Acad. Sci., Paris, *182*, 1926, 1429; Hauduroy et al.,

Dict. d. Bact. Path., 1937, 75.) From cases of splenomegaly in Algeria. Pathogenic.

Pasteurella anaerobiontica Levinthal. (Cent. f. Bakt., I Abt., Orig., *106*, 1928, 195.) From the naso-pharynx of man.

Streptobacillus gracilis Guillemot and Hallé. (Guillemot and Hallé, Arch. Méd. Exp. et Anat. Path., *16*, 1904, 598; *Bacteroides streptobacilliformis* Hauduroy et al., Dict. d. Bact. Path., 1937, 76.) From putrid pleurisies.

Genus II. **Fusobacterium** *Knorr.**

(Knorr, Cent. f. Bakt., I Abt., Orig., *87*, 1922, 536; *Fusiformis* Prévot and *Fusocillus* Prévot, Ann. Inst. Past., *60*, 1938, 300.)

Gram-negative, anaerobic rods, usually with tapering ends. Usually non-motile. Stain with more or less distinct granules.

The type species is *Fusobacterium plauti-vincenti* Knorr.

Key to the species of genus **Fusobacterium.**

I. Acid from maltose.
  A. No gas produced.
    1. *Fusobacterium plauti-vincenti.*
  B. Gas produced.
    2. *Fusobacterium biacutum.*

II. No acid from maltose.
  A. Disagreeable odor produced on cultivation.
    3. *Fusobacterium nucleatum.*
  B. No odor produced.
    4. *Fusobacterium polymorphum.*

1. **Fusobacterium plauti-vincenti** Knorr. (Knorr, Cent. f. Bakt., I Abt., Orig., *89*, 1923, 16; *Fusiformis plauti-vincenti* and *Fusiformis vincenti* Hauduroy et al., Dict. d. Bact. Path., 1937, 240.) Named for H. C. Plaut and for H. Vincent who studied diseases of the respiratory tract.

The relationships between this organism and the following have not been clearly established: *Fusiformis dentium* Hoelling, Arch. f. Protistenkunde, *19*, 1910, 240; *Bacillus fusiformis* Veillon and Zuber, Arch. de méd. expér., *10*, 1898, 517 (*Corynebacterium fusiforme* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 529); not *Bacillus fusiformis* Gottheil, Cent. f. Bakt., II Abt., 7, 1901, 724; *Fusiformis fusiformis* Topley and Wilson, Princip. of Bact. and Immun., 1st ed., *1*, 1931, 300.

Weinberg, Nativelle and Prévot (Les Microbes Anaérobies, 1937, 804) and Prévot (Ann. Inst. Past., *60*, 1938, 285) make a distinction between Plaut's bacillus (*Fusocillus plauti*) and Vincent's bacillus (*Fusiformis fusiformis*), the former being actively motile and non-pathogenic and the latter non-motile and pathogenic.

Rods: 0.5 to 1.0 by 8 to 16 microns, occurring in pairs with blunt ends together and outer ends pointed, sometimes in short, curved chains or long spirillum-like threads. Granules present. Non-motile. Gram-negative.

Serum agar shake culture: After 36 hours, colonies spherical, up to 0.5 mm in diameter, thin, yellowish-brown.

Serum agar plate: Matted growth. Medium around colonies becomes turbid from the precipitation of protein. No surface growth.

Serum broth: Milky turbidity.

Liver broth: No turbidity. Grayish-white, flaky precipitate.

---

* Arranged by Prof. Robert S. Breed, New York State Experiment Station, Geneva, New York, December, 1938; rearranged, December, 1945.

Indole not formed.

Acid from glucose, fructose, sucrose, maltose and sometimes from lactose. No acid from inulin or mannitol. (Hine and Berry, Jour. Bact., *34*, 1937, 524.)

No H_2S produced.

No odor produced.

No gas formed.

Non-pathogenic for white mice (Hauduroy et al., *loc. cit.*).

Temperature relations: Optimum 35° to 37°C. Minimum 30°C. (Hauduroy et al., *loc. cit.*)

Optimum pH 6.8 to 8.0 (Hauduroy et al., *loc. cit.*).

Anaerobe.

Source: Two strains isolated from deposit on teeth.

Habitat: Presumably the buccal cavity.

2. **Fusobacterium biacutum** Weinberg and Prévot. (Weinberg and Prévot, Compt. rend. Soc. Biol., Paris, *95*, 1926, 519; *Fusiformis biacutus* Hauduroy et al., Dict. d. Bact. Path., 1937, 238.) From Latin, double pointed.

Rods: 0.4 to 0.5 by 1.4 to 3.0 microns, with pointed ends, occurring singly, in pairs or sometimes in short chains. Non-motile. Gram-negative.

Gelatin: No liquefaction.

Veillon's agar: Rapid growth. Colonies lens-shaped. Gas is produced which breaks up the medium.

Plain broth: Poor growth.

Glucose broth: Turbid. Medium rapidly acidified. Good growth.

Indole not formed.

Milk: Acid and coagulation in 2 to 8 days. Curd not digested.

Casein and coagulated egg-white not digested.

Neutral red reduced.

Acid from glucose, fructose, galactose, maltose and lactose.

Small amount of H_2S produced.

Does not require blood serum for growth.

Pathogenic for guinea pigs.

Killed in 60 minutes at 60°C.

Anaerobic.

Source: Six strains isolated from a case of appendicitis.

Habitat: Unknown.

3. **Fusobacterium nucleatum** Knorr. (Knorr, Cent. f. Bakt., I Abt., Orig., *89*, 1923, 17; *Fusiformis nucleatus* Bergey et al., Manual, 3rd ed., 1930, 514.) Latinized, nucleated.

Rods: 1.0 by 4.0 microns, spindle-shaped, occurring singly. One or two granules present. Non-motile. Gram-negative.

Serum agar plate: Deep colonies lens-shaped with offshoots.

Plain liver broth: No growth.

Liver broth with serum: After 1 to 3 days, flocculent deposit on the pieces of liver.

Indole not formed (Knorr, *loc. cit.*). Indole formed (Hine and Berry, Jour. Bact., *34*, 1937, 521).

Disagreeable odor produced on cultivation.

No gas produced.

Acid from glucose, usually from fructose, sometimes from sucrose and lactose. No acid from maltose, inulin or mannitol. (Hine and Berry, *loc. cit.*)

No H_2S formed.

Temperature relations: Optimum 35° to 37°C. Minimum 30°C. (Hauduroy et al., Dict. d. Bact. Path., 1937, 239.) Survives 56°C for 15 minutes, but not 60°C for 10 minutes (Hine and Berry, *loc. cit.*).

Optimum pH 6.8 to 8.2 (Hauduroy et al., *loc. cit.*).

Anaerobe.

Source: One strain isolated from deposit on teeth in a healthy mouth.

Habitat: Presumably the buccal cavity.

4. **Fusobacterium polymorphum** Knorr. (Knorr, Cent. f. Bakt., I Abt., Orig., *89*, 1923, 19; *Fusiformis polymorphus* Bergey et al., Manual, 3rd ed., 1930, 515.) From Greek, assuming many forms.

Rods: 0.2 to 0.5 by 8 to 16 microns,

occurring in pairs with the pointed ends adjoining. Often occurring in threads. Non-motile. Gram-negative.

Serum agar plates (alkaline): After 2 to 3 days, colonies 0.5 mm or larger, lens-shaped with offshoots.

Tenacious sediment in liquid media.

Indole not formed (Knorr, *loc. cit.*). Indole formed (Hine and Berry, Jour. Bact., *34*, 1937, 522).

No gas produced.

No odor produced.

Acid usually produced from glucose, fructose, and sucrose. No acid from lactose, maltose, inulin or mannitol. (Hine and Berry, *loc. cit.*)

No H_2S produced.

Temperature relations: Optimum 35° to 37°C. Minimum 30°C. (Hauduroy et al., Dict. d. Bact. Path., 1937, 242.) Survives 50°C for 15 minutes, 52°C for 10 minutes and 56°C for 5 minutes (Hine and Berry, *loc. cit.*, 523).

Optimum pH 7.0 to 8.2 (Hauduroy et al., *loc. cit.*).

Anaerobe.

Source: One strain isolated from deposit on teeth in a case of gingivitis.

Habitat: Presumably the buccal cavity.

Appendix I: The following species are mentioned here because they appear to be related to the organisms in the genus *Fusobacterium*:

Bacillus hastilis Seitz. (Ztschr. f. Hyg., *30*, 1899, 47; *Mycobacterium hastilis* Chester, Man. Determ. Bact., 1901, 356.) A collective name for the organisms frequently found in stinking pus and in tonsillar pockets in both healthy and diseased mouths.

Fusocillus shmamini Prévot. (Ann. Inst. Past., *60*, 1938, 300.) Feebly motile.

Fusiformis acnes, *Fusiformis hodgkini* and *Fusiformis typhi-exanthematici* (Plotz) of Holland (Jour. Bact., *5*, 1920 223) are names presumably intended for bacteria more properly placed in the genus *Corynebacterium*.

Fusiformis muris Hoelling. (Arch. f. Protistenkunde, *19*, 1910, 239.) From the blind gut of a mouse. Stated by the author to be similar to *Fusiformis termitidis* Hoelling.

Fusiformis necrophorus Topley and Wilson. See *Spherophorus necrophorus* Prévot, page 578.

Fusiformis nodosus Beveridge. (Beveridge, Austral. Council Sci. and Indus. Res. Bul. 140, 1941, 56 pp.; *Actinomyces nodosus* Hagan, The Infectious Diseases of Domestic Animals. Ithaca, New York, 1943, 312.) Considered the primary cause of footrot of sheep. Also see *Spirochaeta penortha*.

Appendix II: Because of the preferable form of the name and also because it is questionable whether the anaerobic fusiform bacteria of the mouth closely resemble the more or less aerobic bacteria found in termites, the genus name *Fusobacterium* Knorr has been used for the mouth organisms. The termite organisms live in the intestinal tract bathed in digested wood and have the microscopic appearance of the cellulose-destroying *Cytophaga* Winogradsky. These are shown by Stanier (Jour. Bact., *40*, 1940, 619) to belong to *Myxobacteriales*.

The organisms placed in *Fusiformis* Hoelling are as follows:

Fusiformis hilli Duboscq and Grasse. (Arch. Zool. Expér. et Gén., *66*, 1927, 454 and 486.) Found as an ectoparasite on flagellates *Descovina spp.* which live in the rectum of termites (*Calotermes* (*Glyptotermes*) *iridipennis*).

Fusiformis termitidis Hoelling. (Arch. f. Protistenkunde, *19*, 1910, 239.) From the intestinal tract of termites.

TRIBE IV. HEMOPHILEAE WINSLOW ET AL.

(Jour. Bact., *5*, 1920, 212.)

Minute parasitic forms growing on first isolation only in the presence of hemoglobin, ascitic fluid or other body fluids, or in the presence of certain growth accessory substances found in sterile, unheated plant tissue (potato). Motile or non-motile. Commonly found in the mucosa of respiratory tract or conjunctiva.

Key to the genera of tribe **Hemophileae.**

I. Aerobes to facultative anaerobes.
  A. Non-motile.
    1. Predominantly occurring singly.
      Genus I. *Hemophilus*, p. 584.
    2. Predominantly occurring as diplobacilli.
      Genus II. *Moraxella*, p. 590.
  B. Motile, encapsulated.
      Genus III. *Noguchia*, p. 592.
II. Anaerobes.
  A. Non-motile.
      Genus IV. *Dialister*, p. 594.

Genus I. Hemophilus *Winslow et al.**

(Jour. Bact., *2*, 1917, 561.) From Greek, loving blood.

Minute rod-shaped cells, sometimes thread-forming and pleomorphic. Non-motile. Gram-negative. Strict parasites growing best (or only) in the presence of hemoglobin and in general requiring blood serum, ascitic fluid, or certain growth accessory substances.

The type species is *Hemophilus influenzae* (Lehmann and Neumann) Winslow et al.

Key to the species of genus **Hemophilus.**

I. Affecting the respiratory tract.
  1. Require both V and X growth factors for growth.
      1. *Hemophilus influenzae.*
      2. *Hemophilus suis.*
      3. *Hemophilus hemolyticus.*
  2. V growth factor sufficient for growth.
      4. *Hemophilus parainfluenzae.*
      5. *Hemophilus pertussis.*
II. Affecting the genital region.
  3. X growth factor sufficient for growth.
      6. *Hemophilus ducreyi.*
      7. *Hemophilus haemoglobinophilus.*

---

* Revised by Dr. Margaret Pittman, National Institute of Health, Bethesda, Maryland, October, 1945.

Where the relationship to growth accessory factors is known, the following table may serve as a key:

Species	Growth in peptone water containing		
	Growth factor X	Phosphopyridine nucleotide (V)	Growth factors X and V
Hemophilus influenzae	−	−	+
Hemophilus suis	−	−	+
Hemophilus hemolyticus	−	±	+
Hemophilus parainfluenzae	−	+	+
Hemophilus haemoglobinophilus	+	−	+

1. **Hemophilus influenzae** (Lehmann and Neumann) Winslow et al. (Koch, Wiener med. Wchnschr., *33*, 1883, 1550; Weeks, New York Med. Record, *31*, 1887, 571; Influenzabacillus, Pfeiffer, Deutsche med. Wchnschr., 1892, 28; Ztschr. f. Hyg., *13*, 1893, 357; *Bacterium influenzae* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 187; *Bacillus influenzae* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 434; *Bacterium aegyptiacum* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 191; *Hemophilus meningitidis cerebrospinalis septicemiae* Cohen, Ann. Inst. Past., *23*, 1909, 273; Winslow et al., Jour. Bact., *2*, 1917, 561; *Coccobacillus pfeifferi* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 20; *Hemophilus conjunctivitidis* Bergey et al., Manual, 1st ed., 1923, 270.) From influenza, a disease of the respiratory tract.

Common name: The Koch-Weeks Bacillus.

Very small rods: 0.2 to 0.3 by 0.5 to 2.C microns, occurring singly and in pairs, occasionally in short chains, and at times long thread forms are seen. Frequently show a marked tendency to bipolar staining. Some strains are encapsulated. Non-motile. Gram-negative.

Requires both the factors X and V for its growth.

Gelatin colonies: No growth.

Gelatin stab: No growth.

Blood agar colonies: Small, circular, transparent, homogeneous, entire. Satellitism with *Staphylococcus*.

Blood agar slant: Thin, filiform, transparent growth.

Chocolate agar slant: Luxuriant growth.

Blood broth: Slightly turbid. No hemolysis.

Litmus milk, with blood: Some strains render it very slightly alkaline.

Sterilized potato slant: No growth.

Fresh unheated sterile potato added to broth favors development.

Indole is formed by some strains.

Nitrites are produced from nitrates.

Some strains attack none of the carbohydrates, while other strains attack various carbohydrates, provided a suitable medium is used. Mannitol and lactose never fermented.

Pathogenic.

Aerobic, facultative.

Optimum temperature 37°C. Maximum 43°C. Minimum 26° to 27°C. Killed at 55°C for thirty minutes.

Source: Isolated by Pfeiffer in cases of influenza. Found in conjunctiva, nasopharynx, sputum, sinuses, cerebrospinal fluid, blood, and pus from joints.

Habitat: Respiratory tract. A cause of acute respiratory infections, of acute conjunctivitis, and of purulent meningitis of children, rarely of adults. Re-

garded by Pfeiffer and others to be the cause of influenza.

NOTE: Six types (a–f) of *Hemophilus influenzae* are recognized on the basis of precipitation of immune serum by capsular substance. Strains from cerebrospinal fluid are usually of type b. The majority of the strains from the respiratory tract are not type-specific.

2. **Hemophilus suis** Hauduroy et al. (*Hemophilus influenzae suis* Lewis and Shope, Jour. Exp. Med., *54*, 1931, 361 and 373; *Bacterium influenzae suis* Kobe, Cent. f. Bakt., I Abt., Orig., *129*, 1933, 161; Hauduroy et al., Dict. d. Bact. Path., 1937, 258.) From Latin, swine.

Resembles *Hemophilus influenzae* except it is relatively inert to growth, indole is not formed, nitrites are produced from nitrates, and maltose and sucrose are slightly fermented but not the carbohydrates fermented by *Hemophilus influenzae*.

Source: From cases of swine influenza.

Habitat: With a filterable virus it causes swine influenza.

3. **Hemophilus hemolyticus** Bergey et al. (Bacillus X, Pritchett and Stillman, Jour. Exp. Med., *29*, 1919, 259; Stillman and Bourn, Jour. Exp. Med., *32*, 1920, 665; Bergey et al., Manual, 1st ed., 1923, 269.) From Greek, blood-dissolving.

Morphologically like *Hemophilus influenzae*. Non-motile. Gram-negative.

Requires both the factors X and V for its growth. Valentine and Rivers (Jour. Exp. Med., *45*, 1927, 993) isolated certain hemolytic strains which did not entirely agree with this.

Blood agar colonies: Resemble *Hemophilus influenzae* but surrounded by a zone of hemolysis.

Blood agar slant: Thin, filiform, transparent growth.

Blood broth: Turbid, showing hemolysis.

Blood milk mixture: Slightly alkaline.

Sterile unheated potato favors development.

Indole is formed by some strains.

Nitrites are produced from nitrates.

Some strains do not attack carbohydrates, other strains ferment various carbohydrates.

Aerobic, facultative.

Optimum temperature 37°C.

Habitat: Found in upper respiratory tract of man. Non-pathogenic.

4. **Hemophilus parainfluenzae** Rivers. (Johns Hopkins Hosp. Bull., *33*, 1922, 429.) From Latin, like, and the disease, influenza.

Morphologically like *Hemophilus influenza*. Non-motile. Gram-negative.

Requires the V factor for its growth.

Blood agar colonies: Resemble *Hemophilus influenzae*. No hemolysis.

Blood agar slant: Thin filiform transplant.

Broth containing yeast extract: Floccular sediment.

Indole is formed by some strains from cat.

Nitrites are produced from nitrates.

Some strains attack none of the carbohydrates; other strains ferment various carbohydrates.

Aerobic, facultative.

Optimum temperature 37°C.

Habitat: Found in upper respiratory tract of man and cat. Usually non-pathogenic.

5. **Hemophilus pertussis** Holland. (Microbe de coqueluche, Bordet and Gengou, Ann. Inst. Past., *20*, 1906, 731; Holland, Jour. Bact., *5*, 1920, 219; *Bacillus pertussis* Holland, *idem*; *Bacterium tussis convulsivae* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 317 (Bordet and Gengou's organism); not *Bacterium tussis convulsivae* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 192 (Czaplewski and

Hensel's organism).) From Latin, whooping cough.

Short, oval rods: 0.2 to 0.3 by 1.0 micron, occurring singly or sometimes in pairs and short chains. Show tendency to bipolar staining. Capsules may be demonstrated by special technic (Lawson). Non-motile. Gram-negative.

No growth on the usual laboratory media; adapted by repeated transfer with heavy inoculum. Adaptation accompanied by loss of original characteristics.

Bordet-Gengou medium or some modification containing at least 15 per cent blood is optimum for isolation and maintenance.

Colonies: Smooth, raised, entire, pearly, glistening. Surrounded by a zone of hemolysis.

Litmus milk: (After adaptation) brownish color. Alkaline.

Indole not formed.

Nitrites not produced from nitrates.

No action in carbohydrate media.

Catalase positive.

Aerobic.

Optimum temperature 37°C.

Serologically homogeneous when first isolated (Phase I of Leslie and Gardner). Dissociative changes, recognizable morphologically, culturally, antigenically, and by animal tests, take place when maintained on unfavorable media.

Source: From respiratory tract in cases of whooping cough, especially by the cough plate method.

Habitat: Etiologically associated with whooping cough.

NOTE: *Bacillus para-pertussis* Eldering and Kendrick. (Jour. Bact., *35*, 1938, 561.) From cases of whooping-cough. Closely related antigenically to *Hemophilus pertussis* and *Brucella bronchiseptica*, but distinct from either.

6. Hemophilus ducreyi (Neveu-Lemaire) Bergey et al. (Ducrey, Cong. internat. de dermatol. et syph., Compt. rend., Paris, 1890, 229; Monatshft. f. prakt. Dermatol., *9*, 1889, 387; Riforma med., *5*, 1889, 98; Monatshft. f. prakt. Dermatol., *21*, No. 2; Streptobacillus of soft chancre, Ducrey, Abstract in Cent. f. Bakt., I Abt., *18*, 1895, 290; *Bacillus ulceris cancrosi* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 456; *Bacterium ulceris cancrosi* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 67; *Bacterium cancrosi* Chester, Manual Determ. Bact., 1901, 120; *Coccobacillus ducreyi* Neveu-Lemaire, Précis Parasitol. Hum., 5th ed., 1921, 20; Bergey et al., Manual, 1st ed., 1923, 271.) Named for Ducrey who first isolated the organism.

Small rods: 0.5 by 1.5 to 2.0 microns, with rounded ends, occurring singly and in short chains. Non-motile. Gram-negative.

Requires the X factor for its growth.

Gelatin colonies: No growth.

Gelatin stab: No growth.

Blood agar colonies: Small, grayish, glistening, showing a slight zone of hemolysis around the colony in three or four days.

Best growth is obtained on clotted rabbit, sheep, or human blood heated to 55°C for 15 minutes, and in casein digest agar containing blood. Moisture is important for growth.

Aerobic, facultative.

Optimum temperature 37°C.

Habitat: The cause of soft chancre (chancroid).

7. Hemophilus haemoglobinophilus (Lehmann and Neumann) Murray. (*Bacillus haemoglobinophilus canis* Friedberger, Cent. f. Bakt., I Abt., Orig., *33*, 1903, 401; *Bacterium haemoglobinophilus* Lehmann and Neumann, Bakt. Diag., 4 Aufl., *2*, 1907, 270; *Hemophilus canis* Rivers, Johns Hopkins Bull., *33*, 1922, 149; Jour. Bact., *7*, 1922, 579; Murray, in Manual, 5th ed., 1939, 309.) From Greek, hemoglobin-loving.

Small rods: 0.2 to 0.3 by 0.5 to 2.0 microns, occurring singly, in pairs and

short chains. Non-motile. Gram-negative.

Requires the X factor for its growth.

Blood agar colonies: Small, clear, transparent, entire. Old colonies become opaque.

Blood broth: Turbid.

Blood milk mixture: Doubtful development.

Indole is formed.

Nitrites produced from nitrates.

Acid but no gas from glucose, fructose, galactose, mannitol, sucrose and xylose. No acid from maltose, lactose dextrin, arabinose or glycerol. (Rivers, *loc. cit.*)

Optimum temperature 37°C.

Aerobic, facultative.

Habitat: Occurs in large numbers in preputial secretions of dogs.

Appendix I:* The following species has been placed in the tribe *Hemophileae* by Van Rooyen (Jour. Path. and Bact., *43*, 1936, 469). It has been pointed out by Buchanan (General Systematic Bacteriology, 1925, 490) that the genus name *Streptobacillus* is invalid.

Streptobacillus moniliformis Levaditi, Nicolau and Poincloux. (Compt. rend. Acad. Sci., Paris, *180*, 1925, 1188.)

This organism is regarded as identical with *Haverhillia multiformis* Parker and Hudson (Amer. Jour. Path., *2*, 1926, 357) by Van Rooyen (*loc. cit.*). Topley and Wilson (Princip. Bact. and Immun., 2nd ed., 1936, 270) regard it as identical with their *Actinomyces muris* (*Streptothrix ratti* Schottmüller), the cause of rat-bite fever. *Asterococcus muris* Heilman, Jour. Inf. Dis., *69*, 1941, 32. See *Actinomyces muris ratti* in the Appendix to the genus *Streptomyces*. Jordan and Burrows (Textb. of Bact., 14th ed., 1946, 614) consider all these names synonymous. Dawson and Hobby (Proceedings, Third Internat. Congr. for Microbiol., New York, 1940, Section I, 177) suggest that the pleuropneumonia-like cultures isolated from *Streptobacillus moniliformis* really represent variant phases in the growth of this organism.

Description from Levaditi et al. (*loc. cit.*) and Brown and Nunemaker (Bull. Johns Hopkins Hosp., *70*, 1942, 201).

Streptobacilli: 2.0 to 3.0 microns in length, pleomorphic, with branching filaments up to 30 to 40 microns long, fragmented, bacillary and coccobacillary forms. Swollen and club-shaped cells are found. Morphology is best demonstrated by aniline dyes, e.g. Wayson's plague stain. Non-motile. Gram-negative.

Enriched media are required for good growth. Best liquid media are rabbit blood and broth containing serum or ascitic fluid. Best solid media are glycerol extract of potato-infusion broth-egg yolk medium and nutrient agar containing serum.

Blood agar or ascitic serum agar: Colonies small, clear.

Blood plates: Growth slow. Numerous small whitish colonies appear on the third day.

Veillon's medium: Punctiform colonies, abundant in depth, less growth at surface. No gas.

Broth with ascitic fluid and globular extract: Good growth, forming clots which precipitate and are rather adherent to one another. Growth rapidly reduces the pH of the medium killing the bacteria in cultures 24 hrs. old.

Milk: Slow growth. No coagulation.

Löffler's serum: Poor growth.

Virulent for rabbits and mice.

Good growth at 37°C.

Facultative anaerobe. Grows better under anaerobic conditions in the presence of added CO_2, than in the presence of air.

Source: Isolated from a case of a febrile,

* Appendixes I and II arranged by Prof. E. G. D. Murray, McGill Univ., Montreal, P. Q., Canada, March, 1946.

septicemic disease, accompanied by arthritis, erythema and angina.

Habitat: The cause of an acute febrile disease sometimes called erythema multiforme.

Appendix II: The following species may be identical with some of those listed above or related to them:

Bacillus marianensis Leber and Prowazek. (Berlin. klin. Wochnschr., *1*, 1911, 27.) Allied to the Koch-Weeks Bacillus. Associated with cases of pink eye.

Bacillus weeksi Neveu-Lemaire. (Précis Parasitol. Hum., 5th ed., 1921, 24.) Described by Weeks. The cause of trachoma or granular conjunctivitis in tropical countries. Transmitted by the domestic fly. Probably intended for the Week's bacillus (Weeks, New York Med. Record, *31*, 1887, 571).

Bacterium tussis convulsivae Lehmann and Neumann. (Bacterium, Czaplewski and Hensel, Deut. med. Wochnschr., *23*, 1897, 587; Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 192; not *Bacterium tussis convulsivae* Lehmann and Neumann, *ibid.*, 7 Aufl., *2*, 1927, 317; *Bacillus tussis convulsivae* Lehmann and Neumann, *ibid.*, 4 Aufl., *2*, 1907, 269.) Considered the cause of whooping cough by the original isolators.

Hemophilus aphrophilus Khairat. (Jour. Path. and Bact., *50*, 1940, 497.) From blood and from heart valve of a case of endocarditis.

Hemophilus cuniculi Hauduroy et al. (*Hemophilus sp.* Gibbons, Jour. Inf. Dis., *45*, 1929, 288; Hauduroy et al., Dict. d. Bact. Path., 1937, 249.) From skin abscesses of rabbits.

Hemophilus gallinarum Delaplane, Erwin and Stuart and *Hemophilus gallinarum* Eliot and Lewis. (*Bacillus hemoglobinophilus coryzae gallinarum* De Blieck, Tijdsch. v. Diergeneensk., *58*, 1931, 310; also see Vet. Jour., *88*, 1932, 9; Delaplane, Erwin and Stuart, R. I. State Coll. Sta. Bull. 244, May, 1934; Eliot and Lewis, Jour. Amer. Vet. Med. Assoc., *84*, 1934, 878.) From edematous fluid from the head of a chicken. The cause of an infectious rhinitis in chickens.

Hemophilus influenzae murium (Kairies and Schwartzer) Lwoff. (*Bacterium influenzae murium* Kairies and Schwartzer, Cent. f. Bakt., I Abt., Orig., *137*, 1936, 351; Lwoff, Ann. Inst. Past., *62*, 1939, 168.) From the lung of a mouse.

Hemophilus meningitidis (Martins) Hauduroy et al. (*Coccobacillus meningitidis* Martins, Compt. rend. Soc. Biol., Paris, *99*, 1928, 955; Hauduroy et al., Dict. d. Bact. Path., 1937, 254.) Resembles *Hemophilus influenzae* except that it shows sluggish motility. From cerebro-spinal fluid.

Hemophilus muris Hauduroy et al. (Bacillus of an epizootic of stock mice, Mackie, Van Rooyne and Gilroy, Brit. Jour. Exp. Path., *14*, 1933, 132; Hauduroy et al., Dict. d. Bact. Path., 1937, 255.) From heart blood, spleen and other organs of mice dying from an epizootic disease.

Hemophilus ovis Mitchell. (Jour. Amer. Vet. Assoc., *68*, 1925, 8.) From bronchi of sheep.

Hemophilus pertussis Ford. (*Bacillus pertussis eppendorf* Jochmann and Krause, Ztschr. f. Hyg., *36*, 1901, 193; Ford, Textb. of Bact., 1927, 615; not necessarily identical with Bordet and Gengou's organism, *Hemophilus pertussis* Holland, Jour. Bact., *5*, 1920, 215.) From the respiratory tract and lungs in pertussis.

Hemophilus putoriorum Hauduroy et al. (*Bacterium influenzae putoriorum multiforme* Kairies, Ztschr. f. Hyg., *117*, 1935, 12; Hauduroy et al., Dict. d. Bact. Path., 1937, 258.) From the respiratory tract of ferrets.

Lehmann and Neumann (Bakt. Diag., 6 Aufl., *2*, 1920, and 7 Aufl., *2*, 1927) list

the following species as closely related to this group:

Bacillus catarrhalis Jundell. (Hygieae, *60*, No. 6 and 7, p. 667.) From cases of acute bronchitis.

Bacillus trachomatis Lehmann and Neumann. (The Bacillus Müller, Luerssen, Cent. f. Bakt., I Abt., Orig., *39*, 1905, 682.) From conjunctiva.

Bacterium czaplewskii Chester. (Bacillus bei Keuchhusten, Czaplewski, Cent. f. Bakt., *22*, 1897, 641; *Bacterium tussis convulsivae* Lehmann and Neumann, Bact. Diag., 2 Aufl., 1899, 192; Chester, Man. Determ. Bact., 1901, 153.) From sputum in whooping cough. This is not now regarded as being etiologically associated with whooping cough.

Bacterium exiguum Stäubli. (Münch. med. Wchnschr., No. 45, 1905.) From a case of septic endocarditis.

Bacterium microbutyricum Hellstein. From butter.

Bacterium minutissimus sputi (Luzzatto) Lehmann and Neumann. (*Bacillus minutissimus sputi* Luzzatto, Cent. f. Bakt., I Abt., *27*, 1900, 816.) From a case of pertussis.

Bacterium polymorphum convulsivum Melfi. (Cent. f. d. gesamte Hygiene, *7*, 1924, 133.)

Bacterium septicaemiae canis Paranhos. (Cent. f. Bakt., I Abt., Orig., *50*, 1909, 607.)

Streptobacillus urethrae Pfeiffer. (Cent. f. Bakt., I Abt., Ref., *36*, 1905, 59.) From the normal urethra and from cases of chronic cystitis and urethritis.

Genus II. Moraxella *Lwoff.**

(*Diplobacillus* McNab, Klinische Monatsbl. f. Augenheilk., *42*, 1904, 64; not *Diplobacillus* Weichselbaum, Cent. f. Bakt., *2*, 1887, 212; Lwoff, Ann. Inst. Past., *62*, 1939, 168.) Named for Morax, who first isolated the type species.

Small, short, rod-shaped cells, usually occurring singly or in pairs. Non-motile. Parasitic. Aerobic. Gram-negative.

The type species is *Moraxella lacunata* (Eyre) Lwoff.

Key to the species of genus **Moraxella.**

I. No growth in gelatin.
   1. *Moraxella lacunata.*

II. Gelatin liquefied.
   A. Rapid liquefaction. No growth in milk.
      2. *Moraxella liquefaciens.*
   B. Very slow liquefaction. Cells capsulated. Growth in milk.
      3. *Moraxella bovis.*

1. **Moraxella lacunata** (Eyre) Lwoff. (Diplobacille de la conjunctivite subaigue, Morax, Ann. Inst. Past., *10*, 1896, 337; Diplobacillus of chronic conjunctivitis, Axenfeld, Cent. f. Bakt., I Abt., *21*, 1897, 1; *Bacterium conjunctivitis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 85; *Bacillus lacunatus* Eyre, Jour. Path. and Bact., *6*, 1899, 1; not *Bacillus lacunatus* Wright, Memoirs Nat. Acad. Sci., *7*, 1895, 435; *Diplobacillus moraxaxenfeld* McNab, Klinische Monatsbl. f. Augenheilk., *42*, 1904, 64; *Bacterium duplex* Lehmann and Neumann, Bakt. Diag., 2 Aufl., *2*, 1899, 193; *Hemophilus lacunatus* Holland, Jour. Bact., *5*, 1920, 223; *Bacillus duplex* Hewlett, Med. Res. Council Syst. of Bact., *2*, 1929, 417;

* **Arranged by Prof. E. G. D. Murray, McGill University, Montreal, P. Q., Canada, September, 1945.**

Lwoff, Ann. Inst. Past., *62*, 1939, 173; *Hemophilus duplex* Murray, in Manual, 5th ed., 1939, 308.) From Latin, pitted.

Audureau (Ann. Inst. Past., *64*, 1940, 128) recognizes an atypical variety of this species. To distinguish between the two varieties, she designates these as *Moraxella lacunata* var. *typica* and *Moraxella lacunata* var. *atypica*.

Short rods: 0.4 to 0.5 by 2.0 microns, occurring singly and in pairs and short chains. Ends rounded or square in the chains. Non-motile. Gram-negative.

Gelatin colonies: No growth.

Gelatin stab: No growth.

Blood agar colonies: Small, circular, transparent, entire. Growth on subculture difficult. Certain strains are not surrounded by zones of hemolysis; others are (Oag, Jour. Path. and Bact., *54*, 1942, 128).

Serum agar colonies: Delicate, grayish.

Löffler's blood serum: Slow but definite liquefaction (pitting) around the colonies.

Ascitic broth: Turbid with slight, grayish sediment.

Blood milk mixture: Doubtful development.

Litmus milk: Unchanged.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Various carbohydrates and mannitol are attacked.

Optimum temperature 37°C.

Aerobic, facultative.

Source: From conjunctiva.

Habitat: The cause of subacute infectious conjunctivitis, or angular conjunctivitis.

2. **Moraxella liquefaciens** (McNab) *comb. nov.* (Diplobacille liquéfiant, Pettit, Annales d'oculistique, March, 1899, 166 and Thesis, Paris, 1900, 223; *Diplobacillus liquefaciens* McNab, Klinische Monatsbl. f. Augenheilk., *42*, 1904, 64; *Bacillus duplex liquefaciens* Lwoff, Ann. Inst. Past., *62*, 1939, 170; *Moraxella duplex liquefaciens* Lwoff, *ibid.*, 171; *Moraxella duplex* Lwoff, *ibid.*, 171; *Moraxella duplex* var. *liquefaciens* Audureau, Ann. Inst. Past., *64*, 1940, 139.) From Latin, liquefying.

Diplobacilli: 1.0 to 1.5 by 2.0 microns, occurring singly and in pairs, and having rounded ends. Capsules not demonstrated. Non-motile. Stain uniformly with basic aniline dyes. Gram-negative.

Gelatin colonies: Round, 1.5 to 2.0 mm in diameter, yellowish-white.

Gelatin stab: Rapid liquefaction.

Blood agar: Ready growth in primary and subculture.

Ascitic agar colonies: Grayish, thick, round, viscous.

Peptone agar colonies: Same as above, but less abundant growth.

Coagulated serum: Liquefaction in 3 to 4 days; eventually complete.

Plain broth: Poor growth, if any. Slight uniform turbidity.

Ascitic broth: Abundant growth in 24 hours at 35°C. Uniform turbidity. Later sediment and an opaque pellicle.

Milk: No growth. No coagulation.

Potato: Slight, yellowish-white, viscous growth.

Optimum temperature between 20° and 37°C. Killed at 55°C for 15 minutes.

Aerobic.

Not pathogenic for laboratory animals.

Source: From cases of conjunctivitis associated with corneal ulceration in man.

Habitat: Conjunctivitis in man so far as known.

3. **Moraxella bovis** (Hauduroy et al.) *comb. nov.* (Diplobacillus, Allen, Jour. Amer. Vet. Med. Assn., *54*, 1918, 307; Diplobacillus, Jones and Little, Jour. Exp. Med., *38*, 1923, 139; *Hemophilus bovis* Hauduroy et al., Dict. d. Bact. Path., 1937, 247; *Moraxella duplex* des Bovidés, Lwoff, Ann. Inst. Past., *62*, 1939, 174; *Hemophilus ruminantium* Reid and Anigstein, Texas Reports on

Biol. and Med., *3*, 1945, 187.) From Latin *bovis*, of the ox.

Short, plump rods: 0.5 by 1.5 to 2.0 microns, usually occurring in pairs and short chains, with rounded ends. Capsulated. Non-motile. Gram-negative.

Gelatin: Slow growth at 22°C. Very slow liquefaction.

Blood agar colonies: After 24 hours, round, translucent, grayish-white, surrounded by a narrow, clear zone of hemolysis. Deep colonies tiny with a clear hemolytic zone, usually 1.5 mm in diameter. After 48 hours, surface colonies somewhat flattened, 3.5 to 4 mm in diameter; deep colonies ellipsoidal and biconvex with hemolytic area of 2.5 to 3 mm in diameter.

Blood agar slants: After 24 hours at 38°C, heavy, viscid, grayish-white growth.

Coagulated serum liquefied.

Broth: Slow growth. Slight turbidity. Considerable sediment.

Litmus milk: Alkaline. Partial coagulation.

Indole not produced.

Potato: No growth.

No acid from glucose or other carbohydrates.

Not pathogenic for laboratory animals.

Killed at 58° to 59°C in five minutes.

Aerobic.

Source: From cases of acute ophthalmia (pink eye) of cattle.

Habitat: In the exudate from cases of acute ophthalmia of cattle. The probable cause of bovine infectious keratitis (Baldwin, Amer. Jour. Vet. Res., *6*, 1945, 180).

Appendix: Other species placed in the genus *Moraxella* are as follows:

Moraxella josephi Lwoff. (*Bacillus duplex josephi* Scarlett, Annales d'Oculistique, *153*, 1916, 100 and 485; Lwoff, Ann. Inst. Past., *62*, 1939, 171; *Moraxella duplex josephi* Lwoff, *ibid.*, 174; *Bacillus josephi* Audureau, Ann. Inst. Past., *64*, 1940, 126.) Gram-positive. Pathogenic. From the conjunctiva of man.

Moraxella lwoffi Audureau. (Ann. Inst. Past., *64*, 1940, 150.) Two varieties are recognized: var. *bacteroides* and var. *brevis*. From various types of conjunctivitis in man.

Moraxella non liquefaciens Lwoff. (*Bacterium duplex-nonliquefaciens* Oliver and Wherry, Jour. Inf. Dis., *28*, 1921, 342; *Bacillus duplex non-liquefaciens* Hewlett, Med. Res. Council Syst. of Bact., *2*, 1929, 418; Lwoff, Ann. Inst. Past., *62*, 1939, 171; *Moraxella duplex non liquefaciens* Lwoff, *ibid.*, 174; *Bacillus duplex non liquefaciens* Audureau, Ann. Inst. Past., *64*, 1940, 126; *Moraxella duplex* var. *non liquefaciens* Audureau, *ibid.*, 144.) From an ulcer of the cornea, and from bronchial sputum in man.

Genus III. **Noguchia** *Olitsky, Syverton and Tyler.**

(Jour. Exp. Med., *60*, 1934, 382.) Named for Noguchi, the bacteriologist who isolated the type species.

Small, slender, Gram-negative rods present in the conjunctiva of man and animals affected by a follicular type of disease; mucoid type of growth which on first isolation takes place with some difficulty in ordinary media; motile, flagellated, and encapsulated; aerobic and facultative anaerobic; optimum temperature for growth 28° to 30°C.

The type species is *Noguchia granulosis* (Noguchi) Olitsky, Syverton and Tyler.

Key to the species of genus **Noguchia.**

I. Acid from carbohydrates.
  A. Acid from raffinose, maltose and salicin.
    1. *Noguchia granulosis.*

* Arranged by Prof. C. D. Kelly, McGill University, Montreal, October, 1938.

B. No acid from raffinose, maltose and salicin.

2. *Noguchia simiae.*

II. No acid from carbohydrates.

3. *Noguchia cuniculi.*

1. **Noguchia granulosis** (Noguchi) Olitsky et al. (*Bacterium granulosis* Noguchi, Jour. Exp. Med., *48*, Supp. 2, 1928, 21; Olitsky, Syverton and Tyler, Jour. Exp. Med., *60*, 1934, 382.) From Latin, granular.

Rods: 0.25 to 0.3 by 0.8 to 1.2 microns, motile by means of a single flagellum, usually polar. Pleomorphic. Gram-negative.

No growth on plain agar or broth.

Blood agar plate: Minute round colonies, shiny, somewhat raised, almost transparent or slightly grayish in 48 hours. Later the colonies increase in size, are grayish opalescent and somewhat sticky. Old colonies have a brownish or yellowish tint.

Semi-solid *Leptospira* medium: Grayish-white, diffuse growth, forming a delicate zone 1 cm deep.

Liquid *Leptospira* medium: Diffuse, slightly cloudy growth, with sticky grayish sediment at the bottom of the tube in old cultures.

Acid from glucose, fructose, mannose, sucrose, galactose, maltose, salicin, xylose, mannitol, dextrin, arabinose, amygdalin and lactose. Small amount of acid from raffinose, inulin, rhamnose and trehalose. No acid from dulcitol, sorbitol and inositol.

Non-pathogenic for rabbits, guinea pigs, rats and mice.

Optimum pH 7.8.

Temperature relations: Optimum 15° to 30°C. Grows at 37°C.

Aerobe, facultative anaerobe.

Distinctive characters: Action on carbohydrates; agglutination reactions; motility at 15°, none at 37°C.

Source: From trachoma of American Indians at Albuquerque, New Mexico.

Habitat: Regarded by Noguchi and others as a cause of trachoma in man. Produces a granular conjunctivitis in monkeys and apes.

2. **Noguchia simiae** Olitsky et al. (*Bacterium simiae* Olitsky, Syverton and Tyler, Jour. Exp. Med., *57*, 1933, 875; Olitsky et al., Jour. Exp. Med., *60*, 1934, 382.) From Latin *simia*, ape.

Slender rods: 0.2 to 0.3 by 0.8 to 1.2 microns, occurring singly, in pairs, in short chains or parallel arrangement of two or three, having pointed ends. Capsules are found. Actively motile by means of a single, rarely a double, flagellum, usually polar. Gram-negative.

Gelatin plates: Colonies more mucoid and raised than on agar.

Gelatin stab: Arachnoid growth along line of inoculation. No liquefaction.

Agar plates: Small, circular, grayish, translucent, smooth, convex, slightly raised colonies having a sticky or mucoid consistency.

Blood agar plates: More highly translucent and colorless in early growth than on plain agar, becoming grayish after two or three days.

Agar slants: Grayish-white to white, moist, mucoid, raised, glistening growth. Growth is more profuse when blood is added.

Leptospira medium: Homogeneous, dense growth in a 0.5 cm sharply defined layer, with a slight, nebulous, uniform opacity about 1 cm below. In three or four days the lower layer becomes more dense and in time extends to the bottom of the tube.

Broth: Uniform turbidity, with a slight grayish sediment and no pellicle.

Litmus milk: Unchanged.

Potato: Light tan, spreading, abundant growth.

Indole not formed.

Nitrites not produced from nitrates.

Acid but no gas from glucose, fructose,

mannose, galactose, xylose, arabinose and rhamnose. Small amount of acid from dextrin. Some strains produce a small amount of acid from sucrose, lactose, inulin and mannitol. Raffinose, salicin, dulcitol, amygdalin, maltose, trehalose, sorbitol and inositol unchanged.

Serological reactions: Rabbit antiserum is specific for all strains and no cross agglutination with *Noguchia granulosis*.

Temperature relations: Optimum 28° to 30°C. Thermal death point 56°C for thirty minutes.

Aerobe, facultative anaerobe.

Distinctive characters: Action on carbohydrates; agglutination reactions.

Source: From inflammatory type (Type II) of spontaneous conjunctival folliculosis in *Macacus rhesus* monkeys.

Habitat: Causes conjunctival folliculosis in *Macacus rhesus* monkeys.

3. **Noguchia cuniculi** Olitsky, Syverton and Tyler. (Jour. Exp. Med., *60*, 1934, 382.) From Latin *cuniculus*, rabbit.

Slender rods: 0.2 to 0.3 by 0.5 to 1.0 micron with pointed ends. Capsules are formed of much finer texture than those surrounding *Noguchia granulosis* or *Noguchia simiae*. Actively motile with peritrichous flagella. Non-acid-fast. Pleomorphic forms sometimes noted. Gram-negative.

Gelatin agar plates: Grayish, mucoid and confluent colonies.

Gelatin stab: Tenuous, arborescent, non-spreading growth. No liquefaction.

Agar plates: Small, spherical, translucent, slightly grayish, smooth, somewhat convex, moist and mucoid colonies with entire edges.

Blood agar plates: More profuse, more grayish and less translucent than on plain agar.

Agar slants: Slightly grayish, translucent, coalescent, glistening, mucoid, homogeneous and non-spreading growth. The water of syneresis appears uniformly cloudy or milky depending on amount of growth.

Leptospira medium: After 24 hours, a faint, nebulous surface growth followed by an ingrowing sac-like mass, with its base 5 mm across, lying at the center of the under surface and extending for 5 mm into the medium. The area spreads laterally until at about two or three days there is a uniform, opaque, whitish layer about 1 cm thick which progresses slowly until the bottom of the tube is reached in about seven days.

Broth: Uniform turbidity, without pellicle.

Litmus milk: Unchanged.

Potato: Faint, buff-colored (changing to brown after five days), non-spreading, sparse surface growth.

Indole not produced.

Nitrites not produced from nitrates.

No acid or gas from glucose, fructose, mannose, mannitol, sucrose, raffinose, inulin, galactose, maltose, salicin, xylose, dextrin, arabinose, amygdalin, lactose, dulcitol, rhamnose, trehalose, sorbitol or inositol.

Serological relations: Rabbit antiserum is specific for all strains, and no cross agglutination with *Noguchia granulosis* or *Noguchia simiae*.

Temperature relations: Optimum 28° to 30°C. Thermal death point 56°C for 15 to 30 minutes.

Aerobe, facultative anaerobe.

Distinctive characters: No action on carbohydrates; peritrichous flagella; agglutination.

Source: From spontaneous conjunctival folliculosis, Type II of rabbits.

Habitat: Causes conjunctival folliculosis in rabbits.

Genus IV. Dialister *Bergey et al.**

(Manual, 1st ed., 1923, 271.)

Minute rod-shaped cells, occurring singly, in pairs and short chains. Non-motile.

* Rearranged by Prof. D. H. Bergey, Philadelphia, Pennsylvania, 1933.

Strict parasites. Growth occurs only under anaerobic conditions in media containing fresh, sterile tissue or ascitic fluid.

The type species is *Dialister pneumosintes* (Olitsky and Gates) Bergey et al.

1. **Dialister pneumosintes** (Olitsky and Gates) Bergey et al. (*Bacterium pneumosintes* Olitsky and Gates, Jour. Exp. Med., *33*, 1921, 713; *ibid.*, *35*, 1922, 813; Bergey et al., Manual, 1st ed., 1923, 271; *Bacillus pneumosintes* Ford, Textb. of Bact., 1927, 634.) From Greek *pneumon*, lung and *sintor*, murderer or devastator.

Very short rods: 0.15 to 0.3 (in glucose broth 0.5 to 1.0) micron in length, occurring singly and occasionally in pairs, short chains or masses. The ends are rather pointed. Non-motile. Gram-negative.

Blood agar colonies: Small, clear, circular, entire, translucent.

Growth occurs in media containing fresh sterile rabbit kidney and ascitic fluid. Under strict anaerobic conditions good growth on rabbit blood glucose agar plates.

Glucose broth in which *Escherichia coli* or *Bacillus mesentericus* (non-spore stage) has grown favors growth.

Acid but no gas from glucose. Neither acid nor gas from maltose, lactose, sucrose, inulin or mannitol.

Passes Berkefeld V and N filters.

Optimum pH 7.4 to 7.8. No growth at pH 7.0 or pH 8.0.

Optimum temperature 37°C. Does not survive 56°C for half an hour.

Pathogenic for rabbits and guinea pigs.

Strict anaerobe.

Source: From filtered nasopharyngeal secretions from influenza patients in the early hours of the disease.

Habitat: Nasopharyngeal washings of man.

2. **Dialister granuliformans** (Pavlovic) Bergey et al. (*Bacterium granuliformans* Pavlovic, Cent. f. Bakt., I Abt., Orig., *112*, 1929, 432; Bergey et al., Manual, 4th ed., 1934, 341.) From Latin, forming granules.

Small rods: Non-motile. Gram-negative.

Agar colonies: Very small, transparent. No gas.

Broth: Turbid.

Litmus milk: Unchanged.

Indole not formed.

Acid from glucose, sucrose and mannitol.

Passes through Chamberland L_2 filters.

Pathogenic for rabbits.

Optimum temperature 37°C.

Anaerobic to microaerophilic.

Source: From respiratory tract in influenza.

Habitat: Mucous membrane of respiratory tract.

Appendix, Family Parvobacteriaceae:* De Bord (Iowa State Coll. Jour. Sci., *16*, 1942, 471) describes a new tribe, *Mimeae*, which may belong in this family. The tribe includes three genera: *Mima* with the species *Mima polymorpha* and the variety *Mima polymorpha* var. *oxidans; Herellea* with the single species *Herellea vaginicola;* and *Colloides* with the single species *Colloides anoxydana.* The organisms are Gram-negative, pleomorphic, motile or non-motile rods, often showing bipolar staining, and were isolated from the normal vagina and from cases of vaginitis and conjunctivitis. Deacon (Jour. Bact., *49*, 1945, 511) classifies nineteen cultures in these genera.

---

* Arranged by Dr. A. Parker Hitchens, University of Pennsylvania, Philadelphia, Pa., March, 1946.

FAMILY XII. BACTERIACEAE COHN.*

(Arch. f. path. Anat. u. Physiol., *55*, 1872, 237.)

Rod-shaped cells without endospores. Motile or non-motile. Gram-positive and Gram-negative. Metabolism complex, amino acids being utilized, and generally carbohydrates.

This is a heterogeneous collection of species whose relationships to each other and to other groups are not clear.

Only a single genus is recognized at this time.

Genus I. **Bacterium** *Ehrenberg.*

(IV. Evertebrata, Berlin, 1828, 8.)

The original description of this genus follows:

Bacterium, Novum Genus, Familia Vibrionorum. Character Generis: Corpus polygastricum? anenterum? nudum, oblongum, fusiforme aut filiforme, rectum, monomorphum (contractione nunquam dilatatum), parum flexile (nec aperte undatum), transverse in multas partes sponte dividuum.

This may be translated as follows:

Bacterium, new genus. Family of Vibriona. Character of the genus: Body with many stomachs? without an intestine? naked, oblong, spindle-shaped or filiform, straight, monomorphic (in contraction never dilated), not very pliant (and not definitely wavy), freely separated transversely into many parts.

The type species is *Bacterium triloculare* Ehrenberg.

The original description of this species follows:

B. triloculare nov. spec.; distincte triloculare s. triarticulatum, subfusiformum, hyalinum.

Animalculum 1/300 lineae longum, corpore tereti. Articuli s. septa interna divisionem instantem multiplicem transversam indicare videntur. Mobile sed pigrum animalculum.

In Oasi Jovis Hammonis Siwac observatum, praeterea nullibi.

Bacterii Generis physiologia huiusque obscurra. Cibo colorato Ventriculos replere hae formae respuunt ideoque ad Polygastrica non nisi dubitanter et interim collocantur.

This may be translated as follows:

B. triloculare new. spec. Definitely with three compartments or three jointed, subfusiform, hyaline. Animalcules 1/300 of a line in length, with a smooth body. The joints or internal septa are observed to develop preliminary to multiple transverse splitting. A motile but sluggish animalcule. Observed in the Oasis of Jupiter Ammon of Siwa, nowhere else.

The physiology of the genus *Bacterium* is thus far obscure. These forms refuse to fill their stomachs with colored food and for this reason they are placed with hesitancy and only temporarily in the Polygastrica.

The original descriptions are taken from Buchanan, General Systematic Bacteriology, 1925, 213, and the translations are also furnished by him. Buchanan in his book gives an excellent summary of the nomenclatural status of the term *Bacterium* on pages 213–230.

Since neither the genus nor the type species is characterized in a way to permit definite identification, the term *Bacterium* is used to cover species of non-spore-forming, rod-shaped bacteria whose position in the system of classification is not definitely established (Breed and Conn, Jour. Bact., *31*, 1936, 517).

---

* Completely rearranged by Prof. Robert S. Breed and Mrs. Eleanore Heist Clise, New York State Experiment Station, Geneva, New York, May 1946.

Bacterium triloculare Ehrenberg. (Ehrenberg, IV. Evertebrata, Berlin, 1828, 8; *Bacillus ehrenbergii* Trevisan, I generi e le specie delle Batteriacee, 1899, 18; *Bacterium ehrenbergii* De Toni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 1022; *Bacterium lineola* Cohn, Beiträge z. Biol. d. Pflanzen, *1*, Heft 2, 1872, 170.) Cohn also regards *Vibrio lineola* Miller, 1786 and *Vibrio lineola* (*Bacillus lineola*, *Bactrium lineola*) of other authors as synonyms of *Bacterium triloculare* as explained by Buchanan (*loc. cit.*, 213 and 521). From Latin *tri*, three and *loculus*, cells or compartments.

Key to the remaining species of genus **Bacterium.**

I. Gram-positive.
  A. Non-motile.
    1. Nitrites produced from nitrates.
      1. *Bacterium erythrogenes.*
      2. *Bacterium subrufum.*
      3. *Bacterium linens.*
      4. *Bacterium mycoides.*
      5. *Bacterium mutabile.*
      6. *Bacterium qualis.*
    2. Nitrites not produced from nitrates.
      a. Grow on ordinary media.
        7. *Bacterium racemosum.*
        8. *Bacterium healii.*
        9. *Bacterium insectiphilium.*
        10. *Bacterium tegumenticola.*
        11. *Bacterium minutaferula.*
        12. *Bacterium fulvum.*
      aa. Grow only on sea water media on fresh isolation.
        13. *Bacterium marinopiscosus.*
        14. *Bacterium sociovivum.*
        15. *Bacterium immotum.*
    3. Action on nitrates unknown.
      16. *Bacterium ammoniagenes.*
      17. *Bacterium minutissimum.*
  B. Motile in young cultures.
    1. Nitrites not produced from nitrates.
      18. *Bacterium incertum.*
      19. *Bacterium imperiale.*
  C. Motile. Proteus-like growth on media.
    1. Nitrites not produced from nitrates.
      20. *Bacterium zopfii.*
      21. *Bacterium zenkeri.*

Appendixes I and II: These list 34 additional species of Gram-positive, motile or non-motile, non-spore-forming, rod-shaped bacteria. See p. 609 and 612.

II. Gram-negative. Digest cellulose. Do not digest agar.
  A. Non-motile. Gelatin liquefied. Chromogenic.
    1. Milk acid.
      22. *Bacterium idoneum.*
      22a. *Bacterium liquatum.*

B. Non-motile. Gelatin liquefied. Non-chromogenic.
 1. Milk acid.
  a. Ammonia produced; indole not formed.
   23. *Bacterium udum.*

C. Non-motile. Gelatin not liquefied. Non-chromogenic.
 1. Milk unchanged.
  a. Ammonia not produced; indole not formed.
   24. *Bacterium lucrosum.*
 2. Milk acid.
  a. Ammonia not produced; indole not formed.
   25. *Bacterium acidulum.*
   26. *Bacterium castigatum.*

D. Motile. Gelatin liquefied. Chromogenic.
 1. Milk acid.
  a. Ammonia produced; indole is formed.
   27. *Bacterium bibulum.*

Appendices I to III: These list additional species of cellulose-digesting, Gram-negative, usually motile, rod-shaped bacteria. See p. 615 and 622. Also similar species that utilize bacterial polysaccharides as a sole source of carbon. See p. 623.

III. Gram-negative. Digest agar.
 A. Non-motile.
  1. Nitrites not produced from nitrates.
   a. Acid from glucose and other sugars.
    28. *Bacterium nenckii.*
   aa. Do not form acid from glucose.
    29. *Bacterium polysiphoniae.*
    30. *Bacterium drobachense.*
  2. Action on nitrates unknown.
   a. Do not form acid from glucose.
    31. *Bacterium delesseriae.*
    32. *Bacterium boreale.*
    33. *Bacterium ceramicola.*
 B. Motile but position of flagella not given. May be either peritrichous or polar.
  1. Nitrites not produced from nitrates.
    34. *Bacterium rhodomelae.*
  2. Action on nitrates unknown.
    35. *Bacterium alginovorum.*
    36. *Bacterium fucicola.*

Appendices I and II: These describe 9 additional species and list others that digest agar. All are Gram-negative, motile or non-motile rod-shaped bacteria. See p. 627.

IV. Gram-negative. Digest chitin.
 A. Motile but position of flagella not given.
  1. Non-chromogenic.
    37. *Bacterium chitinophilum.*
  2. Yellow chromogenesis.
    38. *Bacterium chitinochroma.*

Appendix I: One additional species is described. See p. 632.

V. Gram-negative. Phosphorescent bacteria.
- A. Non-motile coccobacilli from sea water.
  - 1. No liquefaction of gelatin.
    - 39. *Bacterium phosphoreum.*
- B. Motile rods from sea water. Position of flagella not given.
  - 1. No growth in broth, and on coagulated blood serum or potato.
    - 40. *Bacterium phosphorescens indigenus.*
- C. Not stated whether motile or non-motile. From diseased insect larvae.
  - 1. Yellow growth on potato.
    - 41. *Bacterium hemophosphoreum.*

Appendix I: This includes a list of more than 40 additional so-called species of phosphorescent bacteria. See p. 634.

VI. Gram-negative. Facultative autotrophic bacteria which secure energy from the oxidation of hydrogen and utilize carbon from CO_2.
- A. Non-motile.
  - 1. Growth shows a red chromogenesis.
    - 42. *Bacterium erythrogloeum.*
- B. Motile with peritrichous flagella.
  - 1. Yellow chromogenesis.
    - 43. *Bacterium lentulum.*
  - 2. Ivory-colored colonies.
    - 44. *Bacterium leucogloeum.*

VII. Gram-negative. Plant pathogens.
- A. Non-motile.
  - 1. Gelatin not liquefied.
    - 45. *Bacterium stewartii.*
- B. Motile with a polar flagellum.
  - 1. Gelatin not liquefied.
    - a. Colonies mustard yellow on agar.
      - 46. *Bacterium tardicrescens.*
    - b. Colonies honey to Naples yellow on agar.
      - 47. *Bacterium albilineans.*

Appendix I: This includes 19 additional species placed in *Bacterium* or *Bacillus* by their authors. All are reported to cause or to be associated with plant disease. See p. 639.

VIII. Gram-negative. Miscellaneous species.
- A. Produce a pink to red chromogenesis.
  - 1. Motile.
    - a. Gelatin not liquefied.
      - 48. *Bacterium rubefaciens.*
    - aa. Gelatin liquefied.
      - 49. *Bacterium rubidum.*
  - 2. Non-motile.
    - a. Gelatin not liquefied.
      - 50. *Bacterium latericeum.*

B. Do not produce pink or red chromogenesis.
1. Motile.
a. Produce clouding in alginic acid liquid medium.
b. From sea water.
51. *Bacterium alginicum.*
bb. From soil.
52. *Bacterium terrestralginicum.*
aa. Action on alginic acid unknown.
b. Causes a disease of swans.
53. *Bacterium cygni.*
2. Non-motile.
a. Causes red spot disease of carp.
54. *Bacterium cyprinicida.*
aa. Causes liberation of ammonia from a mixture of horse manure and urine.
55. *Bacterium parvulum.*
aaa. Utilizes formates in a liquid medium with the formation of a reddish pellicle.
56. *Bacterium methylicum.*

Appendix I: Miscellaneous described species of non-spore-forming bacteria placed by their authors in the genus *Bacillus*. See p. 643.

Appendix II: Includes anaerobic bacteria that produce methane. See p. 645.

Appendix III: Miscellaneous species of non-spore-forming bacteria listed but not described. See p. 647.

1. **Bacterium erythrogenes** Lehmann and Neumann. (*Bacterium lactis erythrogenes* Grotenfelt, Fortschr. d. Med., *7*, 1889, 41; *Bacillus lactis erythrogenes* Sternberg, Manual of Bact., 1893, 636; Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 253; *Bacillus erythrogenes* Matzuschita, Bakt. Diagnostik, 1902, 220; *Corynebacterium erythrogenes* Kisskalt and Berend, Cent. f. Bakt., I Abt., Orig., *81*, 1918, 446; *Erythrobacillus erythrogenes* Holland, Jour. Bact., *5*, 1920, 218; *Erythrobacillus (lactis) erythrogenes* Holland, *ibid.*; *Serratia lactica* Bergey et al., Manual, 1st ed., 1923, 93; *Chromobacterium lactis erythrogenes* Topley and Wilson, Princip. Bact. and Immun., *1*, 1931, 402.) From Greek, red-producing.

Micrococcus lactis erythrogenes Conn, Esten and Stocking, Ann. Rept. Storrs (Conn.) Agr. Exp. Sta., *18*, 1906, 117 is stated to be allied to if not identical with the above species.

Rods: 0.3 to 0.5 by 1.0 to 1.4 microns, in broth often up to 4.3 microns long, occurring singly, and having rounded ends. Non-motile. Stain with the usual aniline dyes. Gram-positive (Lehmann and Neumann, *loc. cit.*).

Gelatin colonies: Small, circular, grayish, becoming yellow, sinking into the medium. Crateriform liquefaction. Yellow sediment. Medium becomes rose-colored.

Gelatin stab: Surface growth a whitish, later yellow, circular, thin layer. Weak growth in stab. Slow liquefaction at the surface, the liquid becoming red, with yellow sediment. The solid portion assumes a weak rose color.

Agar stab: Moist, fairly luxuriant, yellow growth, the medium assuming a rose to wine color.

Broth: Turbid, yellow. Pellicle (Fuller and Johnson, Jour. Exp. Med., *4*, 1899, 609).

Litmus milk: Acid. Slow coagulation, having a clear fluid which becomes blood-red in color. Reaction becomes alkaline.

Sterile milk: Casein slowly precipitated, later peptonized. Reaction neu-

tral or alkaline A stratum of blood-red serum is seen above the precipitated casein and above this a yellowish-white layer of cream. An intensive sweet odor that becomes disagreeable.

Potato: Growth rapid, spreading, grayish, later yellow. On incubation a deep golden yellow color develops after 6 to 8 days. A darkening of the medium occurs around the culture, but soon disappears; later the whole potato becomes a weak yellowish-red.

Indole not formed (Fuller and Johnson, *loc. cit.*). Indole formed (Chester, Manual Determ. Bact., 1901, 174).

Blood serum: Liquefied (Fuller and Johnson, *loc. cit.*). Not liquefied (Hefferan, Cent. f. Bakt., II Abt., *11*, 1903, 456).

Nitrites produced from nitrates.

No gas from carbohydrates.

Slight H_2S production (Matzuschita, *loc. cit.*).

Red pigment insoluble in water, alcohol, ether, chloroform, and benzol. Soluble (Hefferan, *loc. cit.*, 529). Yellow pigment insoluble.

Distinctive character: Milk becomes blood-red in 12 to 20 days.

Non-pathogenic for mice (Fuller and Johnson, *loc. cit.*).

Optimum temperature 28° to 35°C.

Aerobic (Fuller and Johnson, *loc. cit.*). Facultative anaerobe (Hefferan, *loc. cit.*, 530).

Source: Isolated from red milk by Hueppe in Wiesbaden in 1886. Isolated from feces of a child by Baginsky (Cent. f. Bakt., *6*, 1889, 137). Isolated from Ohio River water by Fuller and Johnson (*loc. cit.*). Isolated from Mississippi River water by Hefferan (*loc. cit.*). Tataroff isolated a rose fluorescent coccobacterium (*Bacillus rosafluorescens* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 305; *Bacterium rosa fluorescens* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 142) which Migula reports as identical, but which Hefferan considers atypical.

Habitat: Probably widely distributed in nature.

2. **Bacterium subrufum** Burri and Staub. (Burri and Staub, Landwirtsch. Jahrb. d. Schweiz, *40*, 1926, 1006; *Serratia subrufa* Bergey et al., Manual, 3rd ed., 1930, 123.) From Latin *sub*, somewhat and *rufus*, red.

This organism is stated to be closely related to or possibly identical with *Bacterium erythrogenes*.

3. **Bacterium linens** Weigmann. (Organismus IX, Wolff, Milchwirt. Zent., *5*, 1909, 145; Weigmann, in Wolff, Cent. f. Bakt., II Abt., *28*, 1910, 422, and in Weigmann, Mykologie der Milch, *62*, 1911, 220.) From Latin, daubing, smearing, or spreading over.

Also see Steinfatt, Milchwirt. Forsch., *9*, 1930, 7; Kelly, Jour. Dairy Sci., *20*, 1937, 239; Albert, Long and Hammer, Iowa Agr. Exp. Sta. Res. Bul. 328, 1944.

Rods: Average 0.62 by 2.5 microns when grown 1 to 2 days on tryptone glucose extract agar. Non-motile (Wolff). Gram-positive (Kelly, *loc. cit.*).

Gelatin colonies: At 18°C punctiform at first; after 12 days about 1 mm in diameter, compact, circular, shiny, brownish-yellow to red-brown. Liquefaction.

Gelatin stab: At 21°C crateriform liquefaction, becoming infundibuliform on extended incubation. Rate of liquefaction varies considerably with different cultures, some completing it in 15 days, others not completing it even on long incubation.

Agar colonies: On tryptone glucose extract agar at 21°C after 1 to 2 days, colonies convex, glistening, entire and cream-colored, becoming brown on extended incubation; diameters 2 to 5 mm. On special cheese agar with incubation in oxygen, luxuriant growth, the color becoming bright orange to reddish-brown in 4 or 5 days.

Agar stab: Heavy surface growth on tryptone glucose extract agar at 21°C with no growth along the line of inoculation.

Agar slant: On tryptone glucose extract agar at 21°C after 2 days growth abundant, glistening, filiform, non-viscid and cream-colored. After extended incubation the color usually is brown. On special cheese agar in an atmosphere of oxygen the growth is bright orange to reddish-brown in 4 or 5 days.

Broth: Turbidity and sediment.

Potato: At 21°C after 5 days, growth is scanty, smooth, glistening, and varies in color from grayish to brownish-orange.

Litmus milk: At 21°C the changes are very slow. After 6 or 7 days the reaction becomes alkaline and a yellow sediment appears. After approximately 10 days some digestion is evident, complete digestion generally requiring several weeks to over a month. A distinct ammoniacal odor, more or less objectionable, produced in old cultures. No coagulation. Ropiness often produced on extended incubation.

Indole not produced.

Nitrites produced from nitrates.

Methyl red and Voges Proskauer reactions negative.

Hydrogen sulfide produced in broth and on agar by some cultures but not by others.

Natural fats not hydrolyzed.

No acid or gas from arabinose, dextrin, glucose, dulcitol, galactose, inulin, lactose, fructose, maltose, mannitol, raffinose, rhamnose, salicin, sorbitol, sucrose or xylose.

Ethyl, propyl, butyl and amyl alcohols oxidized largely to corresponding acids; hexyl and heptyl alcohols attacked much less actively.

Catalase rapidly produced in or on various media.

Aerobic.

Growth temperatures: Growth at 8° and 37°C but not at 45°C, with the optimum at about 21°C.

Heat resistance low, cultures being killed at 62.8°C in a few minutes.

Growth in the pH range 6.0 to 9.8; no growth at pH 5.0 or below.

Salt tolerant, cultures growing readily in a concentration of 15 per cent salt in broth or skim milk, with certain cultures apparently capable of growing somewhat in much higher concentrations.

Closely related to or identical with *Bacterium erythrogenes* Lehmann and Neumann.

Source: Originally isolated by Wolff from the surface flora of various soft cheeses.

Habitat: Widely distributed in and especially on the surface of dairy products including blue, brick, camembert, limburger, oka and cheddar cheeses, butter, milk and cream. Also found in various feeds including grains, silage, green plants, hay and straw, and in water, soil, manure, and air.

4. **Bacterium mycoides** (Grotenfelt) Migula. (*Bacterium mycoides roseum* Grotenfelt, Fortschr. d. Med., 7, 1889, 46; *Bacillus mycoides roseus* Sternberg, Manual of Bact., 1893, 640; Migula, Syst. d. Bakt., *2*, 1900, 482; *Bacillus mycoides-roseus* Holland, Jour. Bact., *5*, 1920, 219; *Erythrobacillus mycoides-roseus* Holland, *ibid.*; *Serratia rosea* Bergey et al., Manual, 1st ed., 1923, 96; *Chromobacterium mycoides roseum* Topley and Wilson, Princip. of Bact. and Immun., *1*, 1931, 402.) From Greek *mykes*, fungus and *eidos*, form.

Rods: Non-motile. Gram-positive.

Gelatin colonies: Red, felt-like. Liquefaction.

Gelatin stab: Rapid liquefaction. Red pellicle. Red sediment.

Colonies composed of interlacing filaments (Crookshank, Textb. of Bact. and Inf. Dis., 1900, 524).

Agar stab: Red color produced if grown in dark; a white color in presence of light.

Optimum temperature: Room temperature.

Pigment soluble in water.

Distinctive characters: Morphologically like the anthrax bacillus. Appearance in gelatin. Production of a brilliant rose color when grown in the dark; colonies grown in the light are white, but they assume the red color if developed further in the dark.

Source: Isolated from Wiesbaden soil by Scholl.

Habitat: Unknown.

NOTE: It has been claimed that this or a similar organism forms spores (Matzuschita, Bact. Diag., 1902, 168; Perlberger, Cent. f. Bakt., II Abt., *62*, 1924, 8). However cultures of Scholl's organism received from the Kràl collection by Hefferan (Cent. f. Bakt., II Abt., *11*, 1903, 458) and by Breed in 1926 (personal communication) did not form spores. These cultures produced nitrites from nitrates and failed to liquefy gelatin.

5. **Bacterium mutabile** Steinhaus. (Jour. Bact., *42*, 1941, 775.) From Latin *mutabilis*, changeable.

Short rods: On agar, 0.7 to 0.9 by 1.0 to 2.0 microns. In fluid media, such as tryptophane broth, pleomorphic, bizarre forms frequently appearing slightly branched. Non-motile. Gram-positive.

Gelatin stab: Very slow liquefaction.

Agar colonies: Cream to yellow, circular, smooth, glistening, opaque.

Broth: Moderate turbidity, slight sediment.

Litmus milk: Alkaline, soft curd, slow peptonization.

Indole not produced.

Hydrogen sulfide not produced.

Nitrites produced from nitrates.

Starch not hydrolyzed.

Glucose, lactose, sucrose and maltose not fermented.

Aerobic.

Source: From the alimentary tract of the lyreman cicada, *Tibicen linnei* Smith and Grossbeck.

Habitat: Unknown.

6. **Bacterium qualis** Steinhaus. (Jour. Bact., *42*, 1941, 774.) From Latin *qualis*, of what kind.

Short rods: Very short on solid media, frequently ellipsoidal in shape. In fluid media: 0.5 to 0.7 by 1.4 to 2.2 microns, occurring singly. Non-motile. Gram-positive.

Gelatin stab: Liquefaction.

Agar colonies: Small (1 mm), white, glistening, transparent, circular, entire.

Agar slant: Filiform, smooth, glistening.

Broth: Almost clear; slight turbidity in serum and glucose broth.

Litmus milk: No change.

Indole not produced.

Hydrogen sulfide not produced.

Slight production of nitrites from nitrates.

Starch not hydrolyzed.

Acid from glucose, sucrose and maltose. Lactose not fermented.

Source: From the alimentary tract of the tarnished plant bug, *Lygus pratensis* L.

Habitat: Unknown.

7. **Bacterium racemosum** Zettnow. (Zettnow, Cent. f. Bakt., I Abt., Orig., 77, 1915, 209; *Zettnowia racemosa* Enderlein, Bakt. Cyclogenie, Berlin, 1925, 259; *Flavobacterium racemosum* Bergey et al., Manual, 1st ed., 1923, 115.) From Latin *racemosus*, branching.

Filaments: 0.5 to 0.8 by 10 to 12 microns. Branching forms found. Non-motile. Gram-positive.

Gelatin colonies: White, circular, soft, granular, brownish, entire.

Gelatin stab: White surface growth. Liquefaction napiform.

Agar slant: Light yellow, limited growth.

Broth: Turbid.

Litmus milk: Coagulated, becoming alkaline.

Potato: Dirty-yellowish, limited streak.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 20°C.

This species is selected as the type species for the genus *Zettnowia* Enderlein (*loc. cit.*).

Source: Contamination on agar plate.

Habitat: Unknown.

8. **Bacterium healii** Buchanan and Hammer. (Buchanan and Hammer, Iowa Agr. Exp. Sta. Research Bull. 22, 1915, 249; *Escherichia healii* Bergey et al., Manual, 1st ed., 1923, 200; *Achromobacter healii* Bergey et al., Manual, 2nd ed., 1925, 157.)

Rods: 0.5 to 0.7 by 2.2 to 12.9 microns, occurring singly and in short chains. Non-motile. Gram-positive.

Gelatin stab: Stratiform liquefaction. Villous growth in stab.

Agar colonies: Large, white, rhizoid.

Agar slant: White, hard growth, with no tendency to stringiness.

Broth: Gray pellicle and sediment.

Litmus milk: Slightly acid, becoming slimy, coagulated, peptonized.

Potato: Heavy, white, glistening growth.

Indole not formed.

Nitrites not produced from nitrates.

Acid without gas from glucose, fructose, maltose, sucrose, salicin and starch. No acid from mannitol, lactose, raffinose or inulin.

Aerobic, facultative.

Optimum temperature 22°C.

Source: Slimy milk.

Habitat: Unknown.

9. **Bacterium insectiphilium** Steinhaus. (Jour. Bact., *42*, 1941, 777.) From M. L. *insect*, insect and Greek *philos*, loving.

Rods: 0.8 to 1.2 by 1.0 to 2.8 microns, occurring singly. At times appearing almost as cocci or coccobacilli. Non-motile. Gram-positive.

Gelatin stab: Liquefaction.

Agar colonies: Light greenish-yellow, circular, entire, raised, glistening, smooth, opaque.

Agar slant: Filiform, raised, smooth, glistening, opaque growth.

Broth: Moderate turbidity, slight viscid sediment.

Litmus milk: Alkaline, peptonization, and slow reduction.

Potato: Greenish-yellow, thick, moist growth.

Indole not produced.

Nitrites not produced from nitrates.

Hydrogen sulfide not produced.

Starch slightly hydrolyzed.

No action on the following carbohydrates: Glucose, lactose, sucrose, maltose, fructose, mannitol, galactose, arabinose, xylose, dextrin, salicin, rhamnose, raffinose, trehalose, sorbitol, inulin, dulcitol, glycerol, adonitol, mannose.

Aerobic.

Source: From the body wall of the bagworm, *Thyridopteryx ephemeraeformis* Haw.

Habitat: Unknown.

10. **Bacterium tegumenticola** Steinhaus. (Jour. Bact., *42*, 1941, 775.) From Latin *tegumentum*, cover, skin and *cola*, dweller.

Small rods: 0.5 to 0.8 by 1.0 to 1.5 microns. Have a tendency to be ellipsoidal on solid media. Non-motile. Gram-positive.

Gelatin stab: Generally no liquefaction. Variable.

Agar colonies: Tiny (1 mm), white, convex, glistening, circular, entire.

Agar slant: Filiform, glistening, grayish-white growth.

Broth: Slight turbidity; sediment.

Litmus milk: No change.

Indole not produced.

Hydrogen sulfide not produced.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Acid slowly produced from glucose

and maltose. Acid from sucrose. Lactose not fermented.

Source: From the integument of the bed-bug, *Cimex lectularius* L.

Habitat: Unknown.

11. **Bacterium minutaferula** Steinhaus. (Jour. Bact., 42, 1941, 778.) From Latin, small rod.

Very small rods: 0.4 to 0.9 by 0.7 to 1.0 micron, occurring singly. Non-motile. Gram-positive.

Gelatin stab: No liquefaction.

Agar colonies: Colorless to faint gray, circular, smooth, entire, glistening.

Agar slant: Very thin, transparent, glistening growth.

Broth: Slight turbidity and sediment.

Litmus milk: No change at first; slightly acid after one week.

Indole not produced.

Hydrogen sulfide not produced.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Acid from glucose after 4 days. Slight acid from sucrose. Lactose and maltose not fermented.

Aerobic.

Source: From triturated specimen of the mud-dauber wasp, *Sceliphron cementarium* Dru.

Habitat: Unknown.

12. **Bacterium fulvum** (Zimmermann) Chester. (*Bacillus fulvus* Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 44; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 107; *Flavobacterium fulvum* Bergey et al., Manual, 1st ed., 1923, 115.) From Latin *fulvus*, dull yellow.

Rods: 0.8 by 0.9 to 1.3 microns, occurring singly, in pairs and in chains. Non-motile. Gram-positive.

Gelatin colonies: Circular, convex, reddish-yellow.

Gelatin stab: Convex, reddish-yellow surface growth. Good growth in stab. Slow liquefaction.

Agar slant: Orange-red, glistening streak.

Broth: Turbid with yellow sediment.

Litmus lactose broth: Acid, or acid then alkaline (Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 368).

Potato: Slowly spreading, yellowish, glistening growth.

Indole formed (Dyar, *loc. cit.*).

Nitrites not produced from nitrates (Bergey).

Aerobic, facultative.

Optimum temperature 30°C.

Source: From Chemnitz and Döbeln tap water (Zimmermann). From dust and water (Dyar).

Habitat: Water.

13. **Bacterium marinopiscosus** ZoBell and Upham. (Bull. Scripps Inst. Oceanography, La Jolla, *5*, 1944, 258.) From Latin *marinus*, pertaining to the sea, and *piscosus*, fish.

Rods: 1.2 to 1.6 by 2.0 to 4.7 microns, with rounded ends, show granular staining, occurring singly, in pairs and long chains. Non-motile. Gram-positive, but many cells tend to decolorize leaving Gram-positive granules.

All differential media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: Gray, circular, convex, 1 mm. No pigment.

Gelatin stab: Liquefaction napiform, becoming crateriform to stratiform with age. Complete in 50 days.

Agar colonies: 2 to 4 mm, circular, convex, entire, smooth, irregular edge.

Agar slant: Luxuriant, beaded, glistening, butyrous growth with no pigment.

Sea-water broth: No turbidity, abundant flocculent sediment, slight surface ring.

Fresh-water broth: Good growth.

Litmus milk: Decolorized, neutral, top peptonized.

Potato: Heavy, white, raised, mucoid, dull growth. Potato darkened.

Indole not formed.

Nitrites not produced from nitrates.

Acid but no gas from glucose and man-

nitol. No acid from maltose, lactose, sucrose, glycerol, xylose or salicin.

Starch is hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Casein is digested.

Fats are not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Found on the skin of marine fish.

Habitat: Not known from other sources.

14. **Bacterium sociovivum** ZoBell and Upham. (Bull. Scripps Inst. Oceanography, La Jolla, *5*, 1944, 269.) From Latin *socius*, associate and *vivum*, to live.

Rods: 0.5 to 0.8 by 3.0 to 4.0 microns, with rounded ends, occurring singly, in pairs, and chains. Non-motile. Gram-positive but tends to destain, leaving Gram-positive cell wall and granules.

All differential media except the fresh-water broth, litmus milk and potato were prepared with sea water.

Gelatin colonies: Irregular, sunken, filamentous margin, grayish-white.

Gelatin stab: Crateriform liquefaction becoming stratiform.

Agar colonies: 2 to 4 mm, circular, convex, smooth, entire, darker center.

Agar slant: Luxuriant, beaded, glistening, butyrous growth with no pigment.

Sea-water broth: No pellicle, no turbidity, heavy flocculent sediment.

Fresh-water broth: Fair growth.

Litmus milk: Decolorized, neutral, completely peptonized in 20 days.

Potato: Abundant, dull, light cream-colored growth. Potato darkened.

Indole not formed.

Nitrites not produced from nitrates.

Acid but no gas from glucose, maltose, and mannitol. No acid from glycerol, lactose, sucrose, or salicin.

Starch is hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Casein is digested.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Found associated with sedentary organisms in the sea.

Habitat: Commonly found on submerged surfaces and on sessile diatoms in sea water.

15. **Bacterium immotum** ZoBell and Upham. (Bull. Scripps Inst. Oceanography, *5*, 1944, 271.) From Latin, meaning immobile or stationary.

Rods: 0.8 by 3.1 to 8.6 microns, with rounded ends, occurring singly, in pairs, and long chains. Non-motile. Gram-positive but tend to destain leaving Gram-positive outline and granules.

All differential media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: Small, circular, raised, gray, slowly digest gelatin.

Gelatin stab: Crateriform liquefaction becoming infundibuliform. Beaded growth along line of stab. No pigment.

Agar colonies: 1 to 2 mm, circular, convex, smooth, lobate margin, darker centers.

Agar slant: Luxuriant, glistening, echinulate, mucoid growth with no pigment.

Sea-water broth: No pellicle, moderate turbidity, abundant, flocculent sediment.

Fresh-water broth: Scanty growth.

Litmus milk: Decolorized, neutral, partly peptonized in 20 days.

Potato: Luxuriant, mucoid, creamy growth which darkens potato.

Indole not formed.

Nitrites not produced from nitrates.

Acid but no gas from glucose, maltose, xylose, and mannitol. No acid from glycerol, lactose, sucrose, or salicin.

Starch is hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Casein is digested.

Fats not hydrolyzed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Found associated with marine sedentary organisms.

Habitat: Not known from other sources.

16. **Bacterium ammoniagenes** Cooke and Keith. (Cooke and Keith, Jour. Bact., *13*, 1927, 315; *Alcaligenes ammoniagenes* Bergey et al., Manual, 3rd ed., 1930, 367.) From M. L. *ammonia* and Latin *genero*, develop.

Rods with rounded ends, 0.8 by 1.4 to 1.7 microns, occurring singly. Non-motile. Gram-positive.

Gelatin stab: No liquefaction.

Agar colonies: Circular, flat, smooth, entire, gray.

Agar slant: Growth moderate, smooth, flat, opaque, glistening, butyrous, amorphous.

Broth: Moderate turbidity, with flocculent sediment.

Litmus milk: Slightly alkaline.

Indole not formed.

No action on carbohydrates.

Blood serum not liquefied.

Urea is fermented forming ammonia.

Aerobic, facultative.

Optimum temperature 30°C.

Source: From feces of infants.

Habitat: Presumably widely distributed in putrefying materials.

17. **Bacterium minutissimum** Migula. (*Bacillus pyogenes minutissimus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 447; *Bacterium pyogenes minutissimus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 89; Migula, Syst. d. Bakt., *2*, 1900, 418; *Eberthella minutissima* Bergey et al., Manual, 1st ed., 1923, 228; *Shigella minutissima* Bergey et al., Manual, 3rd ed., 1930, 359.) From Latin, smallest.

Description from Kruse (*loc. cit.*). Description not different from that of *Bacillus tenuis sputigenes* Pansini, according to Chester (Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 89).

Rods: 0.5 by 1.0 micron, occurring singly and in pairs. Non-motile. Gram-positive.

Gelatin stab: No liquefaction. Yellowish growth spreading slightly on surface.

Growth on agar and blood serum is not characteristic.

Acid but no gas from glucose and lactose.

No characteristic odor.

Not pathogenic for mice and rabbits.

Aerobic, facultative.

Optimum temperature 37°C.

Source: Isolated from a facial abscess.

Habitat: Not known from other sources.

18. **Bacterium incertum** Steinhaus. (Jour. Bact., *42*, 1941, 776.) From Latin *incertus*, uncertain.

Short rods: 0.5 to 0.8 by 1.0 to 1.5 microns, occurring singly and occasionally in pairs. Young cultures motile, after 48 hours generally non-motile. Gram-positive; after 48 hours many cells become Gram-negative.

Gelatin stab: No liquefaction.

Agar colonies: Tiny, grayish-white, smooth, almost transparent. Does not grow well on nutrient agar.

North's gelatin chocolate agar slant: Filiform, thin, transparent growth. Brown color of chocolate medium changes to yellowish-green.

Blood agar: Alpha hemolysis at first; after three days beta hemolysis.

Broth: Almost clear; very slight growth.

Litmus milk: No change.

Indole not produced.

Hydrogen sulfide not produced.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Acid but no gas from glucose, sucrose,

fructose, mannose, and maltose. No fermentation of lactose, rhamnose, galactose, mannitol, dulcitol, inositol, or sorbitol.

Voges-Proskauer test: Negative.

Microaerophilic.

Source: From the ovaries of the lyreman cicada, *Tibicen linnei* Smith and Grossbeck.

Habitat: Unknown.

19. **Bacterium imperiale** Steinhaus. (Jour. Bact., *42*, 1941, 777.) From Latin *imperialis*, referring to the imperial moth.

Small rods: 0.5 to 0.8 by 1.0 to 1.7 microns, occurring singly and in pairs. A few cells motile in young cultures. Gram-positive.

Gelatin stab: No liquefaction.

Agar colonies: Circular, entire, almost translucent, pinkish-orange to yellow pigment.

Agar slant: Filiform, glistening, opaque growth.

Broth: Slight to moderate turbidity; slight sediment.

Litmus milk: No change at first, later slightly acid.

Potato: Heavy, glistening, moist growth; reddish to yellowish-orange.

Indole not produced.

Hydrogen sulfide not produced.

Nitrites not produced from nitrates.

Starch not hydrolyzed.

Acid but no gas from glucose, sucrose, maltose, fructose, mannitol, galactose, arabinose, xylose, salicin, raffinose, trehalose, sorbitol, mannose, adonitol, esculin, and slight acid from lactose and dextrin. Inulin, dulcitol, glycerol, rhamnose, adonitol, and inositol not fermented.

Aerobic.

Source: From the alimentary tract of the imperial moth, *Eacles imperialis* Dru.

Habitat: Unknown.

20. **Bacterium zopfii** Kurth. (Kurth, Bericht. d. deutsch. Botan. Gesellschaft, *1*, 1883, 97; *Kurthia zopfii* Trevisan, Atti della Accad. Fisio-Medico-Statistica in Milano, Ser. 4, *3*, 1885, 92; *Helikobacterium zopfii* Escherich, Münch. med. Wchnschr., *33*, 1886, 2, quoted from Enlows, U. S. Hygienic Lab. Bull. 121, 1920, 47; *Bacterium (Proteus) zopfii* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 103; *Bacillus zopfii* Migula, Syst. d. Bakt., *2*, 1900, 815; *Zopfius zopfii* Wenner and Rettger, Jour. Bact., *4*, 1919, 334.) Named for W. Zopf, German botanist.

This is the type species of the genus *Kurthia* Trevisan. (Trevisan, *loc. cit.*; *Zopfius* Wenner and Rettger, Jour. Bact., *4*, 1919, 334.)

Rods: 0.8 by 3.5 microns, with rounded ends, occurring in long curved chains. Motile with peritrichous flagella. Gram-positive.

Gelatin colonies: Radiate, filamentous, gray.

Gelatin stab: Arborescent growth in stab. No liquefaction.

Agar colonies: Fimbriate.

Agar slant: Spreading, gray, fimbriate growth.

Broth: Slow, moderate growth.

Litmus milk: No change.

Potato: Moderate, gray growth; medium becoming dark.

No H_2S produced.

Indole not formed.

Nitrites not produced from nitrates.

Aerobic, facultative.

Optimum temperature 25° to 30°C.

Habitat: Decomposing materials.

21. **Bacterium zenkeri** (Hauser) Chester. (*Proteus zenkeri* Hauser, Ueber Faulnissbakterien, 1885; *Bacillus zenkeri* Trevisan, I generi e le specie delle Batteriacee, 1889, 17; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 103; *Zopfius zenkeri* Wenner and Rettger, Jour. Bact., *4*, 1919, 334; *Bacillus proteus-zenkeri* Holland, Jour. Bact., *5*, 1920, 220; *Kurthia zenkeri* Bergey et al., Manual, 2nd ed., 1925, 215.) Named for K. Zenker, German pathologist.

Rods: 0.65 by 1.6 to 2.3 microns, occurring in pairs and in chains. Motile with peritrichous flagella. Gram-positive.

Gelatin colonies: Feathery, with filaments extending in all directions.

Gelatin stab: Surface growth like colonies. No arborescent growth in stab. No liquefaction.

Agar colonies: Thin, filamentous, spreading, grayish.

Agar slant: Thin, bluish-gray, filamentous growth.

Broth: Slightly turbid, with gray sediment.

Litmus milk: No change.

Potato: Barely visible, yellowish-gray, glistening growth.

Indole not formed.

Nitrites not produced from nitrates.

No H_2S formed.

Aerobic, facultative.

Optimum temperature 30°C.

Habitat: Decomposing materials.

NOTE: Wenner and Rettger, *loc. cit.*, consider the last two species to be identical.

Appendix I: The following Gram-positive, motile species may belong with the above group. All have been placed at one time or another in the genus *Achromobacter* or in the genus *Flavobacterium*.

1. **Achromobacter lipolyticum** (Huss) Bergey et al. (*Bactridium lipolyticum* Huss, Cent. f. Bakt., II Abt., *20*, 1908, 474; Bergey et al., Manual, 2nd ed., 1925, 158.) From Greek, fat-dissolving.

Small, oval rods: 0.3 to 0.5 by 0.7 to 1.4 microns. Motile, possessing peritrichous flagella. Gram-positive.

Gelatin colonies: Circular, grayish to transparent with irregular margin.

Gelatin stab: Infundibuliform liquefaction.

Agar colonies: Growth circular, gray, smooth, glistening, with entire margin.

Broth: Turbid with granular sediment.

Litmus milk: Coagulated, peptonized, becoming alkaline.

Potato: Moist, glistening, grayish growth.

Indole is formed.

Acid from glucose, sucrose, raffinose, xylose, mannitol and glycerol.

Fats are split in milk, giving rise to a rancid odor and a bitter taste.

Aerobic, facultative.

Optimum temperature 35°C.

Source: From the udder of a cow giving abnormal milk.

Habitat: Milk.

2. **Achromobacter stearophilum** (Weinzirl) Bergey et al. (*Bacillus stearophilus* Weinzirl, Jour. Med. Res., *39*, 1919, 404; Bergey et al., Manual, 1st ed., 1923, 145.)

Rods: 0.8 by 5.0 microns, occurring singly. Motile. Gram-positive.

Gelatin colonies: Scanty development.

Pumpkin gelatin stab: Filiform growth in stab. No liquefaction.

Pumpkin agar colonies: Small, smooth, convex, gray, entire.

Pumpkin juice: Slightly turbid.

Pumpkin milk: Acid, coagulated.

Potato: Slight, smooth, gray, glistening, filiform growth.

Indole not formed.

Nitrites not produced from nitrates.

No acid from carbohydrate media.

Starch from pumpkin hydrolyzed.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Canned pumpkin.

Habitat: Unknown.

3. **Achromobacter sulfureum** Bergey et al. (Bakt. 4, Rubentschick, Cent. f. Bakt., II Abt., *72*, 1927, 123; Bergey et al., Manual, 3rd ed., 1930, 220.)

Rods: 0.7 to 0.8 by 1.7 to 2.2 microns, occurring singly and in pairs. Motile. Gram-positive.

Gelatin stab: Saccate liquefaction.

Agar colonies: Circular, grayish-white, flat, homogeneous.

Agar slant: Filiform, grayish-white, smooth, homogeneous growth. Metallic luster.

Broth: Turbid.

Litmus milk: Peptonized.

Potato: Yellowish-brown layer.

Indole not formed.

Nitrites produced from nitrates with gas formation.

Hydrogen sulfide formed.

Ammonia formed.

Urea is attacked.

Methylene blue reduced.

Aerobic, facultative.

Optimum temperature 30° to 33°C. Can grow at 0°C.

Source: Sewage filter beds.

Habitat: Putrefying materials.

NOTE: See *Pseudomonas urease* Bergey et al. for another motile, Gram-positive organism described by Rubentschick (Bakt. 3) from the same source.

4. **Achromobacter aerophilum** (Rubentschick) Bergey et al. (*Urobacterium aerophilum* Rubentschick, Cent. f. Bakt., II Abt., *64*, 1925, 168; Bergey et al., Manual, 3rd ed., 1930, 224.)

Rods: 0.75 to 0.85 by 2.0 to 4.5 microns, occurring singly, in pairs, and in chains. Motile. Gram-positive.

Urea gelatin colonies: Small, circular, dirty-gray, entire.

Urea gelatin stab: No liquefaction.

Urea agar colonies: Circular, grayish, smooth.

Urea agar slant: Dirty-gray, glistening to dry growth.

Urea broth: Turbid.

Urea milk: Unchanged.

Urea potato: Slight, grayish-white streak.

Indole not formed.

Nitrites produced from nitrates.

H_2S not formed.

Ammonia not formed.

Aerobic, facultative.

Source: Sewage slime.

Habitat: Putrefying materials.

5. **Achromobacter citrophilum** (Rubentschick) Bergey et al. (*Urobacterium citrophilum* Rubentschick, Cent. f. Bakt., II Abt., *64*, 1925, 168; *66*, 1926, 161; *67*, 1926, 167; *68*, 1926, 327; Bergey et al., Manual, 3rd ed., 1930, 224.)

Rods: 0.75 to 0.85 by 2.5 to 6.0 microns, occurring singly and in pairs. Motile. Gram-positive.

Urea gelatin colonies: Small, grayish-white, smooth, undulate.

Urea gelatin stab: No liquefaction.

Urea agar slant: Filiform, grayish-white, thin, dry growth.

Urea broth: Turbid.

Urea milk: Unchanged.

Urea potato: Dirty-gray, thin streak.

Indole not formed.

Nitrites produced from nitrates.

Hydrogen sulfide not formed.

Ammonia not formed.

Can derive oxygen from sodium citrate.

Aerobic, facultative.

Optimum temperature 30°C.

Source: Sewage slime.

Habitat: Putrefying materials.

6. **Flavobacterium sulfureum** Bergey et al. (*Bacterium punctans sulfureum* Zettnow, Cent. f. Bakt., I Abt., Orig., *77*, 1916, 222; Bergey et al., Manual, 1st ed., 1923, 103.)

Rods: 0.5 to 0.7 by 0.7 to 1.5 microns. Motile, possessing peritrichous flagella. Gram-positive.

Gelatin colonies: Very small, barely visible, becoming brownish-yellow, granular.

Gelatin stab: Spreading growth on the surface only. Later crateriform liquefaction.

Agar slant: Sulfur-yellow growth.

Broth: Turbid.

Litmus milk: Alkaline, peptonized, yellow.

Potato: Sulfur-yellow streak.

Indole not formed.

Nitrites not produced from nitrates.

Blood serum: Sulfur-yellow growth. Partial liquefaction.

No acid from glucose.

Aerobic, facultative.

Optimum temperature 25°C.

Source: Air.
Habitat: Unknown.

7. **Flavobacterium acetylicum** Levine and Soppeland. (Bull. 77, Engineering Exp. Sta., Iowa State Agricultural College, 1926, 46.) From the chemical term acetyl.

Rods: 0.9 by 1.1 microns, with rounded ends, occurring singly and in pairs. Motile. Gram-positive.

Gelatin stab: Stratiform liquefaction.

Agar colonies: Irregular in form, yellow, smooth, flat, amorphous, entire.

Agar slant: Abundant, echinulate growth, flat, peach yellow, smooth and butyrous.

Broth: Ring growth on surface. Turbid with scant sediment.

Litmus milk: Slight acidity, with granular curd. Peptonization. Litmus reduced.

Potato: Moderate, orange growth.

Indole not formed.

Nitrites not produced from nitrates.

Starch hydrolyzed.

Blood serum liquefied.

Acid from glucose with formation of acetylmethylcarbinol.

Aerobic, facultative.

Optimum temperature 22°C.

Source: From skimmed milk.

Habitat: Unknown.

8. **Flavobacterium fuscum** (Zimmermann) Bergey et al. (*Bacillus fuscus* Zimmermann, Bakt. unserer Trink- und Nutzwässer, Chemnitz, *1*, 1890, 70; not *Bacillus fuscus* Flügge, Die Mikroorganismen, 2 Aufl., 1886, 290; *Bacterium fuscus* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 111; Bergey et al., Manual, 1st ed., 1923, 113; *Chromobacterium fuscum* Topley and Wilson, Princ. Bact. and Immun., *1*, 1931, 405.) From Latin *fuscus*, tawny.

Rods: 0.6 by 1.5 microns, occurring singly. Non-motile. Gram-positive.

Gelatin colonies: Small, with brownish center and yellowish border.

Gelatin stab: Gray, filiform growth in stab. Slow crateriform liquefaction.

Agar colonies: Circular, pale yellow, smooth, slightly convex, entire.

Agar slant: Growth greenish-yellow, plumose, smooth, raised, undulate.

Broth: Turbid, with pellicle and sediment.

Litmus milk: Slightly acid, becoming alkaline, with yellow ring.

Potato: Thick, moist, chrome-yellow streak.

Indole not formed.

Nitrites produced from nitrates.

Aerobic, facultative.

Optimum temperature 30°C.

Source: From Zwönitz River water.

Habitat: Water.

8a. *Bacterium fuscum liquefaciens* (Dyar) Chester. (*Bacillus fuscus liquefaciens* Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 375; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 108.) Received from the Kràl collection labeled *Bacillus fuscus*; also from air. Differs from the above only in liquefying gelatin more slowly and completely.

9. **Flavobacterium maris** Harrison. (Canadian Jour. Research, *1*, 1929, 232.) From Latin *mare*, sea.

Rods: 0.7 to 0.8 by 1.0 to 1.2 microns, occurring singly and in pairs. At 37°C coccoid. Non-motile. Encapsulated. Gram-positive.

Gelatin colonies: Punctiform, red-orange, granular, entire.

Gelatin stab: Red-orange surface growth, filiform growth in stab. No liquefaction.

Agar colonies: Circular, orange-yellow, smooth, glistening, convex.

Agar slant: Growth moderate, orange-yellow, becoming cadmium-orange to red-orange, spreading, glistening.

Broth: Clear with orange pellicle and sediment.

Litmus milk: At first faintly alkaline, becoming faintly acid with orange sediment.

Potato: Scant growth.

Indole not formed.

Nitrites produced from nitrates.

Traces of ammonia formed.

Faint acidity from glucose. No action on lactose or sucrose.

Loeffler's blood serum not liquefied.

No H_2S formed.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Isolated from the skin of fishes. Steinhaus (Jour. Bact., *42*, 1941, 771) found a similar organism in the intestine of a caterpillar.

Habitat: Unknown.

Appendix II: Among the following species reported as Gram-positive are many that appear to be similar to the species listed above, while others may belong to the so-called parasitic lactobacilli of the intestine or even to *Corynebacterium*. The majority have been placed by their authors in genera other than *Bacterium*.

Bacillus achrous Migula. (No. 6, Lembke, Arch. f. Hyg., *26*, 1896, 301; Migula, Syst. d. Bakt., *2*, 1900, 676.) From feces. Motile.

Bacillus asteriformis Migula. (Microbe astériforme, de Klecki, Ann. Inst. Past., *9*, 1895, 735; Migula, Syst. d. Bakt., *2*, 1900, 816.) From feces. Motile. Colonies resemble those of *Bacillus mycoides* but no spores are mentioned.

Bacillus casei limburgensis Orla-Jensen. (Orla-Jensen, Cent. f. Bakt., II Abt., *13*, 1904, 702; *Bacterium casei limburgensis* Yale, N. Y. S. Agr. Exp. Sta., Tech. Bul. 268, 1943, 5.) From limburger cheese. Presumably the same as *Bacterium linens* Weigmann.

Bacillus choukevitchi Herter. (Microbe VIII, Choukévitch, Ann. Inst. Past., *25*, 1911, 265; Herter, Just's Botan. Jahresber., *39*, 2 Abt., Heft 4, 1915, 748.) From the large intestine of a horse.

Bacillus colorabilis Migula. (Bacillus der Gallenblase, Naunyn, Deutsche med. Wochnschr., 1891, 193; *Bacillus cuniculicida havaniensis* Sternberg, Man. of Bact., 1893, 450; *Bacillus coli colorabilis* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 434; *Bacterium coli colorabilis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 87; *Bacterium cuniculicida havaniensis* Chester, *idem*; Migula, Syst. d. Bakt., *2*, 1900, 736.) From a diseased gall-bladder (Naunyn) and from the intestines and liver of yellow-fever cadavers (Sternberg).

Bacillus cupularis Migula. (No. 12, Lembke, Arch. f. Hyg., *26*, 1896, 307; Migula, Syst. d. Bakt., *2*, 1900, 677.) From feces. Motile.

Bacillus fumigatus Migula. (No. 14, Lembke, Arch. f. Hyg., *29*, 1897, 320; Migula, Syst. d. Bakt., *2*, 1900, 679.) From feces. Motile.

Bacillus gazogenes Heurlin. (Heurlin, Bakt. Unters. d. Keimgehaltes im Genitalkanale der fiebernden Wöchnerinnen. Helsingfors, 1910, 97.) From the vagina.

Bacillus glacialis Migula. (Giftproduzierender Bacillus, Vaughan and Perkins, Arch. f. Hyg., *27*, 1896, 308; Migula, Syst. d. Bakt., *2*, 1900, 807.) From ice cream and cheese. Motile.

Bacillus involutus Wälsch. (Cent. f. Bakt., I Abt., Orig., *38*, 1905, 645.) From preputial secretion.

Bacillus laseri Migula. (Gasbildender aërober Bacillus, Laser, Cent., f. Bakt., *13*, 1893, 217; Migula, Syst. d. Bakt., *2*, 1900, 763.) From the lungs and liver of a calf. Motile.

Bacillus membranifer Migula. (No. 7, Lembke, Arch. f. Hyg., *26*, 1896, 302; Migula, Syst. d. Bakt., *2*, 1900, 675.) From feces. Motile.

Bacillus pseudotyphosus Migula. (Typhusähnlicher Bacillus, Lustig, Diag. d. Bakt. d. Wassers, 1893, 18; Migula, Syst. d. Bakt., *2*, 1900, 730; not *Bacillus pseudotyphosus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 383.) Motile. From several samples of water from Thales de Aosta, Italy.

Bacillus pulmonum Migula. (Proteus bei Lungengangrän des Menschen, Babes, Progrès médical roumain, April 6, 1889; Migula, Syst. d. Bakt., *2*, 1900,

755.) From gangrenous lung exudate and the spleen. Motile.

Bacillus radiatus Zimmermann. (Zimmermann, Bakt. unserer Trink- u. Nutzwässer, Chemnitz, *1*, 1890, 58; not *Bacillus radiatus* Lüderitz, Ztschr. f. Hyg., *5*, 1889, 149; not *Bacillus radiatus* Chester, Man. Determ. Bact., 1901, 241; *Bacillus aquatilis radiatus* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 315; quoted as *B. radiatus aquatilis* Zimmermann by Kruse, *idem*; *Bacterium radiatus aquatilis* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 100; *Bacterium aquatilis radiatus* Chester, *idem*; *Bacillus pseudoradiatus* Migula, Syst. d. Bakt., *2*, 1900, 830; *Bacterium aquatilis* Chester, Man. Determ. Bact., 1901, 160; not *Bacterium aquatile* Migula, *loc. cit.*, 469.) From water. Motile. In certain stages of development (presumably old cultures) Zimmermann states that this organism is Gram-negative.

Bacillus splendens Migula. (*Bacillus putidus splendens* Bernabei, Bull. d. Soc. Lancisiana d. Ospedali di Roma, *13*; see abst. in Cent. f. Bakt., *17*, 1895, 469; Migula, Syst. d. Bakt., *2*, 1900, 754.) From a case of fetid bronchitis. Motile.

Bacterium acidiformans (Sternberg) Chester. (*Bacillus acidiformans* Sternberg, Man. of Bact., 1893, 449; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 79.) From the liver of a yellow fever patient. Also reported from beeswax (White, U. S. Dept. Agr. Bur. Entomol., Bull. 14, 1906, 14).

Bacterium cactivorum Pasmetti and Buzzati-Traverso. (Nuovo Gior. Bot. Ital., N.S. *42*, 1935, 117.) From a diseased cactus.

Bacterium dendrobii Pavarino. (Rev. di Pat. Veg., *5*, 1912, 242.) From *Dendrobium sp.*

Bacterium (?) musae (Gaumann) Elliott. (*Pseudomonas musae* Gaumann, Med. van het Inst. voor Plantz., No. 48, 1921, 58; Elliott, Manual Bact. Plant Path., 1930, 170; *Phytomonas (?) musae* Magrou, in Hauduroy et al., Dict. d. Bact. Path., 1937, 385.) From diseased bananas.

Bacterium nicotinovorum Bucherer. (Cent. f. Bakt., II Abt., *105*, 1942, 169.) From a mixture of soil, manure and mud.

Bacterium pseudotyphosum Migula. (Typhusähnlicher Bacillus, Lustig, Diagnostik der Bakterien des Wassers, 1893, 17; Migula, Syst. d. Bakt., *2*, 1900, 428.) Non-motile. Isolated by Sartori from Rome tapwater.

Bacterium teutlium Metcalf. (Metcalf, Cent. f. Bakt., II Abt., *13*, 1904, 28; *Aplanobacter teutlium* E. F. Smith, Intro. to Bact. Dis. of Plants, 1920, 474; *Phytomonas teutlia* Bergey et al., Manual, 3rd ed., 1930, 280.) From a soft rot of sugar beets. See Manual, 5th ed., 1939, 216 for a description of this species.

Flavobacterium dehydrogenans Arnaudi. (*Micrococcus dehydrogenans* Arnaudi, Boll. Sez. ital. Soc. intern. Microbiol., *18*, 1939, 000; Arnaudi, Cent. f. Bakt., II Abt., *105*, 1942–43, 352.) From a pressed yeast cake.

Flavobacterium vitarumen Knutsen. (Knutsen, in Bechdel, Honeywell, Dutcher and Knutsen, Jour. Biol. Chem., *80*, 1928, 234.) From the rumen of a cow.

Kurthia bessoni Severi. (Quoted from Giorn. Batteriol. e Immunol., *34*, 1946, 107.)

Kurthia variabilis Severi. (Giorn. Batteriol. e Immunol., *34*, 1946, 107.) From feces.

22. **Bacterium idoneum** McBeth. (McBeth, Soil Science, *1*, 1916, 460; *Cellulomonas idonea* Bergey et al., Manual, 1st ed., 1923, 165.) From Latin *idoneus*, capable.

Rods: 0.5 by 1.5 microns. Non-motile. Gram-negative.

Gelatin stab: Moderate, yellowish growth. Slight napiform liquefaction.

Agar colonies: Circular, convex, soft, becoming brittle, grayish, granular, entire.

Agar slant: Scant, yellowish-white growth, becoming distinctly yellow.

Gelatin stab: Moderate, yellowish growth. Slight napiform liquefaction.

Agar colonies: Circular, convex, soft, becoming brittle, grayish, granular, entire.

Agar slant: Scant, yellowish-white growth, becoming distinctly yellow.

Ammonia cellulose agar: Enzymatic zone shows a diameter of 2 to 3 mm at the end of 30 days.

Peptone cellulose agar: Enzymatic zone shows a diameter of 1.5 to 2.0 mm at the end of 30 days.

Broth: Turbid.

Filter paper broth: Paper reduced to thin, limp sheet which falls apart on slight agitation at end of 15 days.

Litmus milk: Acid, not digested.

Potato: Abundant, moist, glistening, grayish-white growth, becoming distinctly yellow.

Indole not formed.

Nitrites produced from nitrates.

Ammonia not produced.

Acid from glucose, maltose, lactose, starch and glycerol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

23. **Bacterium udum** Kellerman et al. (Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 514; *Cellulomonas uda* Bergey et al., Manual, 1st ed., 1923, 166; *Proteus cellulomonas* var. *Proteus udus* Pribram, Klassifikation der Schizomyceten, Leipzig und Wien, 1933, 72.) From Latin *udus* growing in marshy ground.

Rods: 0.5 by 1.5 microns. Non-motile. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Luxuriant, faintly yellowish growth.

Cellulose agar: Enzymatic zone 0.5 mm wide.

Broth: Turbid.

Litmus milk: Acid.

Potato: Good growth.

Indole not formed.

Nitrites produced from nitrates.

Ammonia is produced.

Acid from glucose, fructose, arabinose, xylose, maltose, lactose, sucrose, dextrin and starch.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Compost from Arlington, Va.

Habitat: Soil.

24. **Bacterium lucrosum** McBeth. (McBeth, Soil Science, *1*, 1916, 461; *Cellulomonas lucrosa* Bergey et al., Manual, 1st ed., 1923, 167.) From Latin *lucrosus*, lucrative.

Rods: 0.4 by 1.3 microns. Non-motile. Gram-negative.

Gelatin stab: No growth.

Agar colonies: Circular, convex, semitransparent, granular, entire.

Agar slant: Moderate, flat, grayish-white growth, becoming somewhat iridescent.

Ammonia cellulose agar: On crowded plate, the colonies show an enzymatic zone of 1 mm or more.

Peptone cellulose agar: Enzymatic zone 2 to 3 mm wide in 25 days.

Broth: Turbid.

Filter paper broth: Paper is reduced to a grayish-white pulpy mass whose fibers separate on slight agitation.

Litmus milk: No change.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia not produced.

Acid from glucose, maltose, lactose, sucrose, starch and mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

25. **Bacterium acidulum** Kellerman et al. (Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 513; *Cellulomonas acidula* Bergey et al., Manual, 1st ed., 1923, 167.) From Latin *acidus*, acid.

Rods: 0.3 by 1.0 micron. Non-motile. Gram-negative.

Gelatin stab: No liquefaction.
Agar slant: Slight, grayish growth.
Cellulose agar: Enzymatic zone 0.5 to 1 mm in width.
Broth: Clear.
Litmus milk: Acid.
Potato: No growth.
Indole not formed.
Nitrites not produced from nitrates.
Ammonia not produced.
Acid from glucose, maltose, lactose and sucrose. None from glycerol or mannitol.
Starch not hydrolyzed.
Aerobic.
Optimum temperature 20°C.
Source: Soil from Utah.
Habitat: Soil.

26. **Bacterium castigatum** McBeth. (McBeth, Soil Science, *1*, 1916, 458; *Cellulomonas castigata* Bergey et al., Manual, 1st ed., 1923, 168.) From Latin *castigatus*, subdued.

Rods: 0.4 by 1.2 microns. Non-motile. Gram-negative.
Gelatin stab: Moderate surface growth. No liquefaction.
Agar colonies: Circular, slightly convex, brittle, grayish-white, granular, entire.
Agar slant: Abundant, glistening, grayish-white growth.
Ammonia cellulose agar: Enzymatic zone may attain a diameter of 2.5 mm in 30 days.
Peptone cellulose agar: Enzymatic zone may reach a diameter of 2 mm in 30 days.
Broth: Slightly turbid.
Filter paper broth: Paper completely disintegrated and reduced to a pulp-like mass in 15 days.
Litmus milk: Acid, not digested.
Indole not formed.
Nitrites not produced from nitrates.
Ammonia not produced.
Acid from glucose, maltose, lactose, sucrose, starch and glycerol.
Aerobic.
Optimum temperature 20°C.
Source: Soil from California.
Habitat: Soil.

27. **Bacterium bibulum** (McBeth and Scales) Holland. (*Bacillus bibulus* McBeth and Scales, Bur. of Plant Industry, U. S. Dept. of Agr., Bul. No. 266, 1913, 35; Holland, Jour. Bact., *5*, 1920, 217 and 221; *Cellulomonas bibula* Bergey et al., Manual, 1st ed., 1923, 158.) From Latin *bibulus*, thirsty.

Rods: 0.4 by 1.3 microns. Motile. Gram-negative.
Gelatin stab: Crateriform liquefaction.
Cellulose agar colonies: Circular, convex, smooth, soft, grayish to faintly yellowish-white, finely granular. Enzymatic zone 0.3 mm in some cases.
Agar slant: Luxuriant, glistening, smooth, moist, raised growth.
Broth: Slightly turbid.
Litmus milk: Faintly acid.
Potato: Smooth, glistening, canary yellow growth.
Indole is formed.
Nitrites not produced from nitrates.
Ammonia is produced.
Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.
Aerobic, facultative.
Optimum temperature 20°C.
Source: From sewer slimes and cultivated soils.
Habitat: Soil.

Appendix I: The genus *Cellulomonas* as originally proposed was based on a single physiological property and included such diverse types of bacteria as (1) polar flagellate species, now placed in *Pseudomonas*, (2) Gram-variable, non-motile rods now placed in *Corynebacterium*, and (3) peritrichous, non-spore-forming, Gram-negative rods. Unfortunately the name is unsuitable for the third of these groups so that it has not been inserted in the outline used in this edition of the MANUAL. Descriptions of species previously placed in this genus are given below.

Genus A. Cellulomonas *Bergey et al.*

(Manual, 1st ed., 1923, 154.)

Small rods, with rounded ends, non-spore-forming, motile with peritrichous flagella, occurring in soil and having the property of digesting cellulose. Growth on ordinary culture media often not vigorous. Gram-negative.

The type species is *Cellulomonas biazotea* (Kellerman) Bergey et al.

Key to the species of genus Cellulomonas.

I. Motile with peritrichous flagella.
  A. Gelatin liquefied. Chromogenic.
    1. Milk acid.
      a. Ammonia not produced; indole not formed.
        1. *Cellulomonas biazotea.*
    2. Milk acid; digested.
      a. Ammonia produced; indole not formed.
        2. *Cellulomonas aurogenes.*
      aa. Ammonia produced; indole formed.
        3. *Cellulomonas galba.*
    3. Milk alkaline.
      a. Ammonia produced; indole not formed.
        4. *Cellulomonas folia.*
    4. Litmus milk unchanged.
      a. Ammonia produced; indole not formed.
        5. *Cellulomonas flava.*
  B. Gelatin liquefied. Non-chromogenic.
    1. Milk acid.
      a. Ammonia not produced; indole not formed.
        6. *Cellulomonas cellasea.*
      aa. Ammonia produced; indole not formed.
        7. *Cellulomonas iugis.*
      aaa. Ammonia not produced; indole formed.
        8. *Cellulomonas concitata.*
    2. Milk acid; digested.
      a. Ammonia produced; indole not formed.
        9. *Cellulomonas caesia.*
  C. Gelatin not liquefied. Chromogenic.
    1. Milk acid.
      a. Ammonia produced; indole formed.
        10. *Cellulomonas gilva.*
    2. Milk alkaline.
      a. Ammonia not produced; indole not formed.
        11. *Cellulomonas ferruginea.*
  D. Gelatin not liquefied. Non-chromogenic.
    1. Milk acid; not digested.
      a. Ammonia not produced; indole not formed.
        12. *Cellulomonas albida.*
        13. *Cellulomonas alma.*
      aa. Ammonia not produced; indole formed.
        14. *Cellulomonas desidiosa.*
      aaa. Ammonia produced; indole not formed.

15. *Cellulomonas pusilla.*
16. *Cellulomonas gelida.*

II. Motility not recorded.
A. Gelatin liquefied. Chromogenic.
1. Milk acid.
a. Ammonia not produced. Acid from glucose.
17. *Cellulomonas flavigena.*
aa. Ammonia produced. No acid from carbohydrates.
18. *Cellulomonas rossica.*

1. **Cellulomonas biazotea** (Kellerman et al.) Bergey et al. (*Bacillus biazoteus* Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 506; Bergey et al., Manual, 1st ed., 1923, 158; *Proteus cellulomonas* var. *Proteus biazoteus* Pribram, Klassifikation der Schizomyceten, Leipzig und Wien, 1933, 72.)

This is the type species of the genus *Cellulomonas*.

Rods: 0.5 by 0.8 micron. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Luxuriant yellow growth.

Cellulose agar: Enzymatic zone 0.25 mm or less in width.

Peptone cellulose agar: No enzymatic zone.

Broth: Turbid.

Litmus milk: Acid. No curdling or digestion.

Potato: Grows well.

Indole not formed.

Nitrites produced from nitrates.

Ammonia not produced.

Acid from glucose, maltose, lactose, sucrose, and glycerol. No acid from mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from Utah.

Habitat: Soil.

2. **Cellulomonas aurogenes** (Kellerman et al.) Bergey et al. (*Bacillus aurogenes* Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 505; Bergey et al., Manual, 1st ed., 1923, 157.) From Latin and Greek, gold-producing.

Rods: 0.4 by 1.4 microns. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Luxuriant yellow growth.

Cellulose agar: Enzymatic zone 0.5 to 1.5 mm wide.

Broth: Turbid.

Litmus milk: Acid, digested.

Potato: Luxuriant growth.

Indole not formed.

Nitrites produced from nitrates.

Ammonia produced.

Acid from glucose, maltose, lactose, sucrose, starch and glycerol. No acid from mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: From soil from Louisiana and Maine.

Habitat: Soil.

3. **Cellulomonas galba** (Kellerman et al.) Bergey et al. (*Bacillus galbus* Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 509; Bergey et al., Manual, 1st ed., 1923, 157.) From Latin *galbus*, yellow.

Rods: 0.4 by 1.0 micron. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Luxuriant yellow growth.

Cellulose agar: Enzymatic zone 0.5 mm in width.

Broth: Turbid.

Litmus milk: Acid, digested.

Potato: No growth.

Indole is formed.

Nitrites not produced from nitrates.

Ammonia produced.

Acid from glucose, maltose, lactose, sucrose, starch and glycerol. No acid from mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from Louisiana.

Habitat: Soil.

4. **Cellulomonas folia** Sanborn. (Jour. Bact., *12*, 1926, 1 and 343.) From Latin *folium*, leaf.

Description from Sanborn (Jour. Bact., *18*, 1929, 170) and also from his unpublished notes.

Rods: 0.8 to 1.0 by 1.0 to 1.5 microns, occurring singly and in short chains. Motile with four to six peritrichous flagella. Gram-negative.

Gelatin stab: Slow crateriform liquefaction, becoming stratiform.

Agar slant: Growth moderate, dirty-white, echinulate, raised, glistening, opaque, butyrous.

Broth: Turbid with yellowish sediment.

Litmus milk: Alkaline.

Potato: Thick, moist, yellowish-brown growth.

Indole not formed.

Nitrites produced from nitrates.

Acid and gas slowly produced from glucose, sucrose, glycerol and mannitol after prolonged incubation. No acid or gas from lactose.

Starch hydrolyzed.

Ammonia produced.

No H_2S formed.

Aerobic, facultative.

Optimum temperature 25° to 30°C.

Resembles *Cellulomonas rossica*.

Source: From decomposing leaves.

Habitat: Occurring in soil and active in decomposing leaves in composts, having the property of digesting cellulose.

5. **Cellulomonas flava** Sack. (Cent. f. Bakt., II Abt., *62*, 1924, 79.) From Latin *flavus*, yellow.

Rods: 0.2 by 1.5 microns. Motile. Gram-negative.

Gelatin colonies: Circular, citron yellow.

Gelatin stab: Very slow liquefaction.

Agar colonies: Large, circular, citron yellow.

Agar slant: Abundant, citron yellow streak.

Broth: Turbid with pellicle and sediment.

Litmus milk: Unchanged.

Potato: Light brown streak.

Indole not formed.

Nitrites and ammonia produced from nitrates.

Hydrogen sulfide produced.

Cellulose hydrolyzed.

Aerobic, facultative.

Optimum temperature 20°C.

Habitat: Soil.

6. **Cellulomonas cellasea** (Kellerman et al.) Bergey et al. (*Bacillus cellaseus* Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 508; Bergey et al., Manual, 1st ed., 1923, 158.)

Rods: 0.5 by 1.2 microns. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Limited grayish growth.

Cellulose agar: Enzymatic zone 0.5 mm or less.

Broth: Clear.

Litmus milk: Acid.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia not produced.

Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from Utah.

Habitat: Soil.

7. **Cellulomonas iugis** (McBeth) Bergey et al. (*Bacillus iugis* McBeth, Soil Science, *1*, 1916, 456; Bergey et al., Manual, 1st ed., 1923, 158.) From Latin, joined together.

Rods: 0.4 by 1.4 microns. Motile with

one to three peritrichous flagella. Gram-negative.

Gelatin stab: Napiform liquefaction.

Agar colonies: Circular, convex, soft, grayish-white, granular, entire.

Agar slant: Scant, grayish-white, filiform growth.

Ammonia cellulose agar: After 20 days, all colonies show an enzymatic zone of 1 mm or more.

Peptone cellulose agar: Enzymatic zone continues to increase up to 30 days at which time it may reach 5 mm in width.

Broth: Turbid.

Filter paper broth: After 15 days, the paper shows many ragged holes but disintegrates readily.

Litmus milk: Acid, not digested.

Potato: Abundant, glistening, grayish-white growth.

Indole not formed.

Nitrites produced from nitrates.

Ammonia produced.

Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

8. **Cellulomonas concitata** (McBeth) Bergey et al. (*Bacillus concitatus* McBeth, Soil Science, *1*, 1916, 448; Bergey et al., Manual, 1st ed., 1923, 159.) From Latin *concitatus*, rapid.

Rods: 0.5 by 1.2 microns. Motile with one to four peritrichous flagella. Gram-negative.

Gelatin stab: Napiform liquefaction.

Agar colonies: Irregularly circular, decidedly convex, soft, becoming viscid, grayish-white, sometimes slightly fluorescent, granular, entire.

Agar slant: Abundant, flat, moist, faint yellowish-white growth.

Ammonia cellulose agar: Surface colonies show an enzymatic zone of 1.0 to 1.5 mm. Deep colonies no zone but colony somewhat clearer than surrounding medium.

Peptone cellulose agar: Enzymatic zone, surface colonies, 2 to 2.5 mm; bottom colonies, 1 mm or less.

Broth: Turbid.

Filter paper broth: In 15 days, the paper is a disintegrated fibrous mass which retains its pure white color.

Litmus milk: Acid, not digested.

Potato: No growth.

Indole is formed.

Nitrites not produced from nitrates.

Ammonia not produced.

Acid from fructose, maltose, lactose, sucrose, starch and glycerol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

9. **Cellulomonas caesia** (Kellerman et al.) Bergey et al. (*Bacillus caesius* Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 507; *Cellulomonas caseia* (sic) Bergey et al., Manual, 1st ed., 1923, 159; *Cellulomonas casei* (sic) Bergey et al., Manual, 4th ed., 1934, 199.) From Latin *caesius*, bluish-gray.

Rods: 0.4 by 1.5 microns. Motile with one or two peritrichous flagella. Gram-negative.

Gelatin stab: Liquefaction.

Beef agar streak: Moderate, flat, thin growth, slightly bluish fluorescence.

Cellulose agar: Enzymatic zone, 0.5 to 1.0 mm in 15 days.

Broth: Turbid. Slight sediment in 5 days.

Litmus milk: Acid, digested.

Potato: No growth.

Indole not formed.

Nitrites produced from nitrates.

Ammonia produced.

Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from Louisiana, Wisconsin and New Hampshire.

Habitat: Soil.

10. **Cellulomonas gilva** (McBeth) Bergey et al. (*Bacillus gilvus* McBeth, Soil Science, *1*, 1916, 453; Bergey et al., Manual, 1st ed., 1923, 160.) From Latin *gilvus*, pale yellow.

Rods: 0.5 by 1.5 microns. Motile with one to five peritrichous flagella. Gram-negative.

Gelatin stab: Moderate, yellowish-white surface growth. No liquefaction.

Agar colonies: Circular, convex, butyrous, canary-yellow, sometimes with brownish rings, granular, entire.

Agar slant: Filiform, yellowish-white growth.

Ammonia cellulose agar: Enzymic zone not more than 1 mm. Entire colony semitransparent.

Peptone cellulose agar: Enzymatic zone, 3 to 4 mm in 25 days.

Broth: Slightly turbid.

Filter paper broth: In 15 days, the paper is reduced to a thin, white filmy mass which disintegrates readily.

Litmus milk: Acid, not digested.

Potato: Abundant, canary-yellow growth.

Indole is formed.

Nitrites produced from nitrates.

Ammonia is produced.

Acid from glucose, maltose, lactose, sucrose, starch and glycerol. No acid from mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

11. **Cellulomonas ferruginea** (Rullmann) Bergey et al. (*Bacillus ferrugineus* Rullmann, Cent. f. Bakt., I Abt., Orig., *24*, 1898, 465; van Iterson, Cent. f. Bakt., II Abt., *11*, 1904, 694; not *Bacillus ferrugineus* Rullmann, Cent. f. Bakt., I Abt., *24*, 1898, 467; Bergey et al., Manual, 1st ed., 1923, 150.) From Latin, rust-colored.

Rods: 0.5 to 0.8 by 1.5 to 2.0 microns, occurring singly. Motile, possessing peritrichous flagella. Gram-negative.

Gelatin colonies: Brown, the pigment diffusing into the medium.

Gelatin stab: No liquefaction.

Agar slant: Rusty-brown streak.

Broth: Turbid.

Litmus milk: Dark-yellow ring; alkaline.

Potato: Rusty-brown streak.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia not produced.

Aerobic, facultative.

Optimum temperature 25°C.

Habitat: Water.

12. **Cellulomonas albida** (McBeth) Bergey et al. (*Bacillus albidus* McBeth, Soil Science, *1*, 1916, 445; Bergey et al., Manual, 1st ed., 1923, 160.) From Latin *albidus*, white.

Rods: 0.4 by 1.0 micron. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: Scant growth. No liquefaction.

Agar colonies: Circular, convex, soft, grayish-white, granular, entire.

Agar slant: Scant, white streak.

Ammonia cellulose agar: After 30 days the colonies show an enzymatic zone of 1 to 2 mm.

Broth: Clear.

Filter paper broth: In 15 days, the paper is reduced to a thin, filmy, grayish-white mass which readily breaks up.

Litmus milk: Slightly acid, not digested.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia not produced.

Acid from glucose, maltose, lactose, sucrose, starch, glycerol and mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

13. **Cellulomonas alma** (McBeth) Bergey et al. (*Bacillus almus* McBeth, Soil Science, *1*, 1916, 446; Bergey et al.,

Manual, 1st ed., 1923, 161.) From Latin *almus*, nourishing.

Rods: 0.5 by 1.2 microns. Motile with one to five peritrichous flagella. Gram-negative.

Gelatin stab: Scant growth. No liquefaction.

Agar colonies: Circular, convex, soft, becoming brittle, grayish-white, granular, entire.

Ammonia cellulose agar: Enzymatic zone 3 to 4 mm in 25 days.

Peptone cellulose agar: Enzymatic zone 2.5 to 3.5 mm in 30 days.

Agar slant: Scant, grayish-white growth, becoming yellowish-white.

Broth: Slightly turbid.

Filter paper broth: Paper reduced to a loose felt-like white mass in 15 days.

Litmus milk: Slightly acid, not digested.

Potato: No growth.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia not produced.

Acid from glucose, maltose, lactose, sucrose, starch and glycerol. No acid from mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

14. **Cellulomonas desidiosa** (McBeth) Breed. (*Bacillus desiduosus* (sic) McBeth, Soil Science, *1*, 1916, 450; *Cellulomonas deciduosa* (sic) Bergey et al., Manual, 1st ed., 1923, 162; Breed, in Manual, 5th ed., 1939, 495.) From Latin *desidiosus*, inactive.

Rods: 0.4 by 1.0 micron. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: Moderate growth. No liquefaction.

Agar colonies: Circular, slightly convex, soft, becoming somewhat viscid, grayish-white, granular, entire.

Agar slant: Scant, flat, grayish-white growth.

Ammonia cellulose agar: Enzymatic zone 3 to 3.5 mm in 25 days.

Peptone cellulose agar: Enzymatic zone 1 to 2 mm around surface colonies. Bottom colonies frequently show no enzymatic zone until after 20 days.

Broth: Slightly turbid.

Filter paper broth: Paper is divided into gray white mass which readily disintegrates.

Litmus milk: Acid, not digested.

Potato: No growth.

Indole is formed.

Nitrites produced from nitrates.

Ammonia not produced.

Acid from glucose, lactose, maltose and starch. No acid from mannitol, sucrose or glycerol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from California.

Habitat: Soil.

15. **Cellulomonas pusilla** (Kellerman et al.) Bergey et al. (*Bacillus pusilus* (sic) Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 513; *Cellulomonas pusila* (sic) Bergey et al., Manual, 1st ed., 1923, 161.) From Latin *pusilla*, very small.

Rods: 0.6 by 1.1 microns. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: No liquefaction.

Agar slant: Scant, grayish-white growth.

Cellulose agar: Enzymatic zone 1 mm or less in width.

Broth: Turbid.

Litmus milk: Acid.

Potato: No growth.

Indole not formed.

Nitrites produced from nitrates.

Ammonia is produced.

Acid from glucose, maltose, lactose, sucrose, starch and glycerol. No acid from mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from District of Columbia and South Carolina.

Habitat: Soil.

16. **Cellulomonas gelida** (Kellerman et al.) Bergey et al. (*Bacillus gelidus* Kellerman, McBeth, Scales and Smith, Cent. f. Bakt., II Abt., *39*, 1913, 510; Bergey et al., Manual, 1st ed., 1923, 162.) From Latin *gelidus*, stiff.

Rods: 0.4 by 1.2 microns. Motile with one to three peritrichous flagella. Gram-negative.

Gelatin stab: No liquefaction.

Agar slant: Luxuriant, grayish-white growth.

Cellulose agar: Enzymatic zone 1.5 mm in width.

Broth: Turbid.

Litmus milk: Acid, peptonized.

Potato: Grows well.

Indole not formed.

Nitrites not produced from nitrates.

Ammonia is produced.

Acid from glucose, maltose, lactose, sucrose, starch and glycerol. No acid from mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: Soil from Connecticut.

Habitat: Soil.

17. **Cellulomonas flavigena** (Kellerman and McBeth) Bergey et al. (*Bacillus flavigena* Kellerman and McBeth, Cent. f. Bakt., II Abt., *34*, 1912, 488; Bergey et al., Manual, 1st ed., 1923, 165.) From Latin, yellow-producing.

Rods: 0.4 by 1.0 micron. Motility not recorded. Gram-negative.

Gelatin stab: Liquefaction.

Agar slant: Luxuriant, yellow growth.

Cellulose agar: Enzymatic zone 0.75 to 1.5 mm in width.

Broth: Turbid.

Litmus milk: Acid.

Potato: Grows well.

Indole not formed.

Nitrites produced from nitrates.

Ammonia not produced.

Acid from glucose, fructose, arabinose, xylose, maltose, lactose, sucrose, dextrin, starch, inulin, salicin, glycerol and mannitol.

Aerobic, facultative.

Optimum temperature 20°C.

Source: From contaminated culture.

Habitat: Soil.

18. **Cellulomonas rossica** (Kellerman and McBeth) Bergey et al. (*Bacillus rossicus* Kellerman and McBeth, Cent. f. Bakt., II Abt., *34*, 1912, 492; Bergey et al., Manual, 1st ed., 1923, 157; *Proteus cellulomonas* var. *Proteus rossicus* Pribram, Klassifikation der Schizomyceten, Leipzig und Wien, 1933, 72.)

Rods: 0.3 by 1.2 microns. Motility not recorded. Gram-negative.

Gelatin stab: Rapid liquefaction.

Agar slant: Luxuriant, yellow growth.

Cellulose agar: Enzymatic zone 0.5 to 1.0 mm in width.

Broth: Turbid.

Litmus milk: Alkaline.

Potato: Grows well.

Indole not formed.

Nitrites produced from nitrates.

Ammonia produced.

No acid from carbohydrate media.

Aerobic, facultative.

Optimum temperature 20°C.

Source: From contaminated culture.

Habitat: Soil.

Appendix II: The following cellulose-digesting bacteria are not included above:

Achromobacter picrum Fuller and Norman. (Jour. Bact., *46*, 1943, 276.) From soil.

Bacillus aurogenes var. *albus* Kellerman, McBeth, Scales and Smith. (Cent. f. Bakt., II Abt., *39*, 1913, 506.) From soil from New York State. Differs from *Cellulomonas aurogenes* in that it shows no chromogenesis.

Bacillus rossicus var. *castaneus* Kellerman et al. (*loc. cit.*, 508; *Proteus cellulomonas* var. *Proteus castaneus* Pribram, Klassifikation der Schizomyceten, Leipzig und Wien, 1933, 72.) From soils

from Maine, Connecticut and New York. Peritrichous. No liquefaction of gelatin. Chestnut color on potato.

Bacillus subalbus Kellerman et al. (*loc. cit.*, 512). From soils from Georgia, Kentucky and New York.

Bacillus subalbus var. *batatatis* Kellerman et al. (*loc. cit.*, 513). From soil from South Carolina. Differs from the above species in that it liquefies gelatin and forms a very scant yellowish growth on potato.

Appendix III: The following genus has been proposed for Gram-negative rods that utilize bacterial polysaccharides as a sole source of carbon.

Genus A. **Saccharobacterium** *Sickles and Shaw.*

(Jour. Bact., *28*, 1934, 430.)

Pleomorphic, non-motile, non-spore-forming rods. Gram-negative. Grow in mineral solutions containing bacterial polysaccharides as the sole source of carbon. Found in swamp and other uncultivated soils. Placed by the authors in the Family *Mycobacteriaceae* because of resemblances between these bacteria and those placed in *Cytophaga*, *Cellfalcicula* and *Cellvibrio*. As the latter genera are no longer placed in this family, *Saccharobacterium* is placed temporarily in this appendix to the genus *Bacterium* near bacteria that decompose cellulose and agar.

The type species is *Saccharobacterium ovale* Sickles and Shaw.

1. **Saccharobacterium ovale** Sickles and Shaw. (Jour. Bact., *28*, 1934, 422.) From Latin *ovum*, egg, ellipse.

Extremely pleomorphic. Young cells ellipsoidal, 1.5 by 2.0 microns, usually in pairs, contain granules which stain deeply with basic dyes. Older cultures contain cells which may be from 12 to 15 microns long. Non-motile. Gram-negative.

No growth on ordinary media such as beef-extract agar, blood agar, beef-extract agar slants, nutrient gelatin, potato slants, litmus milk, beef-infusion broth and beef-extract peptone broth.

Medium A plus pneumococcus II carbohydrate and 0.8 per cent agar: Very small, round, pink colonies, pinpoint in size after about 5 days. After 2 weeks 1 mm in diameter. Coherent.

Litmus milk: No growth.

Beef-extract peptone with 1 per cent sucrose: Moderate turbidity. Yellowish sediment.

Starch: Hydrolyzed in Medium A containing pneumococcus II carbohydrate.

Growth in lactose and sucrose broths. Growth in maltose, xylose and dextrin broths in some strains. No acid from inulin, mannitol, salicin and glucose broths.

Aerobic.

Minimum temperature 20°C. Optimum 34° to 35°C. Maximum 37°C. Thermal death point 54°C for 10 minutes.

Minimum pH 6.4. Optimum pH 7.0 to 7.4. Maximum pH 7.8.

Distinctive characters: The addition of 0.5 per cent sodium chloride to any favorable medium completely prevents growth of the organism (Medium A is that used by Dubos and Avery in 1931, $(NH_4)_2SO_4$, 1 g, K_2HPO_4, 2.0 g, tap water 1000 ml). Decomposes the carbohydrate of pneumococcus type II.

Source: Swamps and other uncultivated soils.

Habitat: Soil.

2. **Saccharobacterium acuminatum** Sickles and Shaw. (Jour. Bact., *28*, 1934, 425.) From Latin *acuminare*, to sharpen.

Extremely pleomorphic. Young organisms are pointed, often curved rods,

0.5 by 2 microns, having a densely staining granule. The tapering pointed ends remain unstained. Older cells have rounded ends, are spherical, pear-shaped or a long ellipsoid, stain weakly. Non-motile. Gram-negative.

No growth on ordinary media. See preceding species.

Medium S with pneumococcus I carbohydrate and 0.8 per cent agar: Very tiny, pale yellow colonies. Less than 0.5 mm in diameter.

Starch not hydrolyzed.

Growth in sucrose broth. No growth in glucose, lactose, maltose, dextrin, inulin, mannitol and salicin broths.

Aerobic.

Minimum temperature 20°C. Optimum 28° to 32°C. Maximum 34°C. Thermal death point 48°C for 10 minutes.

Minimum pH 6.0. Optimum pH 6.6 to 7.2. Maximum pH 7.8.

Distinctive characters: Decomposes the carbohydrate of pneumococcus Type I. The addition to any favorable medium of 0.7 per cent sodium chloride, of 0.3 per cent beef extract or of 0.5 per cent peptone completely inhibits growth.

The composition of Medium S is as follows: $MgSO_4 \cdot 7H_2O$, 0.2 g, $NH_4H_2PO_4$, 1.5 g, $CaCl_2$, 0.1 g, $FeCl_3$, tr, KCl, 0.1 g, 10 cc N/1 NaOH. Distilled water 1,000 ml, pH 7.2 to 7.4. To this was added the specific pneumococcus carbohydrate as a source of carbon in concentrations varying from 0.002 to 0.01 per cent.

Source: From swamps and other uncultivated soils.

Habitat: Soil.

28. **Bacterium nenckii** Biernacki. (Biernacki, Cent. f. Bakt., II Abt., *29*, 1911, 166; *Achromobacter nenckii* Bergey et al., Manual, 3rd ed., 1930, 227.) Named for Nencki, a chemist at the Medical Institute in Warsaw.

Rods: 0.8 by 1.25 to 2.0 microns, with rounded ends, occurring singly and in pairs. Capsulated. Non-motile. Gram-negative.

Gelatin colonies: Circular, convex, yellowish-white, granular.

Glucose and sucrose gelatin: Colonies larger and slimy.

Gelatin stab: No liquefaction.

Agar colonies: Circular, grayish-white, glistening, concentric, finely granular.

Agar slant: The medium is liquefied.

Glucose and sucrose agar: Heavy slimy growth with gas. Faint fruity odor.

Broth: Slightly turbid with gray sediment and slight odor.

Litmus milk: Acid and gas formation.

Potato: Slight growth.

Glycerol potato: Heavy growth with the appearance and consistency of cream.

Indole not formed.

Nitrites not produced from nitrates.

Acid and gas from glucose, fructose, galactose, maltose, sucrose, raffinose and mannitol.

Fruity odor in cultures.

Facultative anaerobe.

Optimum temperature 37°C.

Source: From Spanish dried grapes.

Habitat: Unknown.

29. **Bacterium polysiphoniae** Lundestad. (Lundestad, Cent. f. Bakt., II Abt., *75*, 1928, 331; *Flavobacterium polysiphoniae* Bergey et al., Manual, 3rd ed., 1930, 152.) From Greek, many tubes.

Rods: 0.5 to 0.6 by 2.0 to 4.0 microns, with rounded ends, occurring singly. Non-motile. Gram-negative.

Fish-gelatin colonies: Circular, slightly glistening, bright yellow, transparent, with denser center.

Fish-gelatin stab: Slight yellowish growth on surface. Slow saccate liquefaction.

Sea-weed agar colonies: Circular, flat, with concentric rings, diffuse margin, light yellow. Agar is disintegrated.

Fish-agar slant: Yellow, flat growth, with undulate margin.

Broth: Turbid with flocculent pellicle and yellowish sediment.

Indole not formed.

Nitrites not produced from nitrates.
No action on carbohydrates.
Slight hydrolysis of starch.
Aerobic, facultative.
Optimum temperature 30°C.
Source: Sea water of Norwegian Coast.
Habitat: Sea water.

30. **Bacterium droebachense** Lundestad. (Lundestad, Cent. f. Bakt., II Abt., 1928, 329; *Flavobacterium droebachense* Bergey et al., Manual, 3rd ed., 1930, 153; *Pseudomonas droebachense* Stanier, Jour. Bact., *42*, 1941, 544.) Latinized, from Dröbak, where this organism was isolated.

Rods: 0.5 to 0.6 by 2.0 to 2.6 microns, with rounded ends, occurring singly. Non-motile. Gram-negative.

Fish-gelatin colonies: Small, circular, compact, opaque, glistening, orange-yellow.

Fish-gelatin stab: Liquefaction infundibuliform becoming stratiform.

Sea-weed agar colonies: Small, circular, flat, opaque, glistening, orange-yellow. Agar is disintegrated.

Fish-agar slant: Flat, opaque, glistening, slimy, orange-yellow, entire growth.

Broth: Slight flocculent turbidity, yellow.

Indole not formed.

Nitrites not produced from nitrates.

Starch hydrolyzed.

Slow growth on surface of glucose agar stab. No gas.

Aerobic, facultative.

Optimum temperature about 37°C. Minimum temperature 5° to 10°C. Maximum 40°C.

Stanier (*loc. cit.*) identified cultures isolated from sea water on the Pacific Coast as belonging to this species. Some liquefied gelatin while others did not. Nitrates were reduced. A yellow membraneous pellicle was formed on broth, and the temperature range is given as 5° to 35°C. Optimum 25°C. He renamed the organism *Pseudomonas droebachensis*, but reported it non-motile.

Source: From sea water at Dröbak on the Norwegian Coast.

Habitat: Sea water.

31. **Bacterium delesseriae** Lundestad. (Lundestad, Cent. f. Bakt., II Abt., *75*, 1928, 332; *Flavobacterium delesseriae* Bergey et al., Manual, 3rd ed., 1930, 153.)

Rods: 0.5 to 0.6 by 1.6 to 2.6 microns, with rounded ends, occurring singly. Non-motile. Gram-negative.

Fish-gelatin colonies: Circular, transparent, glistening, concentrically ringed, yellow.

Fish-gelatin stab: Crateriform liquefaction, with yellow sediment.

Sea-weed agar colonies: Circular, flat, concentrically ringed, light yellow. Agar is disintegrated.

Fish-agar slant: No growth.

Broth: Turbid with flocculent pellicle and sediment, light yellow.

Indole not reported.

Nitrites not reported.

No action on carbohydrates.

Slight hydrolysis of starch.

Aerobic, facultative.

Optimum temperature 23°C.

Source: Sea water of Norwegian Coast.

Habitat: Sea water.

32. **Bacterium boreale** Lundestad. (Lundestad, Cent. f. Bakt., II Abt., *75*, 1928, 333; *Flavobacterium boreale* Bergey et al., Manual, 3rd ed., 1930, 154.) From Latin *borealis*, northern.

Rods: 0.5 to 0.6 by 1.6 to 2.6 microns, with rounded ends, occurring singly. Non-motile. Gram-negative.

Fish-gelatin colonies: Circular, opaque, glistening, concentrically ringed, yellow.

Fish-gelatin stab: Yellow, with crateriform liquefaction.

Sea-water agar colonies: Circular, flat, opaque, glistening, diffuse margin, light yellow. Agar is disintegrated.

Fish-agar slant: Yellow, flat, glistening, opaque, entire growth.

Broth: Finely flocculent, yellow sediment.

Indole not reported.

Nitrites not reported.

No action on carbohydrates.

Slight hydrolysis of starch.

Aerobic, facultative.

Optimum temperature 23°C.

Source: Sea water of Norwegian Coast.

Habitat: Sea water.

33. **Bacterium ceramicola** Lundestad. (Lundestad, Cent. f. Bakt., II Abt., *75*, 1928, 332; *Flavobacterium ceramicola* Bergey et al., Manual, 3rd ed., 1930, 154.) From Greek, living in earthenware.

Rods: 0.5 to 0.6 by 1.4 to 2.4 microns, with rounded ends, occurring singly and lying side-by-side. Non-motile. Gram-negative.

Fish-gelatin colonies: Circular, glistening, transparent, yellow.

Fish-gelatin stab: Slight, yellow surface growth. Liquefaction crateriform.

Sea-water agar colonies: Circular, flat, transparent, glistening, diffuse margin, light yellow. Agar is disintegrated.

Fish-agar slant: Moderate, yellow, flat, entire, glistening, opaque growth.

Broth: Light yellow pellicle and sediment.

Indole not reported.

Nitrites not reported.

No action on carbohydrates.

Slight hydrolysis of starch.

Aerobic, facultative.

Optimum temperature 23°C.

Source: Sea water of Norwegian Coast.

Habitat: Sea water.

34. **Bacterium rhodomelae** Lundestad. (Lundestad, Cent. f. Bakt., II Abt., *75*, 1928, 331; *Flavobacterium rhodomelae* Bergey et al., Manual, 3rd ed., 1930, 146.)

Rods: 0.5 to 0.8 by 1.2 to 2.0 microns, with rounded ends, occurring singly, in pairs, and at times in short chains. Motile. Gram-negative.

Fish-gelatin colonies: Circular, slightly glistening, opaque, white.

Fish-gelatin stab: Rapid infundibuliform liquefaction.

Sea-weed agar colonies: Circular, flat, thin, transparent, glistening, entire. Agar is dissolved.

Glucose agar slant: Moderate growth, white, becoming orange-yellow, flat, undulate margin, opaque, glistening.

Broth: Turbid, with pellicle and grayish-yellow, slimy sediment.

Indole not formed.

Nitrites not produced from nitrates.

No action on carbohydrates.

Very slight hydrolysis of starch.

Aerobic, facultative.

Optimum temperature 20° to 25°C.

Source: Sea water of Norwegian Coast.

Habitat: Sea water.

35. **Bacterium alginovorum** Waksman, Carey and Allen. (Jour. Bact., *28*, 1934, 215.) From M. L., alginic and Latin *voro*, devour.

Rods: 0.75 to 1.2 by 1.5 to 2.0 microns, with rounded to almost elliptical ends, especially when single, occurring frequently in pairs and even in chains. Actively motile. Capsule-forming. Gram-negative.

Alginic acid plate: Colony large, white in appearance with coarse granular center, entire margin. Clears up turbidity caused by the alginic acid on plate. No odor.

Alginic acid liquid medium: Heavy pellicle formation. Active production of an enzyme, alginase, which brings about the disappearance of alginic precipitate in sea water medium.

Salt water medium: A slimy pellicle of a highly tenacious nature is produced, the whole medium later turning to a soft jelly.

Sea water gelatin: Active and rapid liquefaction in two to six days, at 18°C;

highly turbid throughout the liquefied zone.

Agar liquefaction: Extensive softening of agar, no free liquid.

Sea water glucose broth: Abundant uniform turbidity, with surface pellicle; some strains give heavier turbidity and others heavier pellicle.

Litmus milk containing 3.5 per cent salt: No apparent growth.

Potato moistened with sea water: Moist, spreading growth, ivory-colored; heavy sediment in free liquid at the bottom.

Starch plate: Abundant, cream-colored, slimy growth; extensive diastase production.

Aerobic, microaerophilic.

Optimum temperature 20°C.

Source: From sea water, sea bottom sediments and from the surface of algal growth in the sea.

Habitat: Very common in the sea.

36. **Bacterium fucicola** Waksman, Carey and Allen. (Jour. Bact., *28*, 1934, 213.) From Latin *fucus*, seaweed and *cola*, dweller.

Short rods: 0.6 to 1.0 by 1.0 to 1.5 microns, with ends rounded to almost coccoid; slightly curved. Actively motile, with twirling motion. Gram-negative.

Alginic acid plate: Colonies finely granular, entire; at first whitish, turning brown in three to five days, and later almost black, producing a deep brown soluble pigment.

Alginic acid liquid medium: Limited growth on surface in the form of a pellicle. Frequently produces no growth at all.

Sea water gelatin: Active liquefaction; no growth in stab; thin, fluorescent growth throughout liquefied zone.

Agar liquefaction: Positive, although limited; only softening of agar.

Sea water glucose broth: Faint turbidity; no pellicle, no sediment.

Litmus milk containing salt: No apparent growth.

Potato moistened with sea water: No growth.

Starch plate: No growth.

Aerobic.

Optimum temperature 20°C.

Source: From sea water near the surface of the sand bottom.

Habitat: Rare in sea water.

Appendix I: Additional agar-digesting bacteria placed in genera other than *Bacterium*.

I. *Achromobacter*.
  A. Motile with peritrichous flagella.
    1. Nitrites produced from nitrates.
      1. *Achromobacter pastinatar*.

II. *Agarbacterium*.
  A. Non-motile.
    1. Nitrites produced from nitrates.
      2. *Agarbacterium bufo*.
  B. Motile, but position of flagella not recorded.
    1. Nitrites produced from nitrates.
      3. *Agarbacterium reducans*.
      4. *Agarbacterium viscosum*.
    2. Nitrites not produced from nitrates.
      5. *Agarbacterium mesentericus*.
      6. *Agarbacterium aurantiacum*.
      7. *Agarbacterium cyanoides*.
    3. Seven additional species that are numbered but not named.

III. *Flavobacterium.*
  A. Non-motile.
    1. Nitrites produced from nitrates.
      8. *Flavobacterium uliginosum.*
  B. Peritrichous flagella.
    1. Nitrites produced from nitrates.
      9. *Flavobacterium amocontactum.*

1. **Achromobacter pastinator** Goresline. (Jour. Bact., *26*, 1933, 442.) From Latin *pastinator*, one who digs a trench.

Short rods: 0.4 by 1.5 microns, occurring singly and in pairs. Motile with two to five peritrichous flagella. Gram-negative.

Plain gelatin stab: No growth.

Nutrient gelatin stab: Surface growth very scanty. No liquefaction.

Nutrient agar colonies: At first tiny, almost colorless, becoming yellowish and ring-like. Agar liquefied rapidly.

Nutrient agar slant: Growth good, flat, not thick. Agar liquefied along streak often to the depth of a quarter of an inch. Pocket formed at bottom of slant filled with a rather viscous, yellowish fluid.

Nutrient broth: Slight turbidity after 5 days. Subsurface but no surface growth. No sediment.

Litmus milk: Slightly acid after 20 days. No curd. Only a trace of reduction at bottom of tube.

Potato: No growth.

Indole not formed.

Nitrites produced from nitrates.

No H_2S produced.

Acid from arabinose, glucose, galactose, lactose, fructose, maltose, mannose, melezitose, pectin, raffinose, rhamnose, salicin, sucrose, starch and dextrin. No growth in dulcitol, erythritol, mannitol, sorbitol, glycerol, xylose and inulin.

Starch is hydrolyzed.

Limits of growth: pH 5.9 to 9.0.

Temperature relations: Optimum 28°C. Good growth at 25°C. Moderate growth at 20° and 37°C. No growth at 10° and 42°C.

Facultative anaerobe.

Distinctive characters: Digests agar rapidly; colonies sink through to the glass of the Petri dish. Fehling's solution reduced by the liquefied agar. Considerable change in viscosity of agar due to the digestion.

Source: From a trickling filter receiving creamery wastes.

Habitat: Probably widely distributed in nature.

2. **Agarbacterium bufo** Angst. (Puget Sound Biol. Sta. Pub., *7*, 1929, 49.)

Short rods with rounded ends, 0.6 by 0.8 micron, occurring singly and in pairs. Non-motile. No capsules. Gram-negative.

Fish gelatin stab: Stratiform liquefaction, growth best at top.

Fish gelatin colonies: Circular, crateriform, granular.

Fish agar slant: Abundant, filiform, raised, glistening, opaque, yellow, membranous growth.

Fish agar colonies: Circular, concentrically ringed, sunken, entire, granular, yellow to orange.

Digests agar; cellulose not attacked.

Potato: No growth.

Plain milk unchanged, surface growth yellow.

Does not produce H_2S or indole.

Nitrites produced from nitrates.

Acid from mannitol. No acid from xylose, rhamnose, arabinose, glucose, sucrose or lactose.

Starch not hydrolyzed.

Aerobic.

Optimum temperature 25° to 28°C. Maximum under 36°C.

Source: Isolated from *Odonthalia kamtschatica*.

Habitat: On marine algae.

3. **Agarbacterium reducans** Angst. (Puget Sound Biol. Sta. Pub., 7, 1929, 49.)

Short rods with rounded ends, 0.6 by 0.8 micron, occurring singly and in pairs. Motile. No capsules. Gram-negative.

Fish gelatin colonies: Circular, sunken, entire, crateriform, granular.

Fish gelatin stab: Crateriform liquefaction, growth only near surface.

Fish agar slant: Abundant, filiform, flat, glistening, smooth, opaque, white, butyrous growth.

Fish agar colonies: Moderate, circular, smooth, flat, entire, granular, white to buff or colorless.

Digests agar; cellulose not attacked.

Fish broth: Turbid, no sediment, no surface growth.

Potato: No growth.

Nitrites produced from nitrates.

No H_2S or indole formed.

Plain milk unchanged.

Acid from sucrose, arabinose, rhamnose and mannitol. No acid from xylose or lactose.

Starch is hydrolyzed.

Aerobic.

Optimum temperature 25° to 28°C; thermosensitive.

Source: Isolated from *Nercocystis luetkeana*.

Habitat: On marine algae.

4. **Agarbacterium viscosum** Angst. (Puget Sound Biol. Sta. Pub., 7, 1929, 49.)

Short rods with rounded ends, 0.6 to 0.8 micron, occurring singly or in pairs. Motile. No capsules. Gram-negative.

Fish gelatin colonies: Circular, sunken, entire, crateriform, granular.

Fish gelatin stab: Stratiform liquefaction, growth best at surface.

Fish agar slant: Abundant, raised, glistening, smooth, opaque, gray, vesicular, viscid growth.

Fish agar colonies: Circular, contoured, raised, lobate, granular, fluorescent green.

Digests agar; cellulose not attacked.

Fish broth: Flocculent pellicle, turbid, no sediment, fluorescent green.

Potato: Abundant, filiform, glistening, smooth, yellowish-brown, butyrous growth.

Nitrites produced from nitrates.

No H_2S or indole formed.

Plain milk unchanged; surface growth greenish.

No acid from rhamnose, sucrose, lactose, mannitol, xylose or arabinose.

Starch is hydrolyzed.

Aerobic.

Optimum temperature 20° to 28°C; thermosensitive.

Source: Isolated from *Iridaea cordata*.

Habitat: On marine algae.

5. **Agarbacterium mesentericus** Angst. (Puget Sound Biol. Sta. Pub., 7, 1929, 49.)

Short rods with rounded ends, 0.6 by 0.8 micron, occurring singly or in pairs. Motile. No capsules. Gram-negative.

Fish gelatin stab: Infundibuliform liquefaction; growth best at top.

Gelatin colonies: Circular, sunken, irregular, crateriform, granular.

Fish agar slant: Abundant, filiform, raised, glistening, finely wrinkled when old or dry, opaque, buff, membranous growth.

Fish agar colonies: Circular, concentrically ringed, flat, entire, granular, white to buff.

Digests agar; cellulose not attacked.

Fish broth: Membranous pellicle, moderate clouding, no sediment.

Potato: Spreading, raised, glistening, wrinkled, buff to yellowish, membranous growth.

Does not produce H_2S or indole.

Nitrites not produced from nitrates.

Plain milk unchanged.

Acid from mannitol. No acid from xylose, rhamnose, arabinose, glucose or lactose.

Starch is hydrolyzed.

Aerobic.

Optimum temperature 20° to 28°C; thermosensitive.

Source: Marine algae; isolated from *Nercocystis luetkeana.*

Habitat: On marine algae.

6. **Agarbacterium aurantiacum** Angst. (Puget Sound Biol. Sta. Pub., 7, 1929, 49.)

Short rods with rounded ends, 0.6 to 0.8 micron, occurring singly or in pairs. Motile. No capsules. Gram-negative.

Fish gelatin colonies: Circular, sunken, crateriform, entire.

Fish gelatin stab: Stratiform liquefaction, no growth along line of stab.

Fish agar slant: Abundant, filiform, flat, glistening, smooth, opaque, orange, butyrous growth.

Fish agar colonies: Circular, smooth, flat, erose, sunken, granular.

Digests agar; cellulose not attacked.

Fish broth: Membranous pellicle, turbid, no sediment.

Plain milk unchanged; surface growth orange.

Potato: Abundant, filiform, flat, dull, smooth, orange, butyrous growth.

Nitrites not produced from nitrates.

No H_2S or indole formed.

Acid from lactose and mannitol. No acid from xylose, rhamnose, arabinose, glucose or sucrose.

Starch not hydrolyzed.

Aerobic.

Optimum temperature 20° to 28°C; thermosensitive.

Source: Isolated from *Porphyra perforata.*

Habitat: On marine algae.

7. **Agarbacterium cyanoides** Angst. (Puget Sound Biol. Sta. Pub., 7, 1929, 49.)

Short rods with rounded ends, 0.8 by 1.4 microns, occurring singly or in pairs. Motile. No capsules. Gram-negative.

Fish gelatin colonies: Circular, sunken, entire, crateriform, granular.

Fish gelatin stab: Stratiform liquefaction, growth only at top.

Fish agar slant: Abundant, filiform, raised, glistening, smooth, opaque, gray, butyrous growth.

Fish agar colonies: Circular, smooth, flat, lobed, granular, greenish to yellowish.

Digests agar; cellulose not attacked.

Fish broth: Flocculent pellicle, turbid, no sediment, fluorescent green.

Potato: Abundant, filiform, raised, glistening, smooth, buff, butyrous growth.

Nitrites not produced from nitrates.

No H_2S or indole formed.

Plain milk acidified, greenish surface growth.

Acid from sucrose. No acid from xylose, arabinose, glucose, lactose, mannitol or rhamnose.

Starch is hydrolyzed.

Aerobic.

Optimum temperature 20° to 28°C; thermosensitive.

Source: Isolated from *Iridaea cordata.*

Habitat: On marine algae.

NOTE: Seven additional species are described with as much detail by Angst (*loc. cit.*) as are the six above species; but he refers to them only as *Agarbacterium* Nos. 5, 6, 7, 8, 9, 13, 14, and 15. All digest agar.

8. **Flavobacterium uliginosum** ZoBell and Upham. (Bull. Scripps Inst. of Oceanography, Univ. Calif., *5*, 1944, 263.) From Latin *uligo*, ooze or moist mud.

Rods: 0.4 to 0.6 by 1.2 to 3.9 microns, some slightly curved, occurring mostly singly with some short chains. Non-motile. Gram-negative.

All differential media except the fresh-water broth, litmus milk, and potato were prepared with sea water.

Gelatin colonies: 1 mm, orange, sunken.

Gelatin stab: Infundibuliform liquefaction. Yellow pigment. Gelatin discolored brown.

Agar colonies: Sunken, uneven, irregular, gummy colonies which liquefy agar. Produces orange to yellow pigment and discolors agar brown.

Agar slant: Luxuriant, yellowish-

orange, glistening, filiform, adherent growth which slowly liquefies agar.

Sea-water broth: Dense yellow pellicle, moderate turbidity, slightly viscid sediment.

Fresh-water broth: No visible growth.

Litmus milk: Completely decolorized, neutral.

Potato: No visible growth.

Indole not formed.

Nitrates rapidly reduced to nitrites.

Produces acid but no gas from xylose, glucose, maltose, lactose, sucrose and salicin. Does not ferment glycerol or mannitol.

Starch not hydrolyzed.

Hydrogen sulfide not formed.

Ammonia produced from peptone but not from urea.

Casein digested.

Fats not hydrolyzed.

Agar liquefied rapidly. However, after prolonged laboratory cultivation this organism gradually loses its ability to digest agar.

Aerobic, obligate.

Optimum temperature 20° to 25°C.

Source: Marine bottom deposits.

9. **Flavobacterium amocontactum** ZoBell and Allen. (Jour. Bact., *29*, 1935, 246.) From Latin *amo*, to love and *contactus*, touching, contacting.

Slender rods: 0.4 to 0.7 by 1.6 to 2.3 microns, with rounded ends, occurring singly and in irregular clumps. Stain very lightly. Possess well-defined capsules. Actively motile by means of peritrichous flagella. Gram-negative.

Gelatin stab: Good filiform growth with rapid saccate liquefaction.

Agar colonies: Circular, 2.0 to 4.0 mm in diameter, yellow.

Agar slant: Abundant, filiform, smooth, glistening, abundant, bright yellow growth having a butyrous consistency. Originally liquefied agar, but this property was lost following artificial cultivation.

Sea water broth: Good growth with ring at surface. Strong turbidity and abundant viscid sediment. No odor.

Milk: No growth.

Potato: No growth.

Potato dialyzed in sea water: Slight yellow growth.

Indole not formed.

Nitrites produced from nitrates.

Ammonia liberated from peptone.

Hydrogen sulfide produced.

No acid from glucose, lactose, sucrose, xylose or mannitol.

Starch not attacked.

Optimum reaction pH 8.0.

Optimum temperature 18° to 21°C.

Facultative aerobe.

Distinctive character: Adheres firmly to submerged glass slides; cannot be removed with running water.

Source: Many cultures isolated from glass slides submerged in sea water.

Habitat: Sea water.

Appendix II: Another species described recently is:

Bacillus exedens Wieringa. (Wieringa, Jour. Microbiol. and Serol., 7, 1941, 121; *Bacillus agar-exedens* Wieringa, *idem.*) From stable manure, leafmold and soil. Liquefies agar.

37. **Bacterium chitinophilum** Hock. (Jour. Marine Res., *4*, 1941, 103.) From M. L., chitin and Greek *philos*, loving.

Short rods: 0.35 to 0.65 by 0.95 to 1.5 microns. Motile. Gram-negative.

Sea water gelatin: Liquefaction; growth absent in stab but abundant in liquefied zone.

Sea water agar plate: Colonies circular, smooth, entire, raised, white.

Sea water liquid medium: Moderate growth, sometimes with formation of ring or pellicle. Scant granular sediment.

Decomposes natural chitinous material such as horseshoe crab shells and also purified chitin.

Four out of five strains produce nitrites from nitrates.

Acid from glucose and usually from sucrose, glycerol and mannitol. One of five cultures produced acid from lactose, Does not digest cellulose.

Does not hydrolyze starch.

Does not produce hydrogen sulfide.

Aerobic.

Optimum temperature 20°C.

Source: From the shell of a decomposing horseshoe crab, *Limulus polyphemus*, and from the intestinal tracts of *Venus mercenaria*, *Ovalipes ocellatus*, *Mustelus mustelus* and *Spheroides maculatus*.

Habitat: Common in marine sand, mud and water.

38. **Bacterium chitinochroma** Hock. (Jour. Marine Res., *4*, 1941, 105.)

Short rods: 0.45 to 0.75 by 0.90 to 1.4 microns. Motile. Gram-negative.

Sea water gelatin: Active liquefaction; no growth in stab, but thick bright yellow growth throughout the liquefied zone.

Basic agar plate: Colonies circular, smooth, entire, raised, varying in color from lemon to deep orange.

Basic liquid medium: Abundant growth with production of pellicle. Scant granular sediment, increasing with age of culture.

Decomposes natural chitinous material such as horseshoe crab shells and also purified chitin.

Does not produce nitrites from nitrates.

Acid from glucose and sucrose, but not lactose, glycerol and mannitol. Does not digest cellulose.

Hydrolyzes starch.

Does not produce hydrogen sulfide.

Aerobic.

Optimum temperature 20°C.

Source: From the intestinal tract of the squid, *Loligo pealeii*. Common.

Habitat: Marine sand, mud and water.

Appendix I: The first species of chitinovorous bacteria that was described and named was placed in the genus *Bacillus* because it was a motile rod.

1. *Bacillus chitinovorus* Benecke. (Bot. Zeitung, *63*, 1905, 227.) From M. L. *chitin*, chitin; *vorus*, devouring.

Rods: 0.75 by 2.0 microns. Sometimes in pairs and chains. Motile with peritrichous flagella. Gram-negative.

Gelatin stab: Liquefaction.

Mineral agar containing chitin: Good growth if no sugar is added to produce acid. Non-chromogenic.

Peptone mineral agar containing chitin: Good growth if reaction is neutral to slightly alkaline.

Salt in concentrations up to 1½ per cent is favorable for growth. Maximum 4 per cent.

Peptone broth: Turbid with heavy, slimy, whitish to brownish pellicle.

Nitrites produced from nitrates.

Ammonia produced in peptone-chitin media.

Acid from glucose and sucrose.

Optimum temperature 20°C.

Source: Isolated at Kiel from media containing decomposing crab shells and from media containing purified chitin; also from soil.

Habitat: Brackish water and soil.

NOTES: *Bacillus tumescens* Zopf, *Bacillus cohaerens* Gottheil, *Bacillus proteus vulgaris* Kruse, *Bacillus coli communis* Sternberg, *Bacillus fluorescens liquefaciens* Flügge, *Bacillus megatherium* De Bary, *Vibrio aquatilis* Günther and *Spirillum rubrum* von Esmarch did not attack chitin under the conditions tested by Benecke (*loc. cit.*).

Benton (Jour. Bact., *29*, 1935, 449) describes but does not name 17 types of chitinovorous bacteria isolated from water, mud and plankton of fresh water lakes, from decaying May fly nymph shells, intestinal contents of fish, frogs, bats, snipe, and crayfish. Also shore soil, composts, etc. Twelve types are reported to be monotrichous, two are peritrichous and three, position of flagella not stated. Of two Gram-positive types, one may have been a spore-former and the other a *Corynebacterium*. Two types digested cellulose.

ZoBell and Rittenberg (Jour. Bact., *35*, 1938, 275) isolated and studied but

did not name 31 cultures of chitinoclastic bacteria from marine sources. Out of 16 cultures studied intensively, all were Gram-negative. All but 4 of the 31 cultures were motile. One culture was a coccus and two species were vibrios. None digested cellulose.

*39. **Bacterium phosphoreum** (Cohn) Molisch. (*Micrococcus phosphoreus* Cohn, see letter addressed to J. Penn, Verzameling van stukken betreffende het geneeskundig staatstoezicht in Nederland, 1878, 126; *Bacterium phosphorescens* Fischer, Cent. f. Bakt., *3*, 1888, 107; *Photobacterium phosphorescens* Beijerinck, Arch. Néerl. d. Sci. Exactes, *23*, 1889, 401; *Streptococcus phosphoreus* Trevisan, I generi e le specie delle Batteriacee, 1889, 31; *Bacillus phosphoreus* Macé, Traité de Bact., Paris, 4th ed., 1901, 995; *Micrococcus phosphorescens* Chester, Man. Determ. Bact., 1901, 181; Molisch, Die Leuchtende Pflanzen, 1912, 66; *Photobacter phosphoreum* Beijerinck, Folia Microbiologica, Delft, *4*, 1916, 15; *Photobacterium phosphoreum* Ford, Textb. of Bact., 1927, 615.)

Description from Fischer (*loc. cit.*).

Coccobacilli: Occur frequently as zooglea. Non-motile. Stain lightly with aniline dyes.

Gelatin: No liquefaction.

Gelatin streak: Gray-white growth.

Broth: No growth.

Milk: No growth.

Potato: No growth.

Ferments carbohydrates.

Blue-green phosphorescence.

Minimum temperature 5°C. Maximum 25°. Optimum for luminescence 10°C.

Aerobic, facultative.

Source: Isolated from luminous fish.

Habitat: Found commonly on dead fish, meat, etc.

40. **Bacterium phosphorescens indigenus** (Eisenberg) Chester. (Einheimischer Leuchtbacillus, Fischer, Cent. f. Bakt., *3*, 1888, 107; *Photobacterium fischeri* Beijerinck, Arch. Néerl. d. Sci. Exactes, *23*, 1889, 401; *Bacillus fischeri* Trevisan, I generi e le specie delle Batteriacee, 1889, 18; *Bacillus phosphorescens indigenus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 124; *Vibrio fischeri* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 342; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 121; *Microspira fischeri* Chester, Man. Determ. Bact., 1901, 333; *Spirillum phosphorescens* Holland, Jour. Bact., *5*, 1920, 225; *Vibrio phosphorescens* Holland, *ibid.*, 226; *Achromobacter fischeri* Bergey et al., Manual, 3rd ed., 1930, 220.)

Description from Fischer (*loc. cit.*).

Short thick rods: 0.4 to 0.7 by 1.3 to 2.1 microns, with rounded ends, occurring singly and in pairs. Motile. Stain with the usual aniline dyes.

Johnson, Zworykin and Warren (Jour. Bact., *46*, 1943, 167) made pictures with the electron microscope of a culture which they identify with this species. The organisms have a tuft of polar flagella, indicating that this species belongs in the genus *Pseudomonas*.

Gelatin stab: Liquefaction.

Gelatin colonies: Liquefaction. After one week, circular, 1 mm in diameter, entire.

Broth: No growth.

Milk: No growth.

Blood serum: No growth.

Potato: No growth.

Cooked fish: Abundant growth. Entire surface covered with a gray-white, slimy, phosphorescent mass.

Temperature relations: Minimum 5° to 10°C. Optimum 22°C.

Aerobic.

Source: From sea water at Kiel and from herring.

---

* Dr. Frank H. Johnson, Dept. Bacteriology, Princeton Univ., Princeton, New Jersey, assisted in preparing the section on phosphorescent bacteria, May, 1946

Habitat: Live on dead fish and in sea water.

41. Bacterium hemophosphoreum Pfeiffer and Stammer. (Pfeiffer and Stammer, Ztschr. f. Morph. u. Oköl. d. Tiere, *20*, 1930, 136; *Brucella (?) haemophosphoreum* Pribram, Klassifikation der Schizomyceten, Leipzig und Wien, 1933, 67.)

Rods: 1.0 by 4.5 microns, the size varying with the medium. Seem to show bipolar staining.

Fish agar with 3 per cent sea salt: Good growth.

Litmus milk: Acid. Reduction.

Potato: Yellow growth, medium becoming orange.

Indole not formed.

Nitrites not produced from nitrates.

Acid from glucose, sucrose, lactose, maltose, galactose, mannitol and fructose.

Phosphorescent.

Pathogenic for other insects.

Source: Isolated from the blood of diseased larvae of the mealworm, *Tenebrio molitor*.

Habitat: From diseased insect larvae.

Appendix 1: The following phosphorescent species have been described in the literature. Many are incompletely described and they have been placed in various genera without adequate study.

Achromobacter argenteophosphorescens (Katz) Bergey et al. (*Bacillus argenteophosphorescens I*, Katz, Cent. f. Bakt., *9*, 1891, 157; *Bacterium argenteo-phosphorescens* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 121; *Bacillus argenteo-phosphorescens* Migula, Syst. d. Bakt., *2*, 1900, 869; Photobacillus I, Miquel and Cambier, Traité de Bact., Paris, 1902, 881; Bergey et al., Manual, 3rd ed., 1930, 221.) From sea water in Elizabeth Bay, Sydney, Australia. Silver-white luminescence. Probably a variety of *Photobacterium fischeri* Beijerinck, according to Katz.

Achromobacter cyaneophosphorescens (Katz) Bergey et al. (*Bacillus cyaneophosphorescens* Katz, Cent. f. Bakt., *9*, 1891, 158; *Photobacterium cyaneum* Ludwig, according to Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 331; *Photobacterium cyano-phosphorescens* (sic) Ford, Textb. of Bact., 1927, 619; *Vibrio cyaneo-phosphorescens* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 543; Bergey et al., Manual, 3rd ed. 1930, 221.) From sea water in Little Bay, near Sydney, Australia. Bluish-green luminescence. Identical with or similar to *Photobacterium indicum* Beijerinck, according to Katz.

Achromobacter luminosum Bergey et al. (*Bacillus argenteo-phorphorescens II*, Katz, Cent. f. Bakt., *9*, 1891, 157; *Bacterium argenteo-phosphorescens* Migula, Syst. d. Bakt., *2*, 1900, 435; Photobacillus II, Miquel and Cambier, Traité de Bact., Paris, 1902, 882; Bergey et al., Manual, 3rd ed., 1930, 226.) From fish obtained in the market. Greenish-silver luminescence.

Achromobacter phosphoreum (Migula) Bergey et al. (*Bacillus argenteo-phosphorescens liquefaciens* Katz, Cent. f. Bakt., *9*, 1891, 157; *Bacillus phosphoreus* Migula, Syst. d. Bakt., *2*, 1900, 867; Bergey et al., Manual, 3rd ed., 1930, 222.) From sea water along the coast near Sydney, Australia. Luminescence slight. Probably identical with *Photobacterium luminosum* Beijerinck.

Achromobacter phosphoricum (Migula) Bergey et al. (*Bacillus argenteo-phosphorescens III*, Katz, Cent. f. Bakt., *9*, 1891, 157; *Bacillus phosphoricus* Migula, Syst. d. Bakt., *2*, 1900, 870; Photobacillus III, Miquel and Cambier, Traité de Bact., Paris, 1902, 882; Bergey et al., Manual, 3rd ed., 1930, 223.) From cuttlefish (*Sepia sp.*) obtained in the fish market. Bluish-greenish-white luminescence.

Achromobacter smaragdinophosphorescens (Katz) Bergey et al. (*Bacillus smaragdino-phorphorescens* Katz, Cent. f. Bakt., *9*, 1891, 159; *Bacterium smaragdino phosphorescens* Chester, Ann. Rept.

Del. Col. Agr. Exp. Sta., *9*, 1897, 124; *Bacterium smaragdino-phosphorescens* Migula, Syst. d. Bakt., *2*, 1900, 435; *Bacterium smargadinum* (sic) Chester, Man. Determ. Bact., 1901, 181; Bergey et al., Manual, 3rd ed., 1930, 225.) From herring in a fish market in Sydney, Australia. Green luminescence. Probably identical with *Photobacterium phosphorescens* Beijerinck.

Bacillus fischeri Dyar. (Dyar, Ann. N. Y. Acad. Sci., *8*, 1895, 370; *Bacterium fischeri* Chester, Man. Determ. Bact., 1901, 165.) Dyar added to the confusion in the nomenclature of phosphorescent organisms by giving this name to four cultures received by him from the Kràl collection labeled *Photobacterium phosphorescens*, *Photobacterium balticum*, *Photobacterium fischeri* and *Photobacterium pflügeri*.

Bacterium chironomi Issatschenko. (Bulletin du Jardin Impérial botanique à St. Pétersbourg, *11*, 1911, 37; *Photobacterium chironomi* Issatschenko, *ibid.*, 43.) A phosphorescent bacterium from a genus of midges, *Chironomus*.

Bacterium giardi (Kruse) Billet. (Giard and Billet, Compt. rend. Soc. Biol., Paris, 1889, 593; *Photobacterium pathogenicum* Giard, quoted from Eijkmann, see abst. in Cent. f. Bakt., *12*, 1892, 656; *Photobacterium giardi* Kruse, in Flügge, Die Mikroorganismen, 3 Aufl., *2*, 1896, 333; *Bacillus phosphorescens giardi* Kruse, *idem; Bacterium phosphorescens giardi* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 125; Billet, Bull. Sci. France et Belgique, *21*, 1898, 144; *Bacterium phosphorescens-giardi* Chester, Man. Determ. Bact., 1901, 182.) Pathogenic for marine crustaceans.

Bacterium hippanici Issatschenko (*loc. cit.*, 47). From fresh water fish.

Bacterium lucens (van Tieghem) Nüesch. (*Micrococcus lucens* van Tieghem; Nüesch, Karsten's Deutsche Flora, 1880; quoted from Ludwig, Cent. f. Bakt., *2*, 1887, 375.) From luminous meat. Considered identical with *Bacterium phosphoreum*.

Bacterium luminosus (Beijerinck) Chester. (*Photobacterium luminosum* Beijerinck, Arch. Néerl. d. Sci. Exactes, *23*, 1889, 401; *Vibrio luminosus* Beijerinck, Bot. Zeit., 1889, 763, according to Trevisan, I generi e le specie delle Batteriacee, 1889, 23; *Bacillus luminosus* DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 982; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 121; *Microspira luminosa* Migula, Syst. d. Bakt., *2*, 1900, 1015; *Photobacter luminosum* Beijerinck, Folia Microbiologica, Delft, *4*, 1916, 15.) From sea water.

Bacterium pelagia Dubois. (Dubois, Compt. rend. Acad. Sci., Paris, *107*, 1888, 502 and *111*, 1890, 363; *Bacillus pelagia* DeToni and Trevisan, in Saccardo, Sylloge Fungorum, *8*, 1889, 959.) Isolated from the surface of *Pelagiae noctilucae*.

Bacterium pfluegeri Ludwig. (Ludwig, Ztschr. f. wissensch. Mikrosk., *1*, 1884, 181; *Micrococcus pflügeri* Ludwig, Hedwigia, No. 3, 1884; *Arthrobacterium pflügeri* DeBary, 1887; *Photobacterium pflügeri* Beijerinck, Cent. f. Bakt., *8*, 1890, 617; *Bacterium phosphorescens pflugeri* Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 125.) From fish and meat. Considered identical with *Bacterium phosphoreum*.

Bacterium pholas Dubois. (Compt. rend. Acad. Sci., Paris, *107*, 1888, 502.) Isolated from *Pholadis dactyli*.

Bacterium phosphorescens Hermes. (Hermes, Sitzungsber. naturf. Freunde, April 19, 1887, quoted from Cent. f. Bakt., *2*, 1887, 404; *Bacillus hermesi* Trevisan, I generi e le specie delle Batteriacee, 1889, 18.) From sea water. Macé (Traité de Bact., Paris, 4th ed., 1901, 994) says this may be the same as *Micrococcus phosphoreus* Cohn. Emerald-green luminescence.

Bacterium phosphorescens gelidus (Eisenberg) Chester. (Phosphorescirenden Mikroorganismen, Forster, Cent. f.

Bakt., *2*, 1887, 337; *Bacillus phosphorescens gelidus* Eisenberg, Bakt. Diag., 3 Aufl., 1891, 182; Chester, Ann. Rept. Del. Col. Agr. Exp. Sta., *9*, 1897, 125.) From phosphorescent sea fish. Fischer (Cent. f. Bakt., *4*, 1888, 89) states that this organism is the same as his *Bacterium phosphorescens*.

Coccobacillus acropoma Yasaki and Haneda. (Yasaki and Haneda, 1936; quoted from Harvey, Living Light, Princeton, 1940, 33.) From a fish (*Acropoma japonicum*).

Coccobacillus coelorhynchus. (Studied by Hsu, Sei-i-kai Med. Jour., *56*, 1937, 1; quoted from Harvey, Annual Rev. of Biochem., *10*, 1941, 543.) From a deep-sea fish (*Coelorhynchus sp.*).

Coccobacillus ikiensis. (Quoted from Harvey, Living Light, Princeton, 1940, 263.)

Coccobacillus loligo Kishitani. (Kishitani, Proc. Imp. Acad. Tokyo, *4*, 1928, 69; quoted from Harvey, Living Light, Princeton, 1940, 35.) From the squid (*Loligo edulis*).

Micrococcus cyanophos. (Studied by Claren, Ann. d. Chemie, *535*, 1938, 122; quoted from Harvey, Living Light, Princeton, 1940, 184.)

Micrococcus physiculus. (Quoted from Harvey, Living Light, 1940, 34.) The cause of luminescence of a fish (*Physiculus japonicus*).

Microspira phosphoreum Yasaki. (Yasaki, see Sei-i-kai-zasshi, *45*, 1926; quoted from Harvey, Living Light, 1940, 239.) Caused luminescence of a fresh-water shrimp in Japan.

Photobacter hollandiae Beijerinck. (Proc. Sect. Sci., Kon. Akad. v. Wetensch., Amsterdam, *3*, 1900, 352.) Similar to *Photobacterium luminosum*.

Photobacter hollandicum Beijerinck. (Folia Microbiologica, Delft, *4*, 1916, 15.)

Photobacter hollandicum parvum Beijerinck. (Folia Microbiologica, Delft, *4*, 1916, 15.)

Photobacter splendidum Beijerinck. (Beijerinck, Proc. Sect. Sci., Kon. Akad. v. Wetensch., Amsterdam, *3*, 1900, 352; *Vibrio splendidus* Lehmann and Neumann, Bakt. Diag., 7 Aufl., *2*, 1927, 543; *Photobacterium splendidum*, quoted from Harvey, Living Light, Princeton, 1940, 204.) May be a variety of *Photobacterium indicum*.

Photobacter splendor maris Beijerinck. (Proc. Sect. Sci., Kon. Akad. v. Wetensch., Amsterdam, *3*, 1900, 352.) May be a variety of *Photobacterium indicum*.

Photobacterium Beijerinck. (Beijerinck, Arch. Néerl. d. Sci. Exactes, *23*, 1889, 401; *Photobacter* Beijerinck, Proc. Sect. Sci., Kon. Akad. v. Wetensch., Amsterdam, *3*, 1900, 352; *Photospirillum* Miquel and Cambier, Traité de Bact., Paris, 1902, 888; *Photomonas* Orla-Jensen, Jour. Bact., *6*, 1921, 271.) *Photobacterium phosphorescens* is the type species of this genus. See *Bacterium phosphoreum*. Several species are placed in this genus by Fischer.

Photobacterium annulare Fischer. (Fischer, Ergebnisse d. Plankton-Expedition d. Humboldt-Stiftung, *4*, 1894, 41; *Microspira annularis* Migula, Syst. d. Bakt., *2*, 1900, 1014.) From sea water.

Photobacterium balticum Beijerinck. (Einheimischer Leuchtbacillus, Fischer, Cent. f. Bakt., *3*, 1888, 105; Beijerinck, Akad. v. Wetenschappen, Afdeel. Natuurk., 2de Reeks, *7*, 1890, 239; see abst. in Cent. f. Bakt., *8*, 1890, 617; *Vibrio balticus* Lehmann and Neumann, Bakt. Diag., 1 Aufl., *2*, 1896, 341.) From water of the Baltic Sea. The relationship of *Photobacterium balticum* to *Bacterium phosphorescens indigenus* is not clear. The former species is based on a culture sent by Fischer to Beijerinck labeled Einheimischer Leuchtbacillus which Beijerinck considered to be different from his *Photobacterium fischeri*.

Photobacterium caraibicum Fischer. (Fischer, *loc. cit.*, 1894, 41; *Microspira caraibica* Migula, *loc. cit.*, 1015.) From sea water.

Photobacterium coronatum Fischer. (Fischer, *loc. cit.*, 41; *Microspira coronata*

Migula, *loc. cit.*, 1013.) From sea water.

Photobacterium degenerans Fischer. (Fischer, *loc. cit.*, 37; *Microspira degenerans* Migula, *loc. cit.*, 1015; *Bacillus degenerans* Beijerinck, Folia Microbiologica, Delft, I, 1912, 1.) From sea water.

Photobacterium delgadense Fischer. (Fischer, *loc. cit.*, 37; *Microspira delgadensis* Migula, *loc. cit.*, 1014.) From sea water.

Photobacterium glutinosum Fischer. (Fischer, *loc. cit.*, 41; *Microspira glutinosa* Migula, *loc. cit.*, 1014.) From sea water.

Photobacterium hirsutum Fischer (*loc. cit.*, 41). From marine fish.

Photobacterium papillare Fischer. (Fischer, *loc. cit.*, 41; *Microspira papillaris* Migula, *loc. cit.*, 1016.) From sea water.

Photobacterium sepiae. (Quoted from Doudoroff, Jour. Bact., *44*, 1942, 451, who obtained a culture so labeled which had come from Prof. Kluyver's collection at Delft.)

Photobacterium tuberosum Fischer. (Fischer, *loc. cit.*, 37; *Microspira tuberosa* Migula, *loc. cit.*, 1014; *Photobacter tuberculatum* Beijerinck, Folia Microbiologica, Delft, *4*, 1916, 15.) From sea water.

Pseudomonas toyamensis. (Quoted from Harvey, Living Light, Princeton, 1940, 263.)

Sarcina noctiluca Heller. (Heller, Arch. f. Physiol., path. Chem. u. Mikr., N.F., *6*, 1853–54, 44; see Harvey, Living Light, Princeton, 1940, 6.) From fish. Possibly the same as *Bacterium phosphoreum* Molisch.

42. **Bacterium erythrogloeum** Ruhland and Grohmann. (Cent. f. Bakt., II Abt., *61*, 1924, 256.) From Greek *erythros*, red and *glota*, glue.

Rods: 0.5 by 2.0 microns. Non-motile. Gram-negative.

Gelatin plate: Red, droplet-like colonies.

Gelatin stab: No liquefaction.

Agar plate: Red, droplet-like colonies.

Agar slant: Raised, non-spreading, glistening, brick-red growth.

Potato: Abundant, brick-red, warty.

Aerobic.

Facultative autotroph.

Oxidizes hydrogen in an inorganic medium under an atmosphere of H_2, O_2, and CO_2. Produces a pellicle on the inorganic liquid medium.

Source: Calcareous soil.

Habitat: Probably widely distributed in soil.

43. **Bacterium lentulum** Grohmann. (Cent. f. Bakt., II Abt., *61*, 1924, 256.)

Rods: 0.5 by 1 to 2 microns. Motile by long thin peritrichous flagella. Gram-negative.

Gelatin plate: Colonies appear like milk droplets.

Gelatin stab: No liquefaction.

Agar plate: Tough, ochre yellow colonies about 7 mm in diameter.

Agar streak: Parchment-like, folded, yellow streak about 1 cm broad.

Potato: Heavy, yellow growth.

Aerobic.

Facultative autotroph.

Oxidizes hydrogen in an inorganic medium under an atmosphere of H_2, O_2, and CO_2. Produces a heavy folded pellicle on the inorganic liquid medium.

Source: Soil poor in lime.

Habitat: Probably widely distributed in soil.

44. **Bacterium leucogloeum** Ruhland and Grohmann. (Cent. f. Bakt., II Abt., *61*, 1924, 256.) From Greek *leukos*, white and *glota*, glue.

Rods: 0.5 by 0.7 to 52 (?) microns. Motile by means of peritrichous flagella.

Gelatin stab: No liquefaction.

Agar streak: Wide, slimy, wet, ivory-colored growth.

Potato: Gray-brown slime.

Aerobic.

Facultative autotroph.

Oxidizes hydrogen in an inorganic medium under an atmosphere of H_2, O_2,

and CO_2. Produces a pellicle on the inorganic liquid medium.

Source: Calcareous soil.

Habitat: Probably widely distributed in soil.

*45. **Bacterium stewartii** Erw. Smith. (Sweet corn bacillus, Stewart, N. Y. Agr. Exp. Sta. Bul. 130, 1897, 423; *Pseudomonas stewarti* Smith, Proc. A. A. A. Sci., *47*, 1898, 422; Smith, Bact. in Rel. to Plant Dis., *3*, 1914, 89; *Aplanobacter stewarti* McCulloch, Phytopath., *8*, 1918, 440; *Bacillus stewarti* Holland, Jour. Bact., *5*, 1920, 220; *Phytomonas stewartii* Bergey et al., Manual, 1st ed., 1923, 192.) Named for F. C. Stewart, American plant pathologist.

Description from Smith, U. S. Dept. Agric., Div. Veg. Phys. and Path., Bul. 28, 1901.

Rods: 0.4 to 0.7 by 0.9 to 2.0 microns. Capsules. Non-motile (McCulloch, *loc. cit.*). Gram-negative.

Gelatin: No liquefaction.

Nutrient agar colonies: Small, round, yellow colonies.

Broth: Growth feeble with whitish ring and yellow precipitate.

Milk: Yellow ring but no visible action on the milk. Slightly acid.

Nitrites not produced from nitrates. McNew (Phytopath., *28*, 1938, 773) states that less virulent strains assimilate only organic nitrogen; those of intermediate virulence assimilate nitrogen from inorganic salts without reduction of nitrates to nitrites; virulent strains reduce nitrates to nitrites.

Hydrogen sulfide not formed.

Indole production slight or none.

Reduction of methylene blue in Dunham's solution feeble or doubtful.

Acid but no gas from glucose, galactose, sucrose, mannitol and glycerol. No acid from maltose. Acid from fructose, arabinose and xylose (McNew, *loc. cit.*).

Starch not hydrolyzed.
